Finds of Roman provincial coins are one of the crucial sources to use in the studies of the Roman-Barbarian relations. Baltic zone looks rather unremarkable if we look on the distribution of the Roman provincial coin finds in Barbaricum. A “blank spot” is to be seen foremost in Sambian Peninsula, from where until the beginning of the 21st c. only one such coin was known. During the last two decades at least ten new finds of Roman provincial coins, originating from three cemeteries and four settlements, have been discovered. These pieces were minted in the Balkan provinces (Viminacium, Marcianopolis, Deultum), as well as in the cities of Asia Minor (Nicaea, Prusa, Attuda) and in Alexandria of Egypt, from the reign of Septimius Severus until Gallienus. The chronological spectrum and the mints, in general, reflect the picture known from other parts of Central and Eastern Barbaricum. Their inflow to this territory is commonly associated with the involvement of Barbarians in Gothic Wars in the Balkans and in Asia Minor during the 3rd c. But can the finds of Roman provincial coins in Sambia – the domain of Balt’s settlement, be explained by the activity of Goths in the South? On the one hand, it can’t be ruled out, taking into account the written sources saying about a coalition of tribes fighting at the Goth’s side. But on the other hand, the presence of these coins in the Baltic region could result from the redistribution of Roman imports or the bronze coins circulation already inside Barbaricum. Since this topic hasn’t been thoroughly studied, the attention draws first of all the presence of these coins in the grave inventories dated to the Younger Roman Period in West Balt’s culture circle – the custom which remains unknown in other neighbouring parts of Barbaricum.

## 6 ENEMY HITHERTO UNSEEN? A RADIOCARBON-BASED RECONSIDERATION OF TRILOBATE ARROWHEADS FROM PLINKAIGALIS CEMETERY, CENTRAL LITHUANIA

**Abstract author(s):** Kurila, Laurynas (Lithuanian Institute of History)

**Abstract format:** Oral

Trilobate arrowheads had been in use for centuries by peoples along the Eurasian steppe, from the Sarmatians to the Xiongnu. This was not, however, a typical arrowhead form in Europe. It was never adopted here on a massive scale, but was repeatedly brought with major nomad invasions, or through military contacts, e.g. through recruitment of archers from the East into the Roman armies. The Huns who broke into Europe ca 370 AD are considered to be responsible for the spread of trilobate arrowheads in the Migration period Barbaricum. This deadly weapon, together with reflex bow and horseback archery, raised an unprecedented horror. During the battles and through joint military campaigns the European Barbarians could become acquainted with the new arrowhead form and could have added it to own arsenal, too.

Although the current territory of Lithuania was a remote periphery of the Barbarian world, finds of trilobate arrowheads bear witness to turbulent times. About 70 arrowheads have been found in hillforts or adjacent settlements, some of them in destruction layers. These finds encouraged Lithuanian archaeologists to create a narrative about severe incursion of the Huns. However, the debates do not cover the exact circumstances of this event. Whether it happened at the time of coming of the Huns to Europe, during the Attila’s conquests or after the fall of the Hunnic Empire, remains beyond the discussion. The main obstacle faced here is the lack of precise chronology.

Extremely rare finds come from Plinkaigalis cemetery, Central Lithuania. Two trilobate arrowheads were found embedded in human bones. Both individuals had other lethal injuries, and both were interred in group burials together with other presumed victims of brutal attack. Based on new radiocarbon dates, the report will offer new insights into the narrative of the Huns’ attack and historical background of the event.

UNIQUE IMPORTS FROM VEGERIAI, NORTHERN LITHUANIA: RECONSIDERING MIGRATION PERIOD CULTURAL CONTACTS IN THE EASTERN BALTIC

**Abstract author(s):** Petrauskas, Gediminas (National Museum of Lithuania; Klaipėda University, Institute of Baltic Region History and Archaeology) - Bliujienė, Audronė (Klaipėda University, Institute of Baltic Region History and Archaeology)

**Abstract format:** Oral

Northern Lithuania and Southern Latvia were long portrayed as a sparsely populated region in the Early Migration Period. This image was determined by the limited attention of researchers to the peripheral areas further away from the well-known archaeological sites and their clusters, the lack of research and data on the archaeological findings of the Late Roman and Migration Periods. Recent investigations have revealed that the Mūša-Lielupe River basin, located between present-day Lithuania and Latvia, underwent significant social, economic, and cultural changes in the late 5th and 6th centuries. At the time, population growth was accompanied by the development of community contacts and exchanges of various kinds, and the emergence of new political and economic centres. However, the Vadakstis/Vadakste microregion, located west of the Mūša-Lielupe River basin, has not received wider attention of researchers due to the reasons mentioned above.

In 2020, a few Migration Period artefacts were found by metal detectorists in Vegeriai, Northern Lithuania. Archaeological research at the site revealed that a previously unknown Semigallian cemetery has been discovered. Although the cemetery was used intermittently from the 5th through the 17th century, it contained unique Early and Late Migration Period gilded and silver-inlaid imports with only a few analogies from the Eastern Baltic region. They evidence about the contacts of the Vadakstis/Vadakste microregion with the Merovingians and the Ōlsztyn Group, while other analogies are known from the graves of the military elite in the South-Eastern Baltic. The paper attempts to answer how did unique Migration Period objects come to the Vadakstis/Vadakste microregion, which has been considered “empty” until now. The development of cultural contacts and people holding high social status, and the emergence of centres of power and authority in the Eastern Baltic in the Migration Period are being discussed in the paper.

8

THE NORTH IN THE SOUTH, THE WEST IN THE EAST. TRACES OF SCANDINAVIANS AND OTHERS IN POMERANIA AROUND 500 AD

**Abstract author(s):** Schuster, Jan (University of Łódź)

**Abstract format:** Oral

In the beginning of the migration period a destabilization of the settlement system between Oder and Vistula rivers took place. The traditional cultural structures in this area began to vanish, slowly. On the other hand, more and more finds of Scandinavian and Merovingian origin are noticed, inter alia made of precious metal and of high symbolic value dating back to the time around 500. Some have been discovered during regular excavations, others have been found with the help of the metal detector. This finds can be connected with Scandinavian groups that penetrated the southern Baltic coast region. Some of them may even have been founders of centers of wealth and power and / or trade there, others (from the north and from the west) could had been attracted by those centers. In the northernmost part of Pomerania we even have evidence for small groups of Scandinavians that have tried to settle down and buried their deceased at very small cemeteries.

9

NORTH MEETS SOUTH - EAST MEETS WEST: “INTERSECTION” AT THE RIVER CROSSING ON THE WARNOW NEAR WERLE IN MECKLENBURG

**Abstract author(s):** Schmidt, Jens-Peter (Landesamt für Kultur und Denkmalpflege Mecklenburg-Vorpommern)

**Abstract format:** Oral

When the river Warnow were dredged and straightened at the end of the 1920s, in the surrounding of Schwaan, Rostock district, numerous archaeological finds from different ages came to light. A weapon ensemble from the Migration Period is particularly important: the so called “Schwaaner Waffenfund”.

The exact location of the weapons has not been reported, but since the late 1990s there have been increasing indications that they came from a Warnow section near Werle, Rostock district. Since 1997, numerous weapons and personal equipment, but also items of jewelry and costume as well as raw materials and tools have been recovered there. Some finds reveal supra regional cultural contacts to the Eastern Baltic region, to Western and Central Europe or to Scandinavia. Also, the investigations yielded a large number of human skeletal remains, many of them with injuries.

The present material mostly points to the 1st half and the middle of the 5th century AD. This corresponds to the dendro data of a wooden structure, which was determined in the area of the greatest density of finds and build in the 5th century.

Today we can assume, that the Werle site is to be placed in the cultic context like of the Scandinavian war booty deposits, which also occur in the southern Baltic region. But the sacrifices in Werle do not only include military and personal equipment, but also people. This makes this sacrificial site extraordinary.

10

CHANGING CONTACTS: THE EVIDENCE OF NEW COIN FINDS FROM MECKLENBURG-VORPOMMERN

**Abstract author(s):** Wigg-Wolf, David (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts - RGK)

**Abstract format:** Oral

The activities of metal detectorists working in cooperation with the archaeological authorities in Mecklenburg-Vorpommern has led to a dramatic increase in the numbers of Roman coins found. More than 3 times as many coins have been recorded in the last 10 years alone than had been recorded before 1997 when the last inventory of coins from Mecklenburg-Vorpommern was published. This has led to significant changes in the overall picture of the presence and distribution of Roman coins in the region, as well as to new insights into the mechanisms and processes by which the coins arrived there.

This paper will focus on three particular axes and phenomena:

- The influx of Roman silver from the Empire as reflected in an increase in the proportion of denarii in the finds, including a number of hoards;
- imitations of Roman denarii as evidence for links within the Germanic world to the south-east;
- and two recently discovered hoards of 5th-century solidi containing coins otherwise unknown in northern Germany as possible evidence for contacts with Scandinavia.

A.

AUTOCHTHONOUS OR MIGRANTS? ROMAN PERIOD BURIALS WITH WEAPONS IN ROMANOVOPUGACHEV POND I.E. AN UNDERGROUND BURIAL GROUND IN NORTHERN SAMBIA

**Abstract author(s):** Dobrovolskaya, Maria - Mastykova, Anna (Institute of Archaeology Russian Academy of Sciences)

**Abstract format:** Poster

There has long been considered the question of presence and role of an allochthonous, first and foremost Germanic, element in the composition of the population that left behind artefacts belonging in the Sambian-Natangian (Dollkheim-Kovrovo) archaeological culture. This Western Balts (the Aests) culture existed in the Southeast Baltic region in Roman times. The point at issue is the migration to Sambia and Natangia of the carriers of the Wielbark and Przeworsk cultures, as well as descendants from Scandinavia. The present study focuses on the burials of the Roman period, investigated in the necropolis of the Romanovo-Pugachev pond in Northern Sambia. These burials represent the cremated remains of two men, and contain weapons, such as a spear, an ax, a boss. Burial 1.2016 dates to the years 160/180 - 250/270 (phase C1 according to the chronology of the European Barbaricum), burial 2.2016 - to the years 300/320 - 400/410 (phase C3 - D1). Among the weapons there are spears of Scandinavian origin, as well as weapons spoiled (bent) during the rituals, which corresponds more to Germanic rather than Western Balt rites. Therefore, one may wonder whether the people, buried here, were migrants. The cremated remains from burial 1.2016 were subjected to isotopic analysis. The ratio of strontium isotopes (Sr 87 / Sr 86) in bone tissue samples from burial 1.2016 is about 0.713 ‰. This indicates that the last years of life seemed to pertain to landscapes with alluvial sandy deposits. In general, such values are typical of several territories in the Eastern and Southern Baltic states, and not typical of Denmark, Finland, and Central Sweden. To conclude, it is still impossible to unambiguously answer whether the owners of the “military” burials of the Romanovo-Pugachev pond burial ground were autochthonous people or migrants.

RECENT CHRONOLOGY: CHALLENGING COPPER AGE HISTORICAL NARRATIVES IN CENTRAL, SOUTH-EASTERN AND EASTERN EUROPE

**Theme:** 7. From global to local: Baltic-Pontic studies

**Organisers:** Hofmann, Robert (Kiel University, Institute of Pre- and Protohistoric Archaeology) - Kadrow, Sławomir (Rzeszów University, Institute of Archaeology) - Lazar, Catalin (University of Bucharest, Research Institute of the University of Bucharest - ICUB) - Shatilo, Liudmyla - Terna, Stanislav\* (Kiel University, Institute of Pre- and Protohistoric Archaeology)

**Format:** Regular session

Our session will address new insights concerning the chronology of Copper Age sites between the Black Sea and Central Europe. This vast region is characterised by various environments and historical landscapes, which led to an equally large variety of lifestyles and historical archives. The diversity of archives and different research traditions resulted in different ways of constructing chronology such as stratigraphic sequences of the lower Danube tell sites, ornamental styles and local groups of the flat Cucuteni-Tripolye settlements, or grave types in the North-Western Pontic. These different research approaches have built the basis for the establishment of various historical narratives, which often became fixed points of view. For example, current spatio-temporal understanding of ‘Tripolye’ was built up mainly on data obtained before late 1980s and the resulting models are partly used to date. Intensive research and dating have changed the ‘local’ situation dramatically in recent years. But often results of this work are confronted with established ‘global’ narratives that reflect ‘regional research traditions’.

The aim of the session is to explore how these new data increasingly allow us to rethink the typology-focused chronological constructions and historical reconstructions based on them. In particular, we would like to have a closer look on transformations that took place in this region, e.g.:

- Establishment, transformation and disintegration of flourishing agricultural settlement systems in the Lower Danube (BPK V, KGK VI)) and the North-Eastern Carpathian region (Cucuteni-Tripolye),
- Expansion of human groups into the forest-steppe zone between Prut and Dnieper,

- Cucuteni-Tripolye population agglomerations with giant settlements,
- The development of mobile pastoralism with dispersed settlement pattern in the steppe and forest steppe north-west of the Black Sea
- Intensive interlinking of the Pontic-Baltic region through communication and exchange networks (Baden, Funnel beaker, Globular Amphora, Malice).

ABSTRACTS:

1 POPULATION DYNAMICS INFERRED FROM SUMMED PROBABILITY DISTRIBUTIONS OF RADIOCARBON DATES DURING THE 5TH MILLENNIUM BCE IN THE LOWER DANUBE REGION

**Abstract author(s):** Popescu, Gabriel - Covătaru, Cristina - Opris, Ionela - Frujină, Ovidiu (Research Institute of the University of Bucharest) - Sava, Tiberiu (Horia Hulubei National Institute of Physics and Nuclear Engineering – IFIN-HH) - Lazăr, Cătălin (Research Institute of the University of Bucharest)

**Abstract format:** Oral

Past population dynamics play a key role in integrated models of understanding socio-ecological change over time. However, despite the importance of deciphering population change through time, little analysis on this issue has been carried out for the prehistoric societies in the Lower Danube area. Here, we use summed probability distributions of radiocarbon dates (SPDs hereafter) to investigate potential regional and local variation population dynamics.

Our study adopts a formal model-testing approach to the fifth millennium BCE archaeological radiocarbon (14C) record, performing a region-wide, as well as a comparative analysis of the demographic trajectories of the area astride Danube river. We follow the current backdrop of theoretical models of population growth and controlling for taphonomic loss, sampling biases and errors, and perform global and regional significance and spatial permutation tests on the data.

Specifically, we investigate whether populations astride the Danube follow a logistic pattern of steady growth or an exponential growth followed by a major decline over time. Finally, our analysis of local-scale growth will investigate whether considerable heterogeneity or homogeneity within the region may be observed over the timespan considered here. The results will help us understand how similar or different the population trends were across the area.

Our findings will be displayed in relation to the cultural characteristics that the Middle Holocene societies in the region experienced within the timeframe under scrutiny, and some future research directions will be also suggested.

2 TAKE THE WHOLE VALLEY! NON-INVASIVE SETTLEMENT ARCHAEOLOGY OF THE CUCUTENI CIVILIZATION IN THE NEAMŢ DEPRESSION OF THE MOLDAVIAN SUBCARPATHIANS (ROMANIA)

**Abstract author(s):** Preoteasa, Constantin (Neamţ National Museum Complex) - Mischka, Doris - Mischka, Carsten („Friedrich-Alexander” University of Erlangen-Nuremberg)

**Abstract format:** Oral

The Neamţ River’s valley forms a natural path from the Carpathian Mountains to the Moldavian Plateau, part of the great eastern European plain. Where it leaves the mountains, it crosses the hilly Subcarpathian area, where also the Precucuteni and Cucuteni communities had to adopt to the less confined topographical settings. No longer restricted to small hillsides, they had the potential to evolve bigger sites and concentrate larger communities. But did they do this?

Since 2017, a joint project of the Neamţ National Museum Complex (Romania) and the Institute of Pre- and Protohistory of the FAU Erlangen-Nuremberg (Germany) aims for the complete survey of all Precucuteni and Cucuteni settlements in the Neamţ Depression. The main objective is to get reliable data on the organization of the settlements’ plans and based on the number of houses, the settlement intensity, and further data to participate on the discussions of demographic estimations regarding the temporal sequence.

Long-term extensive field walking, which finally covers the whole area, located the sites, and lead the path to the gradiometer-survey. Nearly done for all sites, these surveys revealed the settlements’ sizes, numbers of houses, fortification systems and the remains’ current state of preservation. In addition, more complex structures than expected showed off, like overlapping ditch systems even on sites assumed to be only one-phased, based on the surface finds. To sharpen our understanding of the spatial-chronological processes of all these sites, a second project phase, based on intensive surface collections just started.

3 INTERACTIONS BETWEEN TRYPILLIAN FARMERS AND SREDNIJ STOG PASTORALISTS IN THE DNIEPER AREA AT THE END OF THE 5TH MILLENNIUM BCE

**Abstract author(s):** Nikitin, Alexey (Grand Valley State University) - Videiko, Mykhailo (Kyiv Borys Grinchenko University)

**Abstract format:** Oral

Migration of Cucuteni-Trypillia farmers from the Carpathian region eastwards in the second half of the 5th millennium BCE subdivided the Trypillian complex into a number of relatively isolated local groups. At the same time, some of these groups came into contact with nomadic pastoralists of the Srednij Stog complex from the northern part of the Pontic steppe. At the Trypillian site of Kolomyitsiv Yar Tract in the middle Dnieper area, evidence of Srednij Stog influence on Trypillian kitchenware pottery (Cucuteni C)

has been identified. Human remains uncovered at the site allowed to directly date the Kolomyitsiv Yar Tract settlement to the end of the 5th- beginning of the 4th millennium calBCE. The analysis of diet isotopes of the Kolomyitsiv Yar’s remains suggests that the individual’s subsistence was that of a pastoralist, such as a member of the Srednij Stog community. This finding further supports close relationships between Trypillia and Srednij Stog during the BI-II stage of Trypillia culture chronology.

4 THE CHRONOLOGY OF THE TRYPILLIA CULTURE AND THE BAYESIAN APPROACH

**Abstract author(s):** Chub, Nataliia (RGK - Romano-Germanic Commission DAI)

**Abstract format:** Oral

The relative chronology of the Cucuteni-Trypillia culture was established first of all on the basis of pottery found in the settlements, taking into account both the shapes of the vessels as well as their ornamentation. Besides the main chronological phases, the sites with similar materials, usually clustered spatially, are grouped into so called local groups.

The absolute chronology of Trypillia culture is still controversial despite the rather large amount of radiocarbon dates available. There are two main reasons for this problem. The first one is the quality of the available radiocarbon data, many of which were considered unreliable. Only in recent years the old pool has been supplemented by new sets of radiocarbon data. The second problem is the fact that there are almost no stratified settlements of the Cucuteni-Trypillia culture which would allow a more precise absolute chronology.

While the absolute chronology of the South-Eastern European tell settlements could be refined using the Bayesian approach, this method is not appropriate for the single-layered settlements of the Cucuteni-Trypillia culture. However, some research groups are working on the refinement of the chronology of particular settlements of the Trypillia culture applying the Bayesian modelling.

In my research I have followed a supra-regional chronological perspective of the Trypillia culture using Bayesian approach. The applicability of Bayesian modelling in the context of Trypillia culture was tested, based on relative chronology as prior information. In this paper I will show, that applying the Bayesian modelling on the radiocarbon dates of Trypillia culture has both possibilities and limits. But by and large this method can be used despite the absence of stratigraphic sequences in case of a well-established relative chronology.

5 TRIPOLYE MOBILITY PATTERNS, HOUSE DURATION AND DEMOGRAPHY: THE EVIDENCE OF RADIOCARBON DATING

**Abstract author(s):** Mueller, Johannes - Robert, Hofmann - Ohlrau, Rene (Institute of Prehistoric and Protohistoric Archaeology Kiel) - Rassmann, Knut (Römisch-Germanische-Kommission DAI Frankfurt) - Shatilo, Mila - Terna, Andreea (Institute of Prehistoric and Protohistoric Archaeology Kiel) - Rud, Vitalii (Institute of Archaeology, National Academy of Sciences of Ukraine, Kyiv) - dal Corso, Marta - Kirleis, Wiebke (Institute of Prehistoric and Protohistoric Archaeology Kiel) - Videiko, Mykhailo (Laboratory of Archaeology, Borys Grinchenko Kyiv University)

**Abstract format:** Oral

Numerous new 14C data from different Tripolye settlements enable settlement-related analyses on house, village and town biographies as well as information on the relationship of different Tripolye regions to each other. The results are correlated with archaeological data, primarily stratigraphy and typology of pottery, and the presence of imports. A reassessment of e.g. the data from Maidanestke, Nebelivka and Talianky informs about demographic and cultural processes.

We observe different processes. The emergence of megasites is linked to the depopulation of other regions and the concentration of population in a previously sparsely populated area. In the process, previously separate communities are obviously drawn together. There is also a strong demographic interaction between megasites, through which moments of fluid societies can be identified. In particular, the relocation of large settlements through gradual demographic exchange is discernible. Radiocarbon data can also be used to better assess different phenomena. Some mega-settlements, e.g. Nebelivka, were never settled and abandoned early, while others, e.g. Maidanetske, represent a typical populous mega-settlement. This explains some misinterpretations of the megasite phenomenon of the past.

6 TRANSFORMATION OF SETTLEMENT SYSTEMS AT DNEEPER REGION: FROM MEGA-SITES TO SMALL SITES AT TRYPILLIA CULTURE

**Abstract author(s):** Videiko, Mykhailo (Kyiv Borys Grinchenko University) - Burdo, Nataliia (Institute of Archaeology)

**Abstract format:** Oral

The “Age of mega-sites” in Trypillia Culture started at BI-II stage at the end of Vth Millenium BC. At this moment appeared first agglomerations at different areas: from Dniestr-Southern Bug interfluvium to Dneeper. At Dneeper area at the beginning settling system included one large site (Trypillia, near 60-70 hectares) and few small (2-4 hectares). For the next phase (the end of BI-II stage) we know two middle size sites (16-25 hectares) – Veremya and Kolomyitsiv Yar and few small. From the beginning of BII stage up to the end of CI at this area were only small size sites. On the one hand, we see the process of disintegration of the settling system, the central element of which was mega-site and a returning to the previous system, which included only small sites. The similar transformation of the settlement system we can see at the end of the CI-beginning of CII stages in the interfluvium of the Southern Bug and the Dnieper (Kosenivka local group). On the other hand, the return to the ancient system of settling on the Dnieper occurred at a time, when in

other areas the “Age of mega-sites” became widespread and lasted for next several centuries. Different versions of the explanation of this phenomenon are possible. A return to the previous resettlement system could occur if the population of the mega-site could disperse over a large area. This model seems plausible given the gradual reduction in the size of central settlements. Another version involves military intervention by neighbors, which resulted in the destruction of the local mega-site as the center of power and the establishment of control by other chiefdoms. Further research in the region will allow us to study in more detail the history of the transformation of the settlement system and its probable causes.

7 CHALLENGING POTTERY BASED CHRONOLOGIES AND NARRATIVES ON TRIPOLYE SOCIETIES

**Abstract author(s):** Hofmann, Robert (Kiel University) - Shatilo, Mila (Kiel University; Institute of Archaeology NASU Ukraine)

**Abstract format:** Oral

Already since the end of the 19th century, the ceramics found in Tripolye settlements have attracted great interest among researchers both aesthetically and as a valuable source of information because of their elaborate ornamentation and shapes. Due to the almost complete absence of stratified settlements, style and techniques of ceramics became one of the most important material for chronological constructions, and even more, settlements with similar vessels started to be used for reconstruction of tribes. Thus, ceramics had ceased to be just dishes, but were equated with people. Thanks to the work of many generations of scientists, the archaeological remains in the enormous Tripolye distribution area was divided both temporarily and spatially into a number of accurate periods and ‘local groups’. Unfortunately, there has long been a lack of independent sources to test the chronological relevance of the observed typological variability of pottery and interpretations based on it. In recent years, this situation has changed considerably insofar as different projects have systematically obtained a larger number of new 14c dates that can be used to review existing constructions based on pottery like chronological and others. In our paper we would like to discuss the question to what extent we need to revise and rethink existing narratives and in how far this opens up starting points for new approaches for the interpretation.

8 FALL OF NEOLITHIC SOCIETIES IN CENTRAL EUROPE AND EXPANSION OF STEPPE POPULATIONS AT THE END OF THE 4TH MILLENNIUM BC

**Abstract author(s):** Kadrow, Slawomir (Institute of Archaeology, Rzeszów University)

**Abstract format:** Oral

The contribution presents the materials as well as the chronology and taxonomic position of the heterogeneous Wyciąże group from western Lesser Poland, dated to the 2nd part of the 4th millennium BC, which was the result of mixing of elements of Polgár and Baden cultures. The analysis of the presence of other heterogeneous cultural units in other regions of Central Europe (Mittelelbe-Saale-Gebiet and Kuyavia) showed that their existence was accompanied by crisis processes (Fall of Neolithic societies).

The source of a series of local crises in Central Europe at that time, resulting in a decreasing population and cultural hybridization (e.g. the case of Bronocic IV-V), seems to be local conflicts of a socio-cultural nature. They contributed to a serious weakening of the hitherto dominance of the FBC groups or the late Danube cultures. In the cultural sense, the element co-forming the heterogenization processes at that time was mainly the early Boleraz influence.

In periods of disappearance of hierarchical ties typical of the world system (Wallerstein), or the relationship between the center and the periphery (Braudel), horizontal network structures begin to dominate. The phenomena of poly(multi-)culturalism, heterogenization and multi-ethnicity appear (Maffesoli). Late antiquity (the spread of early Christianity) and modern times (Untergang des Abendlandes by Oswald Spengler or Le temps des tribus by Michel Maffesoli) are an excellent illustration of the flourishing of hybrid cultures in the conditions of a deepening socio-cultural crisis.

The end result of the long-term crisis of Neolithic communities was creation of space for new processes of cultural integration encompassing the entire continent in the form of the formation of the Corded Ware and Bell Beakers as well as the Yamna culture in the east.

9 UNDERSTANDING CHANGES IN HOUSE CONSTRUCTION IN THE SECOND HALF OF THE 4TH MILLENNIUM BC IN THE EASTERN CARPATHIAN AREA

**Abstract author(s):** Król, Dariusz (Rzeszow University) - Sîrbu, Ghenadie (Academy of Sciences of Moldova) - Rybicka, Małgorzata (Rzeszow University) - Sîrbu, Livia (National Museum of History of Moldova) - Burlacu, Vitalie (Academy of Sciences of Moldova)

**Abstract format:** Oral

Among most obvious research activities, the investigation into construction of dwellings, their spatial arrangements, and the nearest surroundings are particularly relevant in studies of functioning of archaeological phenomena. During the field campaigns undertaken so far at the Late Eneolithic fortified settlement in Gordinești Il-Stîncea goală (NCN Opus 15 project no. 2018/29/B/H3/01166), we revealed and fully documented the relics of two dwellings and their directly adjacent economic zones. These dwellings together with their surroundings may be considered as basic units of production referred to as household clusters (Grygiel 1986; por. Flannery 1976; Kent 1984; Jongsma, Greenfield 2003). At the outset of our research some fundamental questions have been formulated: a) What type of dwellings were used by the occupants of this settlement?, b) How their interiors and the adjacent economic zones were arranged?, c) What was the function of the various parts of the household cluster units? In this talk, we would

like to focus closer on these issues. Our goal is to present not only the key attributes of the dwellings, but also to show the results of the spatio-functional analysis of features and artifacts found in the context of the whole household clusters. We are convinced that detailed analysis of these units could be crucial from the perspective of general significance of this site in the broader context of the Eastern Carpathian area in the second half of the 4th Millennium BC.

471 WHAT’S SO CULTURAL ABOUT APPROPRIATION? ARCHAEOLOGICAL PERSPECTIVES ON CULTURAL ANNEXATIONS

**Theme:** 4. Globalisation and archaeology

**Organisers:** Casimiro, Tania (NOVA University of Lisbon) - Simões, Sara (Cambridge Archaeological Unit)

**Format:** Regular session

A simple definition of cultural appropriation can be “the adoption or co-opting, usually without acknowledgment, of cultural identity markers associated with or originating in other communities”. The process is far more complex and even the definition of cultural appropriation, its archaeological use, and if it can be applicable to all the moments of the human past should be debated. The (in) appropriately appropriation of cultural characteristics, either pacifically or violently, has always been observed in the European past from pre-history to the contemporary world, and archaeology has a key role in the study, discussion and understanding of the impact of those appropriations in European societies.

The purpose of this session is to engage archaeologists from all periods and geographies in debating the social and political impact, and power relations, of the appropriation of cultural elements by European societies either by contacts within Europe or with societies across the globe, and how they help us to reconstruct the emergence of modern unequal or equal human social and political organizations. Although archaeology is the base of this session interdisciplinary approaches are welcome.

ABSTRACTS:

1 INTRODUCTION: HOW SHOULD ARCHAEOLOGY APPROACH CULTURAL APPROPRIATION?

**Abstract author(s):** Simões, Sara (UNIARQ - Center for Archaeology, University of Lisbon) - Casimiro, Tânia (HTC/IAP Nova University of Lisbon)

**Abstract format:** Oral

In the abstract of this session we used the definition of cultural appropriation as “the adoption or co-opting, usually without acknowledgment, of cultural identity markers associated with or originating in other communities”. Cultural appropriation has been shaping historical relationships, mostly through structural expropriation processes and mechanisms of oppression. In this sense, the purpose of this introduction is to reflect on possible ways how archaeology studies and analyses those processes of expropriation of identity markers and cultural elements. Whether they are technical, symbolic, religious, ideological or social made by societies in contact, they always underline unbalanced power relations. We aim to theoretically think how these annexations can be studied in wider relations of power and question if these processes can be equality analysed as appropriation, either they were shaped pacifically or violently. Appropriations of cultural elements, as demonstrated by the presentations made in this session, can be recognized along human history whenever different societies interact, from pre-history to the contemporary world. What have been the social, political, economic, cultural or mental implications of the appropriation of different elements by different cultures? Should all annexations be considered appropriations? What defines appropriation in different human groups? In fact, what defines an annexation as appropriation in different historical moments? How have they been conforming the development of unequal or equal human social organizations? Bearing in mind the complexity of all these concepts, we do not hope to find consensus or a unique definition. Instead, we intend to promote discussion, reflecting on how archaeologists can engage with such discussion.

2 WHO’S APPROPRIATING WHO? „IMITATIONS” OF ROMAN COINS FROM OUTSIDE THE EMPIRE

**Abstract author(s):** Wigg-Wolf, David (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts - RGK) - Bursche, Aleksander - Myzgin, Kyrilo (University of Warsaw, Institute of Archaeology)

**Abstract format:** Oral

Today coins are among the most frequently encountered material remnants of the Roman Empire, and they played a central role in the rise of classical scholarship during the Renaissance. This paper considers coins and coin-like objects that were produced by Germanic groupings outside the Roman Empire in Central Europe, and which in some way imitate or reference Roman coins. Numismatists and archaeologists have generally classified these objects as mere “imitations”, but the question arises at to what extent they fit this somewhat simplistic interpretation. While they may simulate Roman coins in their appearance, they do not always do so in function. Many were worn as personal ornaments and were not primarily intended to be used as money. In particular they were often pierced or mounted so that when worn the head of the emperor on the obverse of the coin was correctly oriented and visible.

What does this inform about the social and political impact of Rome on societies outside the Empire, and the relationship between Rome and the Germanic groupings with which it was in engaged in a terminal power struggle in Late Antiquity? What was it exactly

that was being appropriated, and what role did this play in the power relationships and social structures of the Germanic societies of Central Europe?

3 **HOW TO DRESS AND WORSHIP LOCAL GODDESSES – THE ROMAN “MAKING” OF THE SO-CALLED RHINELAND MATRONAE**

**Abstract author(s):** Schmölzer, Astrid (Otto-Friedrich-Universität Bamberg, Institut für Archäologische Wissenschaften, Denkmalwissenschaften und Kunstgeschichte)

**Abstract format:** Oral

The history of Roman provinces varies like the regions and cultures they embrace. The Romans were looking to connect to a certain region, by introducing the Roman traditional culture of worship and blending it in with local religious elements. This also happened at the Roman province Germania Inferior. Here, inscriptions from goddesses called matres or matronae are known from votive altars, showing also a depiction of them in the altar niche. Research on these female deities was very long biased within epigraphy and linguistics, whereas their iconography was very often skipped over general statements.

The matronae are always shown in a triad setting. Next to their bynames of Germanic or Celtic origin their clothing is the obvious local element. We take the form of worship as a starting point to trace back their responsibility – all over the Roman Empire we can observe the custom of setting stone altars with votive inscriptions for various deities. For the matronae/matres of Germania Inferior, we can work with a basis of 440 altars and their fragments, mostly located in the southeastern part of the province.

While their clothing and bynames are the markers of their geographical responsibility, their other attributes are gathered from the visual imagery of classical mediterranean deities. The main attributes are baskets with fruits, followed by bunches of flowers or corn ears, little boxes, as well as cornucopiae and the caduceus. Therefore, we can trace the “making of a Roman provincial deity” (inside the overall discussion on how “Romanisation” works) and illustrate the different parts of their syncretistic creation.

This process went on for 3 to 4 generations after the Roman conquest and ended up with an established depiction of female deities. In addition to this, the worshipping community comprises all social groups, locals as well as officials.

4 **IMITATION AND CULTURAL APPROPRIATION. CHINESE INFLUENCES IN PORTUGUESE TIN GLAZE WARE**

**Abstract author(s):** Casimiro, Tania (HTC NOVA University of Lisbon)

**Abstract format:** Oral

Blue on white tin-glazed earthenware was made in Portugal since the mid 15th century. The early modern production passes by different styles, however, somewhere around mid 16th century the decoration of Portuguese tin-glazed earthenware started to resemble, if not clearly imitate, Chinese porcelain. Potters were widely aware of this attempt to imitate Chinese porcelain considering that most of these objects are mentioned in documents as porcelain. Archaeological and documentary evidence shows that this type of blue on white earthenware started as a luxury product, sometimes reaching the same prices as porcelain, and found in wealthy contexts. However, in the first half of the 17th century the production of this type of earthenware increased to a point that everyone was able to own such objects and thousands of them are found daily in archaeological contexts from around the globe. The purpose of this paper is to discuss the appropriation of forms and decorations of Chinese porcelain in the development of the Portuguese tin-glazed earthenware industry and its international importance from an social, economic, cultural, and symbolic perspective.

5 **CULTURAL APPROPRIATION AND IRON METALLURGY: THE 16-17TH CENTURIES SLAG FROM PARANÁ, SOUTHERN BRAZIL**

**Abstract author(s):** Giardino, Claudio (University of Salento - Lecce) - Chmyz, Igor (Federal University of Paraná - Curitiba, Brazil) - Zappatore, Tiziana (University of Salento - Lecce)

**Abstract format:** Oral

Archaeological excavations in Paraná recovered slag associated with iron metallurgy. The slag, coming from different contexts, could be dated between the 16th and 17th centuries. The items belong to the Jesuit reduction of Santo Inácio Mini (1610-1631) and to a village of Indios Tupiguarani (PR-FL29 site: 1476-1636 cal AD) located a few kilometers from the Spanish village of Vila Rica do Espírito Santo (1589-1632).

Iron objects were produced in the Spanish villages of Ciudad Real do Guaira (1557-1632) and Vila Rica do Espírito Santo, both in Paraná.

Iron smelting was not a technology used by the Tupiguarani before the Spanish arrival. Paraná has iron ore deposits that have been exploited since the 16th century, shortly after the arrival of the conquistadores.

The excavation carried out at the Santo Inácio reduction demonstrates that iron objects were produced by the Jesuits with the help of the Tupiguarani. The Jesuits were prohibited from smelting iron by the Spanish Crown, to which the reductions were subordinate. It was feared that the reductions would become armed nuclei. Research shows that the Jesuits made iron illegally. In Santo Inácio traces of weapons were not found, only domestic utensils.

The presence of slag at the PR-FL29 site indicates contact between the Tupiguarani, who lived there, and the Spaniards from Vila Rica. The Indios, as well as other sites that existed in the space controlled by the military of Vila Rica, were involved in the maintenance of the Spaniards in a regime of slavery.

The slags show that the natives used metallurgical methods of direct European derivation, just a few decades after the Iberian colonization. They explain the impact of the new technologies on the native society. Even the pottery produced by the Indians at the PR-FL29 site is an indicator of influences from European models.

6 **SOCIAL NUANCES DURING THE OLD REGIME PERIOD ON BRAZILIAN PORTUGUESE OVERSEAS POSSESSIONS, ACCORDING TO THE PRESENCE OF PORTUGUESE FAIENCE**

**Abstract author(s):** Bandeira, Beatriz Brito De (Universidade Federal de Sergipe)

**Abstract format:** Oral

From the 17th century onwards, to supply large orders from the Far East, or stimulated to produce something similar and an equal quality to the Eastern Porcelain, the Europeans unleashed a series of technological developments in the production of Faience, a ceramic that was able to compete with herself and the porcelain. In the middle of the 18th century, the English culminated in the progressive improvement of a thinner and more resistant faience, which value would vary according to the complexity of the decorative techniques applied on this ceramic. Recent discoveries of English earthenware in Brazilian slave quarters, on 19th century contexts, it has allowed to analyze the artifact as a symbol of social negotiation, in the sense of building and maintaining social differences and boundaries, especially when it found in non-manorial contexts. However, in Portuguese-Brazilian colonial contexts from 18th Century, located in Sergipe, Northeast Brazil, when it faced with a substantial amount of Portuguese earthenware among ceramics with African decorative patterns and indigenous lytic artifacts, an area of free indigenous and Afro-descendants, who might be free or not, it is possible to question about the use of the faience as a practice of social negotiation, with regard to the policy of social expansion for the maintenance of Portuguese possessions overseas, under the Pombaline Reforms (1750-1777). On this way, the interpretation of this social dialogue from the European faience in non-manorial contexts, these findings have been allowing to give visibility to the people that Historical Archeology has explored recently or of which very little is known.

7 **WHAT’S FOR DINNER? A TAPHONOMIC ANALYSIS OF FAUNAL REMAINS FROM WYBALENNIA, TASMANIA**

**Abstract author(s):** Dougherty, Emma - Flexner, James - Faulkner, Patrick (The University of Sydney)

**Abstract format:** Oral

Introduced domesticated species would have impacted the foodways of Aboriginal Tasmanians during the arrival of colonists during the 19th century, though little previous archaeological work has been done on this topic. An analysis of the taphonomy and stratigraphic placement of the faunal remains from the colonial mission site of Wybalenna, Tasmania provides an opportunity to examine the ways that native and introduced species were distributed in Indigenous habitation sites, albeit ones shaped by displacement and genocide. Zooarchaeological analyses can show whether the Indigenous diet changed from native to domesticated species with the arrival of new food-sources. Comparison with traditional foodways as understood from pre-contact faunal assemblages provides evidence for the levels of continuity and change. Faunal remains also provide a proxy for changing environmental conditions as Australian landscapes were transformed to suit Old World domesticates, particularly sheep and cattle. Finally, the mission context of Wybalenna is important as faunal remains can demonstrate the amount of institutional control of the diet, or the amount of Indigenous autonomy in such a space where people were allowed to retain traditional hunting and foraging practices. This paper offers an examination of the introduction of domesticated species into the diets of an Indigenous community which previously relied entirely on native food sources.

A. **APPROPRIATION AND ATTRIBUTION AS SIGNS OF CULTURAL IGNORANCE?**

**Abstract author(s):** Adlung-Schönheit, Lilian (Hamburg University)

**Abstract format:** Poster

The proposed poster shall present visual and textual narratives of appropriation and rejection in Imperial Rome. Depictions and descriptions of India and Indians in Imperial Roman Art serve as illustrative examples of an interplay between ignorance, appropriation and attributing. Not only is a whole subcontinent with varying political and cultural systems reduced in the single term “India”, it is also presented as a subordinate trading partner, not much distinguished to controlled provinces. While a cultural appropriation is attributed to northern Indians by Alexander biographers through the myth of Dionysus in India and the recalled Indian appropriation of western vegetation cults, visual attribution is made by Roman artists who take on attributes and characteristics from depictions of Ethiopians for Indians. Hereby, they reveal underlying subjective parallelization.

The posters aim is to evoke questions and self-reflections on roots of west-east-stereotypes, European desire to simplify and marginalize non-Europeans and western perception of trading relationships.

472 **EAA COMMUNITY CLIMATE CHANGE AND HERITAGE’ (CCH) ROUNDTABLE**

**Theme:** 2. Pandemics and climate change: responses to global challenges

**Organisers:** Biehl, Peter F (University at Buffalo, SUNY) - Dalen, Elin (Directorate of Cultural Heritage) - Martens Vandrup, Vibeke (Norwegian Institute for Cultural Heritage Research - NIKU)

**Format:** Round table

Archaeology and cultural heritage are central to both human understanding and management of crises such as pandemics or climate change. Interdisciplinary research on responses of previous societies to similar crises can help us to develop resilience, mitigation and adaptation strategies to tackle these global big challenges at the beginning of 21st century.

This fifth roundtable organized by the EAA Community Climate Change and Heritage (CCH) builds on the success of the previous ones and hopes to focus further on: (1) Internationalization, (2) Prioritization, (3) Strategies, and (4) Policies.

We will also invite representatives of key archaeology associations such as the AAA (Elizabeth Chilton), AIA (Ben Thomas), SAA (Anne Jensen) and WAC (Koji Mizoguchi) as well as specialists in climate change and heritage research as a sounding board for the CCH activities as well as opinion leaders in methods and practice of climate change and heritage research. In addition, the roundtable session will provide an update on the work done in and by the community since the previous meeting and discuss next steps for the Community to grow and extends its network and activities in a COVID-19 environment.

473 **CROSS-CHANNEL CONNECTIONS: COMPLEMENTARY NEW PERSPECTIVES ON LATER MEDIEVAL ARCHAEOLOGY IN FRANCE, BELGIUM, NETHERLANDS, AND THE BRITISH ISLES**

**Theme:** 4. Globalisation and archaeology

**Organisers:** Lorans, Elisabeth (University of Tours) - Lewis, Carenza (University of Lincoln) - Guillot, Bénédicte (Institut national de recherches archéologiques préventives - Inrap; Univeristy of Caen-Normandie) - McClain, Aleksandra (University of York) - Tys, Dries (Vrije Universiteit Brussel)

**Format:** Regular session

This session aims to bring together archaeologists working in France, Belgium, Netherlands, and the British Isles to share late medieval discoveries and ideas exploring the character and development of areas connected by the narrowest stretch of water between the British Isles and north-western Europe. Throughout the later medieval period, the territories either side of the Channel were closely connected politically, culturally and economically, but too often their archaeologies remain separated by national and natural divides. This session aims to share new projects, discoveries, methodologies and data from both sides of the Channel so that interpretations, ideas, narratives and even future research directions will be better through being informed by their nearest cross-Channel neighbours. Its overarching aim is to move from discovery and datasets to new narratives.

We welcome papers on recent archaeological excavation, fieldwork, analysis or other research focussing on any part of the first half of the second millennium AD (c. AD 1000-1500) (recognising that the chronological range of some papers may need to begin or end outside this core period). We will be particularly interested in papers which explore key themes of (a) environment and sustainability; (b) identity and belief; (c) health and the life-course (d) mobility and change; (e) power and place (f) production, trade and consumption; but will welcome papers on any aspect of later medieval archaeology which can be shown to have resonance both sides of the Channel and the North Sea.

This session is organized jointly by members of the Society for Medieval Archaeology (SMA), the French Society for Medieval, Modern and Contemporary Archaeology (SAMMC), and MERC.

**ABSTRACTS:**

- 1 **CROSS-CHANNEL MEDIEVAL ARCHAEOLOGIES PAST AND FUTURE – RETROSPECT AND PROSPECT**
- Abstract author(s):** Lorans, Elisabeth (Université de Tours) - Lewis, Carenza (University of Lincoln) - Tys, Dries (Vrije Universiteit Brussel) - McClain, Aleksandra (University of York) - Guillot, Bénédicte (Inrap/University of Caen-Normandie)

**Abstract format:** Oral

This paper introduces this session by contextualising its aims in bringing together archaeologists and archaeologies working in France, Belgium, the Netherlands and the British Isles on the period between AD 1000 and 1500. Throughout this period, these areas were intimately connected politically, culturally and economically but in today’s era their archaeologies have been too often separated by language, administrative boundaries, professional practice and intellectual habit. One of the most important aspects of the annual EAA general meeting is the way in which it brings together archaeologists working on different material in different places, and this is particularly valuable when closer collaboration across borders would be beneficial to the advancement of knowledge and understanding. The inspiration for this session originated in an EAA meeting through MERC which brought together the Société d’Archéologie Médiévale, Moderne et Contemporaine based in France and the Society for Medieval Archaeology based in the British Isles and Ireland. We hope the session will be the precursor to a large conference on cross-channel later medieval archaeologies, jointly hosted by the two societies, which will drive a step-change in collaborative archaeological practice. Accordingly, this paper

2 **NEW APPROACHES TO AN ENVIRONMENTAL HISTORY OF THE NORMAN MARITIME INVASION IN 1066**

**Abstract author(s):** Tyson, Rebecca (University of Bristol)

**Abstract format:** Oral

To date the extensive scholarship of the Norman Conquest has focussed on the activities of the Normans once they landed in England, often passing over the Channel crossing as a necessary means to progress the narrative on to the Battle of Hastings.

This paper outlines how the application of methodologies from environmental history, as part of an interdisciplinary suite of evidence and techniques, can contribute a new perspective to studies of the Norman invasion and start to redress the balance in scholarship to acknowledge the significance of the maritime operation and Channel crossing.

By considering a range of environmental factors influencing the Norman invasion fleet, such as the resources required for construction and the potential impacts of tides and weather, it is possible to illuminate the decision-making process in the early months of 1066 and provide an environmental context within which the textual narratives of the Norman invasion can be properly situated and explored. By placing these narratives within the wider context of eleventh-century shipbuilding and seamanship traditions, as identified through archaeological investigation and reconstruction, diverse textual and material evidence can be brought to bear on questions of the practicalities of a cross-Channel invasion in the autumn of 1066.

3 **IMPROVING CONNECTIVITY – A FRESH LOOK ON MEN-MADE NAVIGABLE CANALS ON BOTH SIDES OF THE CHANNEL (11TH /12TH CENT. AD)**

**Abstract author(s):** Werther, Lukas (Tuebingen University)

**Abstract format:** Oral

Navigable canals and artificial waterways were key elements of Later Medieval waterborne infrastructure on both sides of the Channel. Nevertheless, there is a lack of comparative in-depth analysis. The paper is based on a newly developed database of navigable canals in Central Europe from Antiquity to the 13th century AD, documented by means of archaeological and geoarchaeological fieldwork as well as written sources and surface remains. On a European scale, construction schemes of the 11th and 12th centuries AD are particularly well represented on both sides of the Channel and in this period England, Northern France and the Low Countries have clearly been hotspots of artificial landscape modification at transition zones of navigational networks. Embedded in a wider chronological and geographical analytical narrative, the paper will discuss the specific materiality of canals (e.g. hydrological connection, construction, usability, maintenance), the causes and specific historical circumstances of their construction (e.g. trade, military campaigns, symbols of power), their agency (especially the increasing role of civic agents) and traces of knowledge transfer in canal construction via the Channel before and after the Norman Conquest. Therefore, the paper aims to enlighten direct infrastructural proof for intentional improvements of cross-Channel connectivity as well as the agents and motivations behind it in a period of transition.

4 **THEREIN LIES THE POINT: A STUDY OF KNIFE SHEATH CHAPES FROM CROSS-CHANNEL EUROPE**

**Abstract author(s):** Webley, Robert (University of York)

**Abstract format:** Oral

Study of the protective metal terminals of knife sheaths – called ‘chapes’ – has recently started to expand from its initial, German, historiography, exemplified by a presentation of Danish material by Claus Feveile at the Maastricht meeting (2017). Finally, we are now in a position to appraise relevant material from England, France, the Netherlands and Belgium, not least due to the work of recording schemes for metal-detected discoveries (PAS, PAN, Medea). After decades of their misidentification in the literature, knife sheath chapes from this zone may be placed firmly into the widespread European distribution of such embellishments.

The majority of the knife sheath chapes discussed can mostly be dated to a ‘long-12th-century’ period, based on a combination of contextual dating and more subtle correspondences between different forms based on tool trace evidence. As such, they offer an insight into patterns of trade in a period before documentary evidence attains its full strength. These patterns will be picked out, with some types of chapes suggested to be entirely insular, while others have a cross-channel currency. Interestingly, the types circulating across the English Channel/North Sea appear to be largely distinct from those that are common further east and northeast. Furthermore, within the zone internal distinctions may be drawn out. The social dimensions of these distinctions will also be explored and compared with assessments made in the German literature regarding these objects’ status.

5 CROSS-CHANNEL INFLUENCES IN MEDIEVAL COMMEMORATIVE MONUMENTS

**Abstract author(s):** McClain, Aleksandra (University of York)

**Abstract format:** Oral

This paper will explore the varying influence of continental and native forms, styles, craftworking, and commemorative practices on medieval grave monuments in England after the Norman Conquest. It will draw primarily on examples from the 11th and 12th centuries, when England was in the midst of negotiating the sociocultural transition brought on by the establishment of Norman political rule. By 1066, England already had a strong tradition of stone monumental commemoration, and in the new Anglo-Norman cultural milieu, patrons may well have been making judgements on the relative benefits of preserving past practices versus embracing novel forms and stylistic motifs introduced by the new regime. In some regions of the country, monumental sculpture had proliferated for over 200 years, while in others the pre-existing body of stone monuments was much more sparse. As such, patrons' choices in post-Conquest memorialisation may have been particularly contingent on localised factors, such as the availability of raw materials, the established presence of workshops and sculptors, and the differential value attached to both established and new forms and styles. Through an examination of commemorative practice, the paper will comment on how cross-channel connections, communications, and influence interacted with pre-existing modes of expression in a period of intense change.

6 DETERMINING THE EVOLUTION OF CULINARY PRACTICES THROUGH THE STUDY OF COOKING TRACES: AN EXPERIMENTAL AND MULTIDISCIPLINARY APPROACH

**Abstract author(s):** Chantran, Aurélie (Université Paris1 Panthéon-Sorbonne; UMR 7041 - ArScAn)

**Abstract format:** Oral

Around the 12th and 13th centuries A.D., in northern France, we note changes in the types of utensils and cooking hearths used, but also see the introduction of new animal and plant varieties along with recipes used by people in the upper echelons of society being put in writing. These novelties could be the result of changing tastes and manners of preparing food. The study of archaeological materials could help to determine the cooking methods that may have been used. The range of archaeological sites from which material cooking remains are recovered should moreover allow us to compare context and time periods to point out evolutions and regional specificities. Nevertheless, what actually remains from Medieval period cooking? Traces on ceramics are regularly seen on vessels, while residues trapped inside the ceramic pastes can sometime be analyzed, and some faunal and botanical remains can also be found. However, studies have yet to show how these remains could reveal the way food was cooked. Therefore, experiments were designed and carried out to determine the traces left behind by different cooking methods. The results obtained made it possible to create a reference collection consisting of ceramics as well as animal and plant remains. The study of cooking traces allowed to establish criteria that can be used in use-wear analysis. Preliminary results were obtained from comparing the experimental reference collection with archaeological material recovered from different contexts and regions in France. These data reveal regional and chronological specificities that can be related to cooking recipes written at the same periods. The use-wear analysis, realized on ceramics from Orville Castle (Île-de-France), was complemented by microbotanical and chemical analyses. Combining these data indicates that the analysis of traces is reliable as supports the importance of multidisciplinary approaches in this field.

This innovating methodology can be used on several type of ceramics and could be applied to other European contexts, to understand how, when and where changes in cooking practices appeared and have spread out.

7 THE TRADE OF COAL BETWEEN ENGLAND AND FLANDERS DURING LATE MIDDLE AGES

**Abstract author(s):** Jagou, Benjamin (INRAP; UMR 5060 IRAMAT - LMC; UMR 7041 ArScan TranSphères)

**Abstract format:** Oral

For some time now, many operations of preventive archaeology have been conducted in the former territory of the County of Flanders. These have often allowed to discover traces of metalworking. Studies related to these late Middle Ages metallurgical spaces showed that these crafts used coal. Afterwards, the first researches could determine that this early use was caused by a lack of wood in this territory. This period of time is known for its extensive economic and demographic growth. Indeed, this expansion led to open the landscape widely in order to gain some new farming and housing areas. Then, this brought about a shortage of forest resources and a price inflation, which forced craftsmen to choose another fuel. At this time, the English territory took a leading role in the spread of coal in Flanders. In fact, the English people had been confronted with a lack of wood earlier, so they had to use coal soon, considering that this fuel was abundant in their territory. Moreover, this transition was facilitated by numerous exchanges between Flemish and English cities, particularly related to wool trade.

This presentation intends to unveil a multidisciplinary research (archaeological discoveries, study of written sources and archeometric analysis) which highlights a supply network from English to Flemish cities.

8 STONE MORTARS: RECENT DATA ON THE CONTINENT FOR LATE MEDIEVAL PRODUCTIONS TRADED FROM THE CHANNEL UP TO THE BALTIC

**Abstract author(s):** Verbrugge, Geert (INRAP - National Institute for Preventive Archaeological Research; Centre Michel de Boüard - CRAHAM, University of Caen)

**Abstract format:** Oral

Since the 2000s, discoveries of medieval stone mortars have multiplied in France and Belgium, and some of them have benefited from studies that go beyond summary description. With a recent survey of the available data for the Lower Countries and Denmark, they provide clues for productions concerned by the long-distance trade of this utensil, such as those studies from the sixties on, and synthesized by G.C. Dunning in the King's Lynn excavations monograph (1977) of the Society of Medieval Archaeology.

Two recent preventive excavations in Normandy provide information mainly on the production in Caen stone while expanding its repertory. They revealed also mortars in lutetian limestone whose morphological characteristics refer not only to a production documented in the Paris region, but also confirmed their trade up to the danish harbour city of Ribe, where a fragmented mortar in micaceous sandstone was also uncovered. It is today well documented in the Meuse valley, where it seems to be a Ardennes production. An Estonian excavation attest its use in the kitchen area of a cog wreck in the eastern part of the Baltic Sea.

Another decorated mortar type uncovered in northern France has been identified as carved in Marquise stone, extracted north of Boulogne-sur-Mer. Building stones and baptismal fonts in this stone type are already attested in England, such as is also the case of blue limestone from Tournai, that probably produced also stone mortars, as illustrated mainly by findings in the Netherlands and Denmark.

The use of the English mortars in Purbeck Marble (Dorset) is further documented by Belgian rescue excavations, and now attested also south of the french frontier, nearby Dunkirk.

These recent mortar findings reflect a complex long-distance Late-Medieval trade, whose study requires petrographical examination of the raw material, also relevant to the uses of this culinary utensil.

9 CONTINENTAL CONNECTIONS - THE CHANGING ORIGINS OF SCOTTISH WINDOW GLASS DURING THE 13TH - 16TH CENTURIES

**Abstract author(s):** Spencer, Helen (Society of Antiquaries of Scotland; Heriot-Watt University)

**Abstract format:** Oral

There is no evidence of window glass being manufactured from its raw materials in Scotland until the early 17th Century. Therefore, window glass was imported to Scotland to furnish the numerous Medieval Cathedrals and Abbeys that were built during the 12th – 15th centuries and latterly domestic properties built until the end of the 16th century. Sadly, unlike elsewhere across Europe, almost no window glass from these buildings survives in situ and the only glass remaining is from the archaeological record. In addition, window glass is rarely mentioned in historical documents. In order to determine the potential place of manufacture, window glass discovered during archaeological excavations from 18 late medieval sites from across Scotland was analysed scientifically by SEM-EDS, p-XRF and LA-ICP-MS. The results of the analysis were used to chemically characterize the glass composition and this was compared to previous analytical work on window glass and glass waste from across Europe during this period. The results show that during the 12-13th centuries the majority of window glass imported into Scotland was likely made in north-western France/ Normandy, with a specialized deep blue glass coming from elsewhere. By the 15th century, the majority of plain clear glass was likely to have been made in Belgium/Flanders region. A small number of specialized colours of glass were still being sourced from north-western France and modern day Germany. This paper will compare the results of the analysis with known trade routes and connections between Scotland and the continent.

10 RISE AND FALL: TEST PIT EXCAVATION AND THE RECONSTRUCTION OF HALF A MILLENNIUM OF CHANGE IN RURAL SETTLEMENTS AD 1000-1500

**Abstract author(s):** Lewis, Carenza (University of Lincoln)

**Abstract format:** Oral

This paper will consider what the excavation of small (one metre square) test pits within today's villages, small towns and hamlets can reveal about the development of rural settlements between 1000 and 1500 AD, drawing on data from more than 2,000 test pits excavated between 2005 and 2018 in 75 different rural settlements in south-eastern England. Mapping the spatial distribution of pottery of different types and dates from the test pits has been able to show which areas were in use at different times and enabled the origins and long-term spatial development of settlements to be reconstructed.

Key trends to be explored in this paper relating to the period 1000-1500AD across this large region of England include a three-fold growth in the number, size and density of settlements between c.1100 and c.1300 as the population rose in Norman and Angevin England, and an even more dramatic decline in settlement number and size after the population plummeted in the fourteenth century due to climate change and pandemics which impacted across Europe and beyond. As the population rose, changes observable from the test pit data in southern England include the appearance of new communities along the edges of lanes and commons and the addition of planned settlement extensions, some associated with newly constructed castles. As the population fell, we can see the abandonment of more remote communities and the collapse of formerly large sprawling villages into small nuclei tightly

clustered around churches, as well as the growth of a few resilient communities. The paper will end by considering the potential for a similar approach south of the channel to add to our understanding of change in settlement, demography and economy at wider, trans-regional scale.

11 APPLICATION OF THE SOCIAL ARCHAEOLOGY’S PRINCIPLES TO THE STUDY OF SOCIAL IDENTITY WITHIN ENGLISH AND FRENCH VILLAGES

**Abstract author(s):** Rego, Diane (CRAHAM)  
**Abstract format:** Oral

In 2004 in their A companion to Social Archaeology, L. Meskell and R. Preucel define the Social Archaeology as the study of the social being through “the ways in which we express ourselves through the things we make and use, collect and discard, value”. The Social Archaeology combines three essential concepts: temporality (the way people experienced their environment on a daily basis), spatiality (the way space and distance could be used to express and maintain social relations) and materiality (the material dimension of the excavated artefacts bears social messages) to formulate social interpretations of archaeological remains.

I applied those principles to my PhD investigations about small élites living in late medieval English and French villages. My research focused on the ways people could express their superior social status using their day-to-day environment: their living space. Thus, I studied the topography, the morphology and the material culture of seventy-two archaeological sites: aristocratic sites such as castles or manor houses as well as villages and hamlets, occupied from the 11th to the 15th century. Furthermore, I drew comparisons within each site and between sites on both sides of the English Channel. Finally, I managed to identify thirty-two archaeological indicators of social distinction and seven houses or plots that may be associated with rural élites.

During my presentation, I would also develop two case studies: Trainecourt (Calvados, France) and Caldecote (Hertfordshire, United Kingdom).

12 VUYDANGES ET SALUBRITAS. THE MANAGEMENT OF WASTE IN ROUEN (FRANCE) THROUGH THE EXCAVATION OF THREE PUBLIC GARBAGE DUMPS (15TH-16TH CENTURIES)

**Abstract author(s):** Guillot, Bénédicte (INRAP - National Institute for Preventive Archaeological Research; Centre de recherches archéologiques et historiques anciennes et médiévales - CRAHAM)  
**Abstract format:** Oral

This presentation will present the results of three preventive archaeology excavations led by Inrap to Rouen in 2012, 2015 and 2019. Two of them have taken place in the same district, in the northwest of the fortified city, outside the fortification but around the medieval castle and near one of the main accesses in the city, la Porte Bouvreuil. The third is located west of Rouen, near a another access, la Porte Cauchoise, and inside the city, along the ramparts.

They allowed to study three big public garbage dumps of the second half of the 16th century, named “heurts” in texts of the time (from old French hourd, hillock). The archaeological data illustrate the reality of the management policy of the waste of the city of Rouen, with the arrangement of a real public system of waste management between the 15th and the 16th century.

Having described the evolution of the sector concerned by the excavations before the 16th century, we will be dealing of the arrangement of the heurts in Rouen, the organization and the dating of garbage dumps and what we found (lands, crafts waste, human and animal bones, ceramics and domestic objects).

This paper will also present the particular excavation technique, considering the fine stratification of the deposit, the dipping of the levels and the abundant furnishings (more than 100,000 remains), all in the time allowed by preventive archaeology.

Finally, this paper will compare the waste management in Rouen with similar studies in the British Isles and with the New Lödöse Project in Sweden.

13 THE SAINT-MACLOU ASTER (ROUEN, FRANCE): EVOLUTION OF AN URBAN CEMETERY FROM THE BLACK PLAGUE TO THE MODERN PERIOD

**Abstract author(s):** Coupeur, Camille (EPHE - Université Paris Sciences et Lettres; Centre archéologique Inrap de Grand Quevilly; PACEA UMR 5199 Université de Bordeaux) - Thomann, Aminte (Centre archéologique Inrap de Grand Quevilly; CRAHAM UMR 6273 CNRS - Université de Caen Normandie) - Chapelain de Séreville-Niel, Cécile (CRAHAM UMR 6273 CNRS - Université de Caen Normandie) - Dutour, Olivier (EPHE - Université Paris Sciences et Lettres; PACEA UMR 5199 Université de Bordeaux)  
**Abstract format:** Oral

The Saint-Maclou Aster, located in the city of Rouen (Normandy, France), is one of the last three remaining asters in France. He was built, according to several historical archives, to bury people who died of the Black Plague that impacted the area in 1348. However, others historical texts indicate that the first plots of land acquisition for this cemetery did not take place before 1355. This question concerning the origin of this exceptionally well-preserved cemetery has led to the setting up of several archaeological digs (preventives and programmed), carried out between 2016 and 2019. These digs allowed for the excavation of approximatively 550 skeletons (circa less than 10% of the people buried in the cemetery) and for the identification of two use phases of the cemetery. The first phase (14th-15th centuries), revealed collective burials containing 2 to 6 individuals, indicating episodes of high mortality.

In addition, preliminary paleomicrobiological investigation on one of the 15th century individuals detected the molecular signature of Yersinia pestis DNA.

During the second phase (16th-18th centuries), the buried area seems managed as a parish cemetery. Paleopathological and paleoepidemiological studies are in progress concerning the second phase’s osteological sample in the framework of a PhD degree. The first results show a population affected by numerous infections (tuberculosis, syphilis) and deficiencies (rickets, scurvy).

In this communication, we will describe in a first step the history of this cemetery in the light of these new archaeological discoveries. Then, we will develop the results of the ongoing PhD research on the skeletal sample from the modern period. Finally, we will discuss the new data from the late Medieval period, particularly those from the mass graves, comparing them to others plague’s cemeteries from the North of Europe, particularly in England (East Smithfield Cemetery, Thornton Abbey, etc...).

475 HUMAN BONE AND TOOTH ARTEFACTS IN HUNTER-GATHERER CONTEXTS – CASE STUDIES, ANALYSES, INTERPRETATIONS AND THEORIES

**Theme:** 1. Widening horizons through human-environment interconnections  
**Organisers:** Mannermaa, Kristiina (University of Helsinki; University of Tartu) - Gray Jones, Amy (University of Chester) - Malyutina, Anna (Institute for the history of material culture, St Petersburg)  
**Format:** Discussion session

Excavations at prehistoric sites in Europe and elsewhere have revealed a rare but interesting phenomenon where human bones or teeth have been modified into artefacts and used as pendants, tools or weapons. In this session we focus on these practices, with the aim to investigate their distribution, variety and significance. The scope will be prehistoric and historic hunter-gatherer, pastoral and early farming groups from anywhere in the world and any chronological periods. We call for papers focusing on case studies with contextual and analytical descriptions of the finds, including manufacture and functional analyses and reconstructing object biographies. We would also wish to hear theoretical papers discussing the significance of such practices, for example, how these artefacts may reflect human-environment relationships (for example, similar type of artefacts made of human and other mammal bones), or, how they potentially reflect attitudes towards human remains and the dead. In order to approach these topics thoroughly we warmly welcome colleagues from all disciplines, for example archaeology, anthropology, ethnography, and natural history.

ABSTRACTS:

1 MELODIES FLOWING FROM HUMAN BONES. MUSICAL INSTRUMENTS FROM PRE-COLUMBIAN PERIOD  
**Abstract author(s):** Bak, Judyta (Doctoral School in the Humanities, Jagiellonian University) - Zdeb, Katarzyna (Institute of Archaeology, Cardinal Stefan Wyszyński, University in Warsaw)

**Abstract format:** Oral

Throughout history, societies have dealt with the bodies of the dead in different ways. We can find decoration and engraving of human skulls, mandibles and long bones. Also, various types of tools were made from animal and even human bones, including tattooing devices and drinking vessels.

It is important to notice that music has accompanied humanity almost from its very beginning. As with other items, musical instruments were made of different materials, including animal and human bones. There are flutes made of long bones and drums membranes covered with human skin used in shamanism. Such cultural practices are known in the pre-Columbian civilizations of South America.

The presentation aims to understand the phenomenon of creating musical instruments from human bones in the history of humanity based on archaeological, historical and ethnographic sources. Then, depiction of this cultural practice on the South American continent, based mainly on the analysis of artifacts found as offerings in tombs of the pre-Columbian civilizations of Peru.

2 FROM NEAR AND FAR. TOOTH BEADS FROM LATE MESOLITHIC CEMETERIES IN SKATEHOLM, SOUTHERNMOST SWEDEN

**Abstract author(s):** Larsson, Lars (Department of Archaeology and Ancient History) - Boethius, Adam (-) - Ahlström, Torbjörn (-) - Kjällquist, Mathilda (-)  
**Abstract format:** Oral

Decoration in the form of tooth beads appears in some of the burials at the two Late Mesolithic cemeteries Skateholm I and Skateholm II located in southernmost Sweden. Most of the examples have been produced from the teeth of red deer, fewer from wild boar and a smaller number from elk, aurochs, bear and wolf. Tooth beads occur in burials with both men and women but with different locations in relation to the body. In order to trace the origin of these tooth beads, a number have been subjected to laser ablation with the intention of measuring the strontium content and thereby determining the origin of the animals as well as any change of movement pattern in their adolescence. In parallel, the tooth beads have been examined to identify use wear around the perforation drilled in the tooth root in order to establish how and for how long the tooth beads were used.

Through the combination of measurement of box values and laser ablation, it appears that the humans grew up in the region where they were buried. The limited variation of strontium exhibited by the humans has been compared with the values for the tooth beads. It appears that the majority of tooth beads were made from animals that, like humans, have lived in the vicinity of the settlement. In addition, there are some tooth beads with values that differ to a greater or lesser extent from those of the region. Among these there are not only animals that are well represented in the waste material at the settlements but also some that are poorly attested in the find material. The movement patterns of different animals may have been of some importance in this context.

3 HUMAN BONE PENDANTS FROM LATE MESOLITHIC NORTHEAST EUROPE

**Abstract author(s):** Mannermaa, Kristiina (Department of Cultures, Archaeology, University of Helsinki) - Malyutina, Anya (Laboratory of the Experimental Traceology, Institute for the history of material culture Russian Academy of Sciences, Saint-Petersburg) - Gerasimov, Dmitriy (Russian Academy of Sciences, Peter the Great Museum of Anthropology and Ethnography, Saint-Petersburg)

**Abstract format:** Oral

In this paper we introduce a previously undocumented practice in Northeast Europe. Human bone was used as raw material for making pendants, in a similar way as animal bone. Our material derive from Yuzhniy Oleniy Ostrov (Karelia, Northwest Russia), the largest Late Mesolithic cemetery in Northern Europe. Most of these graves contain human skeletal remains and rich burial inventory of bone and stone artefacts. The grave inventory reveals a variety of goods deposited in the burials. They mainly consist of artefacts of bone, teeth and antler (for example harpoons, points and pendants), and flint and quartz utensils, mostly finished arrowheads. However, by far the most common bone artefacts are pendants made of Eurasian Elk (Alces alces), Eurasian Beaver (Castor fiber), and Brown Bear (Ursus arctos) teeth. In addition to tooth pendants, two other types of osseous pendants are present. One type is pendants made of Cervid or Bovid hyoid bone, and the other type is pendants made of mammalian long bone splinters. All three types of pendants were manufactured by making one or several grooves on the narrowest part of the specimen. Grooved bone pendants made of bone splinters were found in 22 of the 177 registered inhumations. Zooarchaeology by Mass Spectrometry (ZooM) method revealed that the raw material used for twelve of these is human bone. In this paper we present the morphological and microtrace analysis of these human bone pendants and describe their contexts. We also discuss their potential meanings and functions in the context of Mesolithic burial archaeology.

4 THE AGENCY OF THE DEAD IN MESOLITHIC EUROPE

**Abstract author(s):** Gray Jones, Amy (University of Chester)

**Abstract format:** Oral

Evidence for the treatment of the dead in Mesolithic north-west Europe reveals an ever more complex and varied set of mortuary practices taking place. These include inhumation, cremation, secondary burial, manual disarticulation and dismemberment and, potentially, anthropophagy. Recent finds indicate that this also included the modification of human bone into artefacts such as tools/weapons. Such practices clearly involved affective engagements with death and the dead body. What is more, ethnographic studies show that bones and other bodily substances could hold significance beyond the funerary context, being utilised for their affective, magical or powerful qualities. Examples include the potential agency of the dead to enhance hunting success through the use of amulets or charms made from human remains, or spiritual assistance obtained through the consultation of curated dead bodies or the application of their bodily substances to the bodies of hunters and their weapons. This paper will explore the significance of the ways in which human remains (bones and other bodily substances) were engaged with in Mesolithic Europe.

476 UNDERSTANDING AND EXPANDING CAPACITY IN ARCHAEOLOGICAL DATA MANAGEMENT BEYOND WESTERN EUROPE

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Wright, Holly - Richards, Julian (University of York) - Niccolucci, Franco (PIN - University of Florence)

**Format:** Regular session

The COVID-19 pandemic has exacerbated or made more visible many known inequalities across borders and societies. This includes access to archaeological resources, both physical and digital. As both the creators and users of archaeological data adapted to working from their homes, cut off from artefact collections and research data siloed within organisations and institutions, the importance of making data freely and openly available internationally became even more pronounced. The ARIADNE infrastructure (ariadne-infrastructure.eu) for archaeological data, and the SEADDA COST Action (seadda.eu) are working to secure the sustainable future of archaeological data across Europe and beyond, in ways that are Findable, Accessible, Interoperable and Re-usable (FAIR). Experience within the ARIADNE partnership during the pandemic was largely positive, with many partners able to carry on as usual with accessing their digital resources, emphasising what is possible, while also emphasising what is not achievable across archaeology, due to lack of capacity. ARIADNE and SEADDA invite papers discussing the challenges, opportunities and lessons learned across all aspects of archaeological data management during the pandemic, and how it may change and inform our best practice going forward. We particularly invite papers from outside of Western Europe on how the COVID-19 pandemic created barriers or opportunities for accessing archaeological resources, so that we may better understand capacity building during a post-COVID era.

ABSTRACTS:

1 FROM THE 2ARCHIS ARCHAEOLOGICAL INFORMATION SYSTEM TO DATAREPOSITÓRIUM: CASE STUDY OF THE ARCHAEOLOGICAL COINS OF CASA DA BICA

**Abstract author(s):** Botica, Natalia - Machado, Diego - Magalhães, Fernanda - Martins, Maria (Unidade de Arqueologia; Lab2PT; Universidade do Minho)

**Abstract format:** Oral

To promote open science and data reuse, it is necessary to have data available in open repositories that guarantee their accessibility and permanence, while facilitating their reuse.

Data classified as FAIR (Findable, Accessible, Interoperable and Reusable) must follow guidelines that ensure the use of an appropriate metadata scheme, persistent identifiers, well-defined vocabularies, procedures to standardize and improve data quality and sustainable file formats. We will present the methodology used for recording the coin findings from an archaeological excavation carried out by the Archaeology Unit of the University of Minho (UAUM) in the intervention of Casa da Bica, starting with the recording of data in the UAUM's 2ArchIS information system and ending with its availability in the scientific repository "DataRepositórioUM".

We will also present some works of visualization and research as examples of the reuse of these data sets, which can be wider when they are integrated in structures of greater visibility like ARIADNE.

2 WAYS AND CAPACITY IN ARCHAEOLOGICAL DATA MANAGEMENT IN SERBIA

**Abstract author(s):** Tapavicki-Ilic, Milica (Institute of Archaeology) - Šegan-Radonjić, Marija (Mathematical Institute)

**Abstract format:** Oral

Over the past year and due to the COVID-19 pandemic, the entire world has witnessed inequalities across borders and societies. They also include access to archaeological resources, both physical and digital. Both archaeological data creators and users spent a lot of time working from their homes, away from artefact collections and research data. However, this was the perfect moment to understand the importance of making data freely and openly available, both nationally and internationally.

This is why the authors of this paper chose to make a selection of data bases from various institutions responsible for preservation and protection of cultural heritage, in order to understand their policies regarding accessibility and usage of the data they keep. This will be done by simple visits to various web-sites or data bases. They intend to check on the volume and content, but also importance of the offered archaeological heritage. In addition, the authors will estimate whether the heritage has adequately been classified and described and also check whether data is available in foreign languages.

It needs to be seen whether it is possible to access digital objects (documents and the accompanying metadata), whether access is opened for all users or it requires a certain hierarchy access, what is the policy of usage, reuse and distribution etc. It remains to be seen whether there are public API or whether it is possible to collect data through API. In case that there is a public API, one needs to check whether datasets are interoperable or messy, requiring data cleaning.

After having visited a certain number of web-sites, the authors expect to collect enough data to make a satisfactory conclusion about accessibility and usage of Serbian archaeological data web bases.

3 PRESERVING HISTORIC BUILDING DOCUMENTATION FOR REUSE AT THE NATIONAL COLLEGE OF ARTS, PAKISTAN

**Abstract author(s):** Khan, Doa (National College of Arts, Lahore)

**Abstract format:** Oral

Like many countries around the world, Pakistan was forced to go into a COVID-19 national lockdown in March 2020. While this confined most people to their homes, it also had the unintended consequence of catapulting many institutions into embracing going digital. At the National College of Arts (NCA), Pakistan's oldest art school, this meant embracing online tools and digital resources that had previously been resisted or underutilized in the teaching of art, design, and architecture. The experiences of lockdown have highlighted inadequacies and inequities within our systems, and as Pakistan returns to normal there is a renewed will to maintain the momentum gained during the pandemic, and an increased realization of the need for developing and sustaining digital infrastructures. The National College of Arts Archives collect and preserve the records, manuscripts, and other artefacts of historical and archaeological significance at the National College of Arts. From March 2021, the NCA Archives are initiating a project to collect, preserve, and digitize historic building documentation created at the NCA over the past 145 years. This paper will follow this process and document the NCA Archive's attempt at creating a Findable, Accessible, Interoperable, and Reusable (FAIR) database of historic building documentation in Pakistan. It will summarize the experiences of the six-month pilot project, including opportunities that have arisen in the aftermath of the Covid-19 pandemic, and in light of the Government of Pakistan's ongoing Digital Pakistan initiative. The paper will also document and analyze the difficulties and hurdles that might emerge during the course of the project as the NCA Archive's digital infrastructure is built from the ground up in a post-colonial setting and a post-COVID world.

4

INJECTED BY INFORMATION: A SILENT (R)EVOLUTION IN CZECH DIGITAL ARCHAEOLOGY

**Abstract author(s):** Novak, David (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Pajdla, Petr (Institute of Archaeology of the Czech Academy of Sciences, Brno)

**Abstract format:** Oral

Every crisis period puts pressure on the individual components of traditionally functioning systems. This effect is well known from archaeological contexts, where external influences are often viewed as factors motivating the development. Currently, archaeology has an opportunity to view this situation from the opposite perspective, itself facing new challenges linked to the reduction of social contacts, forcing us to maximise the search for innovative solutions. We believe that crisis situations may indeed be the motivation for development. However, often it is imaginary fire-fighting that leads only to unsustainable solutions. We verified this case well after the catastrophic flood of Prague in 2002 and in other unforeseeable events in the past. The event forced us to make anticipated but only partially prepared changes that significantly moved the field forward. Yet, as a result of rapid decisions taken under pressure, we are still dealing with some unintended consequences. COVID-19 found us in a different situation. It has demonstrated the importance of conceptually building robust information systems, which are a welcome aid at any time, but are now becoming a necessity. Due to long-term systematic work, the new situation did not result in any fatal disruptions or problems and in turn helped the full establishment of the large research infrastructure Archaeological Information System of the Czech Republic (AIS CR). The paper analyses the situation in which the current crisis has caught Czech archaeology and how much it motivates changes in the disciplinary routine, or whether the causes of the development can be found in other aspects of archaeological data management practice. We conclude that Czech archaeology was mostly well prepared, and the main change is noticeable in the higher demand for accessible digital archaeological information by the general public.

5

ARCHAEOLOGICAL MAP OF BULGARIA IN ARIADNEPLUS – AN OPPORTUNITY FOR BETTER POST-COVID TIMES

**Abstract author(s):** Kecheva, Nadezhda - Nekhrizov, Georgi (National Archaeological Institute with Museum, Bulgarian Academy of Sciences)

**Abstract format:** Oral

On one hand, COVID-19 world pandemic showed the people vulnerability and inability of face-to-face communication and ideas sharing. Through this point of view digital data that is Findable, Accessible, Interoperable and Re-usable (FAIR) showed its added value in even higher extent. On other hand, online communication became a daily routine enabling easier access of all interested parties regardless of their location. The latter helped focusing on particular tasks difficult to accomplish otherwise. The situation in Bulgaria concerning improving state-of-the-art of site and monument dataset “Archaeological Map of Bulgaria” is still in a work process based on online communication with interested participants. Scientists from the National Archaeological Institute with Museum at Bulgarian Academy of Sciences are responsible for all that. Legacy data available beyond local repositories using FAIR principles is a main focus in the development and up-to-date improvement. Sharing the most informative fields metadata and available digital data in ARIADNEplus portal enabled cleaning other issues in the information system.

6

NORWEGIAN UNIMUS, NORDIC COLLECTIONS, AND ARIADNEPLUS. ENCOURAGING USE AND RE-USE OF COLLECTIONS, EXCAVATION DOCUMENTATION, AND MUSEUM EXHIBITS

**Abstract author(s):** Uleberg, Espen - Matsumoto, Mieko - Kile-Vesik, Jakob (Museum of Cultural History, University of Oslo) - Ore, Cristian-Emil (Department of Linguistics and Scandinavian Studies, University of Oslo) - Dell’Unto, Nicolás - Bonelli, Letizia - Kimball, Justin - Kristensen, Steinar - Samdal, Magne - Tesfamariam, Ermias (Museum of Cultural History, University of Oslo)

**Abstract format:** Oral

This contribution will present digital assets and initiatives at the Museum of Cultural History (MCH), University of Oslo (UiO) and aims at sharing data.

The COVID-19 restrictions have elevated the importance of digital assets. At the beginning of this period, metadata for the archaeological collections were, to a large degree, already digitized and accessible online. This is the result of a national collaboration beginning in the 1990s and continue today in UniMus:Kultur. MCH had also published a map-based overview of all excavations in Eastern/Southern Norway, and begun to release excavation reports through UiO’s science archive. Recently, focus has shifted towards 3D-documentation of exhibits and publication of existing 3D-models on 3DHOP—available through humgis.uiocloud.no

MCH now concentrates on digitizing artefacts at the Viking Ship Museum. The 3D-models from here will be included in the BitFROST project, which will address the active role of 3D-models in research and education. BitFROST will work on FAIRification of 3D-models and promote dialogue with researchers. The 3DHOP platform enables the creation of interactive user-interfaces for researchers and a public audience. Collaboration with DarkLab in Lund, Sweden will create common user-interfaces for Swedish and Norwegian collections. The project will also utilize AR and VR in the presentation of data.

In addition, the infrastructure project ADED (Archaeological Digital Excavation Documentation) provides open-access to excavations in Norway. The five Norwegian university museums and the Directorate of Cultural Heritage take part in the project. ADED’s map-based webpages will integrate excavation documentation and the museums’ artefact/photograph databases, making it pos-

sible to have an overview and detailed information of excavations and finds. As part of migrating the data to a common repository, mapping it to CIDOC-CRMarcheo facilitates further mapping to ADRIADNEplus and/or other datasets.

7

INTEGRATING ARCHAEOLOGICAL DATA FROM DIGITAL REPOSITORIES AND WEB-BASED SPATIAL DATABASES. IDACORDIG AND SUQUIA IN PANDEMIC TIMES

**Abstract author(s):** Izeta, Andres - Cattáneo, Roxana (CONICET; Universidad Nacional de Córdoba)

**Abstract format:** Oral

The COVID-19 pandemic unleashed during 2020 implied a change in the way of doing archaeology on a global scale. In Argentina, in particular, activities had to move to the domestic sphere and, most times, the possibility of carrying out fieldwork, material analysis and collection management in the usual workplaces was lost. This practice showed the need for repositories, libraries and online databases that would allow access to archaeological information. Suquia, the institutional repository of IDACOR, has been compiling and disseminating archaeological information since 2016, although it had not yet developed its capacity to include databases that would allow meta-analysis of the information hosted. So, the needs raised by the lockdown led to implementing an action aimed at incorporating data from 1938 archaeological sites in the Province of Córdoba (Argentina) together with IDACORDIG (an implementation of the Arches software) which links this set to a spatial database, creating a gazetteer of archaeological sites for the region. This integration is the first of its kind in Argentina, and fosters an increase in primary information and grey literature visibility, together with publications preprints and prints that allow continuity in the study of archaeology on a regional scale. In this presentation we will characterize this process and its technical aspects to aware on the potential of this type of platform for its integration into digital infrastructures of global impact.

8

IMPACT OF THE COVID-19 PANDEMIC ON ARCHAEOLOGICAL DATA MANAGEMENT IN FRANCE, THE INRAP EXAMPLE

**Abstract author(s):** Marx, Amala - Bryas, Emmanuelle - Salas Rossenbach, Kai (INRAP - National Institute for Preventive Archaeological Research)

**Abstract format:** Oral

As in many countries, the COVID-19 pandemic took the French public authorities by surprise, forcing them to close the country almost completely in less than 72 hours. The French National Institute for Preventive Archaeological Research, like other public institutions, was not prepared for full teleworking and total shut-down of its activity, its excavation activity having been entirely suspended for two months. After a period of astonishment and reorganisation, many initiatives were taken in terms of management, organisation and even accessibility of data produced by the Institute.

The strict lockdown, that took place in France during the months of March, April and May 2020, has given Inrap’s archaeologists time to develop or implement data management practices, experiments and procedures already initiated internally or induced by the Institute’s participation in European programmes and networks such as ARIADNEplus or COST SEADDA. However, this situation has also brought to light blockages and malfunctions that existed previously but for which workarounds had been put in place (non-dematerialised administrative procedures; scientific documentation scattered ; difficulties of communication ; non-accessibility of archaeological collections ; etc.).

The aim of this paper will be to show how Inrap archaeologists and scientific staff were able to take advantage of this special moment, how this situation was an opportunity for the management and opening up of Inrap’s data, while underlining the difficulties of implementing collective projects at a time of entirely digital communication. We will also look at the lessons to be learnt from the lockdown but also from the period of reinforced teleworking that we continued to experience afterwards. What is the impact of this period of isolation on our practices, research subjects and projects as researcher or research manager despite more accessible data?

479

FROM CLIMATE CHANGE TO ACTIVISM: HOW CAN EUROPEAN HUNTER-GATHERER ARCHAEOLOGY CONTRIBUTE TOWARDS BROADER CONTEMPORARY DEBATES? [PAM]

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Elliott, Benjamin (Newcastle University) - Nyland, Astrid (Universitetet i Stavanger) - Warren, Graeme (University College Dublin) - Piezonka, Henny (Christian-Albrechts-Universität zu Kiel)

**Format:** Regular session

Hunter-gatherer archaeology in Europe covers a wide temporal frame stretching from the initial arrival of Homo Sapiens sapiens until the transition to farming. It explores deep Stone Age histories based on elaborate analytical tool kits and interpretative frameworks. However, within the broader, interdisciplinary field of hunter-gatherer studies, European hunter-gatherer archaeology is distinct to that of other continents, in that it has remained a „consumer“ of anthropological theory and ethnographic analogies – despite its great potential to contribute original and highly relevant perspectives to contemporary concerns. When integrated with anthropological approaches and broader global concerns such as rising social inequality, decolonization processes, climate change and other socio-environmental hazards, it becomes clear that European hunter-gatherer archaeology has a lot to offer in order to approach current problems through its longue durée perspective and its expertise on alternative life worlds.

This session aims to discuss how European hunter-gatherer archaeology contributes to these wider popular debates and contemporary concerns, and seeks to situate this contribution in relation to that of other continents. We will consider the impact on diverse fields such as postcolonial debates, indigenous archaeologies, empowerment and multivocality, the growing interest in multi-species systems, and sociologies of adaptive potential from vulnerability to resilience.

We welcome contributions which discuss achievements and identify future imperatives across this spectrum, addressing e.g. the following questions: How does hunter-gatherer archaeology contribute to wider anthropological debates? What role does hunter-gatherer archaeology play in promoting alternative social structures to counter-act growing social inequalities? How do our findings inform political activism, e.g. concerning indigenous rights and empowerment, or anarchist movements? On the global scale, what role have archaeologists played in advocating the concerns of contemporary hunter-gatherer communities? In a world where anthropogenic climate change rapidly increases natural hazards, what does hunter-gatherer archaeology contribute to understand vulnerability and strengthen contemporary resilience?

ABSTRACTS:

1 A EUROPEAN APPROACH TO HUNTER-GATHERER ARCHAEOLOGY?

**Abstract author(s):** Warren, Graeme (University College Dublin)

**Abstract format:** Oral

This paper compares the character of hunter-gatherer archaeology in Europe to hunter-gatherer archaeology as practised in different parts of the globe. I will argue that there are important features of European hunter-gatherer archaeology that make it distinctive in this comparative context and that this requires careful consideration. This difference arises from how archaeological practice is influenced by the main sources of data available for ancient and recent hunter-gatherer populations: material culture, linguistic evidence, oral tradition, ethnographies. historical sources and genetics. The combination of these sources in different regions is distinctive and has important implications for the development of archaeological practice, not least through the development of indigenous archaeologies. Although these characteristics are, to large extent, self-evident, the implications of them for how we practice hunter-gatherer archaeology in Europe are not widely considered. These implications are outlined in this contribution, including the need to start to decolonise our conceptual frameworks and forms of practice.

2 UNDERLYING NARRATIVES IN MESOLITHIC AND NEOLITHIC SOCIETIES “...TO THE DETRIMENT OF THE [...] HUNTER GATHERERS”?

**Abstract author(s):** Nyland, Astrid (Museum of Archaeology, University of Stavanger)

**Abstract format:** Oral

Although it can seem almost comical how Stone Age Hunter-gatherers in popular culture are portrayed as either aggressive and violent, or simple-minded and primitive, this persisting representation is not created in a vacuum exempt from research. Marek Zvelebil argued 30 years ago that “These perceptions arose from the social evolutionary notions of the eighteenth and nineteenth century and resulted in the privileged treatment of the evidence for the early farming, ‘Neolithic’ societies to the detriment of the earlier hunter-gatherers.” Unfortunately, although there are many examples to the contrary in current archaeological research, the popular or mainstream preconceptions of the primitive Mesolithic hunter-gatherer societies as opposed to civilized Neolithic farming societies still persist. Why is this narrative so hard to change? In the Neolithic, hunter-gatherers are often interpreted as marginalised while their farming neighbours drive change. What are the responsibilities of archaeologists if this bias or prejudice is transferred to contemporary hunter-gatherer groups? In this paper I will discuss the suggested power imbalance and the possible negative effects of the abiding Mesolithic narrative, i.e. of the wild, simple and uncultivated. This is a contribution to the ongoing debate of decolonising the Mesolithic, and through case studies, I will also consider how archaeology can contribute to the empowerment of hunter-gatherer societies, across time and space.

3 URBAN FORAGERS: LINKS BETWEEN PAST PRACTICES AND A SUSTAINABLE FUTURE?

**Abstract author(s):** Damm, Charlotte (Arctic University of Norway)

**Abstract format:** Oral

Hunter-gatherers are by many associated with the deep past, and in popular imagery they are frequently perceived as barely scraping a living. As archaeologists and anthropologists are aware, hunting, fishing and gathering are practices that continued long after domestication and farming were introduced. These ways of acquiring food are active in many communities even today, and here it will be argued that foraging for food is now experiencing a renaissance also amongst the modern urban population.

In Norway “matauk”, meaning complementing the main food supplies with small scale hunting, fishing and gathering has long been important for the Norwegian identity, and has not diminished despite recent urban centralization. While this is generally a small scale supplement, it is part of a general re-orientation towards local products and an awareness of the need for a more sustainable production and consumption regime.

The archaeology, history and anthropology of hunter-fisher-gatherers has the potential to contribute to this trend, with past and recent hunter-gatherers serving as role models. Rather than employ recent analogies to understand past foragers, we can explore

insights from hunter-gatherer archaeology to suggest practices that, albeit in a small way, counteract the negative anthropogenic effects of long distance transport of food products.

4 PARADIGM SHIFT IN THE STUDY OF THE EASTERN EUROPEAN UPPER PALAEOLITHIC IN THE EDUCATIONAL PERSPECTIVE

**Abstract author(s):** Shydlovskiy, Pavlo - Chymyrys, Marharyta (Taras Shevchenko National University of Kyiv; Center for Paleoethnological Research) - Tsvirkun, Ostap (National Museum of the History of Ukraine; Center for Paleoethnological Research) - Dudnyk, Diana (Institute of Archaeology of the NAS of Ukraine; Center for Paleoethnological Research)

**Abstract format:** Oral

General works and textbooks on the prehistoric archaeology of Europe often provide a view of the gradual replacement of one cultural phenomenon by another more developed one. This approach in teaching creates the impression of the culture stability, the idea of constant growth of human achievements, the expansion of the resource base and the successful use of natural resources by prehistoric groups. The presentation of such schemes leads to a misconception about correctness and internal logic of historical development, a false sense of the possibility of infinite growth.

Recent research in the field of prehistoric archaeology in Eastern Europe, together with the rapid development of natural sciences and radiocarbon dating, is radically changing our perception about the development of prehistoric cultures as a slow, steady and gradual process. When studying the Upper Palaeolithic sites in the Dnieper basin, it became obvious that there was a chronological gap in several millennia (24-19 ka cal BP), which occurred after the LGM in northern Ukraine, which calls into question the evolutionary connection between the late Gravettian vestiges and the Middle Dnieper Epigravettian. After the flourishing of the Epigravettian mammoth hunters culture (19-14 ka cal BP), during the transition to the final Pleistocene the absence of technological successors of Epigravettian industry in these areas in the following millennia is possible to observe. Current data allow us to state that as a result of global changes there has been depopulation in large areas, the disappearance of large groups of people in times of crisis, complex migration processes.

This knowledge allows us to draw conclusions about the vulnerability of human networks to abrupt climate change and the need to objectively analysing the current situation. One of the necessary activities should be the explanation the importance of global climate change in teaching and communicating with local communities.

5 TWO STEPS BACK, THREE STEPS FORWARD: HOW TO MAKE PALAEOLITHIC/MESOLITHIC ARCHAEOLOGY RELEVANT FOR CONTEMPORARY CONCERNS?

**Abstract author(s):** Porr, Martin (University of Western Australia)

**Abstract format:** Oral

This paper will argue that “European hunter-gatherer archaeology” can only contribute to “broader global concerns such as rising social inequality, decolonization processes, climate change and other socio-environmental hazards” if it deeply engages with relevant critical strands in anthropological research and debates. This process has hardly started within the fields of Palaeolithic/Mesolithic archaeology and palaeoanthropology. This situation is unsatisfactory, because (1) the latter fields continue to produce highly influential and publicly recognised understandings of human evolution and origins, and (2) key terms within these fields of archaeological research have been critiqued extensively in other social sciences. For example, within the postcolonial movement, the Western idea of humanity has received an extensive amount of critical attention. Similarly, notions of time and history have been identified as part of deeply Western frameworks that have fostered a universalising and exclusive narrative of the deep history of humanity. Finally, even though human interactions with the natural environment are at the core of methodological and theoretical the notion of ‘nature’ itself rarely receives critical attention, even though it is a highly contested term within the social sciences. These are only three examples of key notions that are at the heart of European Palaeolithic/Mesolithic archaeology and which are rarely critically assessed. However, such an engagement is key to the field’s ability to allow European Palaeolithic/Mesolithic archaeology to critically contribute to current debates as outlined above. This paper will make some suggestions in this direction with reference to the necessity to develop a theoretically informed critical research history and a critique of current theories and practices as well as the representation of research results in exhibitions/museums and publications.

6 THE ARCHAEOLOGY OF PERSISTENT HUNTER-GATHERER PLACES: CRITICALLY CONSIDERING THE IMPACT OF KNOWLEDGE GENERATED AT HIGH PROFILE EUROPEAN SITES

**Abstract author(s):** Elliott, Benjamin (-)

**Abstract format:** Oral

2018 witnessed the landmark publication of an extensive program of C14 dating and Bayesian modelling of the Final Pleistocene and Early Holocene deposits at Star Carr (Milner, Conneller & Taylor 2018). This provides a c.800 year-long chronological structure to the complex sequence of hunter-gatherer activities carried out at the at this iconic Early Mesolithic site.

This paper will explore the impact of this model in relation to historic and ongoing land rights disputes involving hunter-gatherer groups around the world. These frequently hinge on the assumption that hunter-gatherer settlement and occupation is short-lived and ephemeral when compared to the perceived permanence of agriculturalist sites (eg Hagen & Minter 2020). A consideration of

- 7
- the new evidence from Star Carr in relation to other examples of long-lived hunter-gatherer occupations within Europe will be broadened to encompass the concept of “persistent places”, and the potential for the actualization of these ideas within indigenous land rites disputes discussed.

### FROM PERCEPTION TO PEDAGOGY: TEACHING THE RELEVANCE OF PREHISTORIC HUNTER-GATHERER RESPONSES TO CLIMATE CHANGE

**Abstract author(s):** Piper, Stephanie - Bates, Jessica - Bell, Taryn (University of York)

**Abstract format:** Oral

This paper seeks to address the theme of widening horizons from a dual perspective on human-environment interconnections: the first is the significance of studying prehistoric hunter-gatherer archaeology in relation to climate change; the second is in the human-learning environment, namely Higher Education. Specifically, we wish to explore student perceptions of the relevance of past hunter-gatherer responses to climate change in relation to addressing this issue in the present.

The authors of this paper reflect on their experiences of teaching UK University students about prehistoric hunter-gatherer societies, and with a particular focus on the Final Upper Palaeolithic and Mesolithic. These discussions have highlighted a diverse range of student opinions, not only about hunter-gatherers in the past, but also on the value of prehistoric hunter-gatherer studies to challenges faced in the present day, and vice-versa. Furthermore, these perceptions appear to be connected to students’ motivation for studying hunter-gatherer archaeology, and how the subject is communicated to the public. This has implications that span issues such as sustainability of degree programmes, influencing climate change policy, widening participation, and decolonisation and diversification of the discipline.

From this, we consider the ways in which the study of Late Glacial and early Holocene communities and their direct relevance to current debates on climate change can be better incorporated into archaeological pedagogy, to continue to address one of the Grand Challenges of archaeology.

8

### OVERCOMING AGRICENTRISM: HOW HUNTER-GATHERER STUDIES CAN CONTRIBUTE TO DE-EVOLUTIONIZING THE NEOLITHIC

**Abstract author(s):** Piezonka, Henny (Christian Albrechts University Kiel)

**Abstract format:** Oral

Many current global concerns such as increasing social inequality and socio-environmental hazards are connected to an essentially extractionist, growth-orientated ontology dominating the globalized world. An underlying dualist concept distinguishes between an inanimate nature, and human societies at who’s disposal nature is to exploit. With most researchers in European archaeology biographically based in “Global North” life words, such an extractionist, dualist, agricentric mind set is often uncritically assumed also for prehistoric actors from the Neolithic onwards. Reflecting this ontology, the transition to farming is perceived as a major evolutionary step, often named the “Neolithic” or “agricultural revolution”. The farming economy is regarded foundational to everything complex across the socio-political, economic and ideological spheres, from sedentary life ways to hierarchical society structure to hereditary leadership.

In the talk, alternative views on socio-economic dynamism from a hunter-gatherer perspective will be discussed. Concerning “Neolithisation”, hunter-gatherers in a way have remained “people without history”, although it was actually hunter-gatherers who were the “great innovators”, as Peter Jordan et al. (2014) phrased it; it was them who were the driving force behind the transformations now largely regarded as “Neolithic” traits. Discussing evidence of technological innovation, economic intensification and socio-political complexity in hunter-gatherer societies from diverse prehistoric, ethnohistoric and contemporary contexts, it will be argued that rather than evolutionist, agricentric notions of “Neolithisation” as a global horizon, an alternative mindset is necessary to grasp the diversity of the historical spectrum as well as underlying more universal patterns. This encompasses e.g. bottom-up models on the diverse local and regional trajectories of socio-economic developments, the assessment of “platforms of societal dynamics” (Arnold et al., 2015), and the incorporation of alternative ontologies into archaeological inquiry, leading to a critique of agricentric models and a fresh view on the role and agency of hunter-gatherer societies in past and present.

### RETHINKING CHILD DEVELOPMENT FROM THE PERSPECTIVE OF ARCHAEOLOGICAL RESEARCH ON HUNTER-GATHERERS

**Abstract author(s):** Milks, Annemieke (UCL, Institute of Archaeology) - Lew-Levy, Sheina (Simon Fraser University, Department of Psychology, Canada; Aarhus University, Department of Archaeology and Heritage Studies) - Lavi, Noa (UCL, Department of Anthropology) - Friesem, David (University of Haifa, The Recanati Institute of Marine Studies; University of Haifa, The Haifa Center for Mediterranean History) - Reckin, Rachel (University of Cambridge, St John’s College)

**Abstract format:** Oral

Research on child development is biased towards samples from Western, Educated, Industrialized, Rich, and Democratic—or WEIRD—societies, thus overlooking the considerable diversity in childhoods in the present and past. Archaeological research elucidating our shared human past has often overlooked children as actors in, and modifiers of, their social and ecological environments. And yet, combining developmental and archaeological perspectives can shed light on children’s agency in the past, and by extension, their contributions to culture change in the present. Here, we present representative cases from a systematic survey of the archaeological literature on hunter-gatherer children. The survey includes archaeological evidence of material culture relating to hunter-gatherer childhood including children’s playthings and tools, learning to flintknapping, and their involvement in the making of marks, art and footprints. Much of this evidence points to children’s agency and autonomy in the deep past. We discuss the implications of these findings in relation to children’s contributions to the archaeological record within and outside of hunter-gatherer societies, child development more broadly, and to understanding children’s agency as transformers of social and ecological spaces. This *longue durée* view is central to supporting youth wellbeing, activism, and global resiliency.

### CLIMATE VICTIMS? CLIMATE EXPERTS! - NEW NARRATIVES FOR OUR PAST AND FUTURE EXISTENCE

**Abstract author(s):** Bradtmöller, Marcel (Rostock University - Heinrich Schliemann- Institute for Ancient Studies) - Grimm, Sonja (Zentrum für Baltische und Skandinavische Archäologie | ZBSA; CRC 1266: “Scales of Transformation - Human-Environmental Interaction in Prehistoric and Archaic Societies”)

**Abstract format:** Oral

Today anthropological and archaeological data from hunter-gatherer communities starts slowly to affect societal or economic frameworks such as the incorporation of Dunbar’s number for stable social relationships into business culture (see Gladwell, 2000). We can expect this development to have a significant effect on our society in the future (cf. Boivin and Crowther, 2021) and it will also support our ability to deal with the current climate change ahead. However, this process is still at the beginning.

In the meantime, new storylines for the climate crisis need to be formed because the actual “doom and gloom narrative” seems to be counterproductive for mobilising people (cf. Hinkel et al. 2018). Here European hunter-gatherers can enter the stage. Ice age cycles, seasonality, or volcanic eruptions had a significant impact on the habitat of human communities. In fact, it seems that human adaptation, reorganisation, and survival were rather the rule than the exception in the general human history. Furthermore, Heinrich stadials and Bond events also initiated regularly extensive biosphere changes in the North-Atlantic region. Hence, European Palaeolithic and Mesolithic societies provide a robust source of stories about successful adaptation to climate change and a possible antidote for the current narratives. By using case studies of Late Pleistocene hunter-gatherers, we will explore the general benefit of focusing more on these climate experts and the practical application of the given scenario in the fields of teacher training and science communication.

### HOW MUCH SHAPE MATTERS? APPROACHES IN POTTERY STUDIES

**Theme:** 6. Material culture studies and societies

**Organisers:** Gomez Bach, Anna - Molist, Miquel (Autonomous University of Barcelona) - Taranto, Sergio (Sapienza University) - Ozbal, Rana (Kos University)

**Format:** Regular session

Some pottery forms have a typology that allows them to be inferred in specific functionalities. Evidently, these first approaches, widely studied by researchers, have been complemented with petrographic and organic residues studies to validate their possible uses and functions. In this session, however, it is proposed to start from the variable shape to limit, as far as possible, these uses, validating and expanding these typologies. Topics such as individualized morphology, profile, typology, and quantitative and qualitative data would be discussed. In this sense, those vessels with singular shapes beyond the anthropomorphic or zoomorphic type will be analyzed.

To understand the role that this variable (shape) plays in the archaeological record, the inclusion of other materials (lithic, bones, wood) and types of support is considered where the form has also been the basic element of study.

Chronologically this research aims to address the early Neolithic and Bronze Age in Europe and the Near East assemblages.

ABSTRACTS:

1 THE BEADED RIM

**Abstract author(s):** Nilhamn, Bonnie (Helsinki University)

**Abstract format:** Oral

In this paper we are zooming in on one detail that first may seem trivial, but when studying the shape and the typology of Near Eastern Neolithic plaster vessels becomes quite extraordinary – the beaded rim.

The beaded rim is a commonly applied feature found on plaster ware, so called white ware, that dates to the Early pottery Neolithic phase, ca. 6700-6200 cal. BC. The plaster material studied comes from the excavation of Tell Sabi Abyad Syria in the River Balikh valley. This site was inhabited from the later PPNB into the Halaf period.

I would like to argue why this specific commonly applied feature on white ware is of importance, what it may say about the manner the vessel was produced and also something about the usage of the vessel. I also want to discuss the “beaded rim” in a broader context by comparing the plaster with other contemporary materials like ceramic, stone, and basketry.

2 INVESTIGATING POTTERY FUNCTION THROUGHOUT EXPERIMENTAL ARCHAEOLOGY

**Abstract author(s):** Taranto, Sergio (Sapienza University of Rome) - Gomez Bach, Anna - Molist, Miquel (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

Since their invention, ceramic artifacts, thanks to their resistance and diffusion, have been the protagonists of archaeological contexts.

Archaeological studies have focused on these artifacts to investigate different aspects of ancient societies: relative chronology, cultural identity, contacts, production skills and techniques, transmission of knowledge, influences.

In recent years, ceramics have been studied from the point of view of its function: residues and use-wear analysis.

In fact, the study of the function of ceramics allows us to investigate the dietary behaviors of societies. These can provide information on the anthropological and sociological aspects of ancient human communities.

In this communication, examples of how a pottery forms can be studied through experimental archeology will be presented. In particular, the importance of reproducing and using ceramic replicas to understand the functional values and characteristics of ceramic artefacts will be emphasized. In fact, only dedicated experimental replicas and focused trials can improve our knowledge about specific pottery forms from the past.

3 ORGANIC RESIDUES AND VESSEL SHAPES. THE CASE STUDY OF CARRER REINA AMÀLIA

**Abstract author(s):** Breu, Adrià - Gómez-Bach, Anna - Molist, Miquel (Autonomous University of Barcelona)

**Abstract format:** Oral

New recent data from the mid Vth millennium neolithic societies in the north-eastern coast of the Iberian Peninsula has shown that, almost a millennium after the arrival of the first agro-pastoral communities, new economic strategies were consolidated and human groups were developing new and unique ways to interact with the environment and themselves. The social developments guiding the transition between the epicardial and postcardial Neolithic certainly implied changes in the way pottery types were produced and used. The goal of this communication is to present the analysis of 51 pottery vessels and their organic residues from the two oldest occupation phases in the site of Carrer Reina Amàlia and assess whether the range of vessel shapes present in this assemblage can explain variations in their contents. These will provide useful data to better understand how much did shape mattered these particular human groups when choosing the best vessel to contain and/or transform organic products.

4 MONTBOLÓ: SINGULAR HANDLES FOR SPECIFIC PURPOSES?

**Abstract author(s):** Gomez Bach, Anna - Faro, Santi - Molist, Miquel (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

This presentation will review main pottery collections from different Early Neolithic sites from NE Iberian Peninsula and South of France. Aspects such as typology, the morphology of handles in relation to a volumetric and experimental approach will be done with the aim of studying the typology known in the references as “Montboló type” or “Montboló style”. This specific pottery production is characterized by thin walls, polished surfaces, and singular apprehension or suspension system.

Those technological and functional analyses have never been revised with attention since its identification in Balme de Montboló at Pyrénées-Orientales (Guilaine et al. 1971-1972, Guilaine 1974). The possibility to set up an exhaustive experimental program

will help us to define and understand these tubular handles, in a vertical position and grouping in 2 to 6 along the vessel surfaces. Moreover, these elements let infer in storage and mechanical properties that go beyond its decorative aspect across the Early to Middle Neolithic sequences.

5 RAW MATERIAL AND POTTERY SHAPES IN BARCELONA THROUGH CLAY STUDIES DURING MIDDLE NEOLITHIC

**Abstract author(s):** Pera, Cristina (Autonomous University of Barcelona)

**Abstract format:** Oral

This contribution aims to identify, characterize and understand the raw material strategies developed by prehistoric societies in Barcelona’s plain (northeast of the Iberian Peninsula). To achieve this goal, the petrographic study performed on main middle Neolithic sets recovered in Carrer Espalter site (Filmoteca de Catalunya) and their archaeometric results will be presented. It is a well-known open-air settlement for being located in the area with the highest concentration of Neolithic sites (Raval area) and for presenting a chronology of the IV BC with later occupation during Early Bronze Age.

Shapes and pottery typology analyses, macroscopic manufacture techniques and archaeometric studies (thin section and petrographic groups) have been carried out with the aim to identify and characterize the acquisition strategies from raw material to technological transfers.

This study addresses this issue at a specific prehistoric cultural phase, such as the Middle Neolithic, a well known period for its richness in pottery production throughout Western Europe.

6 TALKING POTS: INVESTIGATING CONSUMPTION STRUCTURES OF THE LATE COPPER AGE

**Abstract author(s):** Fábíán, Szilvia - Berente, Zoltán (Hungarian National Museum) - Marton, Tibor (Research Centre for the Humanities, Institute of Archaeology, Eötvös Loránd Research Network - ELKH) - Rajna, András (Ferenczy Museum Center)

**Abstract format:** Oral

This research is based on the premise that the archaeological identification of households and activity areas is possible since the basic activities of everyday and symbolic life were carried out in a delimited area and within a delimited timeframe. Our Funded (NRDI Fund K\_129332) research aims to delineate household units, the smallest social unit at the settlements, through the combination of various approaches with statistical and GIS modeling of the settlement remains from the 4th millennia BC in Hungary.

During this investigation, we assume that the assessment of the vessel sets may shed light on the size, complexity, and wealth of a given household and the community. But to determinate these assemblages, we have to reconstruct the functions of the different vessel types which are not necessary derived from the nomenclature of the traditional typology.

We attempt to infer the function of the vessels from their shape, size and technology through statistical analyses rather than from archaeometric analysis bearing in mind the formation of archaeological contexts and wider theoretical and methodological tools, like behavioral and ethnoarchaeology. Three-dimensional modeling was used to get more new data about the ceramics. Based on our statistical evaluations on this new metric data, the ceramic typology developed for the site was verified and we were able to collect data regarding the functionality of the vessel types.

With this method, we also tried to classify the pottery fragments into larger groups to define their functions. Through this, it can be possible to see trends among the ceramic forms and other archaeological finds and features and to delineate activity areas of the given settlement.

7 DIVERSITY IN POTTERY DURING EARLY BRONZE AGE: NORTHEAST OF IBERIAN PENINSULA AS A CASE

**Abstract author(s):** Vicens-Saiz, Laura - Bach Gómez, Anna - Molist Montaña, Miquel (Autonomous University of Barcelona)

**Abstract format:** Oral

During the transition III-II millennium cal BC, and throughout this, the ceramic productions consumed by the human groups of farmers and herders of Europe increase and diversify so much in shapes as in decorations. These have been partially sequenced and grouped by decorative techniques (printing, engraving, and plastic application) and shapes (introduction of carinated vessels, and large containers). Early Bronze Age to Middle Bronze Age assemblages from northeast of the Iberian Peninsula let to deal with this diversity.

In this presentation, we have worked from the pottery materials of three areas: Baix Ebre, Baix Camp and Pla de Barcelona, all placed in the North East of the Iberian Peninsula to look for recurrences and pattern evidence of production and consumption. Mainly we will work with the combination of plastic application motif (outer surface of the vessel and handles) and shapes, to identify how the formal and decorative aspect infers functionality.

8 **DISTINCTIVE CERAMIC FORMS IN SOUTHERN ITALY DURING EBA-MBA: FORMAL TAXONOMY AND FUNCTIONAL HYPOTHESES**

**Abstract author(s):** Marino, Sara (-)

**Abstract format:** Oral

In Southern Italy, during the EBA-MBA, the presence of some characteristic and singular ceramic forms is quite evident: vases with different types of internal support and with internal dividers; the so-called “hourglass” vases and the Aeolian “fruit bowls” are the main ones, although not the only ones. These forms can be found mainly, but not exclusively, in residential contexts. In some cases, in association with these forms, there are also distinctive non-vascular elements or objects in stone and animal hard materials as well as the widespread presence of miniature vases from even ritual and necropolis contexts. The strong distinctiveness of these ceramic objects has, in some cases, discouraged a more restricted typological classification based on formal differences, while it has more easily proposed generic but not definitive functional hypotheses. The diffusion of these forms in other contemporary Mediterranean contexts inspires a more careful and detailed reflection. In this paper we will try to tackle the problem with a harsher taxonomic approach on formal differences, by associating the materials not only with the reference contexts but also with the other non-ceramic elements and with the (few) analyses carried out.

9 **INTERDISCIPLINARY APPROACHES TO THE SHAPE AND FUNCTION OF MIDDLE BRONZE AGE MINIATURE VESSELS FROM EASTERN ROMANIA**

**Abstract author(s):** Drob, Ana (“Alexandru Ioan Cuza” University, Interdisciplinary Research Institute, Science Department, Arheoinvest Research Center, Iași) - Bolohan, Neculai (“Alexandru Ioan Cuza” University, Faculty of History, Iași) - Vasilache, Viorica (“Alexandru Ioan Cuza” University, Interdisciplinary Research Institute, Science Department, Arheoinvest Research Center, Iași)

**Abstract format:** Oral

The typology of some special pottery forms has always been a point of interest for the archaeologists. For the middle bronze age period in the eastern Carpathian basin, the ceramic typologies included a series of miniature vessels attributed to the Costișa and Monteoru pottery cultures. Although the role of these forms is not fully known, being classified as ritual or special purposes, in this research we conducted a case study for this type of vessel. The analyzed pot comes out from the settlement from Piatra Neamț-Bâtca Doamnei (Neamț County) and has on the inner surface consistent traces of red pigment. This find led to a series of questions related to its use, being known that in this period the painting of ceramics was no longer practiced. In order to obtain more information about these residues were performed detailed analyzes, such as those of optical microscopy (details of texture and surfaces), SEM-EDX (elemental composition) and micro-FT-IR (chemical compounds). Following these investigations, a series of data were obtained on the nature of the pigment, the preparation method, as well as some information related to the source of raw material. Therefore, the use of miniature vessels for the preparation of pigments contributes to the knowledge of certain functions that can be attributed to this typological category.

10 **TOO MANY POTS, TOO FEW FUNCTIONS. WHAT IS GOING ON WITH THE URNFIELD POTTERY?**

**Abstract author(s):** Łaciak, Dagmara - Baron, Justyna (University of Wrocław) - Łucejko, Jeannette (University of Pisa) - Stolarczyk, Tomasz (Museum of Copper in Legnica)

**Abstract format:** Oral

Studies on prehistoric pottery usually entail its typological and formal classification suggesting the use of each of the vessel forms (cups, jars, pots etc.). This is followed by the dating and attributing the assemblages to certain “archaeological cultures”. Any further research starts from this point.

The Urnfield (ca. 1300-550 BC in Central Europe) pottery collections consist mostly of vessels suitable for storage, cooking and serving food, such as pots, amphorae, cups, vases, and bowls. Similar vessel shapes and ornamentation occur in funerary and settlement contexts. Rattles, figurines (mostly birds) and other small objects of clay constitute only a small part of the ceramic assemblages.

Most of the vessels found at the cemeteries were suitable for use as containers. It does not mean they were necessarily utilised in household activities: as the prehistoric iconography shows, pottery played a crucial role in funerary practices. For the functional analysis of the vessels, we selected data from three large cemeteries in SW Poland: Domasław, Czernikowice and Wicina.

We started the study by examining the vessel shapes which might also suggest their function. The kernos from Domasław is a compelling example. Kernoi are extremely rare in this part of Europe but in the Mediterranean world, they are connected to making ritual offerings. Finding such an object in a grave so far away to the north may (but does not have to) indicate a matching function. The pottery (both common and more exotic specimens) from the other two cemeteries was sampled for the GC-MS analysis. The obtained data, along with the traditional typology, anthropological information and spatial analysis, gave a new, exciting picture of the ceramic use patterns.

This study is a part of projects of the Polish National Centre for Science (NCN 2014/12/S/HS3/00082, 2016/23/B/HS3/00450) and The National Heritage Board of Poland (no 3686/2019).

11 **QUANTITATIVE SHAPE-BASED APPROACHES TO FUNCTIONAL TYPOLOGIES IN LATE BRONZE AGE AND IRON AGE POTTERY FROM SOUTHWEST ANATOLIA**

**Abstract author(s):** Daems, Dries (Middle East Technical University) - Kafetzaki, Danai (KU Leuven)

**Abstract format:** Oral

Pottery studies have been part and parcel of archaeology since its origins as a scientific discipline. This long research history has resulted in standardized approaches to pottery analysis focused on sets of parameters, as for example in the Peacock classification system of modes of production (Peacock, 1977, Pottery and Early Commerce). An important part of this research has been dedicated to the establishment of pottery typologies. Three main categories of typology building have been identified: intuitive typologies, the type-variant system, and quantitative typologies (Sinopoli, 1991, Approaches to Archaeological Ceramics). Recent research in particular has started to increasingly move from the first two to the latter.

In this paper, we will present our work on using shape-based quantitative methods for typology building, applied to Late Bronze Age and Iron Age pottery collected from the area of Sagalassos (southwest Anatolia). First, we vectorize pottery drawings using the full vessel profile, the profile outline as well as a set of individual scale and shape measurements (e.g. wall thickness, diameter, rim position, roundness, protuberance, etc.) with potential functional relevance. Next, for each of the quantified elements, we compute distance matrices which are used to pick the most suitable mapping and propose coherent material groupings. These groupings are consecutively validated or rejected qualitatively by the material specialist through comparisons with existing type-variant typologies of Late Bronze Age and Iron Age pottery in the area. The feedback is then incorporated in a subsequent iteration of algorithmic grouping. Our work shows how morphological quantitative analysis can be integrated as an additional analytical tool in the toolbox for typological classification and generate new insights for the functional underpinnings of pottery typologies.

482 **MOULDING THE WORLD. CRAFTSMEN AND CRAFTSMANSHIP BETWEEN THE BALTIC AND THE CARPATHIANS IN THE LIGHT OF ARCHAEOMETALLURGICAL RESEARCH (2600-500 BC)**

**Theme:** 6. Material culture studies and societies

**Organisers:** Stróżyk, Mateusz (Archaeological Museum in Poznań) - Kiss, Viktória (Hungarian Academy of Sciences) - Nørgaard, Heide (Moesgaard Museum) - Garbacz-Klempka, Aldona (AGH University of Science and Technology) - Czebreszuk, Janusz (Adam Mickiewicz University in Poznań)

**Format:** Regular session

The mastery of metalworking skills occupies a special and significant place in the history of our culture. Particularly copper and its alloys, due to their physical properties (ductility, colour, strength, and remouldability) found a wide range of applications both on the functional/usability and symbolic/prestigious level. Bronze in the form of raw material or ready-made items crossed the borders between various social, ideological, and economic systems and manufacturing traditions, inspiring societal changes in many regions.

The versatility of this metal resulted in the supra-regional spread of some types of objects and manufacturing techniques in Central Europe, thus triggering the development of many local bronzeworking traditions. The rise of large metalworking centres indicates not only a high demand for bronze products but also the importance of trade contacts, often between distant communities.

The key issues in the interpretation of changes taking place during the Bronze Age (within general frameworks, 2600-500 BC) focus on an attempt to answer the questions of the processes behind the transmission of technical knowledge and metal objects and the dynamics of change. The most satisfying answers are provided by archaeometallurgical investigations, combining scientific experiments and multidisciplinary analysis by the cooperation between archaeologists and scientists.

The proposed session, in the widest sense, will be focused on an attempt to define the origins of traditions and networks of exchange of metalworking-related ideas, the dynamics of changes and technology transfer as well as the durability and innovativeness of metalworking solutions in the area stretching from the broadly defined Baltic region to the Carpathian Basin. This session welcomes papers that discuss:

- development of metalworking in the context of the product quality, with emphasis on the analysis of metal composition and production techniques,
- possibility of reconstructing bronze-working practices and techniques using the potential of interdisciplinary research.

**ABSTRACTS:**

1 **LOCAL OR INTERNATIONAL ARTEFACTS? THE ARCHAEOMETALLURGICAL DIFFERENCE BETWEEN ORNAMENTS AND SWORDS IN THE NBA AND ITS IMPACT ON CRAFT ORGANISATION**

**Abstract author(s):** Noergaard, Heide (Moesgaard Museum, Department of Archaeology) - Vandkilde, Helle (Aarhus University, School of Culture and Society)

**Abstract format:** Oral

We often talk of mobile people and mobile artefacts in the European Bronze Age and consider artefact mobility as proof of people’s mobility. In the last years, our knowledge concerning prehistoric mobility has been put to a new level, mostly due to strontium isotope investigations. Regarding the Nordic Bronze Age, a cultural unit spread in northern Europe roughly from 2000-900BC, natural

scientific analysis proved a far larger mobility rate than previously assumed and natural scientific investigation of metal artefacts showed shifting networks in the metal trade. This paper aims to examine the possible connection between the shifting trading networks and the increase of mobility. Further, it is to be examined if ornaments and swords might reveal different kinds of information concerning this question and what such difference might reveal regarding the organisation of metalcraft.

The study is based on a large scale archaeometric investigation of 550 artefacts from the first 800 years of metallurgical establishment in the Nordic Bronze Age, focusing on the time when the metal trade opened up for the southern European ore sources around 1600 BC and onwards. The metal used to craft ornaments and swords is examined regarding possible differences in their material origin. Lead isotope studies will clarify if ornaments can be considered evidence for local manufacture and might be directly connected to mobile people. It is asked if swords, on the other hand, reveal a much more international picture and should perhaps be seen as traded objects rather than the personal ornament of mobile people. A compared investigation of these two most widespread artefacts groups in the Nordic Bronze Age would allow understanding the local metal workshops' repertoire and their influence on the metal trade. It would also highlight the importance of skilled craftsmanship within the established trading systems of the European Bronze Age.

## 2 DYNAMICS OF RAW MATERIAL SUPPLY IN THE CENTRAL AREA OF THE CARPATHIAN BASIN DURING THE EARLY AND MIDDLE BRONZE AGE

**Abstract author(s):** Kiss, Viktória (Institute of Archaeology, HAS) - Pernicka, Ernst (University of Heidelberg; Curt-Engelhorn-Zentrum Archäometrie gGmbH, Mannheim)

**Abstract format:** Oral

The presentation focuses on 40 Bronze Age metal objects from various Hungarian sites, including burial and hoard finds. We will investigate the period between 2800 BC and 1500 BC, from the transitional period to the Bronze Age until the end of the Middle Bronze Age according to Hungarian terminology. Compositional analysis of Bronze Age finds from Hungary are known from the 1960s, however, only a very small number of Middle Bronze Age lead isotope data were available. Elemental compositions and lead isotope ratios of artifacts were analysed in order to determine the provenance of copper. The geochemical signatures were compared with ores from central and southeastern European copper deposits, exploited during Prehistoric times. The results reveal insights into the raw material supply and management of the Early and Middle Bronze Age communities living in the central area of the Carpathian Basin.

Investigations were supported by the Momentum Programme of the Hungarian Academy of Sciences (Project Nr. LP 2015-3).

## 3 PRODUCTION, FUNCTION AND REPRESENTATION – NEW ASPECTS ON THE BRONZE AGE METALLURGY IN THE BALKANS

**Abstract author(s):** Gavranovic, Mario (Austrian Archaeological Institute, Austrian Academy Of Sciences) - Mehofer, Mathias (Vienna Institute for Archaeological Science, University of Vienna)

**Abstract format:** Oral

Within the frame of ongoing research project “Bronze Age metal producing societies in western and central Balkans” (FWF-Austrian Science Fund, project no. P32095) 562 Bronze Age artefacts from the area of today's countries of Bosnia-Herzegovina, Croatia, Serbia and North Macedonia have been investigated by means of chemical (ED-XRF) and lead isotope analyses (MC-ICP-MS). Bearing in mind the position of the study area between the Carpathian Basin, the Alps and the Mediterranean, one of the important goals of the project is to examine if and to what extent the development of the local metallurgy was connected with neighboring regions in a diachronic perspective.

The paper will discuss selected results with a special focus on the production of Bronze Age metal types with limited regional distribution as they most likely represent objects made in some of the domestic workshops. Especially for the time between 11th and 9th century BC, the archaeological record suggests a significant increase of the local bronze working with a considerable number of sites being engaged in casting of artefacts. However, the technological background of the rising metallurgical activities in the Balkans was for a long time unexplored due to the lack of the analytic approach. Our investigations revealed the existence of chronologically and regionally different alloys as well as specific mixtures for certain object groups. The prestigious objects such as swords or oversized jewelry items deserve special attention since they show often inconsistent composition, traces of subsequent processing and repair. The analytic results also point to the presence of seemingly finished and processed objects whose composition do not meet the criteria for full use in functional sense.

## 4 OLD FINDS IN A NEW LIGHT. ON THE BEGINNINGS OF ENEOLITHIC METALLURGY IN THE MIDDLE WARTA BASIN

**Abstract author(s):** Zurkiewicz, Danuta - Szmyt, Marzena (Adam Mickiewicz University in Poznań; Archaeological Museum in Poznań) - Garbacz-Klempka, Aldona (AGH University of Science and Technology in Cracow) - Silska, Patrycja - Stróżyk, Mateusz (Archaeological Museum in Poznań)

**Abstract format:** Oral

In the second half of the 20th century, a lively discussion was taking place on cultural and chronological classification of the artefacts discovered at Bytyń and Rudki in Greater Poland (Wielkopolska). Spiral bracelets, Bytyń-type axes, silver items, and, above all, unique oxen figurines became the symbols of this debate. The latest findings show that these stylistically and technologically advanced metal artefacts should be linked with a relatively early chronological horizon, in the Polish Lowlands associated mainly with the Funnel Beaker culture.

The presented project aims to provide better insight into the issues of raw material and technology of these rare finds and to place them in a local context including both the evidence of the use of metal objects and indications suggesting the knowledge of metallurgy among the Lowland communities in the 4th millennium BC.

The application of modern analytical methods to the study of metal artefacts and other objects associated with early copper and bronze metallurgy, retrieved from well-recognized settlement contexts, will contribute significantly to the considerations outlined above.

## 5 METAL ARTEFACTS AND THEIR USERS IN THE EARLY BRONZE AGE ON THE POLISH LOWLAND. NEW DATA FROM ŁĘKI MAŁE

**Abstract author(s):** Szmyt, Marzena (Adam Mickiewicz University in Poznań; Archaeological Museum in Poznań) - Garbacz-Klempka, Aldona (AGH University of Science and Technology in Kraków) - Czebreszuk, Janusz (Adam Mickiewicz University in Poznań) - Müller, Johannes (Christian-Albrechts-Universität zu Kiel)

**Abstract format:** Oral

The barrow cemetery in Łęki Małe originally consisted of a dozen or so earth mounds, which covered tombs of stone structures. Five of them were explored by archaeologists in the 1930s, 1950s and in 1970. During the excavations, it was discovered that some of the tombs were completely or partially robbed and destroyed, and only a part remained intact. Nevertheless, a series of bronze and gold artefacts were found in the tombs. Among them there are signs of power (halberds), weapons (daggers), tools and ornaments. The Łęki Małe cemetery is seen as a part of the north-eastern enclave of the Unětice culture. Currently, all artefacts from Łęki Małe are subject to detailed interdisciplinary research undertaken as part of two scientific projects developed jointly by the Archaeological Museum in Poznań, the Adam Mickiewicz University in Poznań and the Christian-Albrechts-Universität zu Kiel. Three scientific agencies - the National Science Centre, Poland, Deutsche Forschungsgemeinschaft, Germany, and National Programme for Development Humanities, Poland, provided funds for the development of the projects.

All organic materials (including human and animal bones, and plant remains), clay vessels, flint, stone and metal artefacts have been analyzed. Among others, a long series of isotopic data including radiocarbon datings and some archaeogenetic data have been obtained. Also the new archaeometallurgical observations have been collected. It is possible now to present preliminary results of the completed research, which reveal a new context for both metal artefacts and their users in the last centuries of the third mill. BC and first centuries of the second mill. BC in the Polish Lowland.

## 6 NEW DATA FROM NON-DESTRUCTIVE INVESTIGATIONS ON PREHISTORIC GOLD ADORNMENTS OF THE SARASĂU HOARD (ROMANIA)

**Abstract author(s):** Bors, Corina Ioana (National History Museum of Romania - MNIR) - Radvan, Roxana - Ghervase, Luminita (National Institute for Optoelectronics - INOE 2000)

**Abstract format:** Oral

The paper presents the results of non-destructive investigations carried out for 11 prehistoric gold adornments, which were part of the Sarasău hoard, a Bronze Age find nowadays partially preserved in the collections of the National History Museum of Romania (NHMR). The other part of this assemblage, found in the mid-19th c., is kept in the collections of the National Hungarian Museum. Several bronze artefacts from this assemblage are lost. For the objects acquired five years ago for the collections of the NHMR, at first a series of preliminary XRF investigations were conducted at the Investigation Department of the NHMR, followed by more complex ones carried out at the National Institute for Research and Development in Optoelectronics – INOE 2000. The analysed artefacts included seven discoidal appliques (a very rare type of prehistoric adornments), three notched rings, and five small beads from the batch of 239 beads. The investigators from INOE used the most advanced methods for the examination of the material and manufacturing technology of these gold artefacts in order to provide additional data to the historic and archaeological study concerning these very rare objects of this LBA hoard. The investigations have yielded a relevant set of information for curators, restorers and conservators. The X-rays allowing to identify the potential hidden degradations or to reveal all the technological aspects also generated high-resolution digital images, which were then processed and combined with other information about the nature of the material. The investigations involved also the elemental analyses obtained by XRF (a new set of data both in addition and comparison

to the preliminary ones obtained at NHMR); these are refined and completed by electronic microscopy associated with V ray disper- sive spectroscopy (EDS). The physical and chemical analyses of this kind were made in the CERTO and RECAST laboratories of INOE.

7 TRAVELLING IDEAS AND METALWORKING TECHNIQUES – THE CASE OF BRONZE SICKLES

**Abstract author(s):** Fejer, Eszter (Eötvös Loránd University FH IAS, Budapest)

**Abstract format:** Oral

Bronze sickles are one of the most common types of metal artifacts in the Bronze Age Carpathian Basin. Based on the assumption that sickles are fairly uniform objects and that they do not show significant variability in time and space, questions about whether and how they reflect transcultural interactions, the transfer of technological innovations have rarely arisen.

Bronze sickles first appeared in the Carpathian Basin at the end of the Middle Bronze Age (ReBA-BB), they were deposited in enormous quantities in the Late Bronze Age (mostly ReBD-HaA1, but also HaA2-HaB) and seemed to be produced until the Early Iron Age (HaB-HaC). From a nearly thousand-year-long period more than 10.000 objects have come to light in the area.

Despite its presumed homogeneity, this large amount of material offers a wide range of possibilities to detect the spread of techniques, ideas or the movement of single objects between different regions. In addition to typo-chronological data, the analysis of production and use-wear marks can also provide us some evidences that technological knowledge had been successfully transferred or lost in translation and only partially forwarded (e.g. the morphological elements of the sickles had been transferred; however, their accompanying hafting techniques got lost). This paper focuses on some tanged sickle types of the Carpathian Basin and, by involving various investigation methods, it aims to reveal the supra-regional and regional connections behind the observed technological changes.

The presentation is supported by the Higher Educational Thematic Excellence Program of the Eötvös Loránd University.

8 FROM BONE TO BRONZE. METALWORKING IN THE LIGHT OF DATA FROM THE EBA CEMETERY AT NIŽNÁ MYŠĽA (SLOVAKIA)

**Abstract author(s):** Jaeger, Mateusz (Adam Mickiewicz University in Poznań) - Stróżyk, Mateusz (Poznań Archaeological Museum) - Olexa, Ladislav (Slovak Academy Sciences)

**Abstract format:** Oral

The proposed paper presents the results of statistical analyses of sources from an extensive cemetery in Nižná Myšľa, Slovakia. A long-term study of the site revealed nearly 800 well-preserved burials dating to the first half of the 2nd millennium BC and associated with the Otomani-Füzesabony cultural circle.

The vast collection of sources of various categories was subjected to a multifaceted statistical analysis in order to establish the chronological and spatial development of the cemetery and to establish possible relations between the material culture and the sex and age of the buried.

The analysis made it possible to capture the stage of appearance of metal in the local community and the dynamics of development of autochthonous metallurgical production, partly based on local tradition and partly modified under the influence of external factors and influences. Moreover, in the course of the research, the elements of equipment of the deceased were identified, which can potentially be connected with the production of bronze objects (graves of metallurgists).

9 NEW DATA ON THE METALLURGISTS’ BURIALS IN THE EARLY AND MIDDLE BRONZE AGE OF THE CARPATHIAN BASIN

**Abstract author(s):** Melis, Eszter (Institute of Archaeology, Research Centre for the Humanities, ELKH; Castle Headquarters Integrated Regional Development Centre Ltd.)

**Abstract format:** Oral

The innovation of copper smelting and alloying represents a turning point in the organisation of production. However, the metallurgists’ burials are considered as exceptional finds; they are one of the main sources of identification of specialised handicraft. The new technologies in metalworking (e.g. two-piece moulds) and the display of craftsmanship, in the burials as well, were included in the ‘Yamnaya Package’ expanded from the Pontic region to Central Europe before the Bell Beaker Period, around 2500 BC. While in the time of Corded Ware and Bell Beaker Complexes (2500–2200 BC) the metallurgists’ tools (stone hammer and anvil) were found almost exclusively in the warrior elite’s graves, the metallurgists’ burials of the Middle Bronze Age (2000–1500 BC) from the territory of Hungary are good examples for non-elite burials with foundry equipment. From this point of view it is problematic, if the deceased was a real craftsman or controlled the handicraft. The emergence of the specialised craftsmen from the less specialised subsistence craft and the organisation of metallurgy during the Early and Middle Bronze Age (2500–1500 BC) will be discussed in my presentation based on the metallurgists’ burials in the Carpathian Basin.

10 TRACING THE CRAFTSPEOPLE. LATE BRONZE AGE GRAVES AND HOARDS OF METALLURGISTS FROM GREATER POLAND

**Abstract author(s):** Stróżyk, Mateusz (Poznań Archaeological Museum) - Garbacz-Klempka, Aldona (AGH University of Science and Technology) - Silska, Patrycja (Poznań Archaeological Museum) - Kozana, Janusz - Piękoś, Marcin - Żak, Paweł - Fijołek, Andrzej - Wardas-Lasoń, Marta - Perek-Nowak, Małgorzata (AGH University of Science and Technology)

**Abstract format:** Oral

One of the chief roles in the development and spread of bronze metallurgy was served by metalworkers. Today we can deduce the level of their skills and technical knowledge almost exclusively on the basis of the ready-made items, tools and metallurgical debris. The most important among these sources are deposits attributed to metalworkers and graves equipped with casting implements. The analysis of these finds permits an attempt at the reconstruction of bronzeworking practices and the workshop of craftspeople, the principles/rules they followed, and the organisation of their work. The application of methods derived both from humanities and science makes it possible to obtain new information regarding, among others, chronology, the context of finds, and the social status of people buried in the so-called graves of metallurgists.

The paper discusses the results of the study on the Late Bronze Age graves and hoards of metalworkers from Greater Poland. The data obtained will provide a good starting point for a more general discussion on the development of the Late Bronze Age metallurgy in Central Europe.

11 ABOUT TRAVELLING CRAFTSMEN IN THE BRONZE AGE: NEW RESULTS ON METALLURGY IN THE EASTERN BALTIC SEA REGION

**Abstract author(s):** Civilyte, Agne (Lithuanian Institute of History) - Duberow, Elka (Curt Engelhorn Centre Archäometry) - Skvortsov, Konstantin (Institute of Archaeology of the Russian Academy of Science)

**Abstract format:** Oral

Many unique materials on the eastern coast of the Baltic sea demonstrate the intense metallurgical activity at the local Bronze Age sites. Namely, hillforts with a plethora of casting moulds. However, this evidence contradicts the real quantity of Bronze artifacts. From a typological point of view, a very limited ensamblage of objects were produced and the Scandinavian forms have proven dominant. Bronze casting seems to have taken place only memontarily during the Late Bronze Age. This makes the situation much more intriguing because it raises questions about the value and use of metal in the society. In this paper we present new results based on archaeometallurgical analysis of Bronze artifacts from the Eastern Baltic sea region. Our aim is to show the potential provenance of this metal and to investigate how it came in to this region. We will focus on the newly discovered hoard from Büsterwalde(formerly East Prussia) with clearly indications for travelling person. We will not only interpret the chemical composition of objects in a wider context but also look at the technological aspects of production. Finally, metal as imported material and the spread know-how will be connected with moving people, economic, and symbolic motivation.

486 HUNTER-FISHER SOCIAL ECOLOGY IN FORESTED ENVIRONMENTS: APPROACHING BOREAL NATURECULTURES

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Schreiber, Tanja - Piezonka, Henny (Institute of Prehistoric and Protohistoric Archaeology, Kiel University) - Nordqvist, Kerkko (Department of Archaeology, University of Helsinki) - Chairkina, Natalya (Institute of History and Archeology of the Ural Branch of the Russian Academy of Sciences) - Taylor, Barry (Department of History & Archaeology, University of Chester)

**Format:** Regular session

The boreal forests of the northern hemisphere, also referred to as taiga, stretch almost continuously across the high latitudes of Europe, Asia and North America, forming the world’s largest biome. The economic and ecological aspects of subarctic forests have been important for generations of people and their significance prevails, especially in view of today’s pressing challenges of global warming and the rising demand for resources.

The cold climatic conditions and the short growing season of northern boreal forests, unsuitable for agriculture, have favored hunter-fisher subsistence for thousands of years, from the beginning of the Holocene until today. As has been seen in modern indigenous forager communities, an interwoven relationship between humans and the boreal forest characterizes lifeways and cosmologies. This entanglement is expressed through several adaptive strategies based on multi-species systems. Strong human-animal ties are reflected in nomadic lifeways based on animal seasonal movements and associated seasonal shifts of hunting and fishing grounds, reindeer husbandry, and the use of dogs for hunting. Of special importance can be mass harvesting strategies of (seasonally) abundant resources such as salmon or shellfish, potentially leading to surplus economies and the rise to territoriality and sedentism, social stratification, the display of wealth and power through terraforming or specific classes of material culture and thus to possible beginnings of social inequalities and conflicts.

We welcome contributions that take into view trajectories of social complexity in hunter-fisher communities of the northern hemisphere and papers that investigate the role forest environments play in shaping lifeways of past and modern forager groups. We

### THE SECRET LIFE OF TREES DURING THE NORTH EUROPEAN MESOLITHIC

**Abstract author(s):** Taylor, Barry (Department of History and Archaeology, University of Chester)

**Abstract format:** Oral

The forest environments of Northern Europe provided a wealth of economic resources for the human communities inhabiting these regions during the Mesolithic. Species of shrubs and trees were particularly important, providing a suite of different materials that were utilised in an incredible range of material culture. However, we know surprisingly little about the ways in which trees were understood by the human communities that exploited them.

This paper seeks to explore this issue, by using the concept of object biography to study the relationships between trees and humans during the North European Mesolithic. Like objects, trees can have long and complex life histories, comprising of numerous interactions with humans, animals, and other aspects of the environment. These interactions constitute relationships between the tree and its world, relationships in which the tree (as a living entity) played an active part. Though the trees themselves rarely survive archaeologically, evidence of these interactions persist in the remains of artefacts made from them, the waste produced through their manufacture, and the remains of plant foods. By studying these forms of evidence, this paper seeks to explore the way different species of tree may have been understood by human communities. It will look specifically at the way humans harvested, used, and disposed of material deriving from different species, and how the trees themselves would have responded to these interactions. In doing so it will highlight the active, but different roles that trees played in the lives of humans, and how humans may have perceived particular species.

### INTO THE WOODS ... APPROACHING COAST-HINTERLAND RELATIONS IN THE LATE MESOLITHIC OF SOUTHEAST NORWAY

**Abstract author(s):** Schülke, Almut (Museum of Cultural History University of Oslo)

**Abstract format:** Oral

This paper explores how human engagement with the wooded hinterland in the Late Mesolithic of Southeast Norway can be approached archaeologically. Hunter-gatherer engagement with the environment is, especially in Scandinavia, often discussed from a maritime perspective, as many archaeological sites are placed at the coast. They are today either submerged or located on uplifted land. In Southeast Norway constant landuplift since Late Glacial times has resulted in the preservation of hundreds of Mesolithic coastal sites on dry land. Their placement in areas which today are exposed to infrastructure development has not only led to a high number of excavated former coastal sites, but has also enhanced the idea that the coast and marine resources played a major role for Mesolithic hunter-gatherers. A generally accepted model on a semi-sedentary way of life prevails, where larger shorebased locations are interpreted as base-camps. But how and to what extend the people who lived in these coastal areas used and were attached to the coastal hinterlands and its extensive woodlands is still is little discussed, even though there are growing indications of such use. These include the evidence of visits of hinterland locations, the human manipulation of forested areas as attested by pollenanalysis, bones of terrestrial animals and depictions of such on rock art, which can indicate (seasonal?) movement and mobility patterns into and across the woods. This contribution aims to set indications of hinterland and woodland use on the agenda, and asks which possibilities these open for a thicker understanding of human-nature encounter at the time – in social, economic, and cosmological terms.

### THE ECOLOGY OF WAR – HUMAN-ENVIRONMENT RELATIONSHIPS IN WARFARE AMONGST CIRCUMPOLAR HUNTER-GATHERERS IN PAST AND PRESENT

**Abstract author(s):** Schreiber, Tanja (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

The relationship between human warfare and the natural environment has rarely been studied outside military histories and environmental contexts, particularly prior to the 20th century. Research into the connection between ecology and conflict has largely focused on the damaging environmental effects of war and how this can dictate modern combat tactics. However, the way environment shapes human behaviour in war and vice versa has not been sufficiently investigated, archaeologically or anthropologically. Is this relationship reciprocal? How does it influence people’s perceptions of their socio-environmental world? In what way was the natural environment used amidst conflict by past societies? Considering the Western dichotomist narratives regarding nature and culture, we can no longer separate war from its environmental context. There is a demonstrated need to consider the symbiotic processes of conflict, especially within non-western, non-agricultural societies.

To address this issue, I present a detailed study on the intersection of ecology and war amongst circumpolar hunter-gatherer groups, using ethnographic, ethnohistoric, and archaeological materials on a comprehensive, multiregional scale. The results reveal a “longue durée” in the ecology of war and reciprocal relationships between humans, non-humans, and built and natural environments in times

### BEAVER NATURECULTURES IN THE EARLY HOLOCENE OF NORTHWESTERN EURASIA

**Abstract author(s):** Hussain, Shumon - Laustsen Lomborg, Kamilla (Aarhus University) - Brusgaard, Nathalie (Groningen University)

**Abstract format:** Oral

Castorid and human lifeways have intersected in Eurasia for many thousands of years – both in glacial and interglacial ecosystems – yet the beaver has left a notable mark especially in material and aesthetic productions of human societies in the archaeological record of the developing Mesolithic of northern latitudes. This paper explores the entanglement of the Eurasian beaver (Castor fiber) with these early Holocene societies in the emerging sub-boreal, boreal, and riverine landscapes at the edge of former glaciers. We argue that the archaeological record testifies to the potent ecocultural role of the beaver across a large geographical area spanning at least Northern Germany, the Netherlands, Southern Scandinavia, the Baltic region, and the Trans-Ural area.

We combine evidence from different fields of material culture, faunal remains and different climatic and environmental archives to show that the highly transformative and “textured” landscapes of early Holocene Northwestern Eurasia provided unique conditions for human-beaver interactions, and that the beaver’s consequential environmental agency not only played an important role in anchoring human activities but also greatly encouraged materially-mediated negotiations of the human-beaver interface. Re-casting the respective societies in Northwestern Eurasia in terms of their “beaver-ness” helps to qualify their naturecultures and elucidates their constitutive multispecies fabric.

### CANNOT SEE THE FOREST FOR THE TREES: THE IMPACTS OF BOREAL ECOLOGY ON REINDEER HUSBANDRY AND FORAGER SUBSISTENCE

**Abstract author(s):** Windle, Morgan - Piezonka, Henny (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

Ethnographic and ethnohistorical research into North Eurasian reindeer herding communities has largely been focused on tundra-dwelling and Inner and East Asian mountainous regions groups. Communities inhabiting the West Siberian taiga have remained on the periphery despite small-scale reindeer herding being practiced by some into the present day. In the tundra, reindeer are a primary subsistence resource in a specialized pastoral economy, whereas reindeer in boreal contexts represent both a resource as wild game and as domesticates predominantly kept for transportation and decoy hunting.

The role of reindeer in the taiga is deeply entwined with other aspects of nomadic multi-species lifeways. The way in which belief systems, exploitation of wild resources, such as bird and fish, and the intricacies of reindeer management articulate within a closed forest landscape versus the vast openness of the tundra is largely undefined. How does the forest impact human-animal interactions? How do herded reindeer influence forest dwelling? How do the role of other species dictate human relationships to reindeer and the forest? The enduring practices of the modern hunter-fisher-herder groups can provide analogous insights into these questions and help inform on the formation processes of boreal archaeological records.

In this paper, we will discuss the intersection of boreal ecology and human-animal interactions in subarctic North Eurasia, comparing ethnographic and ethnoarchaeological evidence from tundra and taiga contexts. From abundant resources and natural storage to herd management architectures and transhumance, we seek to demonstrate how the seasonality and biodiversity of boreal ecosystems reciprocally shape hunter-fisher cultures and lead to specific niche construction strategies. In assessing the mechanisms of forest environments, we can identify the visibility and invisibility of these impacts in the archaeological record, improving our ability to study hunter-fisher-herder societies.
- 6

### ECONOMY IN CHANGING CULTURES AND ENVIRONMENT IN UPPER AND MIDDLE VOLGA AREA

**Abstract author(s):** Lavento, Mika (Valeri S. Patrushev)

**Abstract format:** Oral

The Middle and Upper Volga belong to the area where the environment has slightly changed during the whole Holocene. The livelihood in northwestern Russia was the hunting and gathering where copper was known after the 5th millennium BC. The hunting of elk and wild reindeer had a central role in economy but decreased when the population grew. This took place together with the changing climate. Fishing retained an important role, too and this comes visible in the bone material preserved at the dwelling sites of the large rivers. Human groups living by River Volga were gathering and utilizing plants, but the macrofossile material has not been much analyzed at the dwelling sites. We still know that the economy in this area was changing when the Bronze Age began at the beginning of II millennium BC.

When the Early Metal Age approached, the cultivation began with wheat, barley and lastly rye. The first traces are visible very early, the remains can be dated in the Middle Volga to the IV millennium BC. Dogs were together with humans already during the Mesolithic

### A STONE AGE INNOVATION HORIZON IN THE SIBERIAN TAIGA: EXPLORING THE ENVIRONMENTAL BACKGROUND

**Abstract author(s):** Piezonka, Henny (Christian Albrechts University Kiel) - Chairkina, Natalya (Institutute of History and Archaeology, Ural Branch, Russian Academy of Sciences)

**Abstract format:** Oral

The emergence of complex enclosed and fortified sites among Stone Age hunter-gatherers in the Western Siberian taiga in the 7th-6th millennium BCE is an outstanding and unique phenomenon in world prehistory. The early complex settlements coincided with a range of other innovations that bear witness to an overall horizon of substantial social, cultural and economic changes, among them the appearance of pottery vessels, the foundation of sacrificial mounds, and a decrease in residential mobility reflected by the rise of pit houses. It is unclear, however, what led to such complex hunter-gatherer life worlds with new enclosed settlement types. Based also on archaeological and ethno-historical evidence from other parts of the world, one hypothesis regards mass harvesting strategies of seasonally abundant resources (e.g., migratory fish) as possibly connected to the phenomenon.

In the talk, new data from pilot studies at selected key sites in the Middle and Lower Ob’ regions will be presented. Drillings in peat stratigraphies adjacent to the sites provide first insights into the local landscape development concerning the dynamics of water bodies and peat growth. Based on this data and also drawing on palaeoenvironmental evidence from the wider region between the forest steppe to the south and the Transuralian foothills to the West, we will discuss the current state of knowledge on climatic fluctuations and landscape dynamics and outline future avenues of research.

8

### RED BUTTONS AND GREEN AXES: SPECIALISED CRAFT PRODUCTION AND LONG-DISTANCE TRANSPORTATION OF ARTEFACTS IN THE BOREAL REGION, FOURTH MILLENNIUM BC

**Abstract author(s):** Macane, Aija (Department of Historical Studies, University of Gothenburg) - Nordqvist, Kerkko (Faculty of Arts, University of Helsinki) - Tarasov, Alexey (Karelian Research Centre, Russian Academy of Sciences)

**Abstract format:** Oral

The fourth millennium BCE was a dynamic period in prehistory in the boreal region east of the Baltic Sea. Dominated by fisher-hunter-gatherer societies and varyingly linked with increasing sedentariness and settlement units and possible surpluses based on aquatic resources, this period also shows changing attitudes to materiality and worldview. Among the intriguing new features are evidence of craft specialisation – mass production – appearing in archaeological record. Particular workshops produced objects that were circulated in hundreds and thousands in the boreal region and even beyond. This talk is focused on amber items from the Baltic States and Russian Karelian metatuff artefacts from Lake Onega, the production and exchange of which reached their peaks during the fourth millennium BCE, especially in its second half. Artefacts produced in bulk from particular raw materials in specialised craft centres, and the long-spanning networks distributing them, are often associated with hierarchically ranked farming communities. In the present forager context they can also be seen as indicators of rising of social and economic inequality. At the same time, the distribution of amber and metatuff shows how the waterways have woven communities together and allowed the creation of new kinds of social and material links, reflecting new attitudes not only to the social, but also to the material world.

### BOREAL FISHER-HUNTER-GATHERERS UNDER EXTERNAL PRESSURE: INTERACTIONS WITH ADVANCING PASTORALISTS AND FARMERS

**Abstract author(s):** Nordqvist, Kerkko (University of Helsinki, Faculty of Arts) - Heyd, Volker (University of Helsinki, Department of Cultures)

**Abstract format:** Oral

In the early third millennium BC, major population and cultural turnovers across much of continental Europe led to the emergence of the expansionist Corded Ware Complex. In the regions of the eastern Baltic Sea and beyond, it encountered a new kind of environment – boreal forests inhabited by numerous fisher-hunter-gatherer communities. The new cultural phenomenon took root especially in the Baltic area, but also in the large river valleys in the central part of European Russia. Recent aDNA studies have confirmed that the appearance of Corded Ware in these regions does indeed involve newcomers with a different genetic make-up but they have, so far, not been able to fully clarify the vexed question of the role of fisher-hunter-gatherers in these events. We therefore do not know which contacts prevailed between the arriving and local populations, and how much the interaction involved violence, substitution, cultural adaptation and hybridization. Moreover, it is even less known how forager populations outside the immediate Corded Ware distribution reacted and adapted to the new situation, and how these groups contributed to what we think may be the final centuries of fisher-hunter-gatherers in much of the boreal region.

### A NETWORK FOR AGENT-BASED MODELLING OF SOCIO-ECOLOGICAL SYSTEMS IN ARCHAEOLOGY (NASA)

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Verhagen, Philip (Vrije Universiteit Amsterdam) - Daems, Dries (KU Leuven) - Romanowska, Iza (Aarhus University)

**Format:** Session with keynote presentation and discussion

Agent-based modelling (ABM) has developed into an important methodological tool in archaeological research. ABM allows us to simulate the dynamics of complex systems, hypothesize individual and collective action, and investigate socio-ecological processes at various scales. It represents a veritable paradigm shift, not just for the study of the human past but also for the social sciences in general.

Formal modelling tools such as ABM have several advantages over more informal approaches to study complex dynamics in past human and environmental systems. They 1) enforce conceptual clarity, 2) define mechanisms of change, 3) help infer dynamics in the past from the static archaeological record, and 4) allow for rigorous hypothesis testing.

Applications in archaeology have been growing in number in recent years, but ABM is yet to fully mature as a conceptual and methodological tool for studying the past. To make this maturation possible, we need to encourage wider dissemination among researchers and the establishment of standardized practices. An important step forward was the recent foundation of the Network for Agent-based modelling of Socio-ecological systems in Archaeology (NASA). The main targets of this network are: 1) compile a curated model library for ABM in archaeology; 2) collect and develop best practices and modelling guidelines; 3) develop tools for interoperability following the FAIR principles; 4) create a network for international collaboration.

We invite researchers working on archaeological ABM to present their work and contribute to the goals of the network. Contributions can consist of, but may not be limited to:

- individual case studies highlighting a specific issue, method or solution;
- proposals including demos of ABM modules that can form part of the modelling library;
- examples of integration of ABM with other (archaeological) methods;
- standards and best practices in ABM, as well as directions for the current and future development.

#### ABSTRACTS:

1

### REASSESSING THE ROLE OF CLIMATE CHANGE IN THE EXPANSION OF AMAZONIAN FARMERS DURING THE LATE HOLOCENE

**Abstract author(s):** Gregorio de Souza, Jonas - Madella, Marco (Universitat Pompeu Fabra)

**Abstract format:** Oral

During the late Holocene, the archaeological record of lowland South America shows the emergence and dispersal of ceramic traditions associated with polyculture agroforestry (forest farming). Such expansions coincide with the distribution of the largest language families in the continent. At the same time, starting ca. 4-3 ka, wetter conditions drove the advance of forests in regions affected by the South American summer monsoon. The coincidence between precipitation increase, forest expansion and population dispersal has long suggested that the establishment of modern climate conditions favoured the expansion of tropical forest farmers and their languages. Here, we employ a computational approach to test the role of climate change in determining the rhythm of advance and the routes taken by populations expanding from the Amazon to other parts of South America. We simulate demographic-diffusion processes in an agent-based model informed by the dynamics of growth, fission and movement of Amazonian villages interacting with a dynamic environment that reproduces shifts in landcover based on interpolated fossil pollen data.

2

### AN ABM APPROACH TO THE NEOLITHIC SPREAD IN EUROPE AND AN ANCIENT GENETIC CLINE

**Abstract author(s):** Fort, Joaquim - Pérez-Losada, Joaquim (Universitat de Girona)

**Abstract format:** Oral

We report an agent-based modelling (ABM) approach of Neolithic spread and compare it to archaeological and genetic data. This ABM approach uses integer numbers for the population sizes, so it is more realistic than a previous approach (Isern, Fort and de Rioja, Sci. Rep. 2017). However, implementing this feature is not straightforward and we will explain the difficulties and solutions that we have applied. Our new ABM approach correctly reproduces the arrival times of the Neolithic at several regions of the Near East and Europe, as well as the cline of mitochondrial haplogroup K that has been detected using ancient DNA data. We discuss the implications of our ABM model on the dispersal and interbreeding behaviour of farmers and hunter-gatherers. We also discuss differences along the two main routes of Neolithic spread, namely an inland route along the Balkans and central Europe and a coastal route along the Northern Mediterranean coast.

3 EXPLORING ENVIRONMENTAL DETERMINISM WITH AGENT-BASED MODEL OF SETTLEMENT CHOICE

**Abstract author(s):** Sikk, Kaarel (University of Luxembourg)

**Abstract format:** Oral

Archaeology and the related fields of geography and anthropology have a long history of debate of environmental determinism going beyond discussing methodological issues. The environment’s influence on social processes has always been an important component of archaeological interpretations. Several research tools are completely dependent on the concept, for example it is essential for archaeological site locational modelling both in case of deductive and inductive models.

Studies using empirical inductive models have proven the significance of environmental effects of various spatial processes observed in archaeological material. Those works have resulted in models with varying predictive power, therefore a lot of emphasis has been put on advancing algorithms and model training. It has also been discussed that systemic properties of past human-environment relations like economic intensification, social complexity and spatial configuration of the environment influence the environmental determinism of settlement choice. So far possible influences of those systemic properties have not been quantitatively researched.

In this study possible spatial and systemic effects to environmental influence to settlement choice are explored using Agent-Based Model (ABM). A stylised ABM simulation model of settlement pattern formation is created based on general settlement theories from geography (ekistics) and archaeology. The model includes the generation of synthetic environments and is used to simulate settlement patterns formation as a process of consecutive settlement choice events.

The model is used for testing different systemic properties of human-environmental interactions and their effect on the environmental determinism of settlement choice. It is explored for the sensitivity to various mechanisms of human-environment interactions, population properties and spatial configuration of the environment. It is argued that environmental determinism is valuable information in itself and can be used as an indication of systemic properties of the past. Possibilities for quantifying the environmental determinism of the settlement choice process are explored.

4 MODELING THE LANDSCAPE EVOLUTION AND LAND-USE IN EARLY BRONZE AGE AT HACILAR, IN SW ANATOLIA

**Abstract author(s):** Arikan, Bulent - Özdoğru, İnci (Istanbul Technical University)

**Abstract format:** Oral

The mound of Hacilar (Burdur-Turkey) in SW Anatolia was a major settlement during the Early Bronze Age-I (ca. 3100 – 2900 BC). Systematic archaeological research has been going on for the last decade. Excavations at the site revealed a detailed settlement plan. Based on the site’s layout, it is possible to calculate the approximate population of the settlement. Combined with paleoenvironmental and paleo-climate research conducted at the site, we now have a comprehensive dataset about its immediate region. This paper will deliver the results of agent-based modeling experiments at Hacilar Using this diverse set of data for human behavior and past environmental conditions, agent-based modeling has been applied to simulate how dry farming and ovicaprid-based, site-tethered pastoralism affected the immediate landscape around the site. The use of agent-based modeling at this single-period settlement also informs us about the patterns of socio-economic and demographic changes in the long-term. The results of the modeling experiments allow us to understand the processes of socio-political and environmental processes in greater detail.

5 MODELLING GAIA: TOWARDS AN ACTOR-NETWORK MODELLING FRAMEWORK IN ARCHAEOLOGY

**Abstract author(s):** Ertsen, Maurits (Delft University of Technology)

**Abstract format:** Oral

Agent-based models have become powerful instruments to explore archaeological questions. Yet, one of the main challenges remains to avoid too much pre-structuring of agent activities in such models. Many modelling approaches are less capable to acknowledge change in activities, as they tend to model patterns of activities (defined as behavior). This hampers our understanding of emergence of change in the settings we are interested in. Discussing examples on Mesopotamia and Jordan, this paper explores how the Gaia approach as provided by the French scholar Latour allows an elegant, robust and theoretically convincing modelling framework. A major decision appears to be how to assign agency to non-humans as well, next to human model agents. The contribution will discuss why and how for cases with different spatial and temporal scales like Mesopotamia (landscape change over thousands of years) and Jordan (irrigation systems within days and/or decades), it does make sense to keep the modelling scales (parameters and time step) similar.

6 SIMULATING ROMAN ECONOMIES

**Abstract author(s):** Brughmans, Tom (Classical Archaeology and Centre for Urban Network Evolutions - UrbNet, Aarhus University)

**Abstract format:** Oral

The use of formal modelling and computational simulation (especially agent-based modelling (ABM)) in studies of the Roman economy has become more common over the last decade. This paper will explore why Roman Studies should add these approaches as

tools of the trade. In doing so, the paper aims to reflect on the potential and challenges ahead as ABM becomes integrated in archaeological subdisciplines. The paper will explore seven arguments, and will illustrate these with examples from studies of the Roman economy and personal experiences of a romanist modeller:

1. Formal modelling and computational simulation are necessary techniques for explicitly representing our complicated theories (or aspects of them), and for testing them against historical and archaeological evidence.
2. Complex systems simulation is the only suitable approach for identifying emergent properties in complex systems.
3. The Roman economy was a highly complex system. Theories describing this system are necessarily extremely complicated.
4. Building complicated models is a step-by-step cumulative process, where simplification is key.
5. Simulation should be integrated as one of our tools of the trade. This is an addition to and enrichment of current practice; it is not in conflict with current practice.
6. There are many different and competing views on the nature of the Roman economy. Simulation studies will enhance constructive multivocality of these theoretical debates.
7. Good simulation studies of the Roman economy necessarily rely on collaboration across specialisms (where simulation is a specialism in the same way as ceramology or osteology). Encouraging this means integrating the basics of simulation approaches into education in classical studies.

7 REPLICATION OF VILLAGE, AN AGENT-BASED MODEL OF SOCIO-ECOLOGICAL DYNAMICS IN THE NORTH AMERICAN SOUTHWEST

**Abstract author(s):** Allison, James (Brigham Young University)

**Abstract format:** Oral

Recently, archaeologists have developed increasingly realistic agent-based models to explore the dynamics of human socioecological systems. One of the best-known of these is Village, developed as part of the Village Ecodynamics Project. Village models maize and wild resource productivity for a portion of the North American Southwest, and it populates the landscape with agents conceived as Ancestral Pueblo households, who farm, hunt, gather wood, and interact on the virtual landscape. Recent versions of the model examine warfare, the formation of territorial groups, and the development of complex socio-political systems among those groups.

The fine-grained, spatially explicit modeling is a great strength of Village, but the complexity of the model and the number of agents means that it runs slowly and creates voluminous output that is challenging to analyze. This limits the number of parameter combinations and/or the number of iterations of each parameter combination that are practical. Crabtree et al. (2017), for instance, report results for 36 combinations of parameters, but only 15 runs for each combination. The results are interesting and provocative, and there is no reason to doubt them, but some questions remain. Specifically, 1) is 15 runs really enough to characterize the variability in output from a given parameter combination?; and 2) what effect would expanding the range of tested parameters have?

In this paper, I partially replicate and expand on the analyses presented in Crabtree et al. (2017), using 100 iterations for each parameter combination. This enables reflection on the strengths and weaknesses of the model, as well as those of similarly complex models of the socio-ecological dynamics of past societies.

8 SIMULATING SUBSISTENCE AND RESOURCE EXPLOITATION STRATEGIES IN IRON AGE TO HELLENISTIC COMMUNITIES IN SOUTHWEST ANATOLIA

**Abstract author(s):** Boogers, Stef (Sagalassos Archaeological Research Project; KU Leuven) - Daems, Dries (Sagalassos Archaeological Research Project; KU Leuven; Middle East Technical University)

**Abstract format:** Oral

All human societies need energy and resources in order to sustain themselves. As a result, people have a profound impact on their environment when exploiting these resources. In this paper, we will explore human-environment interactions in the area of Sagalassos (southwest Turkey) from Iron Age to early Hellenistic times (900-200 BCE). We will use an agent-based model to simulate subsistence and resource exploitation strategies and their impact on the natural environment. Specifically, we will test the hypothesis that Iron Age hilltop sites in the area of Sagalassos can be considered the main drivers of environmental change during this period.

In our model, we use a semi-realistic GIS environment, plotting known sites in a simplified landscape with properties such as altitude, forest yield potential, crop fertility and feedstock availability. We simulate three general types of resources across the landscape: agricultural products (subsistence: renewable), clay (production: non-renewable), and wood (fuel for subsistence and production: renewable). We simulate different resource exploitation strategies by varying parameters related to agent behaviour and requirements, after which we investigate the energetic returns on investment for these scenarios. In order to validate our model, we will compare simulated patterns of exploitation and human impact with those apparent in environmental data from the Gravgaz valley.

9

LAND USE MODELLING IN THE DUTCH LIMES: A COMPARISON OF APPROACHES

**Abstract author(s):** Verhagen, Philip (Vrije Universiteit Amsterdam) - de Kleijn, Maurice (SplnLab, Vrije Universiteit Amsterdam)

**Abstract format:** Oral

In this paper, we will compare two approaches to model the impact of settlement on land use in the Roman period in the Dutch river area, on the northern frontier (limes) of the Empire. After the arrival of the Romans around 15 BC, the area witnessed a strong increase in population, putting more demands on the available land to produce food and wood, not only for the local population, but also for the soldiers stationed on the frontier and the citizens of the newly founded towns.

Estimating the spatial effects of this increased agricultural demand through time can be approached through simulations of food production, taking into account the available workforce and the productivity and availability of suitable land. The paper will provide a comparison of ROMFARMS, an agent-based model (ABM) of agricultural production in the region by Joyce (2019), and a simulation model using the Past Land Use Scanner (PLUS; De Kleijn et al. 2018). The ABM is fine-grained, simulating agricultural production at the household level and aiming to explore different the factors and dependencies involved in agricultural production. The PLUS model is more generalized, aiming to provide accurate predictions of land use over larger regions for specific hypothetical scenarios.

How should we evaluate these outcomes within the general context of the debate on land use and agricultural production in the region? What are the advantages and limitations of each? We will discuss issues of scale, temporal resolution and model inputs, together with questions of technical implementation and validation of the model outcomes.

10

THE AGENCY OF CONNECTIONS. AT THE CROSSROAD BETWEEN ABM AND NETWORK MODELLING

**Abstract author(s):** Fulminante, Francesca (Bristol University; University Roma Tre) - Prignano, Luce (University of Barcellona) - Cozzo, Emanuele (University of Tarragona)

**Abstract format:** Oral

The idea of network models as a means for explaining features of real networked systems in terms of the processes and mechanisms that generated them dates back to the late 1990s and is the main motivation for the onset of network science. Such mechanisms are implemented as algorithms that work in different fashions: in some cases, they take as a starting point a regular or random network and proceed to modify it by rewiring or adding connections; in some other cases, nodes are also added at each step. Nevertheless, networks are more often included in the framework of Agent Based Modelling (ABM), one of the most extensively adopted modelling approaches in archaeological research, as interaction topology. Thus, agents interact on an underlying structure that determines who is able to interact with whom, introducing non-trivial heterogeneities whose effects can be measured and tested against data.

However, the output of such interactions can be also regarded as a network sometimes. For instance, the roads built by the communities living in a territory, the web of trade agreements signed by public authorities, or the similarity network of assemblages of artifacts, are all suitable to be studied as the results of the interactions that shaped them. Whenever there is evidence that allows us to build an empirical network, it is possible -in principle- to model the process that created it. The modelling techniques may vary from pure abstract network modelling to more explicit ABM approaches where the nodes can be either the agents themselves (e.g., individuals, polities), or the objects manipulated by them (e.g., artifacts, goods). The common trait is the possibility to implement network science methods for hypothesis testing. We will discuss the potential and limitations of such combined approaches, considering few emblematic scenarios to which they could be profitably applied.

11

EXPLORING CULTURAL AND ECONOMIC TRANSMISSION WITH AGENT-BASED MODELLING

**Abstract author(s):** Romanowska, Iza (Aarhus University) - Carrignon, Simon (University of Tennessee) - Brughmans, Tom (Aarhus University)

**Abstract format:** Oral

Cultural transmission is a dynamic field of research with new and exciting applications being published every week. Here, we turn to the less explored topic of the intersection between cultural and economic exchange. This question lies at the heart of current debates in Roman studies: how integrated was the economy of the Empire? However, the characteristics of the potential transmission of commercial information, usually used as a measure of economic integration, is not easy to derive from archaeological datasets.

Ceramic tableware offers one of the only comparable and quantifiable sources of information for Roman inter-regional trade over centuries-long time periods. For example, the distribution patterns and stylistic features of tablewares from the East Mediterranean dated between 200 BC and AD 300 suggest a competitive market where buying and selling decisions were highly informed implying high levels of cultural transmission between traders.

We test three competing hypotheses formalised in an agent-based model: success-biased social learning of tableware buying strategies (requiring access to reliable commercial information from all traders), unbiased social learning (requiring limited access), and independent learning (requiring no access). We compare their predictions to archaeologically observed tableware distribution patterns. Our results revealed success-bias is not a viable theory and we demonstrate instead that local innovation (independent learning) is the most plausible driving factor in inter-regional tableware trade. We also suggest that tableware distribution should instead be explored as a small component of long-distance trade cargoes dominated by foodstuffs, metals, and building materials.

12

QUANTIFYING BEHAVIOURAL CHANGE AND DECISION MAKING IN THE EARLY NEOLITHIC

**Abstract author(s):** Palacios, Olga - Barceló, Juan Antonio (Laboratory of Quantitative Archaeology, Universitat Autònoma de Barcelona) - Quesada, Miguel (Analytical Sociology and Institutional Design, Universitat Autònoma de Barcelona) - Vilà, Xavier (Department of Economics and Economic History, Universitat Autònoma de Barcelona)

**Abstract format:** Oral

During the early Neolithic (ca. 5600 - 4500 cal. BC), resource availability was probably highly dependent on various drivers including the environment, demographics or socioeconomic practices. These changes likely altered in-settlement organisation and resources management of the available resources. However, socioeconomic processes are very challenging to identify in the archaeological record as only empirical evidence is materialised. Thus, relevant aspects such as adaptive decision-making or social organisation are invisible in the record and, consequently, it is difficult to quantify and understand them.

We propose using agent-based modelling to examine socio-ecological processes and consequences in early agropastoral settlements in the northeastern Iberian Peninsula to provide new insights about resource management and social organisation in the early Neolithic context. Agent-based modelling makes it possible to experiment in silico with past socio-ecological systems and to evaluate potential different ‘options’ and their results. With this approach, the presented model represents different behavioural economic strategies which could have been adopted as adaptive strategies that could have been adopted by early agropastoral to ensure their long-term survival in their living environment. The final aim of this presentation is to generate discussion concerning the use and application of quantitative and computational methods to examine social and ‘invisible’ aspects of the past.

SIMULATING MOVEMENT AND VISIBILITY OF ATLANTIC ROCK ART: AGENT-BASED MODELLING OF SCOTTISH CASE STUDIES IN NETLOGO

**Abstract author(s):** Bjerketvedt, Linda - Valdez-Tullett, Joana - Barnett, Tertia (Historic Environment Scotland) - Jeffrey, Stuart (School of Simulation and Visualisation, Glasgow School of Art) - Robin, Guillaume (School of History, Classics and Archaeology, University of Edinburgh)

**Abstract format:** Oral

Prehistoric rock art in Scotland is part of a wider Neolithic/Early Bronze Age carving tradition known as Atlantic Rock Art (ARA), found in open-air locations along the Atlantic seaboard (Bradley 1997). Cupmarks and cup-and-ring motifs were typically carved on boulders and outcrops in the landscape. Since the 1980s, rock art research has seen a growing focus on landscape settings to better understand the context of rock carvings. In his seminal work, Richard Bradley (1997) emphasised long-distance visibility and pathways as important facets of ARA. In order to analyse environmental parameters of the carvings, some studies have employed GIS-based approaches (Gaffney & van Leusen 1996; Fairén-Jiménez 2007; O’Connor 2006, Valdez-Tullett 2019). This type of spatial analysis is, however, inherently static in nature and struggles to address the processes behind emerging patterns (Davies et al. 2019: 185). Recently, a study has demonstrated that despite the homogeneity of Atlantic Rock Art, there are important regional preferences including variations in terms of ARA’s landscape locations (Valdez-Tullett 2019).

In order to investigate these nuances more dynamically, we have explored data from Scotland’s Rock Art Project through agent-based modelling. We addressed visibility and mobility, two key aspects commonly discussed in ARA research, with NetLogo, an open-source modelling environment. The simulations feature agents moving through or seeing a landscape linked to real elevation data. Our models deconstruct previous assumptions that the rock art was a) marking routes and pathways, and b) made in locations with extensive views to and/or from the landscape. Different case studies from geographically dispersed areas of Scotland were chosen to ensure diverse environments were captured by the model. This is a pioneer approach to rock art and the agent-based modelling will shed light on the perceived importance of visibility and mobility in relation to rock carvings.

MODELLING APPROACHES IN EPIDEMIOLOGICAL RESEARCH OF THE PAST SOCIETIES – SANDBOX OF ANCIENT DISASTERS

**Abstract author(s):** Vlach, Marek - Komoróczy, Balázs (Institute of Archaeology of the Czech Academy of Sciences, Brno)

**Abstract format:** Oral

In past societies documented through archaeological record and other available sources of information, an impact of epidemiological events usually leaves limited or no traces. Yet their occurrence is generally accepted and in “literary” civilization is also reflected through the vivid narratives. In epidemiological modelling as a part of health sciences, methods and approaches have long developed and advanced gradually from the elemental dynamics based on differential equations to the robust modelling approaches encompassing complex social structures including large numbers of individually acting entities. Therefore, modelling and simulation of such phenomena in past societies, yet based on merely approximated demographical representations, has justifiable theoretical grounds and methodological tools available to use. The presented model examples and modelling approaches aim to outline some possibilities of epidemiological impact modelling within the past demographical contexts at various scales (continental, regional, community) and contexts (Roman and barbarian world), either of explicit or implicit nature. Cross-sectionally, the modelled context lies mainly in the topic of potential impact of the so called Antonine plague during the 2nd half of the 2nd century AD. Yet, the certain parts of the models could provide an adjustable general framework for testing hypotheses of epidemiological impact within any context and such solution is intended to become a part of library of the NASA project.

HOW SOCIAL LEARNING SHAPES AMPHORA MAKING-TECHNIQUES DURING THE ROMAN EMPIRE

**Abstract author(s):** Coto-Sarmiento, Maria (University of Barcelona) - Carrignon, Simon (University of Tennessee; University of Cambridge)

**Abstract format:** Oral

The way people interact socially and how they transmit their knowledge from generation to generation leads to different habits and traditions. When these traditions are about pottery making techniques, these differences may have left a quantifiable trace in the remaining cultural material. However, to link the differences observed in the archaeological record with social learning strategies and how production techniques were transmitted is extremely difficult. In archaeology, this has been studied in handmade production but barely analysed in large-scale production implying long-distance social interaction during an extended period of time.

This work aims to analyse the modes of transmission of technical skills between amphora workshops during the Roman Empire in Baetica province (currently Andalusia) from 1st to 3rd century AD.

To achieve this goal we 1) compute the covariance matrix between morphometric measurements and use it as a way to represent different pottery-making techniques, 2) define different scenarios in an Agent-based model to represent hypotheses about how techniques were shared between potters, 3) quantifying how likely each scenario is to reproduce the correlation between morpho-metric similarity of the pottery and the distance between the workshops observed empirically.

Our analysis highlights that the spatial position of the workshops needs to constraint the social interaction between potters, but not too strictly as the close morphometries found even in relatively distant workshops quickly disappear when geography strongly constrains social interactions.

Finally, we believe this provides a versatile framework to explore the transmission processes related to large-scale production in archaeology.

AN AGENT-BASED MODEL TO IMPROVE ARCHAEOLOGICAL SOCIAL NETWORK RECONSTRUCTIONS

**Abstract author(s):** Gravel-Miguel, Claudine - Bischoff, Robert (Arizona State University) - Padilla, Cecilia (University of Zurich)

**Abstract format:** Oral

Agent-based models are powerful tools to reconstruct past dynamic human behavior from the static archaeological record available to us. Here, we use an agent-based simulation to test and improve on the methods used by researchers to reconstruct prehistoric social networks from artifact stylistic similarities and to shed light on how properties of such social networks contribute to the overall diversity of cultural traits observed in archaeological assemblages. Given that cultural transmission and evolution are affected by multiple interacting phenomena, our model allows us to simultaneously explore how different sets of factors - behavioral and environmental - affect how social networks are reflected in the material record. It also creates a simulated archaeological record that we use to test formal methods to reconstruct social networks and improve them. Whilst the archaeological record offers a unique glimpse on cultural changes happening over long temporal scales, our model will help improve our methods of reconstructing networks to better relate patterns observed in the archaeological record to past social processes.

WIDENING HORIZONS: SHARING PERSPECTIVES ON PROFESSIONAL PRACTICE IN EUROPE

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Robinson Wild, Esther (Chartered Institute for Archaeologists; University of York) - Schauer, Michaela (Chartered Institute for Archaeologists) - Hessing, Wilfried (Vestigia Archeologie & Cultuurhistorie)

**Format:** Discussion session

When we look around the world, we see professional practice frameworks for many disciplines built of an ethical code and supporting standards for person, process, and product. For archaeology, the frameworks have evolved on a national basis, and while the ethical principles are largely shared between countries, the more detailed standards and guidance for practice reflect their local origins.

This session, led by the Chartered Institute of Archaeologists (CIfA), builds on the 2020 Networking session organised jointly with the EAA Community for Professional Associations in Archaeology. Starting with a tour d'horizon of established professional frameworks, of which CIfA's is the best known but not the only option within which to practise in Europe, we will ask contributors:

- How much common ground do we have?
- How far do shared values extend and where do national requirements begin?
- Could collaboration on complementary approaches produce even better archaeology-related outcomes for European society?
- Is it easier to carry on working within our respective national frameworks? Is it right to do so?

And specifically

- Collaboratively, could we/should we share and adapt the CIfA framework and make it work for Europe?

We are seeking contributions that explore the panorama of professional ethics and standards, are willing to speculate on what is beyond the current view, and share what more can be done to communicate, learn from and collaborate on a European scale.

ABSTRACTS:

WHAT AN INTERNATIONAL PROFESSIONAL ASSOCIATION CAN DO FOR GERMANY - AND WHAT IT CAN'T

**Abstract author(s):** Schauer, Michaela (CIfA Deutschland/LMU München)

**Abstract format:** Oral

CIfA Deutschland was founded as as branch of CIfA in 2017 on request of German archaeologists. This step was bases on a firm belief that the same shared values, the same ethical rules, should apply everywhere - no matter where you are from, what your back-ground is, where you are working, with which method, material etc. We can all agree, that we need a set of rules - and CIfA's code of conduct and it's regulations are setting a baseline. While CIfA Deutschland evolves, we learn more and more that there are parts of ethics - or in general parts of our shared values - that are more culturally embedded (or biased) then we thought. We learn that dif-ferent legal und cultural systems demand communication and - even more stunningly - the approach for example to ethical dilemmas are different in different cultures. This also means that an international organisations needs to communicate, needs to include 'the specialists' (Germans, Australians etc.) and needs to trust them on establishing a professional association (and the thereby shared values) in their 'natural habitat'. And that's scary as their approaches might be different to those an organisation is used to until that point....

THE ARCHAEOLOGY DOESNT STOP AT THE BORDER, NEITHER SHOULD THE STANDARDS

**Abstract author(s):** Kyle, James (Institute of Archaeologists of Ireland)

**Abstract format:** Oral

The Institute of Archaeologists of Ireland is the representative body for professional archaeologists working on the island of Ireland and thus we find ourselves operating in dual jurisdictions with differing professional frameworks but with a shared archaeology. The aim of this paper will be to examine areas of commonality on the island, to look at the current drive towards the development of new professional standards on both sides of the border and to detail the ongoing efforts of the Institute regarding the collaborative production of standards for the whole island. The paper will also address what, if anything has changed in the last 20 years, what needs to change and where potential collaborations might occur. An examination of the ways in which we can improve and the ethics of our own archaeological model will be made to see where complementary approaches could be developed and learnings might be achieved which benefit the profession as well as the archaeology.

SUPPORTING PROFESSIONAL PRACTICE WITH GLOBAL QUALITY STANDARDS AND REGIONAL GUIDANCE

**Abstract author(s):** Geary, Kate (Chartered Institute for Archaeologists)

**Abstract format:** Oral

As well as setting and monitoring compliance with an ethical code, CIfA sets Standards covering a wide range of professional prac-tice and issues guidance to its members on how the Standards may be met. CIfA Standards and guidance define good practice, expanding and explaining general definitions in the Code of conduct and are formulated in consultation with the sector. They are used by archaeologists commissioning or designing archaeological work to define measurable quality standards. Compliance with the Standards is a professional obligation for CIfA members and for its Registered Organisations.

Despite a growing (and increasingly structured) non-UK membership, the roots of these Standards are still firmly embedded in UK professional practice, and this presents us with a challenge. Even within the UK, archaeological policy and practice across England, Scotland, Wales and Northern Ireland is diverging resulting in a need to ensure the Standards are supported by guidance that is applicable to practitioners operating under different national policy frameworks. For our members across Europe (and the rest of the world), that need is even greater. So how do we go about setting Standards that are internationally applicable but supported by national/regionally specific guidance? CIfA has recently started a comprehensive review and redesign of its suite of Standards and guidance with this question at the heart of the project. This paper will present the work that CIfA has undertaken to date ensure its professional framework of Standards and guidance is applicable to members beyond the UK. A case study is included that highlights the approach taken to mapping the CIfA Standards and guidance against archaeological practice in Northern Ireland. This example highlights a potential pathway for the addition of guidance to the framework from other countries ensuring it is applicable at both an international and country specific level.

HOW SAFE ARE ARCHAEOLOGICAL ENVIRONMENTS? ARGUING FOR A COMMON EUROPEAN FRAMEWORK FOR PREVENTING AND COMBATING HARASSMENT, ASSAULT, BULLYING AND INTIMIDATION

**Abstract author(s):** Coltofean-Arizancu, Laura - Gaydarska, Bisserka - Plutniak, Sébastien (Archaeology and Gender in Europe - AGE - Community of the EAA) - Mary, Laura (Paye ta Truelle Project; Archaeology and Gender in Europe - AGE - Community of the EAA) - Hlad, Marta (Archaeology and Gender in Europe - AGE - Community of the EAA) - Algrain, Isabelle (Paye ta Truelle Project; Archaeology and Gender in Europe - AGE - Community of the EAA) - Vandeveldel, Ségolène (Paye ta Truelle Project) - Pasquini, Béline (Paye ta Truelle Project) - Janežič, Polona - Wouters, Barbora (Archaeology and Gender in Europe - AGE - Community of the EAA)

**Abstract format:** Oral

This paper argues the importance of introducing measures to prevent and combat various forms of harassment, assault, bullying and intimidation in the codes of conduct and ethics of different settings where archaeology is being practiced, from fieldwork, universities and research institutes to museums, companies and organizations. It does so by discussing the preliminary results of two online surveys that have been carried out to determine the degree to which these offensive behaviours occur in European archaeology. The first was a pilot survey conducted in 2020 in four Central-East and South-East European countries (Bulgaria, Hungary, Romania and Serbia). The second survey, carried out one year later, is the result of the collaboration between the board and several members of the Archaeology and Gender in Europe (AGE) Community of the European Association of Archaeologists, and members of the Paye ta Truelle project. The aim of their joint effort was to extend and adapt the previous survey to a Europe-wide scope in order to map the occurrence of these types of misconduct on a broader scale. Both surveys assessed whether professionals and students in archaeology (regardless of gender) in Europe 1/ are aware of the existence of harassment, assault, intimidation and bullying in their work, research and study environments; 2/ have been the subjects of such acts and, if yes, 3/ in which ways these affected them on a personal and professional level, 4/ whether they reported them and 5/ if any measures were taken as a result. In addition, this contribution proposes the creation of a common European framework of recommendations which could contribute to making archaeology a safer and more empowering study, research, and work environment.

Elisavet Stamataki and Amanda Sengeløv (Archaeology and Gender in Europe EAA Community) are also authors of this paper and members of the research team.

UNIVERSAL DESIGN OR HOW TO GUARANTEE ACCESS TO ALL ON ARCHAEOLOGICAL SITES AND PARKS

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Dunning, Cynthia (ArchaeoConcept) - Larsson, Birgitta (Stiftelsen Kulturmiljövård) - Kienzle, Peter (LVR-Archäologischer Park Xanten/LVR-RömerMuseum)

**Format:** Regular session

Archaeological sites and parks open to the public should be accessible to all. This may seem to be a common-place statement. Yet many archaeological sites, through various difficulties of accessibility, are excluding to people with different disabilities, physical or cognitive.

Therefore, the initiators of this session would like to start a discussion to address the following points, emphasizing that clever solutions are necessary for a few, good for many and a bonus for all:

- What has been done up to now on archaeological sites and parks in different European countries to accommodate and allow access to persons with different disabilities?
- Who are the partners which can put into place initiatives for a general accessibility and how do they work together? And on which scale (national – regional – local)?
- How do we develop understanding of the perceptions and needs of people with a disability who would like to visit archaeological sites open to the public?
- Have any guidelines been put into place for the implementation of measures on site? And how have these been used by site managers?
- How can these measures and guidelines be integrated in national and international (EU, UNESCO) standards?

The session will be divided into two blocks. The first part will consider theoretical and socio-political questions regarding implementation, while the second will showcase examples of good practice.

ABSTRACTS:

1

INTRODUCTION TO THE SESSION: UNIVERSAL DESIGN OR HOW TO GUARANTEE ACCESS TO ALL ON ARCHAEOLOGICAL SITES AND PARKS

**Abstract author(s):** Dunning, Cynthia (ArchaeoConcept) - Larsson, Birgitta (Stiftelsen Kulturmiljövård) - Kienzle, Peter (LVR-Archäologischer Park Xanten/LVR-RömerMuseum)

**Abstract format:** Oral

When considering the accessibility of archaeological sites for people with disabilities, the site manager is often overwhelmed and in need of advice.

Since the UN Convention on the Rights of Persons with disabilities entered into force in 2008, persons with disabilities are entitled to full access on an equal basis with others to every public archaeological site. And the UN Global Goals for sustainable development, which mean to make the world better by 2030, include a number of targets considering inclusion, reducing discrimination, and providing access to inclusive public spaces; all elements affected by this issue.

Our session addresses the challenges of how to prepare archaeological sites for universal accessibility, considering physical, mental, intellectual, or sensory impairments. The contradiction between conservation strategies and building requirements for access of persons with disabilities is one aspect; others include access to sites in natural environments, which are often difficult to reach in general. Another question is the need of access for all on archaeological sites, knowing that many are problematic for total inclusive measures.

Our topic is also about communication to all visitors, to fully include those who have special requirements.

If major archaeological sites, mostly managed by official instances, develop inclusive presentation, this is certainly not the case for smaller sites, operated by volunteer-based associations.

One element does stand out though: the need of participation of associations and groups of people with disabilities throughout the development and implementation of accessibility and communication measures on the sites. Only in this way can the manager find clever solutions that may be necessary for few, good for many and finally a bonus for all.

2

IMPROVED ACCESS? PRESENTATION AND ACCESSIBILITY IN THE LVR-ARCHAEOLOGICAL PARK XANTEN

**Abstract author(s):** Quick, Stephan (LVR-Archäologischer Park Xanten/LVR-RömerMuseum)

**Abstract format:** Oral

The LVR-Archaeological Park Xanten/LVR-RömerMuseum (LVR-APX) protects the archaeological remains of the ancient Roman city Colonia Ulpia Traiana. While excavations take place throughout the year, research and education go hand in hand. It is a particular ambition for the Museum Educational Service, to convey the work of the archaeologists and Roman daily life at the time of the city's heyday in the middle of the 2nd century AD to a wide audience. To ensure participation of visitors of all target groups, accessibility and inclusion play a key role in the conception of exhibitions, events and educational programs. The aim of presenting and communicating archaeological findings and physical reconstructions to all is a particular challenge, especially in an open-air museum. In this regard, close cooperation with persons affected has proven to be particularly valuable to make educational concepts succeed in practice. Guided tours in sign language, the use of braille or special orientation aids try to make the visit to the LVR-Archaeological Park as comfortable and barrier-free as possible for people with visual, hearing or mobility impairments. As there are many and often varying needs, day-to-day business in museum education nevertheless shows that usually it is only possible to reach a specific group of visitors with impairments with matching educational offers. The presentation provides an overview of our approaches to improve accessibility in the LVR-Archaeological Park Xanten and puts them up for discussion.

3

PHYSICAL ACCESSIBILITY OF ANCIENT BUILDINGS - THE CASE OF THE AMPHITHEATER IN PULA

**Abstract author(s):** Gobic-Bravar, Đeni - Komšo, Darko (Archaeological Museum of Istria)

**Abstract format:** Oral

Ancient buildings and archaeological sites are often hardly accessible even to people with moving difficulties like elder people or parents with small children. Even more they can be inaccessible to wheelchair users. The existing standards and regulations that cover the problem of architectural accessibility can often not be applied to ancient or historical structures. The duality of making a structure accessible and at the same time keep it's historical values as well as limit the modern interventions is a hard task.

The first step is to understand in which ways a structure is not accessible and communicate with people with disabilities to understand their needs. Once the task is well understood communication between the conservator, archaeologist, architect and final user must be constant and open to adjustments.

For the case of the ancient amphitheater in the city of Pula, Croatia some steps towards a better accessibility have been taken. The structure has few areas to visit, the underground exhibition area, the ground floor and the upper floor with corridors and seats for the visitors. The areas are separated with steep ramps of stairs in no way concordant to the accessibility rules. The ground area is accessible, through adequate information, from a side entrance that is open on request. The underground exhibition has been made

4

accessible by realizing a “wheelchair ramp” that leads to a side entrance avoiding the use of internal stairs. Also the path that leads to the exhibition has been realized in the form of a ramp in order to be accessible.

With this paper we want to show what are the possible and what are the impossible interventions on an ancient structure. How much communication and adaptability are important to achieve some results. Finally what are the tasks that lay ahead of us.

**NORMALITY IS A CONSTRUCT: A CLAIM FOR DIVERSITY FROM THE PERSPECTIVE OF ARCHAEOLOGICAL SITES AND PARKS**

**Abstract author(s):** Meier, Jessica (Römerstadt Augusta Raurica)

**Abstract format:** Oral

The Roman site of Augusta Raurica has been a label partner of ‘Kultur Inklusiv’, a competence center for inclusive culture in Switzerland, since 2018. In accordance with the charter of ‘Kultur Inklusiv’ and the label specifications, Augusta Raurica endeavors to make its archaeological site, exhibitions and educational services accessible to people with all forms of disabilities.

Among other measures, we carried out a site inspection with experts from ‘Sensability’ in preparation of a site plan for wheelchair users. Peep boxes with adjustable height were designed to be accessible to children and wheelchair users. A tactile model of the amphitheater was installed on site in cooperation with ‘tactile studio’ (DE/FR/CA). It includes drawings in raised lines and texts in braille for people with visual impairments. A second model is in the works. A guide in simple language for our Roman house is available free of charge. Our homepage and advertisements contain important accessibility information for people with disabilities. Currently we are working on videos in sign language and on improved signage for our outdoor sites and monuments.

Our Museum Strategy acknowledges the UNESCO Agenda 2030 for Sustainable Development. We perceive inclusive culture as a fundamental right for all people. When planning and realising new projects, we implement the ‘five fields of action’ from ‘Kultur Inklusiv’ and the label’s charter as far as possible. While recognising human diversity, it is not possible to make all information equally accessible to all people. Augusta Raurica is working on finding a good mix of services to ensure individual opportunities for education and development for all our visitors.

**WELCOME TO THE ROMAN FRONTIER! MAKING THE LOWER GERMAN LIMES AN ATTRACTIVE AND ACCESSIBLE UNESCO WORLD HERITAGE**

**Abstract author(s):** Hazenberg, Tom (Roman archaeology; Archaeology and society - UNESCO-goals; Tourism; Archaeological Heritage Management) - Willems, Annemarie (Tourism; World Heritage) - Welling, Menno (Museology) - Dries, Monique (World Heritage) - Simjouw, Marco (Governmental Heritage management)

**Abstract format:** Oral

A group of different stakeholders is developing a holistic plan for an attractive presentation of the western Dutch segment of the Frontier of the Roman Empire. The group of site managers is diverse and consists of museums, private companies, volunteer groups and enthusiastic individuals.

Examples of projects presented in this paper are (a) NIGRVM PVLLVM (multiple disabled), (b) Park Matilo (resident of diverse background) and (c) National Roman Maritime Museum (elderly and visually and hearing impaired). The development of these Limes Presentation Units will show the ambition to let Roman archaeology contribute to the well being of people living along the Roman Frontier.

The focus on accessibility and inclusion is still young. By combining some local initiatives some cooperative partners try to join efforts and exchange experiences knowing that this ambition of inclusion fits in the future UNESCO World Heritage status of the Limes. The regional government encourages this development and emphasises the importance of co-operation in an open and bottom-up approach including an inclusive use of the Limes heritage. Inclusivity is not only focussed on physical accessibility and polyphonic presentations, but also on broad community ownership.

The presentation ‘Welcome to the Frontier!’ will show how multiple disabled get involved in limes tourism (NIGRVM PVLLVM), how two adjacent neighbourhoods will manage their own world heritage (Park Matilo), how elderly restore Roman ships and how the new museum will be an example for universal design accessible for the visual and hearing impaired.

The cooperation between these projects means a start of the ambition for inclusivity and will function as a pilot project for the Management Plan that will govern the Lower German Limes as an World Heritage for everyone.

6

**GUIDELINES FOR THE IMPLEMENTATIONS FOR INCLUSIVE PROJECTS IN CULTURAL PLACES**

**Abstract author(s):** Dall’Agnolo, Daniel (Laténium)

**Abstract format:** Oral

The necessity to create or facilitate access to archaeological sites for people with disabilities is no longer disputed. With the signing of the Convention on the Rights of Persons with Disabilities (2006), inclusion has been anchored in law in most countries. In the meantime, inclusion projects are not only supported ideally, but also financially. Once the financial means are secured, the question of how to implement inclusive projects arises. Which forms of organization are suitable, what should be taken into account so that communication with the different partner - but within the institution and the group - is successful, which procedures and tools are useful, which formats have a chance of success?

7

The Laténium, parc et musée d’archéologie in Neuchâtel (CH) has been successfully implementing inclusive projects since 2016. We are now able to summarize the experience and present a first guide for the implementation of inclusive projects.

Certainly, each project is embedded in a specific political and cultural environment and has its own characteristics. This means that guidelines will always be provisional and must be constantly adapted to new situations.

There are characteristics that are common to most projects and it is worthwhile write them down and made available to interested persons. In this way, some pitfalls and detours can be avoided.

The approach presented here was developed from the perspective of mediation, in close cooperation with people with disabilities.

**NEANDERTHAL: TACTILE INFRASTRUCTURE FOR THE BLIND & VISUALLY IMPAIRED**

**Abstract author(s):** Riethus, Anna (Stiftung Neanderthal Museum)

**Abstract format:** Oral

Since 2018, Neanderthal Museum has set itself the challenge to provide fully self-determined access to its permanent exhibition for blind and visually impaired guests. Whilst also developing an inclusive mobile game, the foundation for reaching this goal is a new infrastructure in the permanent exhibition of the museum.

Offering visitors a new set of permanently installed tactile exhibits, the new infrastructure finally allows the museum’s guests to access information about Neanderthals and Archaeology by touch. The exhibits include a wide range of different material in order to give a versatile tactile experience; f.e. a 3D-printed copy of the worldfamous neanderthal skeleton, replicas of flint and bone tools or comparative casts. All exhibits are complemented by Braille labels and additional tactile lettering. A floor guidance system and tactile plans help visitors with visual disabilities through crowded areas in the exhibition.

Besides presenting the design concept for the new inclusive infrastructure, this talk addresses the importance of inviting advisors with disabilities to the table, as well as the difficulties of creating tactile content on archaeology.

8

**THE USE OF INDICATORS FOR THE ASSESSMENT OF ACCESSIBILITY TO ARCHAEOLOGICAL SITES**

**Abstract author(s):** Salvà, Miquel Àngel (Universitat de les Illes Balears)

**Abstract format:** Oral

Access to archaeological sites should be a central concern for heritage managers. Constant efforts are being put into developing new interpretive displays, yet there are wide segments of the public which are still excluded from the enjoyment of archaeological heritage. Existing barriers, be they physical or cognitive, impede people with different disabilities from fully experiencing the visit to many monuments and sites. The aim of this contribution is to introduce indicators as a useful tool for the assessment of the degree of accessibility to archaeological sites open to the public. If correctly selected, indicators provide concise and relevant information regarding the strengths and weaknesses of access to a given site, allowing for comparison with other sites. This methodology enables us to a quick decision-making process, focusing on the areas which present more obstacles related to accessibility and inclusion. However, caution is due regarding the limited possibilities of the indicators’ analytical value.

**UNTANGLING LIFE CYCLES IN MULTI-FUNCTIONAL DOMESTIC AREAS: INTERDISCIPLINARY APPROACHES TO ANALYSE SPACE USE AND TRANSFORMATION IN THE MEDITERRANEAN**

**Theme:** 6. Material culture studies and societies

**Organisers:** Valente, Rossana (British School at Athens) - Magno, Laura (UCLouvain) - Ragkou, Katerina (Philipps-Universität Marburg) - Harrington, Katherine (Florida State University)

**Format:** Regular session

The identification and the distribution of a range of human activities performed in domestic areas and their immediate surroundings rely on a variety of archaeological datasets and methodological approaches. From the analyses of architectural form and layout to the distribution of artefacts in that space, archaeological research investigates peoples’ activities within inhabited spaces, as well as the social and cultural divisions visible within these spaces. Nevertheless, assessing the functional characterization of space in dwellings and workshops may not be straightforward. An implicit distinction between working and living spaces might not have occurred and living spaces could have been used for a variety of functions. Moreover, valuable invisible evidence in the archaeological record requires interdisciplinary scientific approaches to properly investigate it. Limitations to our knowledge of the different activities performed in domestic spaces can be due to the perishable nature of some artefacts and architectural features, to the intentional maintenance and modification of spaces, to the nature of abandonment and to the destruction or post-depositional events. All these factors may heavily affect the archaeological record of various activities performed in inhabited spaces. This session invites papers investigating and discussing the use of multi-functional domestic contexts in the Mediterranean from the Neolithic to the Late Medieval periods, with the aim of debating on complementary methods of research to tackle the comprehension of space use. Interdisciplinary papers can approach the topic through distributional models of artefacts and ecofacts, micro-archaeological scientific approaches, architectural and spatial analysis, and ethnographic comparisons. The overall aim of this session is to bring together complementary and decisive datasets from interdisciplinary and cross-cultural research environments to embrace a methodological debate on the different approaches in the investigation of the various activities performed in domestic spaces.

ABSTRACTS:

1 THE SOIL HAS MEMORY - IDENTIFYING PLANT PROCESSING AREAS AND THE USE OF DOMESTIC SPACES AT NEOLITHIC ÇATALHÖYÜK

**Abstract author(s):** Santiago-Marrero, Carlos (CaSEs, Department of Humanities, Universitat Pompeu Fabra) - Lancelotti, Carla - Madella, Marco (ICREA - CaSEs, Department of Humanities, Universitat Pompeu Fabra)

**Abstract format:** Oral

Dating to the eighth-millennium cal. BC, Çatalhöyük is considered one of the earliest farming communities of Western Asia. Due to the excellent preservation of architecture and botanical remains, the site has vastly contributed to our understanding of plant management and the use of domestic areas in the past. However, most of what is known about plant processing activities and multiple uses of domestic spaces at the site relies on the contextual deposition and location of macro-botanical and related artefactual remains. But how we interpret the use of domestic spaces and plant processing areas when there are no visible artefactual nor botanical remains? And when we do find these, how can we be sure that what we see in the archaeological record is accurately displaying the real distribution of everyday activities in the past. To tackle this issue we implemented a methodological approach based on the spatial distribution of phytoliths, starch grains, and geochemical signatures. This was achieved by collecting sediment samples from the whole surface extension of two Neolithic houses and one open space. Our results not only successfully identified previously unknown plant processing areas within domestic spaces but also revealed the presence and processing of wild plants that had not been previously identified in the archaeobotanical record. This in turn demonstrates the potential of this integrated methodology for identifying plant processing areas and the distribution of everyday activities even in areas where there is no visible remain for such tasks.

2 CRAFTWORK AND DAILY ACTIVITIES IN MINOAN DOMESTIC AREAS

**Abstract author(s):** Alberti, Maria Emanuela (Università degli Studi di Firenze, Dipartimento SAGAS)

**Abstract format:** Oral

Minoan domestic areas have recently received general attention as a mean to reconstruct the social structure of a society that largely escapes our understanding (Glowacki and Vogeikoff-Brogan 2011; Relaki and Driessen 2020). Some studies focus on the archaeological indicators of activities, especially at single structure or at site level. Actually, most of these buildings seem to have been multi-functional and the specific destination of single rooms is notoriously difficult to detect. Especially intriguing is the clear presence of indicators of specialised production (e.g. seal engraving, stone vases working, metallurgy, pottery production, purple extraction, oil and wine processing) within ‘normal’ houses, overlapping with cooking, storing, spinning and weaving evidence - a pattern that keep unchanged from the Protopalatial to the Mycenaean times (1900 – 1200 BC ca). The paper illustrates some of the most important cases from Malia, Mochlos, Gournia, Kommos, Papadiokampos, Haghia Triada and Phaistos, with a focus on spatial analysis, cross-craft, scale of activities, and discussing the possibility of ‘mobile workshops’ as known from ethnographic parallels

3 UNDERSTANDING ACTIVITIES AND THE USE OF THE SPACE OF A BRONZE AGE COMMUNITY THROUGH AN INTEGRATED INTRASITE SPATIAL ANALYSIS

**Abstract author(s):** Lucci, Enrico (Department of Antiquities, Sapienza - University of Rome) - Minniti, Claudia (Department of Cultural Heritage, University of Salento) - Recchia, Giulia (Department of Antiquities, Sapienza - University of Rome)

**Abstract format:** Oral

The use of spatial analyses to recognise and study activity areas in settlements, economic organisation and social patterns of behaviours has recently increased in Mediterranean Prehistory. These kinds of analyses allow us to consider various types of finds and their interplay in productive and symbolic activities. The study of organic materials plays an important role for the understanding of ancient economic and social practices and advanced analytical methods provide us with increasing available data. Besides these, the in-depth study of animal and plant still remains a pivotal source of knowledge, especially when data is considered in functional perspective as a part of an integrated system of analysis. Animal bones, for instance, are proxies for a wide range of human activities, from economic strategies and diet, to the productions of objects, tools, carpentry implements and processed animal skins.

In this presentation we will propose a case study from the Bronze Age sites of Coppa Nevigata (Southern Italy) focusing on an integrated spatial analysis of artefacts and ecofacts, specifically faunal remains. Beyond a species characterisation, faunal remains have been classified in categories that are specifically designed to cover and interpret all their potential range of usage in the specific context. The spatial distribution analysis has been processed using diverse geostatistical analyses on Qgis and R, among which Kernel Density Estimation and Ripley’s L-Function represent the most significant. The discussion will focus on the adopted methodology and the results obtained, particularly as regards the possibility to figure out social patterns of behaviours at the site, exploring the interplay between the use of structures, animals (and animal-derived products) and the various classes of artefacts.

4 INDOOR-OUTDOOR LIVING: EXPLORING THE RELATIONSHIP BETWEEN EXTERIOR DOMESTIC ACTIVITY AREAS AND THE STRUCTURING AND USE OF INTERIOR SPACES IN GREECE

**Abstract author(s):** Jazwa, Kyle (Maastricht University)

**Abstract format:** Oral

Outdoor areas were fundamental components of Mediterranean domestic spaces. Whether built courtyards or unstructured spaces surrounding a building, they helped extend the household activity area during the many months of favorable weather. They also offered more opportunities for interaction with other households than interior spaces, while increasing the number of potential activities undertaken (e.g., pottery firing, metallurgy).

This paper examines how the use, form, and quantity of attached exterior domestic spaces changed over time. It also considers the influence of interior architectural arrangements, subsistence patterns, and broader settlement organization on the structuring of these areas. Focus will be on the Aegean in its pre- and proto-historic (Neolithic-Late Geometric) periods; this provides a robust dataset of well-excavated households and settlements for a productive diachronic analysis. Comparisons with sedentary populations in other Mediterranean regions, such as the Chumash (southern California) and Aconcagua culture (central Chile), will complement the discussion by underscoring, for instance, the integral relationship between the functionality of the spaces and the shared environmental system.

Several relevant observations and directions for future exploration are offered. I show, for instance, that outdoor domestic areas increased in size in the Middle Helladic and Protogeometric periods alongside changes in the periods’ typical interior architecture, i.e., greater multi-functionality of rooms, less segmentation, and a reduction in the visual distinction between the interior and exterior. Such changes matched shifts towards lower levels of social complexity and more informal interaction within the settlements. Although the physical structuring of these periods’ exterior spaces best resembles that of the pre-contact Chumash, the functionality of the Chumash households’ outdoor areas was more limited and better reflective of periods like Early Helladic II period when less exterior space was devoted to each household and there were more opportunities for community-integrating activities organized outside the domestic realm, like monumental building projects.

5 SMALL FINDS IN ANCIENT EGYPTIAN HOUSEHOLD. MULTIFUNCTIONALITY AND ACTIVITIES IN BUILDING B AT TELL EL-GHABA (NORTH SINAI)

**Abstract author(s):** Calomino, Eva (Instituto Multidisciplinario de Historia y Ciencias Humanas (IMHICIHU) - Consejo Nacional de Investigaciones Científicas y Técnicas (CONICET); Buenos Aires University)

**Abstract format:** Oral

Tell el-Ghaba was an Egyptian frontier post, occupied during the 10th and 7th centuries BC, located on the eastern border of the Nile Delta. The site was connected to Egypt through the Pelusiac branch of the Nile and to southern Palestine through the coastal plain that stretches between the Suez Canal and the Gaza strip. The evidence suggests that, at least by the beginning of the 9th Century BC the site had already some degree of interaction with the trade network of the Eastern Mediterranean. In this frontier context both people and goods were in movement and interaction, therefore the predominance of small finds of local origin is striking, including wdjat, figurines, amulets, scarabs, earrings, rings, beads, platelets, seals and game pieces. The pottery contexts and other finds recovered in Building B (Area I, Level IV) allow us to infer the relationship established between their residents and the domestic artifacts they handled on a daily basis. The idea of ‘multifunctionality’ has been applied to the use of residential spaces, based on the presence of domestic contexts that point to the performance of a variety of activities- such as storage activities, consumption, etc. Specifically, we have proposed Building B at Tell el-Ghaba as a case study of an ancient egyptian household. This work seeks to describe, complement and create ways of interpreting the activities from the study of small finds in this domestic space. This mobilier assemblage is being studied from a novel theoretical-methodological perspective, being classified into categories without referring to the functional question as the primary level of object classification. From these activities and the relationship of Building B’s inhabitants with the materiality with which they interacted on a daily basis, the social and economic dynamics and the beliefs that would have been established in this space is analysed.

6 RE-EVALUATING THE “RECEPTION ROOM”: PATTERNS OF MOVEMENT AND USE IN PUNIC DOMESTIC SPACE

**Abstract author(s):** Huemer, Max (SUNY University at Buffalo)

**Abstract format:** Oral

While “reception rooms” have been identified in Punic domestic architecture by several different scholars (e.g. Fantar 1985, Mezzolani 2000, and Helas 2011), this concept has not been properly defined or interrogated. Such rooms are commonly identified only by their size or decoration, and definitions vary. Reception rooms have been identified at several sites in the central Mediterranean, dating from the fourth to second centuries BCE, including Kerkouane and Carthage in North Africa and Selinus and Motya in Sicily. Some scholars seem to suggest that these spaces were exclusively used to receive guests, and those that suggest other uses fail to point to specific practices. The result is a working assumption of such a space in Punic houses without any real evidence to either support its identification or define its use.

7 This paper seeks to interrogate both the term “reception room” and the spaces themselves. First, by exploring the origins of the term in scholarly literature, along with related terms such as oecus and main room. Second, by identifying specific practices in these spaces outside their use for the entertaining of guests. There are several difficulties in identifying the usage patterns of these spaces, primarily due to the lack of scientific excavations of such spaces. Third, by placing the reception room in the context of the whole house, its potential use as a space for receiving guests can be better understood. Following the theoretical framework of scholars like Amos Rapoport and Penelope Allison, several fixed features can be identified, which were used to control movement and influence behaviors throughout the house, and especially in relation to the reception room. This paper seeks to challenge the current understanding of reception rooms and clarify their usage in Punic domestic architecture.

7 DOMESTIC USE OF SPACE IN THE CLASSICAL CITY OF OLYNTHOS – WHAT CAN GEOARCHAEOLOGY CONTRIBUTE?

**Abstract author(s):** Schumacher, Mara (Newcastle University)

**Abstract format:** Oral

As one of the best-known examples for classical Greek cities, Olynthos with its numerous residential buildings is an important site for the study of domestic space in Greek antiquity.

In domestic houses at Olynthos, most rooms are interpreted as multi-functional. That often leaves complex archaeological records that are shaped by a wide range of processes including not only human activities but also post-depositional processes that can be challenging to interpret. Understanding the impact of natural versus anthropogenic processes is therefore essential to infer human activity and use of space.

The investigation of domestic space in classical Greece is largely based on the study of architecture and spatial distribution patterns of artefacts. Although this approach provides a comprehensive picture of domestic life, it is incomplete as invisible traces of past human activity and formation processes are often not fully considered. A particular problem is that artefacts are rarely located in their systemic context.

Geoarchaeology has the potential to overcome these limitations, as it offers a range of micro-archaeological approaches that shed light on the invisible traces of past human activity. Sediment block samples from House Bix6 at Olynthos were analysed using thin section analysis and XRF spectroscopy to identify ancient surfaces and associated occupation deposits. The results have enabled the identification of earthen floor surfaces that were not visible in the field, and also revealed geochemical differences between the archaeological deposits and the local soil. Deposits in House Bix6 are notably enriched in calcium levels which can be linked to past human activities like floor construction, burning or food preparation.

The study outlines the potential of geoarchaeological approaches for the investigation of domestic space that in combination with archaeological data allow reconstructing detailed life histories of buildings at Olynthos that can ultimately inform us about social relations in the domestic sphere.

8 WORKING ON THE HOME FRONT: HOUSEHOLD INDUSTRY AND ECONOMIC CHOICE IN TIMES OF DURESS IN ANCIENT GREECE

**Abstract author(s):** Harrington, Katherine (Florida State University)

**Abstract format:** Oral

Examples of domestic workshops, including weaving, stone-working, and agricultural processing, are known from many cities in Classical and Hellenistic Greece. These small-scale workshops, in aggregate, contributed much to the economy. While examples of household workshops have long been noted, they have often been considered permanent or long-term endeavors. Less commonly acknowledged is the dynamism of economic strategies employed by households as they responded to changing political, social, and environmental circumstances.

This paper will examine two case studies in which households intensified industry in response to threatening local events. At Olynthos, many of the houses have signs of domestic industry at a scale beyond household need. The North Hill was only settled after a group of local cities banded together in 432 BCE while rebelling against paying tribute to Athens. In the following decades, Olynthos faced numerous military conflicts, culminating in a final sack by the Macedonians in 348 BCE. The economic strategies of the households must be read in this context. I argue that many households scaled up productive activities they were already doing—such as weaving and grinding grain—to help meet their economic needs during the difficult final years of the city. This strategy made specific use of the labor of women, as weaving and grinding were tasks traditionally associated with the female members of the household. Similarly, at the Rachi Settlement at Isthmia, an unusually high percentage of households pressed olive oil in their houses, despite the bulkiness of pressing equipment. While this feature of the settlement has often been interpreted simply as a way to meet the nearby Sanctuary of Poseidon’s need for oil, I instead argue that endemic warfare in the region made relocating pressing operations to this isolated ridge settlement a more attractive option than carrying out all stages of production in the countryside.

9 THE HOUSE OF FOURNI ON DELOS: AN INTERDISCIPLINARY APPROACH ON A MULTI-FUNCTIONAL COMPLEX

**Abstract author(s):** Martz, Anne-Sophie (Independent researcher) - Pagnoux, Clémence (French School at Athens) - Wurmser, Hélène (Lyon University)

**Abstract format:** Oral

Our paper will present an interdisciplinary approach of the House of Fourni, on the Aegean island of Delos, which perfectly illustrates the implication of multifunctional spaces in Hellenistic houses. This house, located beyond the urban centre of Delos and brutally abandoned in 69 BC, represents a kind of suburban house or villa, which is rarely observed in Greece during this period. The complex, with its three entrances and its intricate communication network, reveals many multi-functional spaces: beside spaces for reception, distributed around the peristyle and characterised by the presence of mosaics, we also find spaces for storage, production and, maybe, commerce.

Within the framework of the ArchCook project / Archaeology of Cooking in Ancient Greece: spaces, objects, recipes, supported by the French School at Athens, we will pay specific attention to the question of food in the House of Fourni: where and how the food was stored, prepared and cooked. Indeed, the articulation between domestic space and production / transformation / storage space is at the core of the question of the kitchen, understood as a space, as an action of transformation of the food and as a wealth of dishes and recipes. Various evidences will be examined to reconstruct the culinary practices at several scale of analysis (pottery, archaeobotanical and archaeological, organic residue, written sources).

In this paper, we intend to bring together the results and hypotheses provided by the analysis of its architecture, its instrumentum and its archaeobotanical remains, to draw a complete image of the House of Fourni and its activities.

10 TERRACOTTA FIGURINES AND THEIR DISTRIBUTION AS INDICATORS OF DOMESTIC CULTS IN AKRAI, SE SICILY

**Abstract author(s):** Chowaniec, Roksana (University of Warsaw) - Konrad, Aleksandra (Independent scholar)

**Abstract format:** Oral

This presentation aims to provide a preliminary analysis of cult/ritual-related terracotta material from excavations in the residential area of ancient Akrai in south-eastern Sicily. Presented artifacts were obtained from domestic contexts, from a single Graeco-Roman domus and can be interpreted as indicative of domestic cults. Because the dynamics of a household are strongly attached to broad social, cultural and political contexts, elaborating on the analyzed objects through the lenses of domestic dynamics raises challenges in the interpretation and assignment of artifacts as related to cults or rituals. Through historical contextualization and iconographic methodology, it is however possible to identify cults present in particular areas of the excavated domus. This presentation also informs about distribution of particular groups of artifacts - terracotta figurines, terracotta altars (arulae), or fragments of miniature columns. Finally, a special attention will be drawn to materials indicative of domestic cults, found in spaces considered as “private” and “semi-private”, as well as a semi-public space with foundation deposits. For the purpose of determining the level of “privacy” of the space, Oscar Newman’s model of space organization will be considered as a theoretical framework.

11 WORKING FROM HOME: DOMESTIC PRODUCTION IN ROMAN COLONIES

**Abstract author(s):** Donoghue, Nora (Florida State University)

**Abstract format:** Oral

Since the earliest explorations of the Bay of Naples, Roman domestic architecture has been interpreted as a reflection of the relationship between the elite heads of households and visitors to the house. The Roman house has been defined as an important element in maintaining and displaying power in the public and political spheres, as well as an organizing force in the private sphere. Recent scholarship has attempted to broaden this approach to include households of varying status and architectural plans, however, terminology related to a Roman atrium house is frequently applied to spaces in houses preserving plans of different forms.

This paper analyzes the multifunctional spaces of the row houses constructed in the Republican and Early Empire colonies of the Italian Peninsula through the identification of activity areas with a focus on domestic production. The behaviors of the households inhabiting row houses are compared through spatial analysis and distribution of objects within architectural spaces, and the functions of the spaces are considered in separation from their previously published labels. The houses of Roman colonies in the period employ a variety of architectural plans, resulting in few discussions of Roman non-atrium living spaces that are compared between sites. Framing the discussion through the behaviors of the household facilitates comparison across differing colonial contexts and highlights the activities of the lower-class inhabitants of Roman colonies, traditionally understudied members of Roman society.

MATERIAL CULTURE IN CONTEXT: THE CHANGING LIVES OF RELIEF POTTERY IN THE LATE ANTIQUE URBAN MANSION OF SAGALASSOS

**Abstract author(s):** Uytterhoeven, Inge (Koc University - Department of Archaeology and History of Art) - Malfitana, Daniele (Consiglio Nazionale delle Ricerche; Istituto di Scienze per il Patrimonio Culturale) - Poblome, Jeroen (Leuven University - Department of Archaeology, Art History and Musicology; Sagalassos Archaeological Research Project) - Mazzaglia, Antonino (Consiglio Nazionale delle Ricerche; Istituto di Scienze per il Patrimonio Culturale)

**Abstract format:** Oral

Due to their long occupation history, the Late Antique elite houses in the cities of Asia Minor represent many different phases of construction, maintenance, repair, use and reuse. While most of these impressive residences were constructed in the 4th-5th centuries CE, they generally remained inhabited until the 7th c. CE. Moreover, since these mansions frequently integrated older structures, often reaching back to Hellenistic times, they reflect many layered levels, concerning their architectural features, ornamental programmes and material culture.

The late 4th-early 5th c. CE 'Urban Mansion' of Sagalassos (Ağlasun, Burdur – research by the Sagalassos Archaeological Research Project, KU Leuven, Belgium), which integrated several predecessor constructions, including late 2nd c. BCE walls and two Imperial Roman peristyle dwellings, remained occupied until the mid-7th c. CE. Consequently, the study of the mansion allows diachronic insights in the continuities and changes its architectural and decorative appearance, interior layout and related material culture underwent in close association with developments on the broader city level during the late Hellenistic, Roman Imperial and Late Antique periods.

By placing aspects of material culture, especially relief pottery that was retrieved from the residence, within their architectural and decorative framework, this paper intends to reconstruct the long life of objects in their varying spatial contexts throughout a period of nine centuries and this in relation to the developing political, socio-economic and cultural background of their users and the evolving living practices in Sagalassos and Asia Minor.

THE BYZANTINE HOUSE IN ASIA MINOR

**Abstract author(s):** Fildhuth, Jesko (Universität Freiburg)

**Abstract format:** Oral

The state of knowledge on the Byzantine-medieval domestic house in Asia Minor is poor, especially in comparison to houses of the ancient Greek and Roman period and most recently of late Antiquity. This is due to the fact that large-scale excavations since the late 19th century were mainly conducted in ancient cities, whereby the Byzantine layers were often removed without sufficient documentation in order to reach the supposedly more attractive ancient features. If, however, better-preserved Byzantine buildings were found, as it was the case in Pergamon, the main priority was the study of the architectural structure and the typology of houses, while the concrete use of the single rooms by the inhabitants was of minor concerns. In recent years, excavations as well as surveys have produced new archaeological data which allows a more specific approach to the material.

The paper aims to raise questions about the function(s) and use of Middle and Late Byzantine domestic houses on the basis of selected findings and in consideration of written sources. Houses of the (lower) middle class as well as of the upper class and buildings from rural as well as urban contexts will be included. In addition, especially for rural settlements, a comparison between the Byzantine and the Ottoman houses and farmsteads might also help to enhance our understanding of the use of space and the daily activities of the inhabitants.

SCIENTISTS, SUBMITTERS AND SCROUNGERS: ALTERNATIVE VIEWS ON RADIOCARBON DATING IN ARCHAEOLOGY

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Meadows, John (Leibniz-Laboratory for Radiometric Dating and Stable Isotope Research, Kiel University; Centre for Baltic and Scandinavian Archaeology - ZBSA, Schloss Gottorf) - Rose, Helene (Centre for Baltic and Scandinavian Archaeology - ZBSA, Schloss Gottorf) - McLaughlin, Rowan (The British Museum, London)

**Format:** Regular session

Radiocarbon (14C) dating has become an essential tool in archaeology, but how do we handle results that do not match expectations? This session will focus on 14C 'noise' in the form of outliers, offsets and misfits, and how such noise is interpreted within the broader 'radiocarbon community'. The radiocarbon community traditionally consisted of scientists whose research focussed on accurate measurement of 14C levels in different materials, including known-age samples used for 14C calibration. Archaeologists occasionally provided suitable reference materials, but generally acted as submitters of 'unknowns', whose calibrated 14C ages should constrain the chronologies of archaeological phenomena. Some submitters have developed close working relationships with laboratory scientists, and have taken an active interest in 14C basic research, while others have remained closely integrated in traditional archaeological research. In recent years, as the volume of published archaeological 14C data has grown, a third 14C 'tribe' has emerged: 'scroungers', whose research emphasises aggregating and re-interpreting existing 14C results, often looking for (spatial-)temporal patterns in archaeological phenomena. The proliferation of laboratory techniques and methods of statistical

analysis, with attendant growth in our expectations of what radiocarbon dating can do for archaeology, mean that misunderstandings will inevitably arise. This session challenges participants to consider what each tribe in the wider 14C community can offer to and learn from the others. We invite papers on methodological approaches to identifying and handling 14C 'noise', and on its impact on archaeological chronologies.

ABSTRACTS:

HOW LONG DOES THE MEMORY LAST? BAYESIAN MODELING OF RADIOCARBON DATES AND ISSUES OF MEMORY AT AENEOLITHIC MONJUKLI DEPE (TURKMENISTAN)

**Abstract author(s):** Heit, Ilia (Institute for Ancient Near Eastern Archaeology, FU Berlin)

**Abstract format:** Oral

In recent decades, memory practices have become a focus of attention for archaeological research. However, studies that trace singular acts of remembrance and especially their temporal scope are rare. This paper takes a closer look at one such case at the site of Monjukli Depe. There, a burial of a more than 50 year-old man was found in an open area within the settlement. At this place there had been a house in an earlier settlement phase, which was destroyed by fire and subsequently completely covered by occupational deposits. The location of the burial suggests, however, that the position and interior arrangement of the past house was known quite precisely by those performing the burial. The timing of the interment raises questions: Could the old man and the people who buried him have experienced the house and remembered its furnishings? Or did the burial take place after all the contemporary witnesses of the house had passed away and the memories of it were transmitted to the next generation? In this regard it is important to know the duration of the processes in question. Did they encompass one or more generations of inhabitants?

This question can be approached by Bayesian modeling of radiocarbon dates. This method, which incorporates archaeological information into the statistical analysis of 14C measurements, has been used to more precisely estimate dates of individual events and the duration of specific processes. However, there are several possibilities of interpreting the history of events as they are captured in the stratigraphic sequence. I will examine different scenarios for the settlement history and show how they influence the estimation of the time span between the house destruction and the later human burial. I will use this to reconsider the place of memory and experience in contributing to the burial in question.

LOST IN SPACE - FOUND IN TIME. THE SYNCHRONIZATION OF AMS 14C-DATED CEMETERIES IN THE BALTIC REGION AND UKRAINE

**Abstract author(s):** Shiroukhov, Roman (Centre for Baltic and Scandinavian Archaeology - ZBSA)

**Abstract format:** Oral

During 2017-2020, the author collected 322 samples from 17 10-13th century AD cemeteries in the East-Baltic region and Ukraine. So far, 86 of 101 selected samples have been successfully dated at the Leibniz laboratory, Christian-Albrechts University Kiel. These samples provide dates for 73 graves: 47 cremations and 26 inhumations. Most of dated graves pertain to the East Baltic sites, and 9 to the Ostriv cemetery in Ukraine, attributed to immigrants from the East Baltic region. 8 different materials have been dated: cremated/unburned human bone, horse bones/teeth, charcoal, textile, drinking horn, leather and wood, including samples of different chemical origin from the same grave (e.g. a cremated bone and a charcoal). As a result, 2 different samples from 11 graves of 6 cemeteries have been dated. In 9 cases, the dates of these two samples are compatible. Inhumated skeletal remains from 9 Ostriv cemetery graves and 10 East Baltic graves have been analysed by stable isotopes, aDNA and physical anthropology specialists. Comparative analysis of dietary stable isotope signatures and 14C dates of West Lithuania and Latvia inhumation graves with Ostriv cemetery data demonstrated no obvious risk of dietary reservoir effects, and thus no notable chronological differences. Establishing the age-at-death of skeletal remains has helped to determine the pattern of deviation of 14C dates, as in the case of child inhumations of the Daugava Livs. The most interesting for comparison of Ostriv and East Baltic material are the radiocarbon-dated burials with the same artefacts of Baltic origin. Thus 5 inhumation graves of 4 different East Baltic cemeteries and Ostriv grave 2 with identical brooches demonstrate the gradual emergence of the type in the Baltic region between 980-1020 AD and its appearance in the territory of Ukraine, 1000 km to the East, around 1030 AD. We can conclude that the Ukrainian burials are first-generation immigrants, rather than their descendants, but brooches could also be imports. Thus the synchronization of distant archaeological sites in the time-space pattern of the past is possible using the 14C dating and same types brooches in the funerary context.

NEW 14C DATES OF DOG ASSOCIATED BONE GROUPS IN THE LATE IRON AGE LIV CEMETERIES, LATVIA

**Abstract author(s):** Plankajs, Eduards (Institute of Latvian History, University of Latvia; National History Museum of Latvia) - Legzdina, Dardegas (Institute of Latvian History, University of Latvia)

**Abstract format:** Oral

This paper provides a detailed overview of the newest 14C dates of the dog associated bone groups (ABGs) found in the eastern region of the Baltic Sea, corresponding to the areas inhabited in the Late Iron Age by Finno-Ugrs – Livs. ABGs of dogs have been found

in cultural layers of settlements and hill-forts inhabited by Baltic tribes as well, but only in Finno-Ugric burials dog skeletons have been found associated with inhumations and cremation burials in both flat graves and barrows.

The archaeological context of the ABGs of Livs' dogs is definitely the Late Iron Age burials (10th-13th c. AD). However, the new 14C dates do not correspond with the well-established archaeological dating and thus indicate a significant impact of Freshwater reservoir effect. Paleodiet analysis of the Livs' dogs have been carried out by measuring carbon and nitrogen stable isotope ratios. The results were plotted against human isotope data and a large animal isotope dataset, showing that the paleodiet of Livs' dogs were very similar to that of the co-buried humans. Hypothetically, these dogs were not scavengers, but were fed by the leftovers of the owners' meals, dominated by freshwater fish, that, accordingly, have affected radiocarbon dates.

4 **ARCHAEOLOGY, RADIOCARBON AND DIETARY STABLE ISOTOPES: NOVEL APPROACHES TO 14C DATING OF HUMAN REMAINS IN ESTONIAN BRONZE AGE**

**Abstract author(s):** Torv, Mari (Archaeology Department, Institute of History and Archaeology, University of Tartu) - Oras, Ester (Institute of Chemistry, University of Tartu) - Meadows, John (Centre for Baltic and Scandinavian Archaeology) - Lang, Valter - Kriiska, Aivar (Institute of History and Archaeology, University of Tartu)

**Abstract format:** Oral

Rapid increase in 14C dating of archaeological material throughout the Baltic countries has resulted in a vast dataset of radiocarbon dates from different contexts. These, however, have mostly been used for ad hoc publication purposes with little critical evaluation and further analysis. We present an exemplary case study based on the material of stone cist graves – the first monumental graves in Estonia – where ca. 100 new radiocarbon dates from human skeletal remains have been employed for establishing a new chronology (Laneman & Lang 2013; Laneman et al. 2015; Laneman forthcoming 2021a, b). Although the dates are coupled with the information about dietary stable isotopes – carbon (13C) and nitrogen (15N) –, these proxies have not been used to evaluate the dating results.

We will revisit the previously obtained 14C dates from human bones in the Bronze Age burial contexts, focusing on their relations to the diet. The meticulously described archaeological context, 14C dates and stable isotope values allow testing novel analytical methods for interpreting radiocarbon dates. Moreover, the dates and stable isotope values from animal bones from the burials and other contexts provide a valuable input as baseline information. We employed quantitative palaeodiet reconstruction (FRUITS) and dietary reservoir effect estimation together with statistical modelling to indicate the complexities behind dating ancient human remains.

5 **UNRELIABLE DATES? - RADIOCARBON IN THE THRACIAN PLAIN**

**Abstract author(s):** Brandtstätter, Lennart (University of Tübingen)

**Abstract format:** Oral

After a rough beginning, more than half a century ago radiocarbon dating became an essential tool in archaeology. Since these days, experts applied different models to archaeological sequences and experimented with sum functions for typological phases. Especially with the program OxCal, these methods are accessible for a large group of archaeologists.

By now for most areas within Europe a great number of dates have been individually published and collected in databases like CalPal, RADON or 14SEA. Still there are some regions, which are mostly unaffected by this trend.

This talk will focus on the Neolithic in the Thracian Plain, the Lower Danube and surrounding areas. The role of these regions (not only in the context of the spread of Neolithisation) is constantly discussed and projects like TOTL, BIRTH or Lepenski Vir have greatly enlarged the radiocarbon dataset. Still for some regions reliable data is missing on a larger scale. In the area of research, there are less than 400 radiocarbon dates, measured to a big extent before 2000 CE. These available data will be summed up, reevaluated and analysed specifically on the level of a single site. Problems regarding unreliable and corrupted samples will be discussed and possible ways to deal with will be compared. Methods include Gaussian Monte Carlo Wiggly Matching (CalPal), Sequence and Outlier analysis, as well as Sum and KDE functions integrated in OxCal and free R packages.

A. **RADIOCARBON DATING WITH VILNIUS SSAMS: TREE RING RESEARCH, LAKE SEDIMENTS AND COMPLEX ANALYSIS**

**Abstract author(s):** Pabedinskas, Algirdas - Maceika, Evaldas - Paužolis, Julius (State research institute Center for Physical Sciences and Technology)

**Abstract format:** Poster

Many of archaeological findings are dated by radiocarbon method and it's an important part of whole processes in archaeology. 14C is long-life radionuclide, so it's considered to be one of the most suitable tracers for subject age determination (Synal et al. 2013). Each year radiocarbon dating method improves and expands its usability in archaeology and other science fields. It is well known that naturally radiocarbon originates in upper atmosphere layers caused by cosmic radiation initiated n,p reaction with nitrogen. But in certain areas radiocarbon activity in bio samples may be increased by local Nuclear Power Plant (NPP) exploitation. To analyse longterm radiocarbon emission impact on environment, tree rings analysis is the most useful method. Tree rings and undisturbed lake sediments 14C activity measurements provides an undistorted data of chronology. This information could be used to reconstruct events occurred in time span of nuclear power plant exploitation.

In this research we analysed more than 400 tree ring samples from Ignalina NPP surroundings and 36 layers of Drūkšiai lake bottom sediments core. Pine tree rings were collected from 8 locations and lake sediments core was taken in the deepest lake point. Radiocarbon measurements were completed with preparation equipment AGE3 and measurement equipment - Single Stage Accelerator Mass Spectrometer (produced by NEC) (Skog et al. 2009, Wacker et al. 2010).

All these measurements provide chronological change of radiocarbon activity in NPP environment. Due to different origins of sample material and complexity of analysed processes this research expands radiocarbon measurement use in environment analysis.

This research was funded by a grant (No. S-MIP-19-16) from the Research Council of Lithuania.

493 **'HOW THE NEOLITHIC CREATED THE BRONZE AGE': NEOLITHIC SOCIETIES OF EUROPE ON THE EVE OF METALLURGY**

**Theme:** 6. Material culture studies and societies

**Organisers:** Brozio, Jan Piet (Institute of Pre- and Protohistoric Archaeology, Kiel University) - Johannsen, Niels (Department of Archaeology and Heritage Studies, Aarhus University)

**Format:** Discussion session

The adoption of metallurgy in Neolithic societies was a particularly formative episode in the cultural history of Europe. The Neolithic ended in different regions at different times, but technological changes associated with metal and their socio-economic consequences affected all parts of Europe sooner or later. Late Neolithic societies had their own forms of social organisation, economies and involvement in exchange and communication networks and had often already had contact and experience with metal, albeit more sporadically. But what were the different starting situations for this fundamental cultural development in Europe? In this session we will look at Neolithic societies on the eve of their transformation associated with metallurgy and focus on questions like:

- How were societies organised towards the end of the Neolithic period? Which developments had led to these?
- To which extent did the new technology of metallurgy and the exchange of metals have a push effect that speeded up changes that were already on the way?
- How were social differences presented in advance of the new metal objects? For instance, did house architecture possibly become the main medium of social representation instead of monumental burial architecture?
- Can socio-economic changes be observed on the eve of metallurgy? Did an intensification of agriculture or other forms of raised economic productivity promote the adoption of metallurgy?

The aim is to compare scenarios from different regions in Europe to characterise the complexity and to differentiate between alternative explanatory models for the foundation of transformations from stone- to metal-using societies.

**ABSTRACTS:**

1 **THE SOCIO-ECONOMIC IMPACT OF THE EMERGENCE OF METAL ARTEFACTS IN THE 5TH MILLENNIUM BC IN SOUTHEASTERN ROMANIA**

**Abstract author(s):** Darie, Adelina (Bucharest Municipality Museum) - Mirea, Dragoș (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering; Bucharest Municipality Museum) - Parnic, Valentin (Lower Danube Museum, Călărași) - Lazăr, Cătălin (Division of ArchaeoSciences, Research Institute of the University of Bucharest - ICUB, University of Bucharest)

**Abstract format:** Oral

This research focuses on the Eneolithic communities' changes from the Southeastern Romanian plain, in the 5th millennium BC concerning the manufacturing and exchange of metal artefacts in Southeastern Europe.

The present study refers to the maximum development of Kodžadermen-Gumelnița-Karanovo VI cultural complex (KGK VI), defined by the Carpathian Mountains to the North the Balkan Mountains to the South.

2

## BUSINESS AS USUAL: THE SOCIAL SIGNIFICANCE OF THE FIRST BRONZE OBJECTS IN NORTHERN GERMANY

**Abstract author(s):** Schultrich, Sebastian (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

According to established opinions, the beginning of the Bronze Age is associated with profound social change. According to the terminology, the Bronze Age in northern Central Europe begins half a millennium later than in Central Europe. However, this does not mean that the north was isolated from the innovations, nor that the advent of metal per se must be accompanied by changes. The last aspect in particular is often accepted uncritically.

The study of bronze artefacts in Late Neolithic (2250–1750 BC) Schleswig-Holstein has long been a desideratum. On all published distribution maps, there is a gap between the southern Scandinavian and central German sites, which can now be closed. The contexts of the metal objects follow a pattern that can also be observed in the Younger Neolithic. In the west, Late and Younger Neolithic bronze and stone artefacts were integrated into burials, in the east they were deposited as individual finds and hoards. Bronze artefacts were thus integrated into existing structures and did not significantly change them.

This has two consequences for established views of the southern Scandinavian research.

1. In the Late Neolithic, Bronze artefacts were not kept out of burial contexts per se, as the southern Scandinavian findings suggest.
2. The social consequences of the adoption of early bronze artefacts are less profound than has been assumed.

3

## A POLITICAL ECONOMY APPROACH ON LATE NEOLITHIC CULTURAL DEVELOPMENTS IN THE NORTHERN GERMAN RANGE

**Abstract author(s):** Pfeiffer, Annalena (Institute of Pre- and Protohistoric Archaeology, Kiel University)

**Abstract format:** Oral

Early Bronze Age research in Central Europe is often connected with the question how social hierarchies evolved at the beginning of the 2nd millennium BC. Particularly, the development of the Early Bronze Age Únětice Culture was and still is one of the main research topics. In the southwest Baltic region, socio-cultural changes led to the emergence of Early Bronze Age communities, with a complex structure and clear internal hierarchy. By analysing the socio-cultural character of the previously dominating Younger and Late Neolithic societies, their role in the construction of the northern Únětice Culture identities is investigated.

Theoretical approaches on political economy can provide helpful frameworks for understanding social developments and behaviour during prehistoric times, i.e. identifying possible mechanisms leading to social stratification during the transition from the Late Neolithic to the Early Bronze Age. This specific social development during the Early Bronze Age is often explained by using a top-down approach on political economy. This approach can also be helpful to understand the processes that took place during the 3rd millennium BC in the northern German range. However, the analysis has shown that it is reasonable not to focus on only one established theory, but instead apply multiple theories to explain the development of societies. Especially the bottom-up model based on theories of anarchism seems to provide an applicable model for understanding more decentralized societies.

4

## WHAT WAS GOING ON? - SOCIO-ECONOMIC TRANSFORMATIONS IN THE LATE NEOLITHIC SOCIETIES OF THE NORTH GERMAN PLAIN

**Abstract author(s):** Brozio, Jan Piet (Institute of Pre- and Protohistoric Archaeology CAU Kiel)

**Abstract format:** Oral

The last phase of the Neolithic in the North German Plain starts late compared to other more southern regions. While metallurgy is already widespread in Central Europe, increasing reactions to this phenomenon can be observed in Southern Scandinavia and the Northern European Plain. For the areas of the southern Kimbrian peninsula and Mecklenburg-Vorpommern (North Germany), can also be observed significant increases in land openings and a change in agricultural techniques from extensive to intensive cultivation. It seems that on the eve of metallurgy an economic boom can be detected which, in contrast to the earlier episodes of the Northern Neolithic, is not reflected in elaborate special burial complexes, but in a boom of new status objects and a house architecture that possibly becomes the main medium of social representation. At the end of the Neolithic, metallurgy may therefore have had a push effect on socio-economic changes in societies that had already been started. Therefore, in this talk I will address the questions of how the increasing impact of metal affects the Late Neolithic and which socio-economic transformations had already taken place before or were triggered by it.

495

## COVID 19: ASSESSING THE IMPACT AND PLANNING FOR A DIFFERENT FUTURE FOR ARCHAEOLOGICAL HERITAGE TOURISM

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Gowen Larsen, Margaret (University College Dublin; EAA Community on Archaeological Heritage management and Tourism) - Willems, Annemarie (Cultural Heritage Agency of the Netherlands; EAA Community on Archaeological Heritage management and Tourism) - Dunning Thierstein, Cynthia (ArchaeoConcept; EAA Community of Archaeological Heritage Management and Tourism)

**Format:** Regular session

At the time of writing (November 2020) it is virtually impossible to imagine the longer term effects of the global pandemic. For many archaeological sites and other cultural sites open to the public, a vital stream of income has been disrupted. For some this is due to the loss of international cultural tourism visitors, local visitor activity and temporary closure. The collapse in income has resulted in job losses, loss of critical staff infrastructure and, by association, loss of knowledge. The impact on many local community economies has also been felt, sometimes acutely. For some destination sites, however it has offered welcome respite to get some conservation works done and the possibility to review the impact of visitors, how visitors are managed and who their target visitors are. 'Stay at home' tourism provided some welcome relief during the summer months and provided an indication of the potential for future marketing focus and future development. The home market, a link to rural tourism development, eco-tourism, and green-route tourism initiatives are all areas of increased interest as uncertainty grows about the future of international mass tourism.

This session seeks presentations from archaeological site managers and regional museum managers on how they have coped during the pandemic and how they see the way forward. It will also seek participation from destinations that are partners in European cultural routes and World Heritage to learn of what new promotion strategies that may be envisaged. It also seeks contributions from academic researchers in cultural heritage management, cultural heritage tourism.

### ABSTRACTS:

1

## TOURISM RECOVERY AND RENEWAL AT WORLD HERITAGE SITES: BALANCING SUSTAINABILITY AND RESILIENCY

**Abstract author(s):** Maclaren, Fergus (ICOMOS ICTC)

**Abstract format:** Oral

The global spread of the COVID-19 pandemic has had devastating, consequential effects on the visitor economies of World Heritage sites. This stark challenge to what had been viewed as a substantial and sustainable form of economic development are causing authorities to rethink what it means to support and invest in tourism promotion, services and infrastructure. This reflection also involves immediate and longer-term climate change and sustainability-driven approaches on how to better address and manage the risks related to adapting or mitigating the economic and climate shocks to tourism systems and supply chains, while improving the local environments, livelihoods and well-being of surrounding communities. This presentation highlights initiatives by multilateral agencies such as UNESCO, the Organization of World Heritage Cities and individual sites that are trying to develop a better understanding of the issues and challenges affecting OWHC member cities stemming from the pandemic's ongoing impacts, and potential approaches to aid in improving the immediate tourism response, recovery, renewal and resiliency approaches, while integrating the necessary longer term thinking and initiatives to deal with pressing sustainability and climate change concerns.

2 THE FLÂNEUR, THE COLLECTOR, AND THE GAMBLER: HOW WILL WE READ AND REMEMBER THE EARLY 21ST CENTURY?

**Abstract author(s):** Peterson, John (University of San Carlos; ICAHM)

**Abstract format:** Oral

Walter Benjamin’s three types, the flâneur, the collector and the gambler were proposed as observers or players in his Arcades Project for 1920s Paris. They were engaged in a kind of “tourism” that enjoyed the luxury shopping corridors in the iron-girded structures of the “modern” Paris landscape of that era. It was a transformative time in European history, as is this 2020’s decade just beginning. World Heritage is at the center of how we view landscapes and places. Are these just spaces for strolling to view the exotic and the unique, or are they holistic landscapes with real communities and histories, and do we celebrate their spiritual as well as community and aesthetic character? The Pandemic of 2020 may be a powerful moment, a pause, for us to allow communities to re-occupy their places and landscapes while we are locked-down from the fin de siècle rush of global travel and tourism. As we come off the pause we can perhaps adapt to a world changing from climate impacts and find appropriate ways to appreciate our World Heritage, from homestays, trekking, pilgrimages, and other in-depth encounters. The course of preservation may require us to be more reflective and less invasive. What will be the perspective from AD 2030 as we look back on this decade one hundred years after the Arcades?

3 POST-PANDEMIC TOURISM DEVELOPMENT FOR THE LONG-TERM

**Abstract author(s):** Holtorf, Cornelius (Linnaeus University)

**Abstract format:** Oral

This paper is about the outcomes and lessons learned from a now ending project at Linnaeus University titled “Post-Pandemic Tourism Development: Navigating Uncertainty in the Visitor Economy.” Running from one year until September 2021, the project was a collaboration between Tourism Studies and Heritage Studies at Linnaeus University. It also involved active participation of 10 regional organizations and companies as project partners. The project comprised a series of joint discussions, formal interviews, and a full-day futures workshop. The project’s goal has been to understand how stakeholders in the visitor economy make sense in the short- and long-run of the uncertainty induced by the corona pandemic. It also aimed at building futures literacy and providing support to stakeholders in their decision-making. Besides these aspects, the project group believes that for addressing the challenges of post-pandemic tourism development much can be gained from strengthening interdisciplinary collaboration between our two research areas and from building lasting partnerships between the University and regional stakeholders. In this paper, I will discuss where we are near the end of the project and what we have learned thus far.

4 THE EUROPEAN ROUTE OF MEGALITHIC CULTURE: STRATEGIES FOR A SUSTAINABLE DEVELOPMENT FOR AN INTERNATIONAL ARCHAEOLOGICAL COOPERATION NETWORK

**Abstract author(s):** Kelm, Rüdiger (External Expert)

**Abstract format:** Oral

The European Route of Megalithic Culture (MR) serves as a cooperative platform for museums, Geoparks, scientists and tourism practitioners from Denmark, England, France, Germany, Italy, The Netherlands, Portugal, Spain and Sweden. It was formed to raise the profile of the outstanding importance of the megalithic culture in European history and to promote the tourism value of its monuments and surrounding landscapes. The goal of the association is to link the megalithic monuments of Europe in a cultural route committed to the principles of sustainable tourism. As a result of the Covid-19 pandemic, a recent Executive Board-approved “Road Map” has established new strategies and concepts for the future focused on the following points:

- Definitions - Megaliths/Megalithism in the frame of MR
- Marketing advice
- Development of the Homepage, Social Media platforms
- Improving cooperation with tourism agencies and institutions
- Reaching the public: public seminars and promotion (primarily digital communication channels in 2021)

Our Homepage is the highest priority, as it is here that we can best communicate internally and externally. In addition, we aim to make it more informative while also simplifying it (using English and German only – adding other members languages later on). Short promotional videos will be distributed for use in the social media platforms of our members.

The “Steinzeitpark Dithmarschen”, where the author is the managing director, will be presented as an example of local development of the MR in post-pandemic circumstances. The park is a certified member of a group that is cooperating on sustainable development in the federal state of Schleswig-Holstein. The regional tourism organization has been inspired by our sustainable tourism initiatives (e.g. bicycle tours, family and educational programmes etc., which fit well with the restrictions of Covid-19 management-conditions.

5 CREATING A TRANSNATIONAL CULTURE ROUTE IN THE MIDDLE OF THE COVID-19 CRISIS – THE IRON AGE DANUBE ROUTE EXPERIENCE

**Abstract author(s):** Czifra, Szabolcs - Fábíán, Szilvia (Hungarian National Museum) - Mele, Marko (Universalmuseum Joanneum) - Mihelić, Sanjin (Arheološki Muzej u Zagrebu)

**Abstract format:** Oral

EU-projects regularly present great opportunities to create transnational co-operations in research, monument protection and tourism. They provide funds for many archaeological stakeholders in Europe and sometimes give rise to truly great products. However, they also have an inherent major flaw – all of them sooner or later end. What happens with all the nice results and products of e.g. Interreg projects? Are they sustainable at all?

The partnership of the Interreg Danube Transnational project called Iron-Age-Danube was faced with the same questions as it approached the end of the project in 2019. The new network, a visitor app and an e-learning tool, boards in micro-regions in four countries and joint publications were all available at the end of the project, but now needed a new and sustainable solution. The partners decided to establish the Iron Age Danube Route, which is managed by the Iron Age Danube Route Association in Zagreb (<https://www.ironagedanuberoute.com/>). The goal is to permanently connect and jointly promote Iron Age landscapes and highlights, by joint activities in touristic promotion and research. The Association was established in June 2019 with eleven members from four countries, which set themselves to develop necessary and attractive common activities. Developing a set of joint promotion products was one of the first such activities.

When the Covid-19 crisis started at the beginning of 2020 the Route was already well established and at that point aimed to expand to new members in different countries. The new situation forced the members to rethink and refocus their activities. How this was achieved and which measures are needed in the future in order to make it sustainable is the main topic of our paper.

6 NOVEMBER BLUES AND SPRING FEELINGS – THE LVR-ARCHAEOLOGICAL PARK AT XANTEN (GERMANY) IN THE TIME OF COVID19

**Abstract author(s):** Kienzle, Peter (LVR-Archaeological Park at Xanten)

**Abstract format:** Oral

Since 1973, the LVR-Archaeological Park at Xanten (APX), Germany, protects, researches and presents the remains of the former Roman city Colonia Ulpia Traiana (CUT). Being one of Germany’s largest archaeological sites, the park and the on-site museum attract more than 350.000 visitors annually – in usual years. In 2020, due to the CoVid19-Pandemic, there was the spring-lockdown from March 15th to May 5th and after a period of careful and gradual re-opening in summer a second lockdown from November 2nd until to date (February 2021), cutting the visitor figures in half.

The APX is a museum of the Rhineland Regional Council - an inter-communal public authority – and as such subsidised by tax money. Thus, the APX is not threatened by immediate closure and, besides some minor problems, it will do fine in financial terms. However, there is a severe loss of social interaction and of long established ties with the local self-employed guides, organisations, universities, schools and reenactors, in short, with all the people who brought the park to life each summer. All these stakeholders did and do have their own problems with the CoVid19-pandemic. Due to a wide range of reasons, they may not resume their part in the future life of the APX or, at least, not in the same intensity or manner.

This forces the staff of the APX to rethink its plans and activities. Once the circle is broken, it contains the threat and the opportunity to reshape the programme and the way of presentation which will require both, imagination and stamina. This paper explores the experiences to date and the future plans at the APX.

7 UNLOCKING ARCHAEOLOGICAL SITES TO PUBLIC IN LOCKDOWN: EXPLORING THE LOCAL AND NEGLECTED

**Abstract author(s):** Marik, Jan (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic, Prague) - Lečbychová, Olga (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic, Brno) - Dunning Thierstein, Cynthia (ArchaeoConcept Sàrl)

**Abstract format:** Oral

In 2020, international tourism slowed down and eventually came to a complete halt. The states more or less closed their borders and locked their citizens at home. By doing so, people’s attention focused essentially on local events and activities. Therefore, it opened up new possibilities for presenting archaeological sites that were so far outclassed by more famous monuments and tourist attractions.

To offer the opportunity to explore archaeological sites and present them as an integral part of the cultural landscape to the “locked-down” public, 43 archaeological institutions of the Czech Republic teamed up and prepared the Archaeological Summer. Altogether, 73 sites were presented, and 3,700 participants booked guided tours. According to Facebook data, we managed to reach over 38,000 people. Moreover, 30,078 accesses to the Archaeological Summer website from 9,133 unique IP addresses were recorded.

Several requirements preconditioned the organisation of such a national event: professional archaeologists understood its community nature and participated in it, and we could utilise digital tools for the presentation of archaeological heritage that had been

developed in the pre-Covid times, such as the online Archaeological Atlas of the Czech Republic and 3D and augmented reality tools. The Archaeological Summer became very welcome and popular, mainly because there were limited recreation possibilities in cities during the lockdown, and the people enjoyed the benefit of having “one’s own archaeologist” at disposal right on the site. These activities have contributed to promoting cultural heritage, supporting local tourism, and raising awareness of cultural heritage and historical landscape knowledge. The event has become a national case study. It showed us paths we can take while presenting archaeological sites, their sustainability and limits. At the same time, it outlined the possible role of archaeologists while cooperating with local communities.

A. «THE STONES OF THE ANCESTORS»: AN EXPERIENCE OF HOLDING A MODERN IMMERSIVE EXHIBITION OF STONE TOOLS DURING A PANDEMIC

**Abstract author(s):** Kholkina, Margarita - Muravev, Roman (Saint-Petersburg State University) - Directorenko, Anastasia (independent researcher) - Ivitskaya, Anna (Military Historical Museum of Artillery, Engineers and Signal Corps) - Korneva, Tatyana (Institute for the History of Material Culture RAS) - Sevastyanov, Nikolay (Saint-Petersburg State University) - Mikishatyev, Fedor (Scientific archive of the Russian Geographical Society) - Yatsentkovskaya, Maria (Saint-Petersburg State University of Film and Television) - Loginova, Ekaterina (ITMO University)

**Abstract format:** Poster

One of the main problems of archaeological expositions dedicated to the Stone Age is the lack of appropriate background among the mass visitor. Such a high “threshold of entry” often scares off museum visitors and makes it impossible to fully enjoy the masterpieces of the prehistoric creators. With our team of archaeologists, architects, illustrators and animators we have tried to create such an exposition of ancient artefacts that could easily attract the eyes of an unprepared viewer and awaken in him a passion for search and knowledge. Unfortunately, the organization of the exhibition fell on the period of Covid 19 restrictions, which became a challenge for us. Pandemic conditions led to a decrease in the number of visitors, especially among foreigners. In addition, the need to keep social distance to a large extent defined both the “intimate” nature of the exhibition and the organization of the space on it itself.

The exhibition consists of seven stone tools in total, separated from each other in time and space. Each artefact in our exposition tells its story, opening the doors to the mysterious era when tools were made of stone.

Each object is displayed on a separate pedestal in an isolated room with individual design. This corresponds with the concept of exhibiting artefacts, transmitted by the modern socio-cultural environment through popular films, computer games and science fiction literature. Such an approach, combined with the particular music ambience as well, creates a mysterious atmosphere and feeling of importance of what is happening. In the context of a pandemic with its social distance, the exhibition acquired a special intimate character and visitors got an opportunity to find themselves “face to face” with the artefact and its history in a space filled with light and music.

496 A WORLD OF CLAY I: WIDENING ANALYTICAL HORIZONS

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Arntz, Monique (University of Cambridge, Department of Archaeology) - Delbey, Thomas (Cranfield University, Cranfield Forensic Institute) - Jean, Mathilde (Université Paris 1 Panthéon-Sorbonne) - Delvoye, Adrien (University of Geneva, Department of Genetics and Evolution) - Kroon, Erik (Leiden University, Faculty of Archaeology)

**Format:** Regular session

Pottery production should not be studied in isolation. As studies focus on ceramic production as a craft, we come face to face with the full diversity of clay materials: from figurines to architecture, from medicine to soils. A diversity which is mirrored by the myriad of specialisms dedicated to the study of clay materials.

Yet, many commonalities and interdependencies existed between techniques and activities associated with the utilisation of different clay materials at any given time in the past. As such, specialists who work with these materials often use similar, but slightly different analytical concepts and techniques.

For example, a key concept such as chaîne opératoire is well-established in ceramic analysis, but less so in the analysis of figurines. Petrography is a good example of a method which is widely used for the analysis of many different clay materials, but in slightly different manners for each. Subtle differences also exist between research traditions, such as between Francophone and Anglophone analyses of ceramics: with more attention for technical know-how and creating an empirico-inductive model in the former, and understanding social dynamics through an hypothetico-deductive model in the latter.

In this session, we take a holistic stance towards clay materials. Our aim is to draw upon the wealth of analytical concepts and techniques which exists within the various specialisms of ‘clay material studies’. We welcome papers on all possible clay materials, regardless of region or period, analytical or theoretical. We encourage prospective speakers to delve into the methodologies and concepts employed in their analyses, and to actively engage in discussions with researchers from other fields. Clay material studies is a rich and varied field of research, with ample opportunity for cross-fertilisation and multi-disciplinary enrichment.

ABSTRACTS:

1 AN INSIGHT INTO THE SUITABILITY OF CLAYEY RAW MATERIALS: THE CERAMIC PROVINCES OF NORTHERN PELOPONNESE AND SOUTH EPIRUS, GREECE

**Abstract author(s):** Xanthopoulou, Vayia (Department of Geology, University of Patras; Laboratory of Electron Microscopy and Microanalysis, School of Natural Sciences University of Patras; University of Henan, Key Research Institute of Yellow River Civilization and Sustainable Development, School of Geography & College of Environment and Planning, Kaifeng) - Kougia, Nickoula (Department of Geology, University of Patras; ERAAUB, Facultat de Geografia i Història, Departament d’Història i Arqueologia, Universitat de Barcelona) - Iliopoulos, Ioannis (Department of Geology, University of Patras; ERAAUB, Facultat de Geografia i Història, Departament d’Història i Arqueologia, Universitat de Barcelona)

**Abstract format:** Oral

Corinth, Achaea in Northern Peloponnese and Nicopolis in Epirus (Greece) have a strong archaeological record of ceramic production, from the Early Helladic to Late Roman periods. The geographical location of Western Achaea permitted its control on the seaways of the Ionian Sea, whereas the Eastern Achaea lies at the junction of land roads connecting it with Central Greece. Important archaeological sites, such as Helike, Aigeira, the settlement of Derveni, the cities of Patras and Nicopolis, offer data and findings of unexpected quality. One of the main pillars of the development of the ceramic production in these areas was the availability of local natural resources, among which are the clayey sedimentary deposits that outcropping in the area.

The current study deals with the physical-technological properties (plasticity and granulometry), the mineralogical composition of clayey raw materials (67 samples) in terms of their suitability for ceramic production across all this geographic area. Experimental briquettes were prepared and fired at 700, 900 and 1050oC for a soaking time of 6h. Our aim was to differentiate the three main “ceramic” provinces, based upon the above mentioned properties. The results obtained showed that the clays sampled from Corinth and eastern Achaea are carbonatic materials of poor plasticity, whereas those from Western Achaea and Epirus are both Ca-rich and Ca-poor materials with the majority exhibiting a better plasticity. The macroscopic examination of the experimental briquettes suggests significant differences in firing color and fabric consistency, between the samples from Corinth-Eastern Achaea and Western Achaea-Epirus. The results from this study are expected to constitute an important archaeometric tool for tackling archaeological issues by means of provenance and ceramic technology within the region and in the surrounding areas.

2 IDENTIFICATION OF MANUFACTURING TECHNIQUES AND FIRING TEMPERATURES ON YCHSMA CERAMICS. ARMATAMBO (1250-1532 AD) LIMA PERU

**Abstract author(s):** Pareja Anyosa, Dante (IRAMAT-CRP2A, Université Bordeaux Montaigne - UBM; GPAC, C.I. Micaela Portilla Universidad del Pais Vasco - UPV/EHU; Grupo de Investigación Sociedades Prehispánicas del Litoral-Yungas. Universidad Nacional Mayor de San Marcos) - Iñañez, Javier (Ramon y Cajal Researcher, GPAC, C.I. Micaela Portilla. Universidad del Pais Vasco) - Chapoulie, Rémy (IRAMAT-CRP2A, Université Bordeaux Montaigne - UBM) - Diaz, Luisa (Grupo de Investigación Sociedades Prehispánicas del Litoral-Yungas. Universidad Nacional Mayor de San Marcos)

**Abstract format:** Oral

The Ychsma society was one of the most important civilizations developed between 900-1530 AD in Lima, the Peruvian capital, situated in the central coast of Peru. The Ychsma territory included the lower basin of the Rímac and the Lurín valleys, located in the department of Lima (Peru). Between 1470 - 1532 AD, it was conquered and placed under control of the Inca Empire which allowed local elites to maintain their position and control of the population.

Our project addresses the study of the technical traditions of making ceramics at the archaeological site of Armatambo, one of the main Ychsma sites, which developed between the Middle (1250-1350 AD) and Recent Ychsma (1350 - 1532 AD) phases. This archaeological site was a strategic place for economic interaction and exchange between the various coastal sites associated to the Ychsma culture.

The first results obtained by macroscopic observation of sherd fractures and ceramic surface treatments, showed continuity in the technological tradition between the Middle and the Recent Ychsma phases. This continuity is related to the use of the coiling technique in those phases. We also carried out mineralogical analyses (petrography, XRD) identifying the provenance and relative cooking temperatures. We also made observations with SEM to determine technological features. The first archaeometric results enable us to suggest a regional production in the Rímac Valley, implying in addition, a short distance distribution and low representation of non-local ceramics.

3 DIFFERENT METHODS FOR DUNG DETERMINATION IN THE CERAMICS (BY THE MATERIALS OF YARIM TEPE I SETTLEMENT, NEOLITHIC OF NORTHERN IRAQ)

**Abstract author(s):** Babenko, Anna (Institute of Archaeology RAS, Moscow) - Petrova, Natalia (Department of Archaeology State Historical Museum)

**Abstract format:** Oral

From the beginning of the Northern Mesopotamian Neolithic pottery study researchers noted the presence of organic inclusions in the vessels pottery paste. The study of Protohassuna and Hassuna culture ceramics allowed to determine it like dung. The com-

prehensively research of this inclusion was carried out on the materials of the Yarim tepe I settlement (the end of the 7-th mill. BC - beginning of the 6-th mill. BC). Three methods were used: analysis of plant prints, dung spherulites and pollen analysis.

The determination of the dung by the plant prints based on the microscopic study of their shapes and sizes. Very small plant prints with rounded and pointed tips specific to the dung were highlighted by the data of experiments and archaeological material. Dung spherulites (calcium carbonates that form in animal guts) may be use as the markers of dung. Spherulites are readily visible under cross-polarized light (XPL). Dung spherulites and pollen analysis are known methods for investigation different objects from archaeological sites. But we tried to apply these non-traditional for studying ceramics analyses in order to determine the presence of dung in the pottery paste. The thickest ceramic fragments were selected for pollen analysis. Such fragments are most likely to contain unburned pollen during firing.

The experience of using spherulites and pollen analysis was positive. Dung spherulites and pollen were found in the studied ceramics. The concentration of pollen in ceramics is low, but its content is sufficient for pollen analysis. The largest share of pollen accounts on such taxa as birch (*Betula*), grass (*Poaceae*), wormwood (*Artemisia*), and compositae (*Asteraceae*). A large proportion of insect pollination species pollen (*Asteraceae*) may indicate the presence of dung in the pottery paste.

#### 4 A MATTER OF SCALE! FIELD OBSERVATIONS AND MICROMORPHOLOGICAL ANALYSES ON EARTHEN MATERIALS AT MENTESH TEPE (AZERBAIJAN) IN THE NEOLITHIC PERIOD

**Abstract author(s):** Bellat, Mathias (Museum National d’Histoire Naturelle) - Baudouin, Emmanuel (Université Toulouse Jean Jaurès, UMR 5605 TRACES) - Cammas, Cécilia (AgroParisTech, UMR 5140 ASM; INRAP)

**Abstract format:** Oral

The beginning of the VIth millennium matches with the implementation of Neolithic communities in the Southern Caucasus. This socio-cultural change is based on the adoption of a sedentary way of life with farming and animal herding seemingly inherited from Near East. Cultural exchanges between Mesopotamian and Caucasian communities are also attested by the presence of Mesopotamian sherds in the Southern Caucasus. In this context, specific research on architecture has been undertaken to clarify if Caucasian communities benefited from “Mesopotamian skills” and how knowledge has been transmitted between techno-cultural groups.

Architecture is an original technical marker to define socio-cultural relationships between communities because of its strong inertia. Therefore, architecture gives us a closer vision of Neolithic social dynamics in the Southern Caucasus. Until now, field analyses and bibliographic data define an autonomous implementation of architectural techniques in the Middle Kura Valley. Specific studies in Mentesh Tepe proved the invention of molded mud-brick in the Early Neolithic. However, some materials, undefined on the field, were sampled for micromorphological analyses. The need to carry out microscopic studies on earthen materials has emerged because macro features are not always enough to distinguish specific technical aspects.

The aim of this paper is to prove the interest of a multiscale approach. A specific protocol has been established to combine macroscopic field observations (rims and slight ridges, equalization marks...) with micromorphological analysis (pedo-features, grain consistency, micro-stratigraphy...) in order to define the material used, its degree of mixing and the technicity. Whereas some field interpretations have been approved by laboratory analysis (mud-brick), other were reinterpreted (rammed earth) or identified (straw wastes). This approach – used for a long time to study clay materials for potteries – is pioneering in the Southern Caucasus architecture. We offer new reflections to understand technical exchanges and new ways to interpret social phenomena.

#### 5 CERAMIC BUILDING MATERIAL – A UNIQUE SOURCE OF DOG HISTORY. THE CASE OF VILNIUS (LITHUANIA)

**Abstract author(s):** Blaževicius, Povilas (Vilnius University)

**Abstract format:** Oral

One of the most abundant groups of archaeological finds in urban Medieval and Early Modern archaeological sites is ceramic building material (CBM). Bricks, floor or roof tiles are usually analysed by scientists according to their original purpose and function. Although this group of artefacts is especially abundant, it is often overlooked and the questions raised are mostly limited to the typology or production technologies. For more detailed and varied results, these objects can be studied using trasological methods. By analysing the different imprints in clay artefacts, we can reveal important data not only about the craftsmen who produced them, but also about their pets who roamed around. The purpose of this presentation is to present the results of a case study, when traces of dogs on ceramic artefacts from Vilnius (Lithuania) were thoroughly analysed. Preliminary research data allows us to speak with sufficient accuracy about the dogs bred by artisans engaged in the manufacture of clay products in 14th – 17th cent. Research reveals a variety of dog sizes, their fur length, nail wear, leg traumas, movement specifics, etc. In the light of the results, it can be stated that trasological studies of dog traces significantly complement the zooarchaeological and historical data that have been most relied on to date. It can be argued that the trasological analysis of archaeological clay artefacts provides an opportunity to take a fresh look at various aspects of everyday history.

#### 6 SHAPING AND WRITING ON CLAY: PRODUCING THE LINEAR B TABLETS OF MYCENAEAN PYLOS

**Abstract author(s):** Judson, Anna (British School at Athens)

**Abstract format:** Oral

Writers in the Mycenaean palaces of Late Bronze Age Greece (c.1400-1200 BCE) used the Linear B script to write administrative documents on unfired clay tablets, which were accidentally fired during these palaces’ destructions. The texts of these tablets reveal the palaces’ economic and administrative concerns, while identifications of the work of individual writers through handwriting analysis have been crucial to understanding the palatial administrative systems and the actions of individuals working within them. Less attention has been paid, however, to the first stage of the administrative process – that of shaping clay into tablets in preparation for writing on them, which palmpoint analysis suggests was sometimes done by the writers themselves and sometimes by assistants. Although differences have been noted in the way certain tablets were produced – for instance, whether the clay was rolled out and then folded to produce a flat tablet, or only pressed into shape with the hands – these methods have not yet been systematically studied.

This paper will present my ongoing research into the production of the Linear B tablets, focusing on the site of Pylos in south-western Greece, whose large collection of contemporary tablets offers the opportunity to study the practices of a community of tablet makers and writers. In this project, I combine experimental archaeology – recreating different methods of producing tablets, in order to understand the physical gestures involved in manipulating the clay and the impact of its material properties – with observation of the traces left by these production processes on the original tablets. This combination of methodologies will allow me to compare tablets’ different methods of production with their attributions to particular makers and/or writers, and thus to explore individuals’ differing approaches to the formation of the clay tablets on which the Linear B texts would be written.

#### 7 LATE NEOLITHIC ANTHROPOMORPHIC FIGURINES TECHNOLOGY: PRODUCTION SEQUENCE AS AN INDICATOR OF IDENTITIES AND SYMBOLIC ACTIVITIES

**Abstract author(s):** Vukovic, Jasna (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

**Abstract format:** Oral

Late Neolithic anthropomorphic figurines from the Balkans for decades attract the attention of the researchers. The analyses were usually focused on iconography, corporeality, or personhood, while considerations about the technological processes are still rare. A large quantity (cca. 800 specimens) of Vinča figurines from the site of Pavlovac-Čukar in southern Serbia enabled detailed analyses of their manufacture and firing, and several different forming, as well as firing procedures, were identified. The two largest groups are represented by pillar-like figurines, representing predominantly males, and more realistic ones, representing predominantly females. In the case of the first group, the results revealed that the complexity of the manufacturing process, i.e. large number of steps in the operational sequence is in contrast to the simplicity of figurine form. Moreover, a large number of steps in the majority of cases correspond with low artisan’s skill. In the case of realistic figurine types, in most cases representing females, the separate shaping (and possibly firing) of figurine parts indicates the presence of highly skilled and specialized artisans. This talk therefore will address some of the following questions: Do the differences in the operational sequence indicate different meaning/purpose/usage of figurines? Do the number of steps in the manufacturing process imply the importance of the process itself instead of the finished object? Does the low artisan’s skill indicate the importance of the person who made the figurine instead of a skilled artisan? Do these differences indicate different gender roles connected with figurine usage and manufacture? Do they reflect the presence of several different group identities?

#### 8 TECHNO-PETROGRAPHIC STUDY OF EPN CERAMIC ASSEMBLAGES IN THE SOUTHERN LEVANT (7TH MILLENNIUM CAL. BC): MULTI-SCALAR ANALYSIS TO HIGHLIGHT POTTERY PRODUCTION

**Abstract author(s):** Harivel, Carine (University Paris Nanterre) - Coquinot, Yvan (C2RMF) - Vieugué, Julien (CNRS - UMIFRE 7 Centre de Recherche Français à Jérusalem)

**Abstract format:** Oral

The earliest pottery of the Southern Levant are quite well studied in terms of shapes and decorations, but only a few studies deal with the manufacturing processes. The main objectives of our study are (i) to identify the clay sources extracted by the potters, (ii) to determine the way raw materials were transformed into clay paste, (iii) to characterize the properties of the clayey material and, beyond, (iii) to better understand the technical choices made by the potters. With these objectives in mind, we applied a techno-petrographic approach to two large Early Pottery Neolithic ceramic assemblages from the Jordan Valley, namely Munhata and Sha’ar Hagolan.

Techno-petrographic analysis implies a multi-scale observation of the fine mass and the coarse inclusions (stereomicroscope, optical microscope and electron microscope), which is here combined with chemical analysis (PIXE) in order to characterize the chemical composition of the clay paste. These different analyses aims at characterizing the petrofacies and petrofabrics of the assemblages in order to specify respectively the sources of the raw materials and the way they were transformed into clay paste. These are the first steps before raising the question of the physico-chemical properties of the clay paste which regard to the different stages of the manufacturing process (shaping, drying, firing).

**PETROGRAPHIC-GEOCHEMICAL CHARACTERIZATION OF CLAY DEPOSITS IN THE CEYHAN PLAIN (SOUTHERN TURKEY): THE IMPLICATIONS FOR ARCHAEOMETRIC STUDY OF ANCIENT CERAMICS**

**Abstract author(s):** Haciosmanoglu, Sinem (Eberhard-Karls University of Tübingen, Institute of Scientific Archaeology - INA) - Kibaroglu, Mustafa (Eberhard-Karls University of Tübingen, Institute for Pre-and Protohistory and Medieval Archaeology)

**Abstract format:** Oral

Ceyhan Plain which is also called Yukarı Ova constitutes eastern part of Plain Cilicia, is located in south of Turkey (north of eastern Mediterranean coast) to the 40 km east of city of Adana. It is a well-watered, fertile plain and densely settled in the Bronze and Iron Ages. Its geographic position is strategically located between Central Anatolia, Cyprus and North Syria and historically played important role between the ancient cultures of Anatolia (Hittite), Eastern Mediterranean (Aegean and Cyprus), and northern Syro-Mesopotamian (Hurrian/Mittani and Assyrian-Babylonian).

In this paper, we will report results of archaeometric analysis carried out on a total of 54 clay samples collected from different locations throughout the Ceyhan Plain. The aim is to explore compositional characteristics of the clay deposits within the plain and for distinguish chemical and petrographic groups that can be used as reference material in archaeometric studies of the ancient ceramic materials in this region. The chemical composition of the clay samples was determined by LA-ICP-MS (Laser Ablation Inductively Couple Plasma Mass Spectroscopy) and mineralogical contents and textural analysis were investigated using Petrographic and XRD (X-ray diffraction) techniques. As a result, this paper reports about the identified possible clay sources in Ceyhan Plain and its implications for the archaeometric study of ancient ceramics.

10

**CERAMIC MATERIAL CULTURE OF THE EASTERN ADRIATIC ISLAND OF HVAR TO REVEAL CULTURAL EXCHANGE BETWEEN THE LOCALS AND GREEK SETTLERS**

**Abstract author(s):** Doyle, Emily (Department of Geosciences, Texas Tech University) - Ugarković, Marina (Institute of Archaeology, Zagreb) - Šegvić, Branimir (Department of Geosciences, Texas Tech University)

**Abstract format:** Oral

During the 4th c. BC, the area of the Eastern Adriatic was home to different indigenous communities and Greek cities such as Pharos at the island of Hvar. Discussions on the relationship between the local population and Greek settlers are still in their infancy. Study of the pottery production technology offers a wealth of information on multicultural interactions since technological traditions normally change through cultural diffusion. Prior to Greek settlement at the island the local Iron Age pottery consisted of exclusively coarse wares, marked by simple production techniques and recipes with possibly limited raw material sourcing. Conversely, fine ware production was first introduced in the 4th c. BC and was superior in terms of material quality with regard to Iron Age pottery. This indicates a technological know-how of ancient potters and their sense for raw clay procurement strategies and advanced paste preparation techniques.

This paper aims to examine the coarse wares from the island of Hvar which pre- and postdate the colonization, from both local and Greek settlements to report on and exemplify the possible transfer of knowledge between the two communities. In order to achieve these goals, we are undertaking an extensive archaeometric investigation of ceramic potsherds by means of multiple spectroscopic and microscopic methods. In addition to ceramic potsherds, this paper will look into the available clay material to inspect its possible use in the pottery production during the Late Iron Age and Hellenistic times. Detailed geological prospection has heretofore identified two plausible clay sources – the fine-grained Quaternary accumulations recovered at the chora of Pharos and the Eocene Flysch from the SW of the island. In brief, interdisciplinary study of the island’s material culture will supplement traditional archaeological inquiry by providing more insights into the behavioral patterns, traditions and innovations of the time.

11

**STUDYING ROMAN-PERIOD PLAIN ROOF TILES IN THE EASTERN MEDITERRANEAN AREA: A NEW LOOK AT AN OLD MATERIAL**

**Abstract author(s):** Hamari, Pirjo (Finnish Heritage Agency; University of Helsinki)

**Abstract format:** Oral

Although ceramic roof tiles have been the focus of archaeological research for a considerable period of time, the topics of research have been quite restricted. Tile stamps, decorative terracottas, and the early Archaic tiles all have been the focus of relatively frequent studies. On the other hand, plain, undecorated tiles are only infrequently studied, and questions related to tile production are still not well known. Likewise, the range of methodologies used in researching tiles have only lately started to diversify and expand. This is contrary to the fact that fragments of ceramic tiles form one of the largest find categories from the Roman period in the Mediterranean.

This paper uses Roman-period roof tiles from the eastern Mediterranean as an example on what kinds of methodological approaches can be used in studying plain ceramic roof tiles, extending from traditional typological studies to chemical analyses of the fabrics with p-XRF. It presents the key outcomes resulting from different research methods, highlighting the hitherto unrealised research potential in this particular clay material.

The results not only provide new data on the material, but also on the communities that produced and used the tiles, extending into the social dimension.

12

**WALLS AND RAMPARTS OF CLAY: GEOCHEMISTRY OF IRON AGE MUDBRICKS**

**Abstract author(s):** Kailamaki, Uine - Lorenzon, Marta (University of Helsinki)

**Abstract format:** Oral

This paper presents preliminary results of a geoarchaeological investigation of earthen architecture in the Eastern Mediterranean. Our study is a part of the #buildingsustainability project, hosted at the University of Helsinki, which focuses on investigating the relationship between natural and built environments of the past societies in the Iron Age Levant. Mudbricks are a form of material culture that has thus far received little attention in the study of clay materials. However, interest in earthen architecture and the archaeological information it contains has increased during the recent decades, as it provides us with a new set of data to explore the architectural practices and craft specialization in Iron Age societies.

Geoarchaeological analyses were conducted on Iron Age earthen building materials from archaeological sites of Palaepaphos in Cyprus and Ashdod-Yam in Israel. Mudbricks, mud plaster and soil samples were analysed using X-ray fluorescence spectrometry (pXRF), thin section petrography, loss on ignition and SEM-EDS. Our data reveals specific patterns of interaction between the Iron Age communities and their built and natural environments during the manufacturing and construction processes; for example, in the use of vegetal temper and soil selection. The preliminary results identify possible manufacturing events and, for instance, seem to suggest a relatively simultaneous construction of the sampled Ashdod-Yam acropolis and wall features. Additional analysis, such as micromorphology, will be implemented at a later stage to further explore these findings.

**TECHNICAL AND TECHNOLOGICAL ANALYSIS OF CERAMICS OF THE SETTLEMENT UST-VAS’YEGAN 1**

**Abstract author(s):** Chikunova, Irina - Ilyushina, Victoria (Tyumen scientific center SB RAS)

**Abstract format:** Poster

The ceramic complex of the Middle Ages was obtained from the excavations of the settlement Ust-Vas’egan 1, Northern Ob region). 20 vessels included in two (I and II) morphological groups were subjected to technical and technological analysis. The groups differ from each other in their ornamentation and cultural identity. In the cultural layer of the settlement, the pottery lies together. In the vessels of both groups, the use of one type of plastic raw material was revealed - natural ferruginous clay with a small admixture of sand. For the entire complex, the following compositions of molding masses were determined: “clay + crushed granitoids”, “clay + crushed granitoids + wool” - for group I, “clay + crushed granitoids + organic solution” - for group II. The outer surface of the vessels was smoothed with a wooden knife or spatula. The vessels were fired in a mixed redox medium, with limited oxygen access, most often with short-term exposure to products at a temperature of at least 650°C. The firing was carried out in a simple fire pits or fireplaces. As a result of the technical and technological analysis, the similarity of the morphological groups I and II of the ceramics of the settlement Ust-Vas’yugan 1 was revealed. Gneiss or Granite soil was a traditional additive in the composition of the molding mass in various cultural and chronological groups of the Arctic. The correlation of the obtained data on the characteristics of raw materials and the composition of the molding masses of the studied ceramics allows us to speak about the mutual influence (family-marriage relations) of two groups of potters who lived within the same settlement.

**WHAT DO MY DATA SIGNIFY? HOW CAN THIS THEORY BE SUPPORTED? INTERROGATING CONNECTIONS BETWEEN SCIENCE AND THEORY IN FUNERARY ARCHAEOLOGY**

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Monetti, Lisa (UCL Institute of Archaeology) - Nilsson Stutz, Liv (Linnaeus University) - Snoeck, Christophe (Vrije Universiteit Brussel)

**Format:** Regular session

Theory is intangible without application to data and data are not easily interpreted without theory. This session highlights research within funerary archaeology interpreting treatment, study, and conceptions of the body which bridge the gap between archaeological science and theory. Goals of this session include highlighting and advancing a holistic, body-centric funerary archaeology and creating space for sustainable collaboration within our field.

We welcome papers with strong theoretical or scientific backgrounds and methodology from authors open to augmenting their work through collaboration. We encourage those already working with both scientific data or methods within theoretical frameworks to submit. We invite papers on theoretical concepts including sensory archaeology, ritual practice, embodiment, identity, lived experiences and biography, and digital and medical humanities. Scientific methodology including isotope analysis, aDNA, archaeoethnatology, infrared spectroscopy, and osteology are all welcome. These themes are not exhaustive and we particularly welcome research that is innovative, collaborative, and open to future collaboration.

To adapt to the COVID-19 crisis and to benefit from the increasing accessibility that online conferencing allows, we ask that every submission culminates with a new research question to be provided ahead of the session, which the presenters cannot yet answer, but to which their research can contribute. During the session, the research questions will be discussed by the attendees to identify intersections in our work, to realize new future directions, and to seek out the skills and expertise required to answer them. Ultimately, these discussions can contribute towards the development of collaborative projects. We believe that academic thought

and scientific innovation require diversity and inclusivity to progress and the session organizers will work to create an equitable and respectful environment that welcomes participation from all individuals.

THROUGH THE LENS OF THE DEAD: LINKING THEORY TO AN INTEGRATED ARCHAEOLOGY OF CREMATION IN THE SOUTHERN BRAZILIAN HIGHLANDS

**Abstract author(s):** Ulguim, Priscilla (Teesside University)

**Abstract format:** Oral

Cremation is a complex funerary practice, combining technological, biological, and social phenomena in a fiery transformation, intersecting the body and society. Improvements in our understanding and analysis of physical and chemical heat-induced changes in the body have enabled us to tackle questions from dating to funerary practice and mobility. However, analytical work often lacks contextualisation within funerary archaeology and archaeological theory. Likewise, funerary archaeology sometimes fails to integrate data from the most direct evidence of past people: their remains.

Following calls for an “archaeology of cremation” to interpret ritual, social and technological aspects, I propose a holistic framework for analysing burned human remains from archaeological sites. Placing humans at the centre of an interdisciplinary model linking theory, methods, and evidence from bioarchaeology, funerary taphonomy and bioanthropology with forensic science, chemistry, biology, social anthropology.

The framework is applied to evidence from mound and enclosure complexes across the southern Brazilian highlands, where funerary practices focused on cremation emerged from the turn of the second millennium AD. Current hypotheses focus on the implications for migration, power, status, and society. Few are based on human remains, presenting an opportunity to apply the framework from recovery to analysis.

Integrated planning commenced pre-excavation, with excavation conducted using archaeothanatological principles followed by advanced methods to analyse primary level heat-induced change in bone structure and composition, including FTIR-ATR, XRF, digital colour quantification, digital imaging and SEM.

All the data is integrated with evidence from archaeology, ethnography and ethnohistory to offer a comprehensive interdisciplinary insight into society across the southern Brazilian highlands during the second millennium AD. While other interpretations have focused on inequality, aggrandising strategies, differentiating powerful ‘male leaders’, and territoriality, this paper aims to leave paradigm-focused interpretations behind and test each in the context of a funerary process focused on cosmology, ritualisation, community, and integration.

CRIME – CREMATION OR INHUMATION OF ANCIENT POPULATIONS? A MULTIDISCIPLINARY QUESTION AT THE EUROPEAN LEVEL

**Abstract author(s):** Leskovar, Tamara (University of Ljubljana, Faculty of Arts) - Snoeck, Christophe (Vrije Universiteit Brussel) - Črešnar, Matija (University of Ljubljana, Faculty of Arts) - Potočnik, Doris (Jožef Stefan Institute) - Goderis, Steven - Gerritzen, Carina (Vrije Universiteit Brussel)

**Abstract format:** Oral

CRIME is a joint multidisciplinary Flemish-Slovenian research project funded by the Flemish Research Foundation (FWO) and the Slovenian Research Agency (ARRS). The aim of the project is to improve and increase international research and development cooperation by using state-of-the-art techniques to develop new and upgrade the existing methodological procedures for the study of archaeological heritage. It focuses on the research of prehistoric funeral rituals and their changes, searching for the answers on how and most importantly why these changes happened. The main objectives of the project are to investigate differences in the archaeological record, demography, diet, and mobility within and between communities, and the preparation of a map of biologically available strontium for Slovenia, which will be the basis for understanding the mobility of humans and animals.

Designed on the foundations of international and interdisciplinary cooperation, with the focus on the funerary rituals and their changes, the project stresses the importance of the holistic-oriented research designs within the field of funerary archaeology, and the transfer of knowledge and expertise, crucial for sustainable collaboration and development. This paper will present the main questions of the CRIME project and critically discuss the methods used to answer them.

HANDLING THE DEAD. HOW CAN WE LEARN FROM DEATH INVESTIGATORS TO UNDERSTAND THE PAST SENSORY LANDSCAPE OF DEATH AND DECAY?

**Abstract author(s):** Mickleburgh, Hayley (Linnaeus University; Forensic Anthropology Center Texas State University) - Nilsson Stutz, Liv (Linnaeus University)

**Abstract format:** Oral

Distinct phases of human decomposition – e.g., skin discolouration, stiffening of the body during rigor mortis, release of different odours – along with the sensory experiences they can create, are universally recognized by those who handle the dead. In fact, these

physical transformations are often the focus of body treatment and mortuary ritual, aimed at either concealing or revealing them. Archaeology provides us with information to reconstruct some of these sensory experiences related to death, and can help us understand how most living able bodies may have experienced handling dead bodies. Sensory perceptions are also culturally filtered, and can vary distinctly. Archaeology is well placed to explore how both biological and sociocultural factors structure sensory landscapes.

Yet, perception of corpses and decay also depends on the emotional and social relationship with the deceased and can potentially vary greatly from person to person. Personal sensory and emotional experiences related to (decay of) the dead body could perhaps be as varied as the decomposition processes themselves, which depend on environmental conditions (temperature, humidity, insect access), age, health, biological sex, and treatment of the body before/during the funerary ritual (washing, anointing, wrapping, de-fleshing). In this paper we explore the sensory landscape of handling the dead through forensic taphonomic experiments on human decomposition at an outdoor taphonomy facility. These experiments were designed to document processes of decomposition under different conditions and body treatments, but next to taphonomic data, they produced a rich body of sensory memories in the researcher. While it is clear to us that the sensory observations made when handling dead and decomposing remains could potentially enhance what we know of past experiences, we ask how the individual, personal, culturally embedded, and emotionally distinct experiences of death investigators could be harnessed to improve our understanding of past experiences of death and decay.

SENSORY ENGAGEMENTS WITH THE DEAD IN MESOLITHIC EUROPE

**Abstract author(s):** Gray Jones, Amy (University of Chester)

**Abstract format:** Oral

The treatment of the dead in the Mesolithic of north-west Europe included inhumation, cremation, secondary burial, manual disarticulation and dismemberment and, potentially, anthropophagy. Osteological and taphonomic studies show that many of these practices also involved the living engaging with the dead body in various states of decomposition or skeletonisation, such as preparing and posing the recently dead for immediate burial or cremation, retrieving specific bones from a skeletonised burial, or disarticulating and cleaning tissue from the bones of an exposed body. Such practices clearly involved sensory and affective engagements with bones and other bodily substances, such as decomposing soft tissues. This paper will argue that these engagements with the dead were informed by an appreciation of the affective and powerful properties of these substances. It also poses the question of whether we can gain a better understanding of these acts of engagement with soft tissue through other forms of scientific analysis, other than macroscopic osteological analysis.
- 5

MOURNING AND RITUALIZING THE DEAD: AN ARCHAEOETHANATOLOGICAL ANALYSIS TO TRACE BACK TRANSFORMATIONS IN MORTUARY PRACTICES AT CHECUA, COLOMBIA (9500-5000 BP)

**Abstract author(s):** Ospina, Juan (Cultural Heritage Studies Faculty, Universidad Externado de Colombia; Department of Anthropology, University of Los Andes) - Archila, Sonia (Department of Anthropology, University of Los Andes)

**Abstract format:** Oral

Death commemoration is an active way to mark places and inscribe powerful ideas in the landscape, and those inscriptions are quite related to people’s attitudes towards death, body and place. The milieu for the dead is not random or indeliberate, nor is every single action that is conducted for the sake of the dead during ritual practices. The study of mortuary practices by articulating theory, methods and data enrich our interpretations about how the commemoration of death could operate as an agent of change, and as a powerful mechanism to express meaningful ideas of social life. In this paper, we will present the results of an archaeothanatological analysis which allowed us to accurately register unknown patterns of mortuary practices at Checua. We observed that the living invested big amounts of energy and implemented innovating ideas to accomplish proper rituals for the dead. Some of those actions persisted on time, while others were progressively neglected and replaced. Although the precise reasons why people abandon or adopt funerary patterns may remain unknown, it is accepted that remains of mortuary practices may indicate how ideas about death, body and place can drastically change. Here, we will present how the method provided us with high-resolution data to trace back mortuary ritual transformation in a period of ca. 4500 years. We use this information to discuss how diachronic changes can be studied in hunter-gatherers societies, whose ideology and social dynamics have generally been difficult to be recorded, especially in the Neotropics. Hence, we will highlight how theory of ritualized bodies and places can contribute to the understanding of social changes, which in this case can be seen materialized in the arena of mortuary practices.

SIT, SNA AND ANT: BUILDING FRAMEWORKS FOR STUDYING FUNERARY IDENTITIES AND MENTAL DISTANCES IN CENTRAL ITALY C. 1000-31 BC

**Abstract author(s):** Rajala, Ulla (Stockholm University)

**Abstract format:** Oral

In this paper I will present my take on the Social Identity Theory (SIT) and combine it with the Actor-Network Theory (ANT) and some aspects of the Social Network Analysis (SNA). I use SIT, SNA and ANT as a framework for studying funerary architecture in a long-term in order to explore funerary identities and mental distances in central Italy during the first millennium BC. The study of the main cemetery areas will analyse the changing social networks from Early Iron Age to the end of the Hellenistic period. I will look at the tomb types in different communities along the Tyrrhenian and Adriatic Seas and in the Apennines and how this category of evidence can act as a proxy in defining identities and belonging to different socio-political networks. I will discuss the burial grounds in south-

ern Etruria, Latium, Umbria, Campania, Samnium and Picenum in order to consider the mental distances, the relative closeness and distance, reflected in the regional and supraregional networks. As part of the theoretical and methodological discussion, I will assess the usefulness of SIT, SNA and ANT as the frameworks for such an analysis. I will also explore briefly the effect of the background landscape had in forging contacts and try to discover the effects of the cultural change related to the expansion of the Roman state.

### THE VALUE OF SMALL BUT KEY SAMPLES: ISOTOPES AND IDENTITY AT THE LATE MEDIEVAL IRISH NUNNERY OF ST. CATHERINE D’CONYL

**Abstract author(s):** Alonzi, Elise (University College Dublin; Arizona State University) - Collins, Tracy (Aegis Archaeology Limited) - O’Donnabhain, Barra (University College Cork) - van Acken, David - Daly, J. Stephen - Smyth, Jessica (University College Dublin)

**Abstract format:** Oral

The explicitly religious nature of medieval Irish ecclesiastical sites colours the archaeological interpretation of human burials at these locations, suggesting that the burials were social acts imbued with religious meaning. Many skeletal assemblages from ecclesiastical sites contain large lay populations of mixed ages and sexes, allowing for anthropological interpretations of community life or monastic practice. However, at key sites, such as the late medieval nunnery of St. Catherine d’Conyl in County Limerick, Ireland, excavations have revealed small sample sizes of burials in unique archaeological contexts. Burials from known nunneries are rare, and the individuals at this site exhibit biological affinities that may speak to kinship ties. Radiogenic strontium isotope data from eight individuals buried at the site will be presented to assess mobility. These data will be compared to other medieval Irish ecclesiastical sites of varying sample sizes. Ethics, challenges, and the importance of interpretation of this small dataset will be discussed. These new data will be contextualised within previous research by Tracy Collins that investigates the role of gender at the site and in female monasticism more broadly. The new research question proposed is: How can theories of gender and identity be applied in key contexts with small sample sizes?

8

### EXPRESSIONS OF KINSHIP IN THE CEMETERIES OF EARLY MEDIEVAL WALES

**Abstract author(s):** Butler, Ciara - Madgwick, Richard - Lane, Alan (Cardiff University)

**Abstract format:** Oral

This presentation will summarise the findings of PhD research investigating kinship within the cemeteries of Early Medieval Wales. The apparent homogeneity of burial practice in Wales at this time, at least relative to earlier periods, masks an interesting level of variability. Grave “groups” are often identified within cemeteries, which may be based on similarities in construction, location within the cemetery, or orientation. This can indicate connections between individuals and may be seen as evidence for social relationships and shared identities. Clan or family groupings have been suggested as a factor influencing differential burial practice in Wales in this period, though this has never been investigated osteologically, principally due to poor preservation in the acidic soils. However, in recent years the excavation of several well-preserved cemetery sites has significantly added to the corpus of Welsh osteological material. Some of these have yet to be published and the skeletal material has never been the subject of in-depth research and analysis. The primary methodology of the project is biological distance analysis based on dental metric data, used to identify potential genetic kin groups within a burial population. Data has been collected and analysis is now underway. GIS methods such as kernel density will be used to identify the statistical significance of the aforementioned grave groupings. However, genetic kinship is only one aspect of affiliation in Early Medieval Britain, though historical evidence indicates it is an important one. The presence of genetic relationships does not establish whether individuals attributed significance to these relationships in life. This presentation will deliver the results of the biological distance analysis and compare these to the archaeological evidence for grave groups, while exploring the question of alternative means to assess non-biological kinship.

Research question: How can osteological data be used to explore non-biological kinship?

9

### BURNED BONES, SCIENCE AND THEORY: HOW THEY CAN BE COMBINED TO UNDERSTAND THE CREMATION SETTINGS IN THE ARCHAEOLOGICAL CONTEXT?

**Abstract author(s):** Stamataki, Elisavet (Vrije Universiteit Brussel; Université libre de Bruxelles) - Kontopoulos, Ioannis (Vrije Universiteit Brussel; University of Copenhagen) - Salesse, Kevin (Université Libre de Bruxelles) - Veselka, Barbara (Vrije Universiteit Brussel) - Sabaux, Charlotte (Ghent University; Université Libre de Bruxelles) - Dalle, Sarah (Ghent University; Vrije Universiteit Brussel) - Hlad, Marta (Vrije Universiteit Brussel; Université Libre de Bruxelles) - Sangelov, Amanda (Université Libre de Bruxelles; Ghent University) - De Mulder, Guy (Ghent University) - Snoeck, Christophe (Vrije Universiteit Brussel)

**Abstract format:** Oral

The study of burned human remains, is a major source of information to understand the way in which past societies faced, perceived and interacted with death. Despite the limitations that cremated bones present due to the structural, chemical and isotopic changes that occur to the inorganic fraction of bone (bone apatite) during burning, they play an increasingly important role in understanding pyre technology as well as body and pyre managements in ancient societies in which cremation was the dominant funerary practice.

The aim of this study is to understand the way cremation was performed in the Metal Ages using a combination of archaeological theory and state-of-the-art analytical tools on burned human remains from Belgium. The lack of written sources from the Metal Age makes it challenging to approach questions related to the specialisation in the performance of funerary rituals and creates a gap in our understanding of funerary practices from a period where cremation was the dominant funerary rite. As a result, the combination

between theory and science contributes to addressing not only questions about the body management and the cremation settings but also about who was managing the cremation ritual and what the skills and the specialisation of the cremator were.

10

### HOW CAN WE IDENTIFY TRANSPORTATION OF THE CADAVER THROUGH THE ANALYSIS OF HUMAN BONE?

**Abstract author(s):** Peyroteo Stjerna, Rita (Dep Organismal Biology, Human Evolution, Uppsala University)

**Abstract format:** Oral

Transportation of a cadaver is a costly endeavour, in particular if the place of death is distant from the designated place of disposal. Evidence for corpse transportation in prehistory is speculative mostly due to the lack of direct archaeological data. This is unfortunate, because investigating mobility of the dead in the past is interesting from social-culture perspective as it allows to explore choices in the selection of places for the dead.

Taphonomic approaches such as archaeoethnatology allow the determination of funerary depositions in primary or secondary position, the identification of spaces of decomposition, or the documentation of wrappings and other binding elements. These observations have great potential to address questions about the transportation of the cadaver but require other evidence so correlation of practices could be made. On the other hand, current methods used in archaeology to investigate patterns of mobility, such as stable isotope analysis of strontium and oxygen, offer a resolution in the order of years, and can only be used to explore larger scale mobility patterns by identifying the geographic origins of the deceased.

The purpose of this exploratory paper is to discuss which skills and expertise would be required to answer questions about the transportation of the dead. While I think this may be methodologically challenging, I believe that a multi-method approach may be the way forward. The discussion of this theme at the EAA, can potentially open new collaborations and testing grounds on methodologies that could help us address the question: how can we investigate if the cadaver was transported to the place of burial?

The development of a robust methodology that could accurately address the transportation of the dead could be used not only by archaeologists working across any chronological period, but also in forensic applications.

11

### THEORIZING DIETARY PREFERENCES IN THE ROMAN PROVINCE OF MACEDONIA: REFLECTIONS FROM THE HUMAN BONES

**Abstract author(s):** Vergidou, Chryssa (Groningen Institute of Archaeology - GIA; The Science and Technology in Archaeology and Culture Research Center - STARC - of The Cyprus Institute)

**Abstract format:** Oral

The application of an integrative biocultural model in the study of past human remains is by now given a clear and strong awareness within the discipline of archaeology. The theoretical framework upon which relevant interpretations will unfold is of equal importance. Building upon this session’s premises, the aim of my paper is to theorize dietary preferences in Roman Macedonia and to conceptualize how different social groups in this province experienced life under the Roman Empire. This will be attempted by looking at the human remains from two contemporaneous cemeteries (1st to 5th c. CE) of the Roman Macedonia, belonging to two diametrically different communities in terms of micro-ecology and connectivity. The theoretical approach is inspired by globalization theory, which seeks to study networks of connectivity that can bind but also differentiate groups of people from each other. Within this theoretical framework, the distinctive micro-ecological identity of each community under study is expected to be reflected in the consumption preferences of the population. However, the two different communities, or social groups within them may share common characteristics, including dietary patterns, which were transmitted through networks of interaction. The different communities therefore become entangled in local and broader food systems, thereby creating a sense of interconnectedness parallel with the emergence of new and complex intra- and inter- power structures. In this context, individuals or groups may continuously balance between different social, cultural and/or ethnic identities. Therefore, the question to address here is: To what extent do dietary patterns relate to the way in which different communities of the Province of Macedonia, as well as social or ethnic groups within them, positioned themselves within the region and within the Roman Empire?

A.

### DOOMED TO BE FORGOTTEN? CAN SMALL FIELD ANTHROPOLOGY DATASETS STILL CONTRIBUTE TO BIG DATA RESEARCH IN BIOARCHAEOLOGY?

**Abstract author(s):** Lema Seabra, Ana (CIAS; ICArEHB)

**Abstract format:** Poster

The current increase of commercial/rescue archaeology due to the boom in the construction, has led to massive interventions similar to open-area excavations that result in full cemeteries and necropolis being excavated and sizable number of human remains being exhumed. However, this scenario might not be sustainable long term, especially in urban historical centres, where much of the construction is driven by the tourism industry to which the effects of Post-Covid are unknown. Traditionally, urban archaeological interventions tended to be small scale and geographically disperse. In areas where human remains were found, this resulted in numerous small-size samples that were exhumed and remain “buried” in grey literature archives. In this presentation we explore the value of this small samples for scientific research, especially when integrated within bigger datasets. We will present examples from our ongoing PhD project which aims to analyse Late Medieval to Modern Portuguese burial practice.

Our research aims to characterize burial practice through the analysis of burial position, grave goods and other information observed on-site prior to exhumation which is mandatory recorded in archaeological intervention Field Reports when Human Remains are detected. Although we will cross the information with various existing written sources, and question the possibility of intra-site comparison, this presentation focuses on the datasets themselves, the methods and the criteria for collection. One of the proposed criterion relates to sample size, and as such we will debate the inclusion of small samples and ascertain their influence in the results through comparison of datasets which only include samples with a Minimal Number of Individuals above 20, with another dataset that does not include this criterion. Since one of the main cornerstones of archaeological burial exhumation relates to their scientific interest as samples, we question the potential of small size samples for large-scale integration in data analysis.

B. **EXPLORING KINSHIP AND COMMUNITY THROUGH LANDSCAPE ANALYSIS OF CEMETERY AND SETTLEMENT PLACEMENT IN EARLY MEDIAEVAL BRITAIN**

**Abstract author(s):** Fry, Megan (University of Florida)

**Abstract format:** Poster

This research explores the relationship between landscape and site placement for the people of Lindissi, an Early Medieval Kingdom in Britain (4th – 9th centuries AD). Little is known about the association of settlements to cemeteries during the pre-Christian era, although it has been suggested cemeteries may have been utilized by multiple settlements simultaneously, and arranged in familial plots. In this study, landscape features that may have affected site placement choice were assessed to understand if cemeteries and settlements associate in ways that may indicate kinship ties. Point data was compared for elevation, ecological features (e.g., rivers, bodies of water), remnants of previous occupation (Roman roads, villas, forts, and Bronze Age barrows, etc.) to cemetery and settlement locations. GIS techniques (viewshed, intervisibility indices, distances) evaluated statistically reveal patterns relating to site settlement choice. For example, there was a significant association between elevation and site location ( $p=4.533e-06$ ), where cemeteries were more likely to be located at elevations above 96.7m. Intervisibility analysis indicated particular cemeteries were used by multiple settlements, which may imply familial ties. Viewshed also demonstrated specific landscape features (barrows, rivers, other settlements) were visible from cemeteries, but were not viewable from settlements, which suggests an important connection to the landscape for the dead that may not have been vital to the living. This research provides insight into settlement versus site choice, as well as possible applications in predictive modelling, allowing archaeologists to estimate undiscovered site locations which may be useful for finding at risk heritage sites.

C. **A SPATIAL ANALYSIS OF THE CEMETERY SITE AT EASTGATE SQUARE, CHICHESTER, WEST SUSSEX**

**Abstract author(s):** Welty, Shannon - Rando, Carolyn (University College London)

**Abstract format:** Poster

The excavation of St Michael’s Litten at Eastgate Square, Chichester revealed an expansive cemetery site ranging from the Roman to post-medieval periods. This yielded 1644 skeletons which were subsequently mapped in AutoCAD for the excavation report. Stratigraphic analysis of the cemetery sequence undertaken to date is limited and thus much of the sequence remains unphased. A number of variables were initially thought to indicate separate phases of interment, however lacking associated archaeological finds no concrete phases were presumed. This research examines the available data to determine if spatial evidence exists to understand chronological phasing, and to consider if further applying archaeological theory may help elucidate social and temporal patterning of the site. Spatial analysis was conducted, including visual assessment of each variable layer, kernel density analysis, nearest neighbour indices, orientation calculations, and depth analysis. The cemetery demonstrated considerable variation in the treatment and construction of the graves expressed by the number of individuals per grave, orientation, position, presence of associated burial furniture, and biological profile. However, the results of this research found that there is limited spatial data which may be used to reconstruct the chronology of the cemetery space. This research demonstrated that variables including orientation and burial type are not good indicators for chronological phasing in statistical isolation. Conceptualising the funerary archaeology through a theoretical framework may add to the depth of understanding about the assemblage that cannot be gleaned from the spatial data alone.

498 **INTERDISCIPLINARY STUDIES ON SICILY: CASE STUDIES AND METHODOLOGY**

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Montesana, Roberta (Universitat de Barcelona) - Speciale, Claudia (Istituto Nazionale di Geofisica e Vulcanologia)

**Format:** Discussion session

The central Mediterranean has been a crossroad of cultures since prehistoric times. A system of larger islands, such as Sicily and Malta, surrounded by smaller isles and archipelagos, created an ideal land/seascape where people could move and share their material culture. However, far from creating a homogeneous cultural entity, Sicily and the islands around followed different trajectories of development. In the last years, the application of analytical methods (i.e. landscape archaeology, bioarchaeology, geochemical analyses, ...) shed lights on patterns of human-landscape interactions, knowledge transfer, diet change, and people movements, which however remained limited to some spot-areas unbalancing our perspective of the wider region.

This roundtable aims at providing a discussion on the current status of the interdisciplinary studies on Sicily and how to move forward to the advancement of our knowledge of its cultural landscape from prehistoric times to recent times. The discussion will be

encouraged around these main topics: interdisciplinary studies over time (historiography); new approaches and techniques (methodology); knowledge advancement (research); specialisation and knowledge gaps (academic formation). While focused on chronologically and geographically, this roundtable can provide insights for researchers working on other regions for the broadness of the subjects discussed.

The discussion will be guided by the presentations of three key speakers, who have extensive experience in the field of material culture studies, landscape analysis, and digital archaeology, and who will introduce some of the topics listed. Besides these main presentations, a maximum of 8 short presentations (the 6 slides in 6 minutes format) will be chosen from those early-stage researchers who are currently performing interdisciplinary research in order to give an up-to-date view of the status of the field. For this last part of the session, we welcome short presentations by early-stage researchers working on material culture, digital, landscape, and experimental archaeology in Sicily.

**ABSTRACTS:**

1 **THE BIOCULTURAL HERITAGE OF SICILIAN OLIVE TREES**

**Abstract author(s):** Ferrara, Vincenza (Department of Archaeology and Ancient History, Uppsala University; Department of Human Geography, Stockholm University) - Ekblom, Anneli (Department of Archaeology and Ancient History, Uppsala University) - La Mantia, Tommaso (Dipartimento di Scienze Agrarie e Forestali, Università degli Studi di Palermo) - Brun, Anders (Department of Information Technology, Uppsala University) - Wästfelt, Anders (Department of Human Geography, Stockholm University)

**Abstract format:** Oral

We would like to present the new transdisciplinary research project “The Biocultural Heritage of Sicilian Olive Trees” (2021-2024), recently funded by Vetenskapsrådet (The Swedish Research Council), coordinated by the Department of Archaeology and Ancient History at Uppsala University (Sweden) and co-designed in collaboration with local olive small-holders in Sicily.

Mediterranean perennial agrosystems are the results of long term entanglements between humans and nature, playing a crucial role for local livelihood but today critically under pressure due to global market forces and climate change.

Sicily represents a unique case for its position, geomorphology and biological diversity of endemic species, being moreover the cross-road of diverse cultures for millennia, which have brought to an extraordinary melting pot of different traditional ecological knowledge. Olive cultivation is the non-discursive result of the long cultural negotiation process among all these different ecological practices crossing the island.

Before too late, we need to secure this knowledge and the biocultural heritage represented by ancient olive orchards since, thanks to their extraordinary longevity, these long-lasting agrosystems may offer insights on how to tackle adaptation challenges and manage agrobiodiversity sustainably in the future.

To reach these objectives, we have developed a transdisciplinary methodology combining:

1. spatial analysis: regional reconstruction of vegetation dynamics at different temporal and spatial scales over the last two millennia (by developing and applying new contextual segmentation algorithms of remotely sensed data), and their interpolation with regression analysis of climatic variability reconstructions;
2. local-scale archaeological and palaeoecological analysis of individual olive trees/stands (experimental analyses of stable isotopes,  $\delta^{13}C$  and  $\delta^{18}O$ , wood anatomy and phytoliths), to be then used to crossvalidate results from spatial analysis;
3. collaborative collection of local ecological memory and non-discursive knowledge on agricultural practices related to olive trees.

2 **HUMAN-ENVIRONMENT INTERRELATIONSHIPS AND CO-CREATION IN LATE PREHISTORIC SICILY: INTEGRATED METHODOLOGICAL AND THEORETICAL PERSPECTIVES**

**Abstract author(s):** Cantisani, Matteo (Institute of Archaeological Studies, Bochum University; Center for Mediterranean Studies, Bochum University)

**Abstract format:** Oral

Recent narratives of later Sicilian prehistory, particularly those of the transition to the Early Bronze Age, testify to increased cross-disciplinary methodologies. Combined with pollen analysis data, recent surveys opened up new understandings of the economic processes which were essential for developing the integrated system of farming and herding, especially in the upland regions of Sicily. These studies also engendered new theoretical speculations which highlighted the importance of looking at the relationship of humans with the landscape, and the early impact of humans upon the environment. Yet, there remains much to say in terms of appropriation of multiple-resource landscapes into wider fields of practices, possibly underlying mechanisms of co-creation with the environment. Understanding appropriation and use of resources is essential to investigate dynamic societal processes indeed, but appropriations can also endanger ecological sustainability and foster social tensions. Inspired by the former approaches, this paper tackles a new materialist, phenomenological approach to stimulate a discussion about the opportunity of less reductionist models of longer-term societal developments; it integrates a science-based study of landscapes of resources with an experiential understanding of the clay affordances and locations, in order to explore also entangled landscape management practices. It aims to discuss human-environment interrelationship in terms of symbiotic interaction and co-creation. It proposes to uphold this dis-

cussion through looking at the appropriation and use of clay sources within the 6 km<sup>2</sup> area centred on the site of Monte Grande (Agrigento), along the coastal strip between the Naro and Salso river, and including the new evidence discovered by the Author of MCA-EBA occupation. It is argued that this evidence, if understood in combination with landscape managements of the coastal environments and the transhumance practices already known for the uplands, will offer new scope to discuss human-environment co-creation and societal transformations throughout the island.

3 **MULTIDISCIPLINARY STUDY ON ANCIENT HUMAN IMPACT ON THE NATURAL LANDSCAPE. AKRAI/ACRAE, CASE STUDY**

**Abstract author(s):** Chowaniec, Roksana (University of Warsaw)  
**Abstract format:** Oral

Multidisciplinary study on ancient human impact on the natural landscape. Akrai/Acrae, case study  
The recent approaches of the ancient human impact on the natural landscape in the region of ancient town Akrai / Acrae, in the Hyblaean Mountains, south - eastern Sicily can be presented here. The discussion is focus on the changes in the environment with particular emphasis on the Late Hellenistic period till Byzantine periods. The multidisciplinary observations include the studies on the ancient town, founded in the Sicilian interior in the 7th century BC, located close to the modern town of Palazzolo Acreide, in the Palazzolo Formation. The research comprises interdisciplinary studies, which enable the observation of changes in nature and land usage due to breeding, farming, building, manufacturing, etc. The presented research provides insight into the historical changes and degradation of the landscape and human impact on the Mediterranean environment. The data were collected within the recently excavated residential areas of the ancient town and in its vicinity.

4 **DIET AND MOBILITY IN SICILY AND THE CENTRAL MEDITERRANEAN: ISOTOPIC AND ELEMENTAL ANALYSES**

**Abstract author(s):** Tykot, Robert (University of South Florida)  
**Abstract format:** Oral

The analytical study of human remains has become a highly important aspect of modern archaeology. Isotopic and elemental analysis can provide a life history of individuals regarding dietary practices and mobility, especially when integrated with other archaeological data. In Sicily, research questions specifically address the importance of seafood in the overall diet; the proportions of meat, milk and cheese from domesticated cows, sheep, and goats; their geographic origins if non-local; potential differences between individuals based on sex and/or status; and changes over time from the Mesolithic thru Medieval periods. This research has been conducted on several different sites in Sicily, dating to Copper Age, Bronze Age, Greek, and Roman time periods, and may be compared to other studies in Malta, peninsular Italy, and Sardinia.  
In general, it appears that in Sicily and Malta for all time periods seafood was rarely a dietary staple, if consumed at all, even in coastal zones, and despite the maritime travel involved with these islands. Of low importance was millet, a C4 plant used in many areas of peninsular Italy by the Bronze Age. There also seems to have been negligible differences based on status prior to Roman times. Refined research questions for future studies will be discussed.

500 **INTEGRATING NEANDERTAL LEGACY: FROM PAST TO PRESENT (PAM)**

**Theme:** 3. The new normality of heritage management and museums in post-Covid times  
**Organisers:** Mihelic, Sanjin (Archaeological Museum in Zagreb, Croatia) - Leskovar, Tamara (Faculty of Arts, University of Ljubljana, Slovenia)  
**Format:** Regular session

Neandertals are the first human population that can be truly recognized as a pan-European phenomenon. Traces of their cultural and skeletal remains are found in most European countries, covering a quarter-million years. A lot of scientific work has been undertaken on various aspects of their heritage and there is a vast collection of archaeological and anthropological data available. However, there is still a discrepancy in available and updated datasets from various countries, which often reflects negatively on research, but also on management of Neandertal heritage.  
Arguably, the Covid pandemic has only exacerbated the negative aspects of this situation. But, has it really? Is it not quite the opposite? Could not this ‘new normality’ also represent a new context for best overcoming the real and self-imposed boundaries of communication within Neandertal scholarship? Furthermore, the Covid virus notwithstanding, what really prevents us from enhancing our focus on the methods and conduits of dissemination and communication with lay audiences? Likewise, arguing for Neandertals to become stakeholders in cultural tourism may seem far-fetched, but we still welcome in this session all those who are willing to try. Bring your museum display scenarios, your visualisations, your ARs and your VRs and let’s discuss them all together in Kiel for the sake of our Neandertals’ future.  
This session aims at fostering dialogue among Neandertal scholars from different countries and disciplines. Papers may range from topics related to stratigraphy and typology, through genetics, object interpretation and the spiritual aspects of Neandertal popula-

tions, to methods of site presentation and heritage tourism. We especially welcome contributions that offer proactive, realistic and feasible solutions leading to synergistic effects in research and valorisation of Neandertal heritage.  
The session is organized in partnership with the network of scholars gathered around COST Action 19141: Integrating Neandertal Heritage: From Past to Present (<https://www.cost.eu/actions/CA19141/#tabs|Name:overview>).

**ABSTRACTS:**

1 **COST ACTION: INTEGRATING NEANDERTAL LEGACY: FROM PAST TO PRESENT (INEAL)**  
**Abstract author(s):** Jankovic, Ivor (Institute for Anthropological Research)

**Abstract format:** Oral  
Neandertals are the first human population that can be truly recognized as pan-European phenomenon. Traces of their cultural and/or skeletal remains can be found in most European countries and cover a period of more than 250 000 years. A lot of scientific work has been done on various aspects of their heritage and there is a vast collection of archaeological and anthropological data available. However, there is still a discrepancy in available and updated datasets from various countries. In addition, communication between scientists from various fields and from various countries is still based on personal connections between individual scientists, mostly related to specific projects. This Action is a long overdue attempt to bridge the geographic, language, disciplinary-and-data specific gap, as well as a gap created by traditions of different disciplines in different European countries. Through a combined, scientifically-based and geographically inclusive approach, creation of a growing inclusive database, and promoting dialogue among scientists and creating guidelines for research, a solid base for better understanding of Neandertals can be reached. Further, this will allow a base for inclusion of Neandertal legacy into the present, through scientifically based guidelines for public presentation and further actions for promoting their heritage via inclusion of non-scientific stakeholders, such as administrators, museum and cultural workers, touristic sector, small and medium enterprises and other interested parties.

2 **A 2.0 CATALOGUE OF FOSSIL HOMINIDS: NEANDERTALS MOVING INTO THE 21ST CENTURY. A COMPREHENSIVE KNOWLEDGE REPOSITORY ON THE NEANDERTAL LEGACY**

**Abstract author(s):** Voisin, Jean-Luc (CNRS, EFS, ADES, Aix-Marseille université) - Hermon, Sorin (The Cyprus Institute) - Benazzi, Stefano (Department of Cultural Heritage, University of Bologna) - Degioanni, Anna (Aix Marseille Université, CNRS, Ministère de la Culture, LAMPEA) - Hajdas, Irka (Laboratory of Ion Beam Physics, ETH Zurich) - Hajdu, Tamas (Eötvös Loránd University, Faculty of Science, Institute of Biology, Department of Biological Anthropology; Hungarian Natural History Museum, Department of Anthropology, Budapest) - Harvati, Katerina (Palaeoanthropology, Senckenberg Centre for Human Evolution and Palaeoenvironment, Eberhard Karls, University of Tübingen) - Janković, Ivor (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb) - Soficaru, Andrei Dorian (Department of Paleoanthropology, ‘Fr. J. Rainer’ Institute of Anthropology, Romanian Academy)  
**Abstract format:** Oral

Traces of Neandertal cultural and skeletal remains are found in most European countries, covering a time-span of more than 250,000 years. Since the recognition of Neandertals as a specific human group, following discoveries in the Neander valley in 1856, much works has been taken on many aspects of their heritage (cultural, anthropological, genetic, etc.); human remains and associated artefacts have been discovered since then in large quantities, and new discoveries of recent excavations are published yearly. However, there is still a discrepancy in available datasets from various countries, which often impacts negatively on research, but also on the overall management of Neandertal heritage. The most updated record is still the “catalogue of fossil hominids” published by Oakley and colleagues in .... 1967! The EU funded Neandertal Tools Project\* was a very promising initiative set in 2004, which however did not succeed to develop a sustainability plan and maintain its developed tools and services and nowadays it is not functional.  
The recently launched initiative iNEAL (COST Action 19141) set as one of its primary ambitious tasks (in Workgroup 1) to establish a comprehensive knowledge repository on the Neandertal legacy. Such a repository should include as many aspects related to the study of Neandertals as possible, such as climatological, environmental, chronological data, as well as material culture and skeletal remains. It might also include data about DNA. Data has to be organized in a semantic way and according to the FAIR data principles. As first steps, WG1 of iNEAL aims to gather updated information on Neandertal remains and related research particularly from countries with scarce data so far, followed by work on defining an ontology for the Neandertal legacy, the backbone of the planned knowledge repository.

\* <https://cordis.europa.eu/project/id/507909>

3 NEANDERTHALS: NEW INSIGHTS FROM OLD BONES

**Abstract author(s):** Röding, Carolin (Paleoanthropology, University of Tübingen) - Harvati, Katerina (Paleoanthropology, University of Tübingen; DFG Centre of Advanced Studies ‘Words, Bones, Genes, Tools’, University of Tübingen; Museum of Anthropology, Medical School, National and Kapodistrian University of Athens)

**Abstract format:** Oral

When hearing the word Neanderthals most people have a few famous fossils in mind. However, besides well-known, iconic specimens, many less known and sometimes forgotten materials can be found in storage rooms and museum basements. These little-known materials have great potential to provide us with new insights about Neanderthals and human evolution in general. Technological improvements of the last decades allow us to analyze even very fragmented and damaged fossils in a comprehensive framework and thereby, to study materials that could not be analyzed in depth at the time of their discovery. The fossil crania from Apidima and the isolated molar from Megalopolis, Greece, are examples illustrating the potential of new analyses of materials excavated decades ago to our understanding of Neanderthal legacy. On the one hand, the virtual reconstruction, direct dating and comparative shape analysis of the Apidima remains overturned previous hypotheses by indicating the presence of an early Homo sapiens population, followed by a Neanderthal one, at this site (Harvati et al., 2019). On the other hand, the previously unidentifiable Megalopolis molar, likely assigned to the Neanderthal lineage through its crown shape comparative analysis, contributes to the scarce Pleistocene human fossil record of Greece (Röding et al., in press). Such re-evaluations of old materials can therefore provide important new insights, and are particularly crucial in cases where new excavations are not always possible, to better integrate our knowledge of the Neanderthal legacy across the European continent.

4 A TENTATIVE SUMMARY OF VARIATION IN TERMINOLOGY, INTERPRETATION, PROBLEMS AND PERSPECTIVES OF SMALL TOOL TECHNOLOGY BETWEEN NEANDERTHALS AND EARLY SAPIENS

**Abstract author(s):** Romagnoli, Francesca - Mellado, Miriam (Universidad Autónoma de Madrid) - Cieřla, Magda (Institute of Archaeology, Jagiellonian University) - Elefanti, Paraskevi (National & Kapodistrian University of Athens) - Mihailović, Duřan (University of Belgrade) - Pereira, Telmo (Universidade Autónoma de Lisboa Luís de Camoes) - Peresani, Marco (Università di Ferrara) - řkrdla, Petr (Institute of Archaeology, Czech Academy of Sciences) - Stefański, Damian (Archeological Museum in Kraków) - Valde-Nowak, Paweł (Institute of Archaeology, Jagiellonian University)

**Abstract format:** Oral

The microlithic component was traditionally considered a trait of modern human behaviour from Homo sapiens, attesting the more advance of our species. Recently, the production of small tools has been highlighting the relevance of this technological behaviour by Neanderthals [1–8]. Within the Middle Palaeolithic, the small-sized tool production has been progressively incorporated different phenomena, including core-on-flake, single core reduction progressively using different knapping systems (Levallois, discoid, blade etc.), configuration of retouched tools, bipolar knapping and the search for unmodified cutting edges. In addition to the variability of production processes and stylistic patterns, recent studies also highlight a variety of economic strategies (expediency, planning, recycling, and integration), and its relations with raw material constraints and mobility patterns. Furthermore, some methodological problems in the identification and terminology of the microlithic stone tool component (e.g., the notion of size, the distinction between knapping waste and searched tools, and the use-wear data) are contributing to enlarge the discrepancies in the knowledge of small-sized tools in time and space. This work is an attempt to present a systematic overview of this variability and to propose a collective discussion of problems and perspective in this topic through some archaeological examples. This work is expected to be a first step to identify geographical and substantive shortcomings, improve future systematic studies of small tools, and facilitate comparisons between sites.

5 NEW ADVANCES IN ZOOARCHEOLOGICAL METHODS UNVEIL NEANDERTHAL BEHAVIOUR

**Abstract author(s):** Marin-Arroyo, Ana (Grupo de I+D+I Evoadapta. Universidad de Cantabria) - RIVALS, Florent (ICREA; Institut Català de Paleoeecologia Humana i Evolució Social - IPHES; Universitat Rovira i Virgili, Departament d’Història i Història de l’Art)

**Abstract format:** Oral

In the last two decades, the advances in Archaeological Science have widened and diversified the information we can obtain today from material artefacts and ecofacts. The study of the subsistence strategies carried out by Neanderthals during Pleistocene has revealed exciting and, sometimes, surprising results when material remains are approached from a multidisciplinary point of view. In addition, the reconstruction of the past environments and climatic conditions is revealing new local and regional data that allows un-

derstanding the adaptation and resilience skills of this human species to changing scenarios. Today, in combination with vertebrate archaeozoology studies, the application of stable isotopes, dental macro and microwear, dental calculus, ancient DNA and proteomic analyses, such as ZooMS, on animal remains found in archaeological contexts and directly related with Neanderthal societies, is providing exhaustive information. All these proxies provide high-resolution data at the scale of human behaviour. It is possible to reconstruct Neanderthals’ diet, the mobility of animal populations, the surrounding vegetation and climate data when both animals and humans lived, the interaction and relationships between past and present populations or the origin of the species. In this presentation, we will present these current advances within iNEAL, a COST European funded project dealing with Neanderthal heritage.

6 THE MIDDLE PALEOLITHIC RESEARCH IN ROMANIA: DRAWBACKS AND ACHIEVEMENTS

**Abstract author(s):** Dobos, Adrian (Institute of Archaeology “Vasile Parvan”, Bucharest)

**Abstract format:** Oral

Romania holds a key geographical position in understanding the population dynamic throughout Pleistocene Europe. My presentation discusses several older and recent problematic aspects related to the current state of the art of the Middle Paleolithic (MP) in Romania. These aspects tend to be obscured by the recent important (re)discoveries of the Anatomically Modern Human fossils that took place in Romania.

The current MP evidence comes from a bit over 20 sites of various sizes excavated during the 20th century. There are different problems regarding the traditional MP research in Romania: field research methods were non-standardized and in many cases inaccurate; interpretations on lithic assemblages were centered on typological descriptions; the oldest MP occupations were considered to be dating only from early Würmian stages.

Recent re-assessment of the age of some sites in Romania has revealed that the timescale for the MP evolution spans to late Middle Pleistocene, being much older than previously assumed. New research on loess sequences and cave sediment dynamics has led to a better understanding of climatological aspects and intensity of taphonomic processes.

Similarly, fresh perspectives on lithic assemblages have gone beyond cultural-historical interpretations and provided a broader picture on the dynamics of the MP groups.

Despite these recent advancements, issues in the research of the Middle Paleolithic persist: incomplete lithic and faunal assemblages, uncertainties regarding the tridimensional provenience of the pieces, the impossibility to resume excavations in some sites (destroyed by industry or fully excavated).

However, in spite of these old and new problems, MP still presents significant research interest, since the number of potential sites in Romania is much larger than the excavated sites, as is indicated by the over 150 findspots with surface lithics which can belong to the MP, and also by the great number of fossil caves which have not been tested.

7 ON THE EDGE OF THE ICE SHEET, POLISH CONTRIBUTION TO THE RESEARCH ON THE NEANDERTAL MAN

**Abstract author(s):** Stefanski, Damian (Archaeological Museum in Kraków) - Cieřla, Magda - Valde-Nowak, Paweł (Institute of Archeology of the Jagiellonian University)

**Abstract format:** Oral

Finds from the region of Poland designate the outline of the northern periphery of the Neanderthal ecumene. The discussed area was under a strong influence of middle and upper Pleistocene climate changes. The repeated episodes of cold climatic conditions affected the dynamics of the Middle Paleolithic settlement. We can surmise that periodic transgressions of the northern ice sheet changed the readability of the cultural record in the northernmost areas of the ecumene. A significant part of the archaeological sites from the times of Neanderthals is situated in southern Poland. These are loess open-air sites as well as and cave sites. A significant part of them were investigated in methodical excavations, during which the stratigraphy and the chronology of the finds were determined. It can be assumed, that the area of northern Poland – possibly also accessible for Neanderthals in the warm climatic phases – was wiped out by an ice sheet, mainly during the ice transgression in LGM. This article aims to present the characteristics of the Polish MP archaeological sources which consist almost entirely of remnants of the material culture, although the biological remains of Neanderthals have recently been reported. We would like to brief you with key points of the regional Middle Paleolithic discussion and to present selected finds that could be incorporated into the global reflection of the discussed issue.

8 NEANDERTAL MIGRATIONS THROUGH EUROPE AND THEIR LEGACY IN NORTHERN AND EASTERN FRANCE (MIS5-3)

**Abstract author(s):** Lamotte, Agnes - Desmadryl, Thomas (University of Lille)

**Abstract format:** Oral

At the end of the Middle Palaeolithic, Northern and Eastern France had many archaeological sites whose typo-technological content (especially leaf-shaped tools) indicate origins from outside this region. During OIS 8 to 5e, the differences between the lithic series relate to the knapping and shaping function and also to the presence or absence of bifaces. During that time, in Europe, there is no clear evidence of real ruptures in typo-technology except in the shapes of the bifaces and the presence of specific knapping methods (Quina, laminar, Levallois, Discoid). However, during OIS 5d and especially the OIS 3, changes are noticeable and similarities

9 between France and Central and Eastern Europe become more common. They are the signature of the migratory movements of Neanderthals modelled on that of the fauna. Evidence for this in the North-Eastern region of France and beyond this region is provided by typological and technological aspects like Kostienki thinning, plano-convex biface, flat retouching, bipointed tools, handle to tools, clearly evoke affinities with Poland (Prondniks), Germany (blattspitzen), leafpoints (Central Europe), scrapers and bifacial tools from Crimea. Undoubtedly, these are the best neanderthal craftsmanship demonstrations that allow us to propose much more precise migration routes like danubian way or the plains of northern Europe and when they were used during the late middle Palaeolithic.

## 9 NEANDERTHAL OCCUPATION IN WESTERN IBERIA DURING THE MIS 6: THE MONTE DA REVELADA OPEN-AIR SITE

**Abstract author(s):** Pereira, Telmo (Universidade Autónoma de Lisboa. Departamento de História, Artes e Humanidades; Instituto Politécnico de Tomar, Instituto Terra e Memória, Centro de Geociências da Universidade de Coimbra; UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Cunha, Pedro (University of Coimbra, Dep. Earth Sciences; MARE – Marine and Environmental Sciences Centre) - Martins, António (Universidade de Évora, Departamento de Geociências; ICT – Instituto de Ciências da Terra) - Monteiro, Mário - Caninas, João - Henriques, Francisco (Emerita - Empresa Portuguesa de Arqueologia, Unipessoal Lda) - Paya, Alexandre (Câmara Municipal de Vila Velha de Ródão; Instituto Politécnico de Tomar, Instituto Terra e Memória, Centro de Geociências da Universidade de Coimbra)

**Abstract format:** Oral

Monte da Revelada, at 112 m a.s.l, is an open-air and multi-component site located in western Iberia (Vila Velha de Rodão, central Portugal). The site was excavated due to the construction of a factory. The archaeological sequence revealed Modern, Neolithic, Epipaleolithic and Mousterian occupations. Over 40,000 artefacts were found, some associated with hearths and postholes.

The site Quaternary sedimentary sequence overlays, by disconformity, a Paleogene sedimentary unit. The Mousterian industry is associated with the lower bed of the sequence and can be correlated with the topmost deposits of the T4 terrace (~45 m above the riverbed). Up to the present, the age of this bed was not yet obtained by a numerical method.

The lithic analysis of the lower bed of Monte da Revelada shows a typical Mousterian industry with Levallois and Discoidal debitage made on different types of local quartzite and milky quartz, although rare small flint nodules exist in the gravels.

In Ródão area, Mousterian industries were found associated to the topmost deposits of the T4 terrace (probable age of ~200-170 to 155 ka), to the T5 terrace (~140 to 70 ka) and to the lower division (gravels) of the T6 terrace (~62 to 44 ka) (Cunha et al., 2019).

The Vila Velha de Ródão region, located at the beginning of the Lower Tejo River, in the NE edge of the Lower Tejo Cenozoic basin, is an exceptional study case for the ecodynamics during the presence and demise of the Neanderthal populations, as it has corresponded to the ecotone between the coastal (Atlantic) and the inland environmental and climatic conditions.

- Cunha, P. et al. 2019. The Lowermost Tejo River Terrace at Foz do Enxarrique, Portugal: A Palaeoenvironmental Archive from c. 60–35 ka and Its Implications for the Last Neanderthals in Westernmost Iberia. Quaternary 2(3), 31-60.

## 10 HOLDING ON. COMMUNICATION OF CONTENT DURING THE PANDEMIC. THE EXAMPLE OF THE NEANDERTHAL MUSEUM

**Abstract author(s):** Auffermann, Bärbel - Schneider, Beate (Neanderthal Museum)

**Abstract format:** Oral

The Neanderthal Museum has a unique selling point in the mediation of human evolution. Every year, more than 600 groups book our offers on this topic in preparation for biology exams.

In order to be able to provide a professional offer despite the lockdown, we created eight short videos on selected topics of human evolution in spring 2020. The links to the videos were distributed via social media, but also directly through the teachers and we received positive feedback.

This experience subsequently led to the need to monetize the digital offerings. The Neanderthal Museum is largely self-sustaining and revenue including from bookings of educational programs is one of the pillars of funding. Thus, the idea of paid online tours came up.

For the preparation of graduation exams, it is now possible to book an exclusive online live guided tour on the evolution of human-kind, which is conducted in dialogue with an educator of the museum. During and after the tour, there is time and opportunity to ask questions. In the online live workshop, fossil skulls from 6 million years of human history are presented live and examined together using various scientific methods. Participation in the guided tour or seminar works via Zoom. This offer is very well received and expands the catchment area of the museum, as schools from other federal states also book. Together with European partners, we are thinking the offer further and are also planning guided tours in Spanish and Italian, for example. We are planning an evaluation of the 2019-2020-2021 ranges in comparison.

With our presentation we would like to share our experiences with other institutions and stimulate an exchange.

## 11 NEANDERTHAL RESEARCH, EARLY HUMAN HISTORY AND THE ISSUE OF MASCULINITY. THE ROLE OF GENDER IN SCHOLARLY AND POPULAR NEANDERTHAL DISCOURSE

**Abstract author(s):** Peeters, Susan (Erasmus School of Philosophy - ESPhil, Erasmus University Rotterdam; Institute for Science in Society - ISiS, Radboud University Nijmegen) - Zwart, Hub (Erasmus School of Philosophy - ESPhil, Erasmus University Rotterdam)

**Abstract format:** Oral

Recently, Neanderthals have metamorphosed from the losers of the human family tree to people like us, full-fledged humans. However, the persistent quest for a minimal difference which separates them from us continues. Palaeoanthropology primarily studies ancestors from a distant past, but its findings also affect the identity and self-image of us, modern humans, defining what it means to be human today. This raises several questions, ranging from more general ones (e.g. How have we used Neanderthals to conceptualize ourselves as human beings?) up to more specific ones (e.g. How are gender issues constructed in narratives about Neanderthals and what does that reveal about current implicit views about gender identities?). This is not only visible in academic discourse, but also in popularisations of research. Popularised versions of Neanderthal research function as spotlights, conveying and amplifying the stereotypes and ideologies which are also at work in scholarly discourse more explicitly. Explicit attention will be given to how males and masculinity are presented. Implicit biases underlying our ideas and ideals of human and humanness, we argue, should be acknowledged and addressed. This will allow us to become open to more inclusive visions of the past, and of what it is to be human.

## 12 IN THE MIND’S EYE. COMMUNICATING NEANDERTAL RESEARCH THROUGH FICTION

**Abstract author(s):** Dielemans, Linda (Independent researcher)

**Abstract format:** Oral

Neandertals have captured people’s imagination since the discovery of the first Neandertal bone. The way we think of our long-lost cousins evolves as science advances. Or does it? The witless caveman stereotype seems to persist with the general public, despite researchers’ best efforts to communicate the results of their hard work. But perhaps that is no wonder. From picture books to even the most well-intended films and novels, Neandertals are consistently portrayed as ‘the Other’: creatures not-quite-human, dumb or silly, limited compared to ourselves at best. No front-page headline or science book, however brilliant, seems to be able to erase the image popular culture has been feeding us since childhood. In this paper, I propose to fight fire with fire, utilising science-based fiction to tip the scale. Instead of waiting for an author or filmmaker to come and ask for advice, researchers could – or even should – make the first move by actively reaching out to and working with the creative community. Through examples from my own experience as an archaeologist and professional novelist, I hope to make a case for the idea that fiction can be an important tool, that is not only powerful enough to finally beat Boule’s Neandertal, but, if used well, also has a way of aiding and enriching original research.

## 13 EXPLORING OPPORTUNITIES OF CROSS-BORDER DIGITAL HERITAGE APPLICATIONS USING EMBODIED INTERACTION IN VIRTUAL REALITY SIMULATIONS TO DISSEMINATE THE NEANDERTHAL LEGACY

**Abstract author(s):** Rodil, Kasper - Danevičius, Edvinas - Stief, Frederik (Aalborg University)

**Abstract format:** Oral

In collaboration with “COST Action Integrating Neandertal Legacy: From Past to Present,” this project details how to design, validate with field experts, and demonstrate a Virtual Reality application to be experienced by the wider public, and as a space for making live the theories of Neanderthal tool crafting.

This merger of Virtual Reality, gamification, and efforts for the protection and dissemination of the Intangible Cultural Heritage has, as an example, recently been explored with contemporary indigenous people (Rodil, Maasz and Winschiers-Theophilus, 2020). Yet, the potential impact for better understanding and disseminating the Neanderthal legacy using VR both in terms of appeal and opportunity to offer alternative learning materials is quite large.

By utilizing VR, there is a dissemination and engagement potential through embodied interaction (Winn, 1993). Embodied interaction is human-computer input responding to the body rather than relying on symbolic interfaces and has been shown to enhance learning and engagement through the feeling of grounding, immersion, and presence while accomplishing a task (Lindgren et al., 2016). Focusing on learning through embodied interaction rather than text or speech enables circumventing the need for adapting an application to the linguistic patchwork that is Europe, thereby making it as accessible as possible.

A. "NEANDERTHAL: MEMORIES" I WRITING AN AUDIO GAME ABOUT NEANDERTALS

**Abstract author(s):** Riethus, Anna (Stiftung Neanderthal Museum)

**Abstract format:** Oral

Within reserach project NMsee - a cooperation between the federation of the blind and visually impaired and the Neanderthal Museum in Germany - an inclusive mobile game on Neanderthals was developed in the last 3 years. "Neanderthal: Memories" offers museum visitors a new, accessible and playfull form of access to explore our past.

The game copies simple screenreader gestures and audio game mechanics in order to guide visitors trough Neanderthal Museum. The main character of the game, the Homo sapiens-Ice-Age huntress Nami, remembers her last journey with her adolescent son Lemminki, together with the strange encounters and difficult decisions they made along the road. As they proceed on their way to the family's new camp, both Lemminki and the player learn more about their ancestors, the mysterious "elders" (our modern-day Neanderthals) and the Ice Age way of life.

Whilst game design & development was done by specialized companies, the narrative design of Neanderthal: Memories was done by project leader Riethus. This talk presents the game narrative and adresses the advantages and difficulties when writing a solely audible game story about our favorite ancestors - the Neanderthals. Furthermore, the potential of (audio) games as informational museum media is put out for discussion.

B. LONG DISTANCE RAW MATERIALS IN THE MIDDLE PALAEOLITHIC OF NORTHERN HUNGARY: NEANDERTHALS OR ANATOMICALLY MODERN HUMANS, WHO DID WHAT?

**Abstract author(s):** Mester, Zsolt (Institute of Archaeological Sciences Eötvös Loránd University; UMR 7194 HNHP CNRS/MNHN/UPVD, Equipe NOMADE, Paris) - Lamotte, Agnès (UMR 8164 HALMA CNRS, University of Lille)

**Abstract format:** Poster

Studies dealing with the procurement and circulation of raw materials during the Middle Palaeolithic tend to demonstrate that Neanderthals used raw materials from local and regional sources. In Western Europe, the distance of the sources rarely exceeded 25–30 km from their settlements. It has also been demonstrated that the use of long distance raw materials increased during the Upper Palaeolithic by Anatomically Modern Humans (AMH). In Eastern Central Europe, the distances of the sources are usually higher in both periods. The case of Northern Hungary provide an interesting situation for the study of the procurement problem. The region is rich in siliceous rocks (limnosilicites, quartz-porphry, silicified rocks) of different abilities for knapping, but good quality raw materials (radiolarite, flint) are almost lacking. Sources of these latter are located at around 200 to 400 km, mainly outside the Carpathians. However, the use of extra-Carpathians raw materials was reported in Middle Palaeolithic context. During new excavations at Sajóbáony open-air site (dir. A. Lamotte & Zs. Mester, 2019-2022) the eponymous of the Middle Palaeolithic Bábonyian industry, artefacts made of flint from Poland have been discovered in archaeological contexts. They are blades, crested-blades and ordinary flakes, scrapers and end-scrapers. As demonstrated in France in the 1990s and later in other part of Europe and Africa, these artifacts can also be produced by Neanderthals. Taking into account the archaeological context of this specific raw material, the question could be posed: Neanderthals or AMH, who did what?

**Abstract author(s):** Lamotte, Agnes (University of Lille) - Mester, Zsolt (University of Budapest) - Ringer, Arpad (University of Miskolc)

**Abstract format:** Poster

In the study of a lithic assemblage, the fractured pieces are just as important as whole or unbroken artifacts. When we devote time to the source of the artifact fracture in an assemblage, we are trying to determine between typology, technology, quality of traw materials but also the skill or cultural legacy of the Neanderthals. The relevant criteria in our study are based on the morphology of the fractures (rectilinear, angular, convex, concave, mixed and irregular), the direction of the fracture (transverse, parallel, oblique), and where on the tool the fracture is located. Similarly, significant progress has been made on the fracture hypothesis: whether fracture resulted from poor quality of the raw materials undetectable before shaping, use by flexion, clumsiness of the knapper or voluntary anthropic fracturing. Whatever the fractures are, they leave waves very specific to each situation. By analysing fracture patterns and other typological, technological and techno-economic characteristics, we are able to measure the relative frequencies of these 3 consequences : fracture as a result of poor quality raw material, fracture through use, or deliberate, intentional fracturing by man as a cultural criteria. We apply this analysis/method to the site of Sajóbáony (eponymous site of the bábonien) where whole leafpoints are present as well as numerous broken leafpoints (excavations of 1986-87-1991 (dir. A. Ringer, Ringer & Adams, new excavation of 2019-2022 A.Lamotte & Zs. Mester). About 50 pieces help us to build our demonstration of fracture pattern, with a special focus on whether intentional fracture is a legacy of neanderthals from Central Europe.

501 WIDENING THE HORIZONS OF ARCHAEOLOGICAL METALWORKING STUDIES - ARCHAOMETALLURGY@EAA, PART 2

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Wärmklärer, Sebastian (Dept. of Archaeology and Classical Studies, Stockholm University; UCLA/Getty conservation programme, Cotsen Institute of Archaeology, UCLA) - Saage, Ragnar - Roxburgh, Adrian (University of Tartu) - Neiss, Michael (Uppsala University) - van der Stok, Janneke (Metals Inc.; University of Amsterdam)

**Format:** Regular session

Archaeometallurgy is a multidisciplinary field where researchers from different fields come together to answer a range of different questions related to ancient metalworking. In this session we welcome full-length papers on archaeometallurgy that relate to the two main themes of the 2021 EAA meeting, i.e. "widening horizons" and "environment". Large-scale metalworking can have large effects on the surrounding environment, but the local environment – including the locally available resources as well as social environment – may dictate which metal-working activities can be carried out. On a smaller scale, microenvironments and microclimates – in a workshop or in a burial - influence how metal objects are created but also how they deteriorate. Some of the best research on ancient metalworking has been done as collaborations between different disciplines, such as engineering, field archaeology, and social sciences. In order to widen the horizons of archaeometallurgy, we encourage presenters to involve in their research projects novel ideas and methods from other academic fields. The horizons of ancient metalworking can be expanded also by demonstrating long-distance trade networks, or technological similarities between cultures of different time periods or geographic regions. To encourage such comparisons, the papers in this session are not limited to a particular time period or culture. We especially welcome contributions from young researchers.

**ABSTRACTS:**

1 A LOST TECHNIQUE OF ORNAMENTATION FROM 12TH-13TH CENTURY ESTONIA

**Abstract author(s):** Saage, Ragnar - Rammo, Riina (University of Tartu)

**Abstract format:** Oral

The cemetery of Kukruse in North Estonia has richly decorated burials dating to the 12th-13th century. A central part of a woman's burial dress included a chain assembly, which is composed of two decorated pins that attach to the dress, and two chain holders that hang from the pins and supported the chain itself. Elemental analysis from the copper alloy chain holders has revealed an ornamentation technique that only preserves in certain depositional environments. In the best cases, the tin-rich decoration layer is corroded on the copper alloy, while the worst examples show no visible traces of it. The most interesting example has a tinned surface with a silver inlay, which is an unknown way of ornamentation that is very susceptible to the environment. Hence, there are two primary questions to answer: what did this technique look like before the artefacts were deposited, and how not to miss the use of this technique.

2 WROCLAW, GDAŃSK- TWO MEDIEVAL HANSEATIC TOWNS. COMPARISON OF THE QUALITY OF PROTECTIVE WEAPONS ON THE BASIS OF THE ARCHAOMETRIC RESEARCH

**Abstract author(s):** Miazga, Beata - Marek, Lech (University of Wroclaw)

**Abstract format:** Oral

Mail and brigandine, as universal forms of body protection, often recycled and reused over long periods of time, are not unusual finds in medieval towns. Small scraps of mail and single brigandine plates, which are the most common, could have been lost during tailoring or repairs of armor. Although modest in size, their careful archaeometric analysis gives us invaluable insights into everyday activities of our ancestors, their customs, prevailing fashions and, above all, their technical culture (in terms of raw materials and the technology). The quality of these items varies. If we take mail as an example, it turns out that not only is it made of wire or sheet metal, riveted or not, but most of all it has different properties, including hardness - a parameter very important not only from a functional point of view, but also in ascertaining the age of a given mail fragment. So the question is whether the quality of mail is an accident or a conscious activity of the craftsman? This presentation will be an attempt to resolve this issue. The results of archaeometric research on elements of armor, obtained during archaeological investigations in Wrocław and Gdańsk will be shown. The data from the microscopic studies in visible light and SEM, microhardness tests or spectrometric analyzes (ED-XRF, EDS) will be discussed. The other important fact is that most of the artifacts were conserved before sampling, which also affects the results obtained.

3 TIME MACHINES; A PXRF EXPLORATION OF COPPER-ALLOY OBJECTS FROM THE STONE ENCLOSURE GRAVES OF NORTH-EAST ESTONIA (C.200BC-200AD)

**Abstract author(s):** Roxburgh, Marcus Adrian (Tartu University)

**Abstract format:** Oral

Rome had been a republic for over 500 years before Augustus became its first Emperor in 27 BC. In Estonia, in the North Eastern reaches of the Baltic, this period is still defined as the Pre-Roman Iron-Age, a period of time and geographic space set aside from

797

the intensifying “Roman” world far to the south. For Estonia, the Roman Iron-Age only begins in the middle of the 1st Century AD, with a change that is traditionally defined by a surge in imported objects being deposited in the regions communal stone enclosure graves. This period also coincides with the ‘Roman industrialisation’ and widespread distribution of brass, a new type of copper-alloy containing zinc. A great many of the new objects in these graves were made of copper-alloy and as these objects tend to survive rather well in the archaeological record, they have received much typological attention. But for these objects, especially for those recovered in the cemeteries of the Eastern Baltic, the nature of the raw material choice is less well understood. This short talk presents an innovative use of pXRF, whereby copper-alloy artifacts from well documented graves are qualitatively sorted into basic categories, in turn allowing for innovative new geo-temporal analyses.

4 „THE ITALIAN CONNECTION“ – LONG DISTANCE METAL EXCHANGE BETWEEN THE SOUTHEASTERN ALPS AND THE WESTERN BALKAN DURING THE 2ND MILLENNIUM BC

**Abstract author(s):** Mehofer, Mathias (Vienna Institute for Archaeolgical Science, University Vienna) - Gavranović, Mario (Austrian Archeological Institute, Austrian Academy of Sciences)

**Abstract format:** Oral

In the last decades numerous archaeological and archaeometallurgical publications focused on the examination of copper ore deposits, slags and metal artefacts in order to investigate the copper exchange systems during the Bronze Age. In this context, the Balkan peninsula with its rich copper ore deposits delivered remarkable new insights into the beginning of metallurgy during the Copper Age. Unfortunately, for the Bronze Age one has to state that there was a lack of such systematic analytical research in the region. This lecture will present new archaeometric data, which was obtained within the research project “Bronze Age metal producing societies in western and central Balkans” (FWF, pr. no. P32095). Ores, slags and approximately 560 copper and bronze samples from Bosnia-Herzegovina, Serbia, Northern Macedonia and Croatia. were investigated by chemical (SEM-EDS, ED-XRF, XRD) and lead isotope analyses (MC-ICP-MS). Special emphasis was laid on the examination of the exchange networks that provided copper for the local workshops during the 2nd millennium BC. Our analyses confirmed the production of copper around 1800 calBC near Bor in Eastern Serbia and the use of this metal in regional casting workshops. During the Middle and Late Bronze Age the picture changes fundamentally. Now, copper with a geochemical signature comparable to the South Eastern Alpine mining regions (Trentino) became the dominate metal in the analysed ingots and finished products. How the underlying metal exchange systems which are centered around the mining regions e.g. in the Alps, the Slovakian ore mountains as well as the Mediterranean are interwoven and which role the copper ore deposits in the Eastern Alps played for the metal consumption on the Balkan peninsula will be in the focus of the presented archaeological research.

5 SHIFTING NETWORKS AND MIXING METALS: CHANGING METAL-TRADING ROUTES TO SCANDINAVIA CORRELATE WITH NEOLITHIC AND BRONZE AGE TRANSFORMATIONS

**Abstract author(s):** Noergaard, Heide (Moesgaard Museum, Department of Archaeology; Aarhus University, School of Culture and Society) - Pernicka, Ernst (Curt-Engelhorn-Centre for Archaeometry, CEZA) - Vandkilde, Helle (Aarhus University, School of Culture and Society)

**Abstract format:** Oral

550 metal analyses shed decisive light on how the Nordic Bronze Age was founded on metal from shifting ore sources in correlation with altered trading routes. It was shown that an on-and-off presence of copper characterised the Neolithic. A continuous rise in metals to southern Scandinavia began around 2100-2000 BC. First, high-impurity metal from the Austrian Inn Valley and Slovakia arrived via central German Únětician hubs complemented by high-tin British metal allowing for early local production of tin bronzes. Metal growth locally fuelled leadership competitions visible in the metal-led material culture.

The Únětice downfall 1600 BC resulted in raw materials shortage during a short period visible in the reuse of existing resources; however, brought direct Nordic access to the Carpathian Basin. This expedited metalwork innovations, relying on chalcopyrite from Slovakia and the opening of new sources in the eastern Alps along an eastern route, also bringing Baltic amber as far as the Aegean. During this period, British metal played a central role. Finally, from c.1500 BC British copper had ceased while the predominance of novel north Italian copper coincides with the full establishment of the NBA and highlighting a western route connecting the NBA with the southern German Tumulus culture and the first trans-Alpine amber traffic.

This presentation will lead you through the scientific and archaeological analyses behind the presented results concerning the metal trading networks that promoted the Nordic Bronze Age’s establishment to its peak around 1300 BC. A threefold approach, using source-critical artefact classification analyses, trace-element analyses, together with and lead-isotope analyses, allowed to create a realistic assumption regarding the alliances and networks around the metal trade towards Scandinavia.

6 COPPER PRODUCTION AND TECHNOLOGY AT THE MID-LATE BRONZE AGE TALDYSAI WORKSHOP (KAZAKHSTAN): ITS PLACE IN THE WIDER EURASIAN METALMAKING FRAMEWORK

**Abstract author(s):** Calgaro, Ilaria - Veronesi, Umberto (Institute of Archaeology, University College London) - Yermolaeva, Antonina (Margulan Institute of Archaeology) - Radivojević, Miljana (Institute of Archaeology, University College London)

**Abstract format:** Oral

Second millennium BC Eurasian copper extractive metallurgy is widely assumed as large-scale and standardised, with its highest technological peak reached during the Mid-Late Bronze Age. Present-day Kazakhstan and Southern Urals host among the richest polymetallic ore deposits of Eurasia, massively exploited since the Early Bronze Age by the Steppe pastoralist communities. The metallurgical workshop of Taldysai in the steppes of central Kazakhstan was one of these production centres and represents the focus of this study. Extensive evidence of metalmaking has been unearthed at this site, including complex smelting furnaces, production debris, mining and beneficiation tools and finished metal artefacts.

Out of these, seven copper smelting slags were chemically and microstructurally analysed by Optical and Energy Dispersive Scanning Electron Microscope and provided a first insight into the multi-step metallurgical chaîne opératoire carried out onsite. Then, in order to test the estimated uniformity of Mid-Late Bronze Age copper extractive metallurgy, data collected from Taldysai were integrated with a comparative reference database of thirteen coeval metalmaking sites located between Eastern Alps and Central China and analysed through multivariate statistics in form of principal component analysis (PCA) and ternary diagrams. Chemical data were interpreted paying attention to the function of the comparative sites entered in database, i.e. extractive centres, workshops, settlements.

Overall, this study sheds light on the metallurgical process carried out at Taldysai and presents preliminary elements to fit in the wider second millennium BC narrative. Results highlight how specific choices dictated by local/regional-scale inventiveness, the exploitation of different mineral ores and the technological solutions adopted by Bronze Age metalsmiths determined variations in smelting steps, technological parameters and efficiency of copper production across Eurasia.

7 COPPER AND TIN BRONZE METALLURGY AT THE LATE BRONZE AGE SITE OF SEMIYARKA (KAZAKHSTAN)

**Abstract author(s):** Amirova, Saltanat (McDonald Institute for Archaeological Research, University of Cambridge) - Radivojević, Miljana (Institute of Archaeology, UCL) - Mertz, Ilya (S. Toraighyrov Pavlodar State University) - Lawrence, Dan (Archaeology Department, Durham University) - Mertz, Victor (S. Toraighyrov Pavlodar State University)

**Abstract format:** Oral

Copper and copper alloys, especially tin bronze, played a crucial role in the development of the Eurasian Steppe region during the Bronze Age. Tens of thousands of copper and tin bronze artefacts have been found in the region, however, the vast majority originated from the burial complexes. Here we present the unique case of Semiyarka, a large mid 2nd millennium BCE settlement located in east Kazakhstan, with evidence for copper and tin bronze production. A recent survey confirmed the distribution of dwelling and materials debris across c. 100 ha, and included more than 40 remains of various metallurgical processes on this site, the analysis of which are presented here.

We conducted microstructural and compositional analysis of copper ores, crucible slags, metal debris and finished artefacts in order to characterize the nature of metal making processes on this site, infer their potential scale and finally, learn about the organisation of production. The highlight of our results is detecting six crucibles for tin bronze making, alongside copper production, the combination of which has not been identified anywhere in the settlement archaeology of the Bronze Age of Eurasian Steppes. We also suggest potential resources for copper and tin exploitation, alongside routes for trade and exchange of metals during the stated period in east Kazakhstan, and across the steppes.

8 NEW INSIGHTS INTO THE MANUFACTURE OF HIGH-LEADED BRONZE PALSTAVES THROUGH EXPERIMENTAL CASTING AND NEUTRON TECHNIQUES

**Abstract author(s):** Armada, Xose-Lois (Institute of Heritage Sciences - Incipit, Spanish National Research Council - CSIC) - Arcidiacono, Laura (ISIS Pulsed Neutron and Muon Source) - Comendador, Beatriz (Grupo de Estudos de Arqueoloxía, Antigüidade e Territorio, Universidade de Vigo) - Faro, María G. (Institute of Heritage Sciences - Incipit, Spanish National Research Council - CSIC) - Lackinger, Aaron (Grupo de Estudos de Arqueoloxía, Antigüidade e Territorio, Universidade de Vigo) - Martínón-Torres, Marcos (Department of Archaeology, University of Cambridge) - Silva-Sánchez, Noemí - Sureda, Pau (Institute of Heritage Sciences - Incipit, Spanish National Research Council - CSIC)

**Abstract format:** Oral

Bronze palstaves are the most abundant metal object in the northwestern Iberian Peninsula during the Late Bronze Age and the transition to the Earliest Iron Age. They usually occur in isolated hoards and many of them contain high quantities of lead and have morphological features (such as the presence of the casting jet) that are incompatible with their use as ‘functional’ tools or weapons.

Some of these palstaves have massive lead cores, which show a spherical shape in the casting sprue. Two hypotheses have been suggested to explain this phenomenon: 1) the intentional casting of pure lead inside a bronze casing; and 2) massive lead segrega-

tion during solidification. As the production and hoarding of these palstaves may have strong social implications, the analysis of this issue matters not only from a technological perspective.

An ongoing research project, “Mass production and deposition of leaded bronzes in Atlantic Europe during the Late Bronze Age - Iron Age transition” (ATLANTAXES), focuses on these high-leaded palstaves dealing with issues such as technology, metal provenance and hoarding patterns.

This contribution introduces some of the experimental and analytical work carried out within the project, aiming a better understanding of the manufacturing process of these palstaves. On the one hand, a non-invasive characterisation through neutron tomography and radiography, prompt gamma activation analysis and neutron diffraction of one of these palstaves at the ISIS Pulsed Neutron and Muon Source (Oxfordshire, UK) provides unique insights about the bulk of this object. On the other, experimental casting under laboratory conditions allows a better understanding of the factors that determine the internal structure of these palstaves, suggesting that their lead cores are massive lead segregations resulting from high-leaded ternary alloys. Finally, the paper also discuss the advantages of combining such analytical and experimental approaches.

## SHIFT IN THE ELEMENTAL COMPOSITION OF COPPER ALLOYS AND METALWORKING TRADITIONS IN LITHUANIA IN THE FIRST MILLENNIUM AD

**Abstract author(s):** Bliujiene, Audrone (Klaipėda University, Institute of Baltic Region History and Archaeology) - Bagdzevičienė, Jurga (Klaipėda University, Institute of Baltic Region History and Archaeology; Lithuanian National Museum of Art, Pranas Gudy-nas Centre for Restoration) - Petrauskas, Gediminas (Klaipėda University, Institute of Baltic Region History and Archaeology; National Museum of Lithuania) - Vybernaitė-Lubienė, Irma (Klaipėda University, Institute of Baltic Region History and Archaeology; Klaipėda University, Marine Research Institute)

**Abstract format:** Oral

The elemental analysis of copper alloy composition of almost 2,000 artefacts recovered from 151 find spots dated to the first millennium AD was performed in Lithuania between 2019 and 2020. The samples for the analysis were obtained from the surface and core of the artefacts. They were examined with the aid of portative and stationary X-ray fluorescence (XRF) devices, as well as the inductively coupled plasma mass spectrometry (ICP-MS) method, using certified reference materials (CRM) and standards. The samples, drilled both from the surface (patina) and metal core of the finds, were analysed through the ICP-MS method. The XRF and Energy dispersive X-ray fluorescence (EDXRF) methods were employed for studying the surface of the finds, as well as shavings of the metal core and alloys compressed into tablets were also taken into analysis. The obtained results were normalised and further analysed by using simple descriptive and multidimensional statistics. The performed analyses enabled the classification of copper alloys into basic alloy groups, i.e. brass, gunmetal, leaded gunmetal, bronze, etc. Furthermore, shift in the composition of copper alloys was evaluated in regards to chronology. The distribution of copper alloys revealed certain regional differences, which led to considerations of different directions of exchange that could have been used to source raw metal. The obtained results allowed a more accurate description of corrosion processes (such as the formation of lead on the surface of artefacts), metalworking tradi-tions (e.g., tinning of the surface), whereby the surface is not visible due to being entirely covered by corrosion. The shifting elemen-tal composition of copper alloys is associated with changes in the sources of raw material, exchange routes, and development of metalworking technologies.

## METALLURGICAL ANALYSIS OF IRON BARS FROM BALTIC SEA SHIP WRECKS

**Abstract author(s):** Wärmländer, Sebastian (Stockholm University)

**Abstract format:** Oral

Iron and steel, in different stages of refinement, has been a major Swedish export good since at least the Viking Age. However, the different iron manufacturing processes employed in Sweden from the Viking Age to the modern era are not fully understood. Nor is it fully known what kind of iron qualities were exported during the centuries. Iron from cargo ship wrecks, which preserve well in the Baltic Sea, is an important source for understanding the history of iron production and iron trade in Sweden and the larger Baltic region. Here, we present the analysis of different kinds of iron, such as Osmund iron and bar iron, excavated from Baltic ship wrecks dating to the 16th and 17th centuries. The analytical results increase our understanding of the iron manufacturing technology used in these centuries, and the results are interpreted in relation to the changing patterns of iron trade during this period.

11

## IRONWORKING AT THE SCYTHIANS

**Abstract author(s):** Zavyalov, Vladimir - Terekhova, Nataliya (Institute of Archaeology, Moscow)

**Abstract format:** Oral

The Scythian period (7th-3th cc. BC) occupies a special place in the history of iron production in Northern Eurasia. It was the time when the local population started using iron in everyday life. In the context of overall iron production development, transition of nomadic steppe population to a sedentary lifestyle played an important part. The Kamenskoe hillfort is the most outstanding center in steppe Scythia of that time. It was a permanent settlement of settled metalworkers in the country of the Scythian nomads. More than 80 items (knives, sickles, chisels, awls, etc.) were examined by archaeometallographic method. These studies provide an insight into the process of the blacksmith craft development among nomadic groups during this transition to sedentary life. The results suggest that in the 5th-4th centuries BC highly developed craft centers appeared in steppe Scythia. These centers served

as a stable source of blacksmithing products of the Scythian population. The obtained data demonstrate that contacts between nomads and population groups which possessed technological knowledge played a key role in this process.

12

## FROM THE ASHES: UNPRECEDENTED ARCHAEOMETALLURGICAL INVESTIGATIONS IN NOTRE-DAME-DE-PARIS FOLLOWING THE FIRE

**Abstract author(s):** L’Héritier, Maxime (Université Paris 8 - ArScAn UMR 7041) - Azéma, Aurélia - Syvilay, Delphine (Laboratoire de Recherches sur les Monuments Historiques) - Delqué-Kolic, Emmanuelle (Laboratoire de Mesure du Carbone 14 - LSCE) - Ivan, Guillot (Université Paris Est Créteil - ICMPE) - Sarah, Guillaume (IRAMAT CNRS UMR 5060) - Baron, Sandrine (TRACES CNRS UMR 5608) - Dillmann, Philippe (Laboratoire Archéomatériaux et Prévision de l’Altération : LMC IRAMAT UMR5060 CNRS et NIMBE UMR3685 CEA/CNRS)

**Abstract format:** Oral

Metallic structures are omnipresent in medieval great stone monuments. The newly opened restoration yard in Notre-Dame-de-Paris following the 15th April 2019 fire gives a unique opportunity to question the evolution of practices related to these metals over the centuries: quality and use for construction, provenance, recycling... This contribution aims to present the research themes and first results of the “Metal workgroup” of Notre-Dame-de-Paris scientific program coordinated by French National Research Centre and Ministry of Culture.

On the one hand, the restoration works reveal various iron cramps, chains and series of hitherto unknown iron armatures. Their archaemetallurgical study enables to clarify their role in the structure of the building, their chronology, but also their quality and origin, enlightening the builders choices builders and the ancient supply circuits. More than 30 iron cramps and pins coming from diverse parts of the masonry (tribunes, upper walls...) or collected in the archaeological remains of the burnt framework were sampled and analysed by metallography. Slag inclusion were analysed by SEM-EDS to study the production processes and by LA-ICP-MS to look for iron provenance. Eight samples were also submitted to tensile tests to determine their mechanical behaviour. At last, ten arte-facts were radiocarbon dated, revealing the use of iron as early as the 1160’s, almost 50 years before the earliest examples known so far for such monuments.

On the other hand, the research focuses on the different uses of lead (covering, decoration, sealing...) and on the practices of crafts-men according to the period. The identification of the different sources of lead and recycling practices is conducted by means of elemental (LA-ICP-MS) and isotopic analyses (MC-ICP-MS) of more than 300 lead samples coming from lead joints still in place and from the remains of the spire and the roof.

13

## USE OF COAL IN FLEMISH FORGES DURING LATE MIDDLE AGES

**Abstract author(s):** Jagou, Benjamin (INRAP; UMR 5060 IRAMAT - LMC; UMR 7041 ArScan TranSphères)

**Abstract format:** Oral

For some time now, many operations of preventive archaeology have been conducted in the former territory of the County of Flan-ders. These have often allowed to discover traces of metalworking. Studies related to these late Middle Ages metallurgical spaces showed that these crafts used coal. Moreover, these studies revealed that this particular use led to specific slags. Afterwards, the first researches could determine that this early use was caused by a lack of wood in this territory. This period is known for its exten-sive economic and demographic growth. Indeed, this expansion led to open the landscape widely in order to gain some new farming and housing areas. Then, this brought about a shortage of forest resources and a price inflation, which forced craftsmen to choose another fuel. At this time, the English territory took a leading role in the spread of coal in Flanders. In fact, the English people had been confronted with a lack of wood earlier, so they had to use coal soon, considering that this fuel was abundant in their territory. More-over, this transition was facilitated by numerous exchanges between Flemish and English cities, particularly related to wool trade.

The use of coal had few impacts on the forge technical processes, nevertheless its combustion had many undesirable effects. Indeed, noxious smoke and bad smells produced by urban workshops had led to regular conflicts between the craftsmen and their neighbours. Therefore, the urban network of these Flemish cities was modified: blacksmiths had to move their workshops to sub-urban areas.

14

## COMPARISONS OF CHEMICAL COMPOSITIONS AND MICROSTRUCTURES OF SLAGS RECOVERED IN RECENT ARCHAEOLOGICAL EXCAVATIONS IN THE ROGALAND REGION, NORWAY

**Abstract author(s):** Gebremariam, Kidane (University of Stavanger)

**Abstract format:** Oral

A number of slag and slag-like materials were recovered in recent archaeological excavations in the Rogaland region of Norway. Attempts are made to determine the compositions of these materials and characterize their micro-structural features. Such inves-tigations, among others, help to identify whether the slag materials are associated with smelting or smithing activities. In the case of smelting slags, information about the nature of the ores and other raw materials utilized can be acquired along with the conditions under which the slags were produced. Manganese appears to be the most commonly element associated with the smelting slags acquired from different excavation sites. Could this element be used as a marker to iron ore sources available in this particular re-gion? Some micro-structural characterizations and elemental microanalyses are conducted to trace the distribution of this element

METALWORKING OF THE YENISEI KYRGYZ OF THE US RIVER VALLEY BASED ON RESEARCH MATERIALS OF IRON TOREUTICS AND SMITH TOOLS

**Abstract author(s):** Davydov, Roman (Humanities Research Laboratory, Novosibirsk State University) - Kuleshov, Dmitry (Institute of Archaeology and Ethnography SB RAS)

**Abstract format:** Oral

The metalworking of the nomads has a number of peculiar features. The study of smithing and jewelry of medieval nomads allows us to fix the specifics of their production in the conditions of mobile life in steppes of Eurasia. Mass material is of great interest. It contains information on trends in blacksmithing and jewelry. For the culture of the Yenisei Kyrgyz (Southern Siberia, VI-XIV centuries AD), this is toreutics.

The object of the study was iron toreutics with silver inlaid from the burial sites of the Yenisei Kyrgyz in the Us river valley (south of the Minusinsk Basin). This is a local group of burials of the X-XII centuries AD.

A total of 142 things were studied using the technological-traceological method, 4 technological schemes were reconstructed. The gradual development of technology with the optimization of techniques is revealed. The items were made by a group of craftsmen, including apprentices.

The results of the analysis of the elemental composition of silver and iron (104 samples) showed that artisans used metals from the Minusinsk Basin and from the Tuva. At the same time, there was a secondary processing of material, the use of scrap.

Additionally, metalworking tools of the Yenisei Kyrgyz have been research in the museum collections. These are compact items for use in a mobile workshop, include multi-functional tools.

The workplace of the Usinsk Kyrgyz metalworkers is a mobile workshop with some craftsmen, including apprentices. They used small and versatile tools, and the costs were extremely rational, with recycling. Such a reconstruction has parallels with ethnographic data on nomadic metalworkers.

The study was supported by a grant from the Russian Science Foundation (project No. 20-18-00111). The analysis of the elemental composition was carried out within the framework of the State assignment in the field of scientific activity No. 0329-2019-0008.

A.

BRONZE AGE METAL: METALLOGRAPHIC AND ISOTOPE ANALYSES OF BRONZE WEAPONS FROM BOHEMIA, MORAVIA AND SW SLOVAKIA

**Abstract author(s):** Havlíková, Markéta (Masaryk University)

**Abstract format:** Poster

The aim of this poster is to demonstrate the application of modern metallographic analysis on Bronze Age metal weapons from Bohemia, Moravia and SW Slovakia. My research focuses on their functional properties, as well as questions of their production and provenance. If we want to understand the social and economic role of Bronze Age weapons, then data acquired with the help of archaeological science are of tremendous importance. My analysis is based on the combination of optical and scanning electron microscopy in the modern metallography analyses (SEM/EDS, p-XRF, X-ray etc.), use-wear analysis and lead isotopes analysis (MC-ICP-MS method). The results of a research sample of data from this area will complement the international research data network and permit the clarification of these issues in the Czech Republic. The aim is also to obtain a comprehensive source of data for further research and discussion of Bronze Age material culture in Europe.

TOWARDS AN INCLUSIVE FUTURE: A STRATEGY FOR ROCK ART RESEARCH, MANAGEMENT AND SOCIAL VALUE

**Theme:** 6. Material culture studies and societies

**Organisers:** Valdez-Tullett, Joana (Historic Environment Scotland) - Figueiredo, Sofia (University of Minho) - Barnett, Tertia (Historic Environment Scotland) - Botica, Natália (University of Minho)

**Format:** Discussion session

Rock art is at the heart of passionate debates which often relate to identity, ancestry or political claims. The associated lore which survives in many countries demonstrates its active role in people’s ontologies until recent times. On the other hand, only in the last three decades has rock art become the subject of more scientific approaches, and it still does not feature comfortably within wider historical and archaeological narratives. There is a dichotomy in the relationships with rock art between heritage sector professionals and communities. In fact, in some cases, due to claims for preservation, local communities have been barred from accessing their local rock art.

In this session we will introduce UNESCO’s 5Cs’ – Credibility, Conservation, Capacity-building, Communication, Communities - to explore models of research, management, outreach and public engagement with rock art of various chronological and geographic scopes. We are interested in hearing and discussing projects that have or are currently implementing inclusive strategies to research rock art whilst promoting community engagement and social value, in view of long-term safeguard, preservation and man-

agement. We also welcome contributions that discuss contemporary issues that affect rock art on a daily basis such as restricting physical and knowledge accessibility, climate change, rapid changes to modern land use, and the role of digital recording techniques as methods for preservation and outreach.

ABSTRACTS:

1

INTRODUCTION

**Abstract author(s):** Valdez-Tullett, Joana (Historic Environment Scotland)

**Abstract format:** Oral

The “Towards an Inclusive Future: A Strategy for Rock Art Research, Management and Social Value” session originated from the realisation that, as researchers, we face many obstacles when dealing with rock art, regardless of its type, tradition or chronology. From the issues with safeguarding and conservation, to management, research, public engagement and social value there are a number of elements that are common to a variety of projects being developed in several countries.

In this Introduction slot, we will have a short presentation of the session and explain why we thought about it, and which are the issues that we are more concerned about. We will set out out the main goals and objectives for the day, carrying our a short introduction of our speakers.

Since this is a discussion session, we will outline some thoughts and ideas that may be useful for the debate, which are relevant for all contributions.

2

ROCK ART DATA SHARING TOWARDS A MORE INCLUSIVE KNOWLEDGE

**Abstract author(s):** Botica, Natalia (Universidade do Minho; Lab2PT; Unidade de Arqueologia) - Figueiredo, Sofia (Universidade do Minho; Lab2PT) - Magalhães, Fernanda (Universidade do Minho; Lab2PT; Unidade de Arqueologia)

**Abstract format:** Oral

The access to rock art data, whether for scientific research, management issues, dissemination or to raise interest of a wider public and involvement of local communities, implies the collection of data into open repositories. By doing so, we set the ground for up-to-date interpretations among the scientific community through new analysis and visualization tools, as well as for their reuse in other areas such as cultural and creative tourism. However, to produce FAIR data (Findable, Accessible, Interoperable and Reusable), they must obey certain guidelines that include the use of an appropriate metadata scheme, persistent identifiers, well-defined vocabularies, sustainable file formats, as well as procedures that standardize and improve the quality of data. Taking these principles into account, we aim to present the developed methodology for the RARAA project. The RARAA project intends to do the survey of four sites with impressive Iron Age rock art, all located in the Côa Valley, classified as World heritage since 1998.

3

TREASURES OF THE DESERT: VALUE OF COMMUNITY ENGAGEMENT IN ROCK ART MANAGEMENT WITHIN THE WADI RUM PROTECTED AREA, JORDAN

**Abstract author(s):** Groom, Kaelin (Stone Heritage Research Alliance LLC; Arizona State University) - Al-Noaimat, Saleh (Wadi Rum Protected Area)

**Abstract format:** Oral

In 2017, the Community-Based Rock-Art and Epigraphic Recording (CB-RAER) Project, funded through the USAID-SCHEP program, completed several interrelated goals in the Wadi Rum Protected Area (WRPA). Besides providing an effective monitoring program for this World Heritage site via smartphone-based GIS data-collection using the Rock-Art Stability Index (RASI), the project combined Jordanian and foreign CB-RAER team leaders’ expertise with data gathered during field surveys to create the Rock-Art Rangers (RAR) program, expanding local guides’ knowledge and skillsets. Upon successful completion of this program, tour guides were accredited as Rock-Art Rangers and as guides qualified to offer enhanced tours that focus on the region’s rock-art heritage. As more tourists seek out new experiences in Wadi Rum that go beyond its spectacular natural heritage, this RAR accreditation will become ever more important for local guides. Now several years later, the area is still reaping the longer term benefits of local engagement in rock art management, research, and promotion of the region—as will be shared in this presentation.

4

**THE PREMEDIA PROJECT: A CROSS-BORDER STRATEGY FOR ROCK ART PAINTINGS IN A CROSS-BORDER REGION (SPAIN-PORTUGAL)**

**Abstract author(s):** Rey, Beatriz Pilar (GEAAT - Group of Studies of Archaeology, Antiquity and Territory, University of Vigo; GIDEP - Group of Educational Innovation in Heritage Education, University of Vigo) - Estévez, Benito (GEAAT - Group of Studies of Archaeology, Antiquity and Territory, University of Vigo; GIDEP - Group of Educational Innovation in Heritage Education, University of Vigo; Árbore Arqueoloxía e Restauración S. Coop) - Rey, Fátima (Cultural Anthropology Area, University of Vigo) - González, Manuela Elizabeth (Group PE4 Images and Contexts, University of Vigo)

**Abstract format:** Oral

The northwest of Iberia is a particular region due to the convergence of different types of rock art traditions, like engraved Atlantic Art and painted/engraved Schematic Rock Art. Furthermore, during the past three years several sites with prehistoric paintings were found in the inner part of Galicia (Spain) at the archaeological sites of Lobarzan (Monterrei, Ourense) and Penedo Gordo (Vilardevós, Ourense) which were discovered by locals, linked to the cultural networks of the region. The University of Vigo has coordinated the research of these sites, within the framework of collaboration agreements.

Due to their singularity, the identification of these two archaeological sites with schematic paintings in the valley of Monterrei in the cross-border area between Galicia /Tras-os-Montes (Portugal), represents a milestone in the literature of Galician Rock Art. However, it also poses significant challenges in terms of their preservation, research and management, due to their location in a depopulated region, with strong aging demographics and affected by a predatory model of land management.

The PREMedia project undertook a number of varied actions including the design of virtual visits, incorporating interpretative resources, and an innovative experience in the use of artistic illustration and animation. Also, the joint collaboration between Prehistory (Arts and Humanities) and Social and Cultural Anthropology (Social Sciences) in the development of this project, opens a new line of work focused on social aspects by involving the local people. An innovative ethnographic approach to the surroundings of the sites enables a more realistic approximation to the interests and needs of the local communities. Finally, it highlights the need for more direct communication and engagement with the local population.

5

**AN EMPTY STOMACH HAS NO EARS: PROJECT TO INVOLVE DOURO VALLEY LOCAL COMMUNITIES IN THE IRON-AGE THROUGH ROCK ART HERITAGE**

**Abstract author(s):** Figueiredo, Sofia (Lab2PT, Universidade do Minho) - Silva, Andreia - Maciel, José (Independent Researcher) - Figueiredo, Elin (CENIMAT/i3N - Centre for Materials Research, Universidade Nova de Lisboa) - Galarza, Javier (Lab2PT, Universidade do Minho) - Borges, Adriano (Departamentos de Ciências da Comunicação e de Sociologia, Universidade do Minho) - Botica, Natália (Lab2PT, Universidade do Minho; Unidade de Arqueologia, Universidade do Minho)

**Abstract format:** Oral

In 2007, in the frame of the Portuguese national program of dams with high hydroelectric potential, the hydroelectric exploitation of Baixo Sabor was approved. Construction of the dam started in 2009, integrating an ambitious Plan of Heritage Protection, given the great impact on the landscape, which included 3000 hectares to be submerged. The preventive archaeological work, which ended in 2015, uncovered an immense heritage with exceptional findings related to the Iron Age. Two of the major archaeological sites excavated revealed an unknown reality, composed by hundreds of engraved plaques from the Iron Age period, unique in the world. In 2015, scientific studies on these discoveries were initiated at an academic frame. But it was not until 2021, that a first proposal towards the engagement of local communities in the archaeological research materialized. Our aim is to present the first steps of the development of a project involving local communities through a culinary framework, that take into account the archaeobotanical and archeozoological findings as well as the representations in rock art, where wild boars and deer are hunted. A set of recipes will be created based on archaeological information, regional ingredients and the local community's imagination guided by Kitchen chef's expertise. With the support of local restaurants, Iron Age ritual banquets will be recreated. With these actions we do also seek to undertake a critical discussion on the social function of archeology, and possible ways to share scientific knowledge, in a playful way, and very Iberian: with a full stomach!

6

**WORKING TO AN INCLUSIVE MODEL OF DIALOGUE AND CROSS-CULTURAL EXCHANGE: FLUTEPLAYER IMAGERY IN CHACO CANYON, MEXICO**

**Abstract author(s):** Vendome-Gardner, Charlotte (University of Exeter)

**Abstract format:** Oral

The Fluteplayer is a widely recognised figure within Southwestern American rock art, characterised by a figure, anthropomorphic or ambiguous, with a flute being held or played and is characteristic of an Ancestral Puebloan culture who's ideological center was located in Chaco Canyon, New Mexico. Over the past century the Fluteplayer has been miss-interpreted, appropriated and widely commodified as the Kachina Kokopelli, part of a belief system which succeed the Chacoan ideology, and Fluteplayer imagery is now entangled with modern, predominantly western, interpretations of the Kokopelli character, which are subsequently rooted in shamanistic interpretations of fertility. Although the association with Kokopelli has been discredited and widely accepted within rock art research, the propulsion of this character continues on a monumental scale. The universal interpretation of Fluteplayers in this way detracts from the true value of individual and unique imagery and creates the notion of a static culture for the Native American

people. This discussion will present current PhD research and will discuss how the Fluteplayer can be studied to move beyond the stereotypes pertained by the Kokopelli association using a landscape-based approach to establish a context, in Chaco Canyon, and the wider socio- cultural placement of the image in Chacoan society. Specifically, there will be a focus on cross-cultural dialogue. Establishing an open and respectful sharing of knowledge with the descendants of the Chacoans, the Pueblo, a greater understanding of Fluteplayer imagery can be gained and shared within communities, aiding the dismissal of the Kokopelli association and opening up new avenues of research and discussion. It will also highlight the importance of working with Native American people when studying aspects of their culture to aid the long-term management and heritage of rock art sites between two cultures who share a mutual, but sometimes conflicting, interest.

7

**DISCOVERING THE VALUE OF SCOTLAND'S ROCK ART THROUGH DIGITAL CO-PRODUCTION**

**Abstract author(s):** Jeffrey, Stuart (School of Simulation and Visualisation, Glasgow School of Art) - Tertia, Barnett - Bjerketvedt, Linda Marie (Historic Environment Scotland) - Robin, Guillaume (School of History, Classics and Archaeology, University of Edinburgh) - Valdez-Tullett, Joana (Historic Environment Scotland)

**Abstract format:** Oral

Scotland's Rock Art project (ScRAP) is a five year AHRC funded project run by Historic Environment Scotland, the University of Edinburgh and the School of Simulation and Visualisation at the Glasgow School of Art (AH/N00745X/1). At the core of the project is a collaborative endeavour with multiple avocational community groups to enhance the recording of Scotland's Rock Art. Building on the models provided by such projects such as England's Rock Art and others (Barnett 2010, Jeffrey et al 2015), the project has involved significant effort in community capacity building in technical recording approaches such as photogrammetry. Working together with these groups, over 1400 sites (including 200 previously unknown) have been fully recorded, have 3D models made available and details submitted to the National Record of the Historic Environment of Scotland.

Central to the project was the opportunity that the co-production process offers for rapid ethnographic intervention (Pink & Morgan 2013), specifically to capture the multiple strands of contemporary social value associated with Scotland's Rock art. This process looks at the changing values around this type of site during the lifetime of the project as well as the changes to specific sites' significance precipitated by the recording process (Jeffrey et al 2020) and the implications this has for the perceived authenticity of both site and record (Jones et al 2017). This paper will present for the first time detailed outcomes of our analysis of the social value capture element of the ScRAP project through multiple lenses. However, we focus on what changes in value have been revealed by medium term engagement and our longitudinal study of this engagement, as well as the relationship between the wider social benefits of engagement, as identified by the community participants, and the specifics of engaging with rock art in the field and through the record.

8

**PROTECTING, PROMOTING AND TRANSMITTING THE AFRICAN ROCK ART HERITAGE AS A MEANINGFUL TRANS-CULTURAL AGENT**

**Abstract author(s):** Gallinaro, Marina (Dipartimento di Scienze dell' Antichità - Università di Roma La Sapienza)

**Abstract format:** Oral

Rock art is a fragile and threatened heritage. However, being a unique visual archive into the social and symbolic worlds of past human societies can have an emotional impact on the contemporary observers effectively contributing to raising the awareness on specific critical topics:

- the informative value of rock art in the reconstruction of past living societies;
- the challenge to preserve the cultural heritage for future generations;
- the past and present cultural dynamics connected to climate change, and the exchanges and connections between different cultural systems, including migration.

Africa hosts an impressive presence of rock art, widespread all over the continent, of different styles, techniques and age. Up to now, 11 African UNESCO World Heritage sites include rock art, ca. 20 more sites are in the tentative list, more than in any other continent.

This paper aims to trace the main paths that have been followed in different African contexts to connect or re-connect the rock art stakeholders and the local communities, both inside and outside the continent. The balance is not always even, and it shows traits that require careful evaluation, in terms of cultural, political and economic backgrounds. Facts and figures (as far as available) on the impact that the UNESCO aegis has on conservation and sustainable development issues will be discussed, as a stimulus to isolate the best practices to fill the existing gaps.

A particular focus will be placed on the Saharan context of the "Tadrart Acacus rock art sites", one of the first African sites recognized by the UNESCO in 1985 and currently in the Endangered List (since 2016). This research is part of the ASArt-DATA Project (Funded by the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 795744).

**Theme:** 4. Globalisation and archaeology

**Organisers:** Burkhardt, Laura (Institute for Oriental and European Archaeology - Austrian Academy of Sciences; German Archaeological Institute - DAI) - Brunner, Mirco (University of Bern, Institute of Archaeological Sciences, Prehistory Department; University of Bern, Oeschger Centre for Climate Change Research - OCCR) - Laabs, Julian (Institute of Pre- and Protohistoric Archaeology, Christian-Albrechts-Universität zu Kiel; Department of Geography, Physical Geography, Christian-Albrechts-Universität zu Kiel) - Massy, Ken (Ludwig-Maximilians-Universität München, Institut für Vor- und Frühgeschichtliche Archäologie)

**Format:** Regular session

The Bronze Age is a well-researched epoch in most regions of Europe, where strong narratives are built upon rich data sets and mostly top-down theoretical approaches. Those narratives, however, are not going undoubted or undebated and currently a reassessment of the Bronze Age – or Prehistoric – World is ongoing. Influenced by reflexive approaches towards the social interpretation of archaeological data and scientific studies as well as the incorporation of bottom-up approaches this session aims at challenging old narratives about the European Bronze Age.

Widening up perspectives, we would like to bring together a - theoretically, methodologically, geographically and thematically – diverse and interdisciplinary group of researchers to (re)present the broad spectrum of studies and opinions on the Bronze Age.

Within the framework of our integrative and multifaceted approach, we would like to draw special attention to the emerging dynamics that are visible on different spatio-temporal scales, settings and data sets (from site data to big-data, from artefacts to aDNA, between long-durée and adaption of innovation). Hereby, we define dynamics as the effect and interplay of forces over time and space that can be identified from the evidence of archaeological remains – investigating dynamics, as well as their theoretical and methodological exploration, is of our main interest.

Based on case studies from all over Europe dealing with dynamics of and within site occupation sequences, settlement systems, exchange networks, socio-political organisations, economic relations or the ideological framework, we want to explore the often fostered unity/heterogeneity of the European Bronze Age starting from regionally diverse settings. Therefore, we would like to invite especially contributions dealing with demography, mobility, identity, economy, politics and social organisation to discuss with us the identification and scaling of dynamics in the European Bronze Age and their theoretical and methodological investigation and to widen up horizons.

ABSTRACTS:

1 THE YAMNAYA “INVASION” OF EUROPE: THE ARCHAEOLOGICAL DATA AGAINST OLD AND NEW NARRATIVES

**Abstract author(s):** Palalidis, Stefano (Institut für Prähistorische Archäologie, Freie Universität Berlin)

**Abstract format:** Oral

Since its first formulation by Marija Gimbutas in the 1950s, the “Kurgan hypothesis” has seen numerous peaks in popularity and revivals. Though being largely rejected in its original articulation, some scholars have used it as the basis for further studies and partially revised it, ultimately landing to what is nowadays known as the “steppe hypothesis”, which is generally more accepted. The recent introduction of paleogenetic data in the scientific discussion has caused the latest revival of “Gimbutas-was-right-all-along” feelings, especially among the non-specialized audience and mass media. The aim of this paper is not to question the steppe influence that is testified in Bronze Age Europe from a wide array of sources, but rather the emphasis put on its violent nature. Claims of a murderous invasion and even of male genocide have caused great sensation inside and outside the scientific community, yet the actual archaeological data is often underrepresented. The basis for this paper is a dataset of 5704 Yamnaya graves from the Great Hungarian Plain to the Ural Mountains containing detailed information on the grave construction, grave inventories, demographic and radiocarbon data which is used to address general and specific research questions. The archaeological evidence provides scarce indications for violence in the Yamnaya horizon, while suggesting on the other hand a peaceful interaction with local communities in the contact zones.

2 MIKULOVICE – THE ÚNĚTICE FAMILIES IN FOCUS

**Abstract author(s):** Ernée, Michal (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Papac, Luka (Department of Archaeogenetics, Max Planck Institute for the Science of Human History, Jena) - Langová, Michaela (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Massy, Ken (Ludwig-Maximilians-Universität München - LMU Munich) - Friedrich, Ronny (Curt-Engelhorn-Center Archaeometry, Mannheim) - Haak, Wolfgang (Department of Archaeogenetics, Max Planck Institute for the Science of Human History, Jena)

**Abstract format:** Oral

In recent years, archaeogenetics has progressed from continent-wide, broad-scale studies to more targeted and detailed investigations of smaller regions and even single sites and communities. Through the combination of archaeology, anthropology, paleopathology, isotopes, 14C dating and genetics, it is now possible to gain insights into biological kinship structures of local communities

and family networks, both within and between sites. Here we present the results and interpretations of the first detailed interdisciplinary analyses of the rich Early Bronze Age Únětice cemetery in Mikulovice, Eastern Bohemia, Czech Republic. Thanks to rich grave assemblages of the cemetery (e.g. large collections of amber jewellery, bronze and gold artefacts, sea shells, bone artefacts etc.), which were completely analysed and published during the last years, it is also possible to integrate the results of archaeological, bioarchaeological and isotopic research into the more complex picture of the Early Bronze Age local community living and buried on the important long-distance road - the Amber Road.

3 UNLOCKING THE SECRETS OF CREMATED HUMAN REMAINS FROM LATE BRONZE AGE AUSTRIA

**Abstract author(s):** Rebay-Salisbury, Katharina (Austrian Academy of Sciences)

**Abstract format:** Oral

Cremation as a new way of dealing with the dead resulted in large cemeteries with several hundred urn burials in the Late Bronze Age (c. 1300–800 BC). In recent years, scientific advances in osteological sexing, strontium isotope analysis and radiocarbon dating have widened the information value that can be extracted from cremated bones.

The FWF-funded project ‘Unlocking the secrets of cremated human remains’ makes use of these developments and investigates aspects of over 1000 burials from the Lower Austrian Traisen river valley, which came to light through rescue excavations in the late 20th century.

‘Unlocking the secrets’ aims to track social changes through time by establishing a chronological framework that combines artefact-based and radiocarbon dating of selected funerary contexts. People’s geographic origin and mobility will be analysed through isotopes, and better methods of sexing cremated human remains will enable the investigation of gendered mobility and family relations in the Late Bronze Age. Dating burnt and unburnt bones from the same contexts will reveal ritual practices such as delayed deposition and ancestor curation.

This presentation will introduce the new project and aims to discuss the learning potential of linking scientific analysis of cremated human remains with context information.

4 BRONZE AGE SETTLEMENT DYNAMICS IN CENTRAL GERMANY: A CASE STUDY FROM THE WEISSE ELSTER RIVER CATCHMENT

**Abstract author(s):** Miera, Jan (Institute for Pre- and Early History, University of Leipzig; Institute for Pre- and Early History, Friedrich-Schiller-University Jena) - Schmidt, Karsten (eScience-Center, University of Tübingen) - von Suchodoletz, Hans - Ballasus, Helen (Institute of Geography, University of Leipzig) - Werban, Ulrike (Helmholtz Centre for Environmental Research - UFZ) - Fütterer, Pierre (Institute for the History of the Middle Ages, Otto von Guericke University of Magdeburg) - Werther, Lukas (Department of Medieval Archaeology, University of Tübingen) - Zielhofer, Christoph (Institute of Geography, University of Leipzig) - Ettel, Peter (Institute for Pre- and Early History, Friedrich-Schiller-University Jena) - Veit, Ulrich (Institute for Pre- and Early History, University of Leipzig)

**Abstract format:** Oral

The conference contribution focuses on long-term settlement dynamics during the Bronze Age in the immediate catchment of the Weiße Elster river between Leipzig and the German-Czech border in the western Ore Mountains. The study area covers a territory of about 3026 km² and extends over administrative districts of the federal states of Saxony, Saxony-Anhalt and Thuringia. Geographically, it extends from the Northern German Plain into the Central Uplands. The Northern German Plain is characterized by gentle rolling slopes and fertile soils on loess as well as annual average temperatures of ca. 10° and an annual precipitation between 550 and 650 mm. The Central Uplands are marked by a heterogeneous topography with steep slopes, low-yielding soils, lower average temperatures, increasing amounts of annual precipitation as well as longer periods of winter.

Between 2017 and 2020, ca. 2900 pre- and early historic sites were recorded using local area files from the Saxonian Archaeological Heritage Office, the State Office for Preservation of Monuments and Archaeology Saxony-Anhalt and the Thuringian State Office for Heritage Management and Archaeology. The archaeological data base includes 350 sites that can be used for the analysis of Bronze Age land use.

Initially, the presentation will discuss the pre-processing of archaeological data from the three archives to generate a unified data base and the reconstruction of the digital elevation model, because the topography south of Leipzig is distorted considerably by open-cast mines. The Bronze Age site distribution is evaluated by discussing the potential impact of archaeological field work and geographical filters (modern land use, erosion, weathering conditions etc.). The description of land use is based on various aspects such as analyses of site density, site frequency, and the geographic location of the sites. Finally, a supra-regional discussion of the results is carried out by comparison with other study areas.

5 **BRONZE AGE SETTLEMENT AND POPULATIONS DYNAMICS IN THE NORTHWESTERN ALPINE REGION**

**Abstract author(s):** Brunner, Mirco (Institute for Ecosystem Research, Christian-Albrechts-University Kiel; Oeschger Centre for Climate Change Research - OCCR, University of Bern) - Laabs, Julian (Institute of Pre- and Protohistoric Archaeology, Christian-Albrechts-Universität zu Kiel; Department of Geography, Physical Geography, Christian-Albrechts-Universität zu Kiel)

**Abstract format:** Oral

At the beginning of the Bronze Age and in contrast to the Final Neolithic the landscapes of major entries to the Alps and the big alpine valleys became hot spots of human settlement activities. The reasons for that profound change in the settlement landscape are yet rather speculative but seem to be connected with the maintenance and establishment of intensified trade and the access to alpine resources such as metals, pasture or wood. However, the alpine foreland was not abandoned as the scarce record of Bronze Age pile dwellings might suggest. Interesting spatio-temporal dynamics can be witnessed in the overall settlement system in the Northwestern alpine region. Over the course of the Bronze Age there are reoccurring shifts for several kilometers of core areas of settlement activities. Those shifts seem to emerge especially during times when changes also took place in the social, economic or ideological realm of the Bronze Age communities, but socioecological reasons are also quite likely.

Methods of archaeological population reconstruction such as 14-C SPD (summed probability densities), site counts/densities and the use of palaeoenvironmental proxies show ongoing human activities during the Bronze Age and do not indicate any severe population decline in the course of the witnessed spatial shifts of settlement activities. The social transformations that can be inferred from changing material culture and burial rites or the relocation of settlement core areas seemingly only had minor effects on the demographic development of the northwestern alpine region.

Based on those findings we like to discuss possible social, economic or environmental drivers for the documented dynamics and present an interpretation of those developments in the local and over-regional context of the European Bronze Age.

6 **CONTINUITY AND/OR INNOVATION AT THE END OF THE LATE BRONZE AGE AT THE FRINGES OF SE ALPS**

**Abstract author(s):** Cresnar, Matija (University of Ljubljana; Institute for the Protection of Cultural Heritage of Slovenia)

**Abstract format:** Oral

Numerous and extensive construction projects carried out in Slovenia in the last 25 years have brought to light a large number of new mainly lowland archaeological sites dating from Bronze Age. After numerous reports, but also integral monographs have been published, we are for the first time able to deal with settlements excavated on a scale where we can truly speak about their layout, internal development, etc., but also about settlement patterns on (micro-)regional levels.

Although the number of sites dated to different subphases of the Bronze Age has increased, most of them can (still) be dated to the Late Bronze Age. On the one hand, this gives us the opportunity to study the relationships between the individual settlements, but also to combine these new findings with the knowledge about the (accompanying) cemeteries, most of which were excavated some time ago.

Modern excavation techniques should also be taken into account, as the recently excavated shallow cremation graves have also shed new light on grave preparation, cemetery layout and burial rites in general.

Important new data have also been obtained from research projects concerned with the origins and development of Early Iron Age centres, including the application of remote sensing techniques and geophysics, as well as series of radiocarbon dates to help understand their settlement dynamics.

When combining these rather large datasets, it becomes also obvious that what appeared to be an abrupt change is much less clear on closer inspection. In a sense, the more we (seem to) know, the more complex the questions we can pose and which, for the time being, remain unanswered... But then again, that is what keeps us going...

7 **SCALING DYNAMICS ON THE SOUTHEAST BALKANS IN THE LATE BRONZE AGE**

**Abstract author(s):** Burkhardt, Laura (German Archaeological Institute - DAI)

**Abstract format:** Oral

In the Late Bronze Age on the Southeast Balkan, regional communication zones that connected groups in different resource areas can be traced. This can be seen in the use of pottery concepts (vessel types and decoration systems) across the ore-rich regions (Rhodopes) as well as the large agricultural zones (Northern Greece, Thracian Plain). This speaks for an interweaving of everyday practices and exchange networks within and between these regions. But beside connecting pottery concepts unifying settlement patterns or burial practices can hardly be found. While on the one hand, this diverse picture allows discussing dynamics on different spatio-temporal scales, on the other hand, it contributed to the fact that previous approaches defining cultural groups spatially and chronologically were difficult. Moreover, such narratives were largely made using unsystematically researched sites and settlements that were short-lived. The latter may point to specific modes of subsistence and a certain degree of mobility. Therefore, more complex models, e.g. a polyetic model of culture and the hypothesis of trans-locality are being discussed based on new systematic research from the Eastern Rhodopes. An attempt to update and eventually revise old and partly inflexible narratives about the Late Bronze Age on the Southeast Balkans.

8 **TRACING CONNECTIONS: THE BRONZE AGE SITE OF TORRE CASTELLUCCIA IN THE REGIONAL AND INTERREGIONAL NETWORKS OF THE GULF OF TARANTO**

**Abstract author(s):** Pizzuti, Elisa - Palazzini, Flavia (Sapienza - Università di Roma)

**Abstract format:** Oral

Starting from the South Italian Middle Bronze Age (1700 - 1300 BC), we can observe a complex landscape of fortified coastal settlements around the Gulf of Taranto (Apulia, Basilicata, Calabria). These long-lasting sites, often occupied until Greek colonization (ca. 700 BC), were located at a short distance from each other and mostly stood on headlands flanked by natural bays and inlets. This location made the settlements highly accessible and thus privileged landing places, further allowing defense from external threats. While in the Mediterranean basin trade, mobility, and social connectivity were ever-expanding in complexity, the Gulf communities participated in both local and interregional networks, hence developing social and economic relationships (e.g. LBA Mycenaean contacts). In this setting, the renewed studies on the site of Torre Castelluccia (18 km south-east of Taranto) offer a fresh perspective, increasing the current state of awareness on the social and cultural dynamics in the focus area. Excavated around the middle of the XX century, Torre Castelluccia belongs to the quoted group of long-lasting sites. Both settlement - placed on the hilltop - and funerary areas are known, with a clear spatial relationship of contiguity. Furthermore, the Late Bronze age cremation cemetery is in part coeval with the use of one chamber “grotticella”-type tomb, revealing a complexity of coexisting rituals. We present the results of our research based on a solid typo-chronological frame, using a multi-layered spatial approach (local, regional, supra-regional). The analysis of legacy data combined with the renewed study of artefacts sheds new light on Torre Castelluccia, offering both a valid testimony of the settlement dynamics in the Gulf of Taranto and relevant information on the communication networks established in the broader Mediterranean scenario.

9 **SARDINIA AND THE LATE BRONZE AGE SEA-BORNE METAL TRADE BETWEEN SCANDINAVIA, ATLANTIC EUROPE AND THE MEDITERRANEAN**

**Abstract author(s):** Sabatini, Serena (University of Gothenburg)

**Abstract format:** Oral

This paper aims to discuss the role of Sardinia in the metal trade between Scandinavia, Atlantic Europe and the Mediterranean during the Late Bronze Age or the second half of the second Millennium BCE. Recent analyses on bronze finds from Northern Europe provided a relevant idea of the complexity of the European Bronze Age metal trade. The discovery –by means of lead isotope and trace element analyses- of copper of likely Sardinian origin in a number of local artefacts was a highly unexpected result, imposing rethinking the role of the island as a metal producing region for a wide variety of ‘customers’. The issue is open and complex and far from being fully investigated.

The purpose of this paper is to present a preliminary work suggesting that metal trade and exchanges unfolded between Atlantic Europe and the Mediterranean, also thanks to the contribution of strategically positioned Sardinian communities. A combination of evidence suggests that what we could call Sardinian ‘maritime enterprises’ might have played a significant role in the sea-borne metal trade between copper-rich Mediterranean and tin-rich Atlantic Europe.

10 **EXPECTATIONS OF CONSUMERS – HOW TO PROMOTE COPPER IN A GLOBALIZED BRONZE AGE EUROPE**

**Abstract author(s):** Nessel, Bianka (Institute for Pre- and Protohistory, Johannes-Gutenberg University Mainz) - Uhnér, Claes (University of Oslo, Museum of Cultural History)

**Abstract format:** Oral

Copper ingots appear in different shapes during the European Bronze Age. Some are widely distributed; others only circulated in regional networks. It is often assumed that similar forms indicate that ingots are made of similar raw materials. However, scientific material analysis shows that the shape or form of an ingot type is often not, or at least not directly affected by changes in the exploitation of ore sources. A reason for this might be that certain regions, or particular consumer groups, had developed a general acceptance or preference for specific ingot types. Consumers might have associated trusted suppliers with certain types and/or visual appearances of raw copper. But they also had to deal with disruptions when an ingot type was not obtainable and had to be substituted. This paper discusses the distribution of plano-convex casting cakes during the Late Bronze Age and their relevance for socio-economic interpretations of copper exchange in order to better understand Bronze Age exchange networks and communication zones.

11 **MYTH, MESSAGES AND MATERIALIZED CONNECTIONS IN NORDIC BRONZE AGE ICONOGRAPHY: MULTISCALAR INVESTIGATIONS**

**Abstract author(s):** Ahlqvist, Laura (Aarhus University)

**Abstract format:** Oral

The Late Nordic Bronze Age (c. 1100-600 BC) brought about marked socio-cultural shifts and disruptions in, for example, exchange networks, burial rites and hoarding, affecting the daily lives of the people inhabiting the area. In addition, the period is particularly famous for its elaborate iconography on metal objects. The style is geographically very distinct, yet referencing and incorporating ‘international’ elements. Especially one-edged razor blades and large belt ornaments (hængekar) are adorned with zoomorphic im-

agery, suns and ships, which have been interpreted as direct representations of Bronze Age mythology. Importantly, this art also underwent various transformations during this time, seemingly intertwining with the aforementioned changes in social practices, a complex process that has, as of yet, not been investigated fully. This paper seeks to explore the intangible large-scale societal developments through a lens of ornamentation analysis.

Using a novel quantitative approach, the paper explores the spatio-temporal trends in iconography on key object types of the Late Nordic Bronze Age. The individual elements of the ornamentation form the point of departure for multiscale investigations into the cultural transmission creating these trends, thus considering the agency and communication of the people behind the art. Simultaneously, a persistent view to the wider geographical distribution of iconographic developments may hint at modes of contact and exchange as well as political and ideological implications. Thus, the paper aims to elucidate wider societal developments in the Nordic region and beyond - from the viewpoint of the individual to entire societies.

12 OF TRADERS AND CUTTERS - DYNAMICS OF AMBER DISTRIBUTION IN THE EUROPEAN BRONZE AGE

**Abstract author(s):** Serbe, Benjamin (Institut fuer Ur- und Fruehgeschichte Kiel)  
**Abstract format:** Oral

The Bronze Age can be viewed as kick-off in European trade. Although it already started beforehand it is a time in need for exchange. With the spread of the bronze technology the respective resources copper and tin are in constant flow throughout the continent. In this era of intensified connectivity amber steps up into the European exchange systems.

This study aims to investigate the exchange networks of the Bronze Age through the spread of amber in Europe. As this work is still in progress a first glimpse of this matter can be caught in the research history and the use of different classification systems displaying the regional varieties of amber artefacts in the time of 2200 to 800 BC. They give insight in the exchange of raw material (the trader's work) and finished amber products (the cutter's work) throughout Europe and the underlying dynamics of interaction. Further Network Analyses will help to discuss this matter of exchange and test the overall narrative of the so called Amber Route.

13 SCALING INFRASTRUCTURE AND SOCIAL TRANSFORMATION IN THE BRONZE AGE

**Abstract author(s):** Quinn, Colin (Hamilton College)  
**Abstract format:** Oral

The European Bronze Age was a time of expanding interregional connectivity and rising social inequality. Archaeologists have suggested that trade routes played a central role in structuring Bronze Age societies, and the control of these economic networks and associated technologies were important pathways to power. Despite the perceived importance of trade and exchange to explain social organization and development in the Bronze Age, the nature of these networks remain undertheorized. The concept of infrastructure, adapted to archaeological contexts, can provide a way to unpack trade, exchange, and distribution as analytical concepts. Infrastructure is the dynamic multi-scalar cultural system that emerges out of human interaction to facilitate the movement of people, goods, and ideas. Using this approach, I trace the development of infrastructure in Bronze Age Europe, with particular attention given to the metal-rich region of southwest Transylvania. Transylvania is home to and played a critical role in supplying raw materials, especially gold, copper, and salt, that fueled the development of inequality in the Bronze Age. In this paper, I examine how infrastructure was organized at the local scale, how Transylvanian communities articulated to increasingly large-scale infrastructural networks, and how these small and large scale systems changed throughout the Bronze Age (2700-1200 cal. BC).

A. EARLY BRONZE AGE AEGEAN GENOMES FROM PERACHORA CAVE, CORINTH, GREECE

**Abstract author(s):** Psonis, Nikolaos - Vassou, Despoina - Tabakaki, Eugenia (1 Ancient DNA Lab, Institute of Molecular Biology and Biotechnology, Foundation for Research and Technology – Hellas, Heraklion, Crete) - Stravopodi, Eleni (Ephorate of Palaeo-anthropology and Speleology, Ministry of Culture and Sports, Athens) - Kafetzopoulos, Dimitris (1 Ancient DNA Lab, Institute of Molecular Biology and Biotechnology, Foundation for Research and Technology – Hellas, Heraklion, Crete)  
**Abstract format:** Poster

Research involving ancient DNA (aDNA) has experienced a true technological revolution in recent years, mainly through the advance of high-throughput sequencing. Archaeogenomic research on present-day Greek/Aegean sites has been focused either on Neolithic (covering the period from ~ 8.000 to 4.000 BCE) or on Middle to Late Bronze Age specimens (covering the period from ~2.400 to 1.200 BCE). Hence, there is a sampling gap concerning the period from the Final Neolithic to Early Bronze Age, an important transitional phase during of which noticeable changes have been documented on archaeological basis that may indicate broader cultural changes. Previous analyses of ancient genomes have concluded that Middle/Late Bronze Age Peloponnesian populations (attributed as Myceneans) and Middle Bronze Age Cretan populations (attributed as Minoans) could be modelled as a mixture of the Anatolia Neolithic-related substratum with additional 'eastern' (Caucasus/Iran-related) ancestry and could be considered as distinct from Neolithic Aegean populations who had only Anatolian farmer ancestry. In this study we provide archaeogenomic evidence from an Early Bronze Age (Early Helladic) population located in central present-day Greek mainland (Perachora cave, close to the Early Helladic settlement of Perachora in the Gulf of Corinth), in order to examine if the Bronze Age 'eastern' ancestry was present in the mainland Aegean area from the early onset of the Bronze Age. Our preliminary results suggest that the Early Bronze Age Perachora population is clustering together with Early/Middle Neolithic farmers from Europe, Aegean, and Anatolia, an indication of distinctiveness

from Middle/Late Bronze Age Peloponnesian and Cretan populations. Hence, southern mainland Early Bronze Age Aegean people may not have been genetically admixed yet, with populations carrying the additional 'eastern' ancestry, an event that possibly occurred immediately after, during the Middle Bronze Age and the advent of the intensified Minoan mobility and interchange network.

505 ON THE MOVE: INTERDISCIPLINARY APPROACHES IN STUDYING HUMAN MOBILITY

**Theme:** 1. Widening horizons through human-environment interconnections  
**Organisers:** Fernée, Christianne - Trimmis, Konstantinos (University of Bristol) - Drnić, Ivan (Archaeological Museum in Zagreb)  
**Format:** Regular session

Mobility and movement are central to human evolution. Human history has been marked by mobility and migration events, from early humans to the modern migration crisis. The nature of this mobility ranges from micro-mobilities, mobilities of everyday life, to seasonal mobilities, such as in transhumance, and occasional large-scale movements. The broad social, economic and political underpinnings of mobility are diverse and not always known. However, human mobility has always had a great influence on the spreading of cultural, social and technological ideas. Consequently, within archaeology this has typically be studied using artefactual evidence and material culture.

Bones and teeth present a multifaceted array of data from which mobility can be reconstructed. The dynamic nature of bone means that is provides a record of life conditions, health and lifestyle. This can be studied on a range of different scales, from the individual, to the community and regional levels. Human remains, therefore, provide a great tool to understand human experience and the impact of transitions such as mobility.

This session aims to discuss methodological advances in the study of human mobility, particular its interplay with the human body. This session welcomes papers that focus on but are not limited to biomechanical, biogeochemical and biomolecular studies (e.g., functional morphology, stable isotopes and ancient DNA). We also welcome papers that integrates bioarchaeological data with other methodological approaches, including but not limited to computational and climatic modelling, material culture, textual, and social anthropology studies.

ABSTRACTS:

1 PEOPLE'S STORIES: AN INTEGRATIVE BIOARCHAEOLOGICAL STUDY OF SHORT-TERM MOBILITY

**Abstract author(s):** Fernée, Christianne - Trimmis, Konstantinos (University of Bristol) - Drnić, Ivan (Archaeological Museum in Zagreb)  
**Abstract format:** Oral

Tangible places and objects are often used as evidence of mobility. However, this evidence removes the individual from the discussion of mobility. Bioarchaeology enables the individual to be brought back into focus. Bones and teeth present a multifaceted array of data from which mobility can be reconstructed. The human skeleton is malleable, or plastic, responding and adapting throughout the life of an individual to external environmental and social pressures. The dynamic nature of bone means that they provide a bio-narrative for individuals, providing a record of life conditions, health and lifestyle from infancy to adulthood. Two aspects of mobility, although not mutually exclusive, can be studied: mobility itself and its impact.

Recent scientific advances have enabled the creation of a detailed timeline for single individuals, in terms of mobility and its effects. This can help bring to light the rhythms and social relations of mobility directly from human remains. This paper will present an integrative methodological approach to studying mobility and its impact. It will bring together traditional approaches with recent advances in the field of bioarchaeology into a single methodological framework. There will be a particular focus on the study of short-term mobility as identifying short-term and sub-group mobility using the archaeological record has been particularly challenging.

2 HOW TO APPROACH MOBILITY IN THE LA TÈNE PERIOD? ADVANTAGES AND DISADVANTAGES OF THE COMBINED BIO-MOLECULAR ANALYSES AND MATERIAL EVIDENCE

**Abstract author(s):** Danielisova, Alzbeta - Bursák, Daniel (Institution of Archaeology of the CAS, Prague)  
**Abstract format:** Oral

The standard way to detect movement, in the case of individuals, is through strontium isotope analysis. The isotopic data on mobility indicate changes of residence, although evidence of long-distance movement is problematic for methodological reasons. Analysis of skeletal material from La Tène cemeteries across Europe shows that bio-archaeometric evidence makes no case for large migrations in the 4th century BCE or later. According to the findings so far, migrations represent smaller groups of people or individuals who changed their place of residence at least once in their lives. There is no evidence that certain groups within the population were more mobile. Therefore, the usual image of 'Celtic migrations' as conveyed in historical sources does not seem to be supported by interdisciplinary analysis. It is amid such fragmentary evidence that provenance analysis of material culture may be useful in addressing questions of mobility by detecting various origins for what seem to be typologically identical everyday objects. As the long-distance trade with common clothing accessories as well as the raw materials in this period is improbable, it is likely that everyday objects, like jewellery, could have been subjects of mobility as well as their owners. This contribution aims to demonstrate that

geochemical data from everyday objects such as items of personal jewellery can be a useful proxy source when used in combination with bio-molecular analysis and in a context of socio-economic complexity.

3 **BABY STEPS: A STUDY OF THE SHAPE OF CHILDHOOD MOBILITY**

**Abstract author(s):** Stark, Sarah (UCL)

**Abstract format:** Oral

Growth and early mobility are a heavily studied field in juvenile bioarchaeological studies. The question of shape or developmental trajectories, however, has only recently been investigated as methodological advances such as geometric morphometrics methods (GMM) have become more available.

The application of GMM allows for a novel analysis of developmental trajectories as whole bone morphology is analysed and visualised in a three-dimensional space. To determine if long bone plasticity and movement is influenced by population variation, juveniles of Anglo-Saxon to Post-Medieval foetal to 12-year-old long bones were examined; they formed a comprehensive dataset to integrate auto3dgm with traditional bioarchaeological methodologies of growth and development. This study seeks to identify how biological processes affect bone shape during ontogeny to answer, 'what is bone shape and what do shape trajectories tell us?'

The principal findings were that long bone shape is statistically significant by site and period from foetal to 5 years old and that shape is not a linear progression but rather fluctuates during the life course. It was also found that the developmental trajectories had different potential in the extent of shape that could be achieved for each age group, and that trajectories could change as a result of developmental pathways such as nutritional or environmental stress that occurred during growth.

4 **ADNA AND THE ESTABLISHMENT OF DISCRIMINANT FUNCTIONS IN COMMINGLED REMAINS. PUNTA AZUL'S CASE (EL HIERRO, CANARY ISLANDS)**

**Abstract author(s):** Ordóñez, Alejandra (Departamento de Bioquímica, Microbiología, Biología Celular y Genética. Universidad de La Laguna; Departamento de Geografía e Historia. Universidad de La Laguna) - Cockerill, Samuel (Departamento de Geografía e Historia. Universidad de La Laguna) - Serrano, Javier - Fregel, Rosa (Departamento de Bioquímica, Microbiología, Biología Celular y Genética. Universidad de La Laguna) - Arnay de la Rosa, Matilde (Departamento de Geografía e Historia. Universidad de La Laguna) - González Reimers, Emilio (Facultad de Medicina. Universidad de La Laguna)

**Abstract format:** Oral

One critical subject in any bioanthropological study of a population is the sex determination of the individuals. It becomes even more crucial when analyzing daily and seasonal mobilities in a specific society, especially those related to gender roles. In cases where the archaeological remains are comingled, discriminant functions become a fundamental tool to achieve this goal. Nevertheless, they should have been made with populations as close as possible to those being studied. Punta Azul's burial site is one of the island's most important funerary sites. It has remains of more than a hundred individuals. However, as in most of the burial sites in the archipelago, the remains were highly comingled.

Considering previous anthropological studies, we chose the astragalus and calcaneus establish discriminant functions. Prior results suggested that the distinction of males and females in these specific bones could give us insights into this population's activities. The appearance of certain traits led us to think there could be genetic, gender, or movement patterns that were conditioning its presence. Indigenous populations adapted their behavior to take advantage of the limited available resources with seasonal mobility, like going to higher lands in the summer and everyday mobility related to pastoral activities. These movements were probably different for men and women. Therefore, the analysis of activity patterns in these bones by sex is fundamental to address these questions.

As a preliminary approach, we analyzed 31 samples and established the genetic sex of 25. Although it is still a small number, we could design a discriminant function for the calcaneus and the astragalus with an overall accuracy of 88% and 100%, respectively. These promising results lead us to analyze a higher number of bones, using aDNA, to increase our functions' reliability and assure the gender assignation to see our bioanthropological results' social implications.

5 **BIOMUSE: THE GENOMIC HERITAGE OF ANCIENT GREECE, BRINGING DIGITALISED BIOHISTORY IN MUSEUMS**

**Abstract author(s):** Theodoroudi, Eleftheria (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Winkelbach, Laura (Palaeogenetics Group, Institute of Organismic and Molecular Evolution - iomE, Johannes Gutenberg University Mainz) - Ganiatsou, Elissavet (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Pukaj, Albert (Palaeogenetics Group, Institute of Organismic and Molecular Evolution - iomE, Johannes Gutenberg University Mainz) - Souleles, Angelos (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Brami, Maxime - Blöcher, Jens - Diekmann, Yoan - Burger, Joachim (Palaeogenetics Group, Institute of Organismic and Molecular Evolution - iomE, Johannes Gutenberg University Mainz) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

**Abstract format:** Oral

For some years now, genetic studies have complemented the portfolio of archaeometric techniques to accurately reconstruct the ancestry, life history and phenotype of prehistoric people. Museums and cultural centres are keen to attract and inform their visitors with exhibits based on these cutting-edge research techniques. Yet the potential that the combination of different research methods, including palaeogenomics, offered to museums has not yet been fully exploited.

BIOMUSE is a project that brings together bio-molecular and anthropological expertise with heritage professionals to present individual biographies of ancient Greek (pre-)history to the public.

The idea is to use a holistic set of analytical techniques to help document, digitise and share a hitherto underutilised source of information on human cultural and biological heritage. To this end, we analysed more than 50 prehistoric humans, including their complete genomes, in diachronic time periods ranging from the Mesolithic to the Byzantine period. We then combined the genomic information with data from different scientific fields, i.e. archaeology, history, isotope chemistry, physical anthropology, to give a snapshot of the lives of these people and present them to the public using state-of-the-art museological communication and visualisation tools. By collaborating with museums and heritage organisations, we aim to raise awareness of the potential of biohistorical approaches to document the lives of anonymous people from the deep past. We hope that this will not only increase the existing knowledge about the genomic history of Greece, but also increase the attractiveness of the biological heritage to the public.

6 **METHODOLOGICAL DEVELOPMENT OF DECONTAMINATING OSTEOLOGICAL MATERIALS COATED IN ANIMAL GLUES FOR STRONTIUM ISOTOPIC ANALYSIS**

**Abstract author(s):** Wathen, Crista - Isaksson, Sven - Lidén, Kerstin (Stockholms Universitet)

**Abstract format:** Oral

The effects of diagenesis on the strontium isotopic values of osteological materials have been well documented, however, the effects of preservatives and adhesives have not. These are generally added in a museum-setting or during an archaeological excavation for stabilization. Thus allowing the material to either travel or be saved for future analysis. However, there is evidence that these practices may affect isotopic or DNA analysis, and whether or not they affect strontium isotopes has not been widely studied. Unfortunately, the exact adhesive and the methodology to create it was seldom documented, making it difficult to determine the appropriate method to remove it. This means that if the glue is not fully removed then the biogenic values of the bones may not be the portion analyzed but the glue itself! Additionally, depending on the isotopic values of the glue it might cross-link with the material, thus changing the biogenic values. Thus creating issues when trying to determine any mobility patterns in a population. For this reason, a multi-step study has been created to determine the effects of glues with known strontium values and if they can be removed with the decontamination methods set by the Stockholm University Laboratory.

7 **THE MYSTERY OF THE CENTURY. WHO WERE THE PEOPLE BURIED IN THE GRAVES WITH STONE SETTINGS IN MEDIEVAL POLAND?**

**Abstract author(s):** Blaszczyk, Dariusz (Faculty of Archaeology, University of Warsaw)

**Abstract format:** Oral

About a hundred years ago, archaeologists became interested in and began to study specific cemeteries present in central and eastern Poland. They were characterized by a characteristic structure of graves with stone settings and very rich equipment, including made of silver ornaments, weapons, clay, wooden and bronze vessels as well as everyday objects. These cemeteries were established and used in the Middle Ages between the beginning of the 11th and the beginning of the 13th century. Their occurrence was limited mainly to two regions of Mazovia and Podlachia, and they were usually recorded near the strongholds.

The specific form of these cemeteries from the very beginning of research on them raised questions about the origins of the people who created and used them. Some researchers believed that these are the graves of the local Slavic people. However, among a large group of archaeologists, the view was also adopted that in these cemeteries were buried the newcomers from Scandinavia, who were settled in these places by the Piast rulers. In turn, another group of researchers proposed that in this type of cemeteries were buried people of Baltic origin.

As part of the Populus Masoviae Madii Aevi project, an attempt was made to answer the question of who were and where came from the people buried in medieval cemeteries with stone settings in Poland. It was decided to try to answer this question, on the

EMORPHPROJECT: EXAMINING MOBILITY DEGREE OF PALAEOLITHIC REINDEER THROUGH AN OSTEOMETRIC ANALYSIS OF METAPODIAL BONES AND PHALANGES IN COMBINATION WITH ML ALGORITHMS

**Abstract author(s):** Galán López, Ana Belén - Costamagno, Sandrine (TRACES - UMR 5608 CNRS) - Burke, Ariane (Université de Montréal)

**Abstract format:** Oral

Mobility patterns of reindeer will have affected the hunting strategies and the mobility of hunter-gatherer groups that depen upon them. The question of the season occupation of human territories and the seasonal behaviour of reindeer remains open. Due to the important role that reindeer (Rangifer tarandus) played for human populations in Western and Central Europe during much of the Palaeolithic period, many studies have focused on it particularly during the Magdalenian. However, and despite the numerous attempts to reconstruct the migratory behaviour of Palaeolithic reindeer, there has yet to be a definitive model that can explain their movement patterns.

Modern ethological data indicates that reindeer herds adopt different mobility strategies that correlate with habitat type and topog-raphy. Furthermore, it has been demonstrated that an animal’s habitat and mobility patterns hypothetically affect bone density and limb bone morphometry as has been proven in several species.

Therefore, the main goal of our project is to quantify the link between mobility and morphology using metacarpals, metatarsals and phalanges (because they occur more often in our archaeological records) from modern caribou populations (migratory and sed-entary settings) and to apply these results to twenty-three faunal assemblages from Upper Palaeolithic archaeological sites in South-western France to reconstruct reindeer mobility.

Thus, metapodial bones and phalanges from modern and archaeological samples have been studied taking linear measurements from them in combination with Machine Learning (ML) algorithms. As a result, ML analyses showed how it is possible to distinguish reindeer mobility patterns with more than 90% of accuracy depending on the skeletal part and bone type. These results will allow us to reconstruct how migratory patterns of Paleolithic reindeer affected human hunting strategies and the mobility of hunter-gatherer groups that depended upon them during Magdalenian period.

INVESTIGATING PALEOMOBILITY PATTERNS AT THE SITE OF AMBOINA, BONAIRE (DUTCH CARIBBEAN), THROUGH ISOTOPIC ANALYSIS

**Abstract author(s):** Seferidou, Eleni (Faculty of Archaeology, Leiden University, Netherlands.) - Laffoon, Jason (Faculty of Ar-chaecology, Leiden University, Netherlands.)

**Abstract format:** Poster

Due to its geographical diversity, the Caribbean region promotes interaction between the different groups of people inhabiting its islands and the neighboring mainland. Each of these regions has specific resources that are either unavailable or less available at other locations, requiring the movement of goods and people across space. The heterogeneity of resource availability activates people to engage with each other and move through the islandscape, creating extensive communications networks, especially during pre-colonial times. This paper takes an isotopic approach to investigate patterns of paleomobility amongst the pre-colonial population from the site of Amboina in Bonaire, Dutch Caribbean. Samples of tooth enamel from eight individuals were analyzed for strontium isotope compositions. The results are evaluated based on existing strontium baseline, to determine whether the individ-uals were of local or nonlocal origin. A macro-regional database of bioavailable strontium isotopes is used to assess places of origin for the nonlocals to the island. In addition, associations between biological sex and age-at-death of the individuals will be attempted based on their place of origin. The burial practices encountered at the site were complex. This paper will explore possible associa-tions between these practices and the origins of the individuals. Lastly, comparisons with other contemporary populations in the circum-Caribbean region will be presented, to establish commonalities in migration patterns and burial rituals.

PRESERVING THE “LIVING HERITAGE” OF ABANDONED LANDS. ARCHAEOLOGY AND SUSTAINABLE PRACTICES TO PROTECT AND CONSERVE UPLAND LANDSCAPES

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Panetta, Alessandro (University of Genoa) - Martín Civantos, José María (University of Granada) - Dalglish, Chris (INHERIT - Institute for Heritage & Sustainable Human Development) - Stagno, Anna (University of Genoa)

**Format:** Regular session

Europe’s upland rural heritage is the complex result of an interaction of nature and culture over millennia. In these areas, both archae-ological research and local communities can play an active role in the conservation and protection of landscape and rural heritage. However, current conservation measures and land-use decisions often fail to consider relevant aspects, such as the historical di-mension of upland landscapes, perceiving and managing them as “natural” places, or the contribution of local practitioners in sus-taining their environment.

This session aims to discuss and define a “living heritage” approach to landscape conservation, through the historical-archaeologi-cal reconstruction of local stakeholders’ cultural values, expertise, and practices.

Archaeological research can highlight the process of marginalization that has affected upland areas and their heritage. The progres-sive abandonment of historic practices, such as agro-forestry-pastoral ones, is leading to the loss of the intangible heritage those practices represent and of their wider social and environmental benefits.

Moreover, archaeological analysis can help preservation policies such as, for example, historic building ones, that often seek to pre-serve the physical form of rural buildings without regard to their broader cultural values and historical uses. Yet every rural building was created through relationships of environmental resource management, production and trade. Reconstructing these networks can lead to better conservation, protection and use of these assets, through a better understanding of their character and function.

The session aims to explore other aspects of this issue and the possibility of:

- Identify stakeholders’ cultural values and local expertise, useful in conservation practices.
- Define best practices of conservation measures, such as ‘protection through use’
- Promote collaboration among local institutions and communities and realise effective participation in the conservation, protection and sustainable development and use of upland landscapes
- Suggest new tools to policy-makers, that will allow taking into account the historical dimension of rural places.

WHATEVER IT TAKES TO PRESERVE THE EUROPEAN RURAL HERITAGE. SUSTAINABLE PRACTICES TO PROTECT AND CONSERVE UPLAND LANDSCAPES AND MEMORIES

**Abstract author(s):** Panetta, Alessandro (University of Genoa) - Martín Civantos, José María (University of Granada) - Dalglish, Chris (INHERIT - York Archaeological Trust) - Domínguez, Pablo (CNRS - University of Toulouse Jean Jaurès) - Gerrard, Chris (Dur-ham University) - Py-Saragaglia, Vanessa (CNRS - University of Toulouse Jean Jaurès) - Stagno, Anna Maria - Salvidio, Sebastiano (University of Genoa)

**Abstract format:** Oral

This contribution will give an overview of the project “IRIS - Inspiring Rural Heritage: Sustainable Practices to Protect & Conserve Up-land Landscapes & Memories”, developed under the European “Joint Programming Initiative on Cultural Heritage and Global Change” (“Conservation, Protection and Use” call).

IRIS involves different researchers and stakeholders from Italy, UK, Spain, France and Montenegro, and is focused on conservation and enhancement of rural heritage, especially of upland areas. These areas need a new perspective to overcome the nature/culture divide which currently characterizes their study, management and conservation. Indeed, the dualistic policies of cultural heritage conservation and naturalistic area protection seem to fail when facing the fragile heritage of rural areas, denying, for example, the historical dimension of biodiversity process, or the relationship of historical settlements with environmental resources manage-ment. As historical land use practices have shaped landscapes and habitats through time, this historical characterisation can in-form current management and conservation of rural areas. IRIS aims to highlight how the multifaceted concept of “living heritage” (intended such as the intangible heritage of practices, knowledge and representations, as a currently relevant cultural heritage in local communities, and as the biological component of historical landscapes) can be assumed at the basis of effective policies of protection.

Focusing on upland areas highlights the loss of social, economic and environmental benefits linked to the progressive abandonment of historical practices, and the need for a shift in decision-making, actively involving the whole network of local communities, stake-holders, researchers and policy-makers which act in rural areas.

2

THE CHEVIOT HILLS (UK) – HISTORIC LAND USE PRACTICES, CONSERVATION & SUSTAINABLE USE OF UPLAND LANDSCAPES FOR COMMUNITY BENEFIT

**Abstract author(s):** Dalglish, Chris (INHERIT - York Archaeological Trust) - Gerrard, Chris (Durham University) - Walker, Skye (York Archaeological Trust)

**Abstract format:** Oral

In this paper, we will present ongoing research into the upland landscapes of the Cheviot Hills (UK). This research is being undertaken as part of the project ‘Inspiring Rural Heritage: Sustainable Practices to Protect & Conserve Upland Landscapes & Memories’. The project has case studies in Italy, Spain, France, Montenegro and the UK. It began in late 2020 and will continue until 2023.

The Cheviot Hills lie on the border between England and Scotland, and partly within the Northumberland National Park. Through our research, we are exploring how land use practices have shaped these moorland, forest and farming landscapes over time.

We are also investigating how knowledge of land use history might inform conservation both of the historic environment and of nature. And we are exploring how this knowledge might inform the development and use of these landscapes, for the benefit of local people. Conservation and development issues include: the economics of farming; depopulation; the loss of traditional skills; climate change impacts on land use and habitats, and; predicted increases in tourism, recreation and forestry.

- 3
- In the paper, we will introduce the Cheviot Hills, their landscapes and land use histories. We will discuss the methods we are using in the research and the emerging results. The methods include:

  - a) historic land use analysis (with a range of archaeological, landscape and historical data, and GIS);
  - b) participatory mapping and interviews, to explore the cultural values and knowledge of local residents and organisations;
  - c) stakeholder engagement, to identify risks to the historic environment, to the sustainability of local communities and to the continuation of their 'living heritage', and to develop proposed policies and actions to address these risks;
  - d) narrative development, working with local people and stakeholders to communicate the values of land use heritage.

### LEARNING FROM THE PAST: HISTORICAL WATER MANAGEMENT AND AGRARIAN PRACTICES IN NORTHERN SIERRA NEVADA MOUNTAIN (GRANADA, SPAIN)

**Abstract author(s):** Martin Civantos, Jose Maria - Abellan Santisteban, Jose - Ramos Rodriguez, Blas - Roman Punzon, Julio (Universidad de Granada)

**Abstract format:** Oral

Water has been a connecting element between man and his environment. As an indispensable resource, its management has marked the settlement in areas with water scarcity. The Sierra Nevada is one of these areas in which water management is an example of adaptation to the environment. Numerous irrigation systems from medieval times are identified on its slopes. Irrigation is still managed today by rural communities, ensuring a constant source of water for agriculture and pastures and maintaining a living and sustainable rural legacy. A historical legacy that is maintained in response to the intensive industrial exploitation of natural resources. This paper focuses on the Northern slope of Sierra Nevada because of its archaeological and historical legacy. The village of Jerez del Marquesado has five irrigated zones from medieval times with their own irrigation channels and water distribution rights. The maintenance of these systems depends on cooperation between local farmers, being an example of a sustainable and Nature-based Solution to preserve the living heritage of rural zones. A historical, sustainable and resilient system that has been maintained to the present.

5

### RURAL HERITAGE AND LANDSCAPES OF SIERRA NEVADA: HISTORICAL IRRIGATION SYSTEMS AND PASTORAL LANDSCAPES FROM AN ARCHAEOLOGICAL PERSPECTIVE (18TH-21ST C.)

**Abstract author(s):** Sánchez García, Agustín - Stagno, Anna Maria (Università di Genova) - Martín Civantos, José María (Universidad de Granada)

**Abstract format:** Oral

In this paper, we aim to address some aspects related to historical practices of environmental resource management in the Sierra Nevada (Granada-Almería, Spain), today Parque Natural/Nacional. The focus of the investigation is the changes in the environmental resources management practices documented from the 18th century to the present day.

The research is being carried out, thanks to a collaboration between LASA (University of Genova) and MEMOLab (University of Granada), through archival research, historical photography analysis, as well as landscape archaeological investigations. The focus on the last three centuries will make it possible to link the reconstruction of the changes in the environmental resources management with the changes in the access rights to lands, to understand the role of those changes in the process of abandonment of the territory and social and political marginalisation of these areas and of their local societies.

The topographical and microanalytical approach adopted will allow to cross at the topographical level different sources and to fill the gap in the knowledge about these processes, focussing on irrigation systems and pastoral areas.

The final aim is to discuss the methodological aspects of the interdisciplinary investigation and to discuss in which way the archaeological and historical perspective could also contribute to a deep reflection around the meaning of the mountain heritage, the intersection between natural values, the current risks and threats.

As well known, the Sierra Nevada irrigation system is of Islamic origin and still used for agricultural and livestock purposes. We will reflect on historical practices and benefits associated with, as well as on the possibilities open by their historical investigation to address the risk of abandonment of some of these practices, with negative consequences for the whole systems in terms of desertification level, which risks to be increased also by the climate change.

6

### HOW LESSONS FROM HISTORICAL ECOLOGY CAN CONTRIBUTE TO UPLAND MANAGEMENT AND CONSERVATION

**Abstract author(s):** Costello, Eugene (University College Cork; Stockholm University)

**Abstract format:** Oral

This paper asks how lessons and data from the past can contribute to sustainable habitat conservation in Europe's uplands, particularly in areas protected under Natura 2000 legislation. It is based partly on an article I published in 2020 in Landscape Research, and partly on research and stakeholder engagement undertaken since.

The paper focuses on a mountainous peninsula in Kerry, Ireland. It begins by highlighting the difficulties that conservation of upland bog, heath and grassland habitats is facing due to rural depopulation and over-grazing. It then uses landscape history and archaeology to assess the long-term feasibility of conserving or restoring these habitats under current EU and National Park policy. Pointing

- 6
- to the surprisingly recent disappearance of woodland due to grazing, charcoal production and logging, I show that pre-1950s land use was not as 'traditional' or static as conservation discourse holds it to be. Historical management of uplands by farmers could vary greatly over space and time depending on socio-political factors and economic trends.

This historical ecology of change is crucial to understanding the relative failure of habitat conservation in many parts of Ireland and other parts of the EU today. I outline how 'lessons from the past' can help to make upland management more realistic, if all stakeholders accept that society and landscape have been constantly co-evolving. The paper finishes by providing concrete examples of how archaeologists and historians might act on what they have discovered about past land management. I suggest that engagement with local land-use partnerships and ecologists is a crucial first step, before ever we attempt to influence legislation at a national or supra-national level.

7

### RECOGNISING CONTEMPORARY USER VALUES AND SIGNIFICANCE IN THE CONSERVATION OF UPLAND PEATLANDS

**Abstract author(s):** Jennings, Benjamin - Flint, Abbi (University of Bradford)

**Abstract format:** Oral

Upland landscapes of the UK include large areas of peatland. While not 'abandoned' landscapes, these are almost 'shunned' environments depicted on maps as open spaces, with a perception of being dangerous and inhospitable. In reality, upland peatlands are palimpsest landscapes of use and occupation. In the present day this often focusses on conservation and preservation of the natural landscape for biodiversity and global climate benefits, and recreational use. Less prevalent in the conservation agenda are considerations of cultural heritage, both tangible archaeological remains and past, contemporary and emerging intangible cultural heritage.

Through literature review (Flint and Jennings, 2020), analysis of online User Generated Reviews (Flint and Jennings, In Prep), surveys and targeted interviews with people who use Ilkley Moor, an upland moorland in West Yorkshire, UK, the 'Wetland Futures in Contested Environments' project explored aspects of heritage which are identified and valued by members of the public. Ilkley moor is a mixed landscape combining prehistoric and historic use for agriculture and quarrying, with more recent use as common land, wellbeing and leisure environment. We explore the role cultural heritage plays in shaping how people perceive, value and use the landscape, and the impact various forms of land use may have on this heritage. This research offers insights for landscape managers, and contributes to alternative interpretations of peatland heritage.

There is a tendency to observe landscapes as static features, enduring and unchanging. The emerging and continuing living heritage of peatlands must be recognised in narratives of the landscape rather than allowing heritage interpretation to fall into static and backward looking perceptions.

- Flint & Jennings (2020) 'Saturated with meaning: peatlands, heritage and folklore', Time and Mind, <https://doi.org/10.1080/1751696X.2020.1815293>

### LIFE OF AN IMPRESSIVE LANDSCAPE: FROM MUNICIPIUM TO TOURISTIC ATTRACTION

**Abstract author(s):** Hoxha, Zana (Institute of Albanology) - Rama, Zana (Archaeological Institute of Kosovo) - Luci, Kemajl (Museum of Kosovo)

**Abstract format:** Oral

This paper documents the phases of life of the city of Ulpiana from the roman period until today. As an urban centre Ulpiana was founded by the emperor Marcus Ulpius Traianus (98-117) and named after him. Due to economical changes because of wars and illnesses the boundaries of the city changed several times. It was until the 7th century when the last traces of the population were found. As a powerful city it was mentioned by several ancient writers it remained a trace in time. It remained as a beautiful rural landscape, of the town of Gracanica for many centuries, until in 1926 it was identified as an archaeological site. The land was used for agriculture purposes for centuries and it is still used. Parallel to this function, it is a subject of research of local and international archaeologist. As several structures are unearthed, this rural landscape is being transformed into one of the main tourist attractions in Kosovo. Although an archaeological park, the rural landscape surrounding the site is still being utilised by the local community as agriculture land. As you visit the site, you can enjoy the structures but also the countryside feeling. This multiuse of this impressive landscape and the cohabitation of the local community with the archaeological works is worth documenting. Thus, the objective of this paper is to present the transformations of this landscape and the economical and social effects of this transformation in the life of the local community.

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Binde, Marion (Université de Bordeaux; UMR 5199 PACEA) - Bede, Ilona (Université Paris 1 Panthéon-Sorbonne; UMR 8167 Orient et Méditerranée - Monde byzantin) - Csiky, Gergely (Archaeological Institute of the Research Center for Humanities, Budapest)

**Format:** Regular session

Horse riding greatly impacted past societies by increasing mobility and revolutionizing warfare. Horses were also frequently used for sports and hunting. These various practices implied close interactions between riders and their mounts, considered as precious companions. This couple is also strongly linked to wealth and power, therefore social representations. This relationship contributed to raising a figure of the horseman, between myth and reality, often in a positive/negative duality.

A variety of sources provide precious evidence including human and equids bones, harness, archaeological contexts, written sources and pictorial depictions, nowadays ethnographical observations and method of ethology on this special couple across time and space. Their analysis can provide information on equestrian practices, physical interactions and performances of the rider with his mount and methods of training and grooming of these animals. It can also give us an idea of cultural perceptions of horsemen on their horses, of the society on the horsemen.

This session aims to explore the strong horseman-horse relationship by highlighting the multidisciplinary and interdisciplinary approaches. We hope to illustrate the need to share knowledge from different disciplines for a better understanding of this strong link. We expect papers focusing on - or even crossing - different realms as archaeological context analysis, studies on human and equid bones, equestrian material, iconography, social and cultural anthropology, etc. which can document this topic. Works interested in European as well as non-European contexts and on diverse periods are welcome.

ABSTRACTS:

1 OSTEOBIOGRAPHY OF A 19TH CENTURY BELGIAN INFANTRY CAPTAIN AND ITS CONTRIBUTION TO THE KNOWLEDGE OF SKELETAL MARKERS OF HORSE RIDING

**Abstract author(s):** Polet, Caroline (Royal Belgian Institute of Natural Sciences) - Villotte, Sébastien (PACEA, Université de Bordeaux)

**Abstract format:** Oral

Within the framework of the constitution of an identified collection of human skeletons, the royal Belgian Institute of the Natural Sciences exhumed in Châtelet (Province of Hainaut) the remains of an infantry captain died in 1883 at the age of 48. Historical data and his military file give evidence that he was riding a horse since at least 1859 (year in which he turned 24 years).

His skeleton presents the sequelae of diverse pathologies and joint alterations which could result from the equestrian practice. Some of these pathologies have an acute traumatic origin as the right acromio-clavicular dislocation, the fractures of four ribs, four transverse processes of lumbar vertebrae and the antero-inferior margin of the body of T12 and L5. They could result from fall(s) off a horse. Other pathologies are rather in connection with the daily practice of horse riding (repeated micro-traumas). These lesions consist of a myositis ossificans of the adductor muscles on both femurs and enthesopathies on the femur and the coxal bone. Degenerative osteoarthritis can be observed on the vertebral column (especially between C7 and T1). The joint alterations found on this skeleton are iliac impressions (extension of the articular cartilage in the direction of the femoral neck) and an ovalization of the acetabulum.

Given that the studied individual died young (before 50 years), his enthesopathies are likely in part the consequence of microtraumas, rather than only from degenerative processes linked to ageing. It is thus an ideal candidate to study the markers of horse-riding practice. This study also confirms the contribution of the collections of identified skeletons in reconstruction of the activities of past populations.

2 THE RIDER SIZE – HORSE SIZE RELATIONSHIP THROUGH TIME AND SPACE

**Abstract author(s):** Niskanen, Markku (University of Oulu)

**Abstract format:** Oral

Absolute and relative sizes of horses and riders affect riding performance. A rider can be too heavy for a horse, but a horse can also be too big for a rider (e.g. legs too short to reach well enough around a horse's sides). This study examines the rider size – horse size relationship in past and present in light of osteoarchaeological, historical and ethnographical data. Heights and weights of past people and horses are estimated from skeletal dimensions, but known body sizes are used in more recent cases (e.g. cavalry troopers and horses, competitive riders and their sport horses). Conformation (e.g. metapodial proportions) affects horses' ability to carry weight and is taken into account. Results demonstrate temporal and geographic variation in absolute and relative sizes of humans and horses likely reflecting in horses' usability for riding as well as the overall riding performance. For example, early domestic horses were generally big enough for adult male riders; horses from the sites of the La Tène culture of Central Europe were generally too small for adult male riders for "proper" riding being much smaller than earlier and later domestic horses from Central Europe, but

some horses from the same sites were bigger than many contemporary steppe horses. It is acknowledged that it is not always known if archaeological horses (e.g. the early domestic horses) were used for riding.

3 BECOMING EQUESTRIAN: PEOPLE AND HORSES IN BRONZE AGE HUNGARY

**Abstract author(s):** Kanne, Katherine (Northwestern University)

**Abstract format:** Oral

The Bronze Age was a transformative period in European prehistory and human-horse relationships. The changing relationships between people and horses correspond to the origins of complex tell societies of Middle Bronze Age of Hungary (2000/1900–1500/1450 BC). For this paper, I present the results of my research of the human-horse relationships in this period, where I used an integrated methodology combining zooarchaeology, bioarchaeology, stable isotope analysis, bit study, and GIS mapping to analyze data from five tell settlements and ten cemeteries I compared to existing assemblages.

I illustrate that when the tell societies were formed, horses and the first bridle bits were widely distributed and horses gained a cultural significance different from other livestock. Mortality profiles and strontium isotopes show that horse breeding was generally localized to the tell communities, but people were importing in a few horses from other regions. Wither's heights, bit-wear, and post-cranial pathologies suggest that horses were likely ridden, which is further supported by the evidence for riding from human remains. Riding was probable, relatively widespread, and not restricted by class or sex. Though equestrianism is often linked to wealth and power, horses and riding were not obviously aligned with elites at this time. Horses were probably ridden by regular women and men to herd livestock, travel, and trade.

In contrast to earlier expectations which assumed chariot driving warrior aristocracies ruling the tells and controlling the bronze trade, I argue horses gave people individual power and autonomy which enabled them to variously resist the development of centralized authority and hierarchical social differentiation previously thought to characterize this period, a sentiment supported by a growing body of research of the Hungarian Bronze Age.

4 HORSES IN THE EARLY AND MIDDLE BRONZE AGE IN CENTRAL EUROPE

**Abstract author(s):** Wittmann, Sarah-Julie (Albert-Ludwigs-Universität Freiburg; LWL-Museum für Archäologie Herne)

**Abstract format:** Oral

The complex relationship between horses and humans is unique and fascinating even today and had a great impact on past societies. But when and how did it start? Horse domestication had been practiced in Central Europe in the early Bronze age at the latest. However, the earliest evidence is particularly scanty. Only the application of a holistic approach towards the integration of various disparate sources and methods permits to unveil a fuller picture of early domesticated horses in Bronze Age societies.

This paper introduces diverse strands of archaeological evidence concerning early domestic horses between the Carpathian Basin and the river Rhine, the Po Valley and Southern Scandinavia: Zooarchaeological remains, artifacts (such as bridle-equipment) and imagery (for example on rock art or bronze figurines).

On the basis of this data, the different forms of husbandry and exploitation of early domesticated horses as well as their role in Bronze Age imagination will be discussed. Can we tell how equids were kept and bred? What do we know about their part in Bronze Age nutrition? To when can we trace the first evidence of riding and were horses used as draught animals? Did early domesticated horses really have such a crucial impact on Bronze Age conflicts? Finally, the emphasis is put on the role of horses in Bronze Age societies and imagination, and on the relationship between equids and humans. In this process, widespread narratives in Bronze Age archaeology ("warrior horsemen", "warrior aristocracy") are challenged under close examination of the archaeological material. Moreover, the long history of research is being taken into consideration to grasp the present-day understanding of Bronze Age horses.

5 THE EARLIEST SPUR IN EUROPE? ABOUT HORSES AND MEN IN THE LATE HALLSTATT NECROPOLIS FROM VALEA STÂNII (ROMANIA)

**Abstract author(s):** Mandescu, Dragos (Arges County Museum)

**Abstract format:** Oral

The paper focuses on the graves of mounted warriors in the archeological group Ferigile (south of the Carpathians, the 7th-5th centuries BC) and offers a detailed look at this kind of spectacular tombs from the necropolis at Valea Stânii (Argeş County). I will try to follow first of all quantitatively the spread of the tombs of horsemen in the whole Ferigile group and the way of funeral expression of the presence of the horse in the grave of the rider warrior (usually a symbolic presence). Then I will insist on the situation illustrated by the incineration necropolis from Valea Stânii. They are presented the clues that allow the attribution of some of the graves to the elite group of mounted warriors: not only the horse-harness parts deposited as a grave goods, along with weapons, but also some pits with ashes and animal cremated bones placed at the fringes of graves. The result of archaeozoological analysis confirmed the presence of horse bones (among other animals). This could be an indication of the slaughter of the horse, along with other animals, at the funeral banquet (perhaps to be eaten?), and could indicate eventually a much closer connection between man and animal. The analysis of the horse-harness elements attests to large-scale supraregional contacts, at the interference between the Thracian, Scythian and Illyrian cultural milieux. A very recent discovery at Valea Stânii (2020 archaeological season), made in the last explored funeral feature (the barrow no. 22, radiocarbon dated to 8th-6th centuries BC), seems to reveal one of the earliest spurs, if not the

earliest, from Europe. A comparative discussion upon the earliest known spur specimens from the Iron Age Illyrian, Celtic and Thracian worlds brings arguments in this regard.

6 THE HUMAN-HORSE INTERACTION IN THE PREHISTORY OF ROMANIA

**Abstract author(s):** Balasescu, Adrian (Institute of Archaeology, Romanian Academy)

**Abstract format:** Oral

The horse became a constant presence in the archaeozoological studies in Romania since the Chalcolithic period (approximately 4500-3900 BC). The increased number of horse bone remains from various sites during this period (over 5%) led some romanians authors to consider that this species had already begun to be domesticated, but this fact has not been confirmed. It is considered that the first domestic horses in Romania come from the Bronze Age (after 3000 BC). The skeletal remains of this species have been discovered in various domestic contexts, which attest to horse consumption (hypophagy). However, in some archaeological contexts, ritual deposits of horses have been discovered, which illustrate the special relationship that existed between these animals and humans. Ritual deposits of complete horses were discovered in various prehistoric settlements (Negrileşti, Ripiceni) from the Noua culture (1800-1100 BC). A review of the archaeological contexts, the archaeozoological, taphonomic and biometric study of these horses from Noua culture will be made in this presentation.

This work was supported by a research grant developed with the financial support of the Recurring Donors Fund at the disposal of the Romanian Academy and managed by the "PATRIMONIU" Foundation GAR-UM-2019-II-2.1-1 (project no. GAR-UM-2019-II-2.1-1/15.10.2019).

7 VICTORIOUS HORSES, HORSEMEN AND CHARIOTEERS IN ANCIENT GREEK GAMES

**Abstract author(s):** Liveri, Angeliki (Greek Ministry of Education and Religious Affairs)

**Abstract format:** Oral

This paper presents images of horses, horsemen, chariots and charioteers who were victorious in ancient Greek Games, Panhellenic or local. Horses and related competitions were very popular in Ancient Greece. Owning a horse was a status symbol. Motifs of equestrian or chariot races contests and their winners are represented in various artistic works (e.g. sculpture, vase-paintings, jewelry and coins). Victory processions of winning horses or chariots are particularly interesting. Such works (monumental or in small dimensions) were dedicated to sanctuaries. Tyrants and kings were frequently represented in the obverse or reverse of their coins as horsemen or winner in chariot race. Horses and chariot races are linked with deities or heroes. This paper aims to categorize the representations according to the competition and the celebration's phase of the prizes' awarding. Therefore, it would be possible, combining archaeological evidence and written sources, to reconstruct the customs related to the victory celebrations (proclamation and prizes awarding), the relationship between horses and horsemen or charioteers and the winner's status.

8 "A HORSE IS WORTH MORE THAN RICHES" – EXPLORING HUMAN AND EQUINE RELATIONSHIPS IN MIDDLE TO LATE IRON AGE BRITAIN

**Abstract author(s):** Barker, Jane (The University of Manchester)

**Abstract format:** Oral

"A horse is worth more than riches" is an old Spanish proverb, and this simple phrase encapsulates the complex relationship between humans and horses, which is far more than economic value. The occurrence of equine remains, and elaborately decorated horse gear and chariot components, is widespread in archaeological contexts from Middle to Late Iron Age Britain (circa 500 BCE to 100 AD). It appears, therefore, that ponies were important to Iron Age people. Previous equine related research has focused mainly on typological approaches to horse gear, researching different component parts, such as bridle-bits or terrets, or on art and decoration, whilst research into faunal remains has relegated the pony to either economic or symbolic meaning purely for the benefit of humans.

Recent zooarchaeological advances in the study of skeletal morphology have illuminated some fascinating changes connected to the different effects of harnessing, chariotry and equitation on equine remains. My research takes a novel and holistic approach to the human and equine relationship, combining these advances in zooarchaeology, with equine ethology, material culture studies, osteoarchaeology, iconography and classical and ancient texts. This paper will explore some of these themes through a specific case study. The overarching aim is to gain a more nuanced understanding of the complexities of the relationship between people and ponies during the Middle to Late Iron Age period of British prehistory.

9 THE MEANING OF FUNERARY HORSE RACES IN POMERANIAN CULTURE

**Abstract author(s):** Wojtecki, Jakub (Nicolaus Copernicus University in Toruń)

**Abstract format:** Oral

The archaeological iconographic evidence, supported by an awareness of similar customs in a wide variety of Indo-European cultures, suggests that funerary horse races were indeed performed by inhabitants of the Baltic sea's south coast region in the early Iron Age. The aim of my presentation is an attempt to clarify of the meaning of those rituals and of the horse itself for the society forming what is largely referred to as the Pomeranian Culture, in the context of the people's religious and mythological systems.

The need for a proper funeral, as a condition for living in the afterworld, indicates the significance of its elements. According to van Gennep's theory of the rites of passage, funerary equestrian races, often connected with a competition for the deceased's property, were performed in the middle phase of the ritual, when both the dead and the mourners stood between the world of the living and those inhabiting the afterworld. In the Indo-European cosmology, the horse was an animal which appeared to be able to cross the borders between the worlds of humans and gods. It can be observed in the mythology, as well as in the archaeological iconography or the written sources describing pagan religions. It may further suggest that the horsemen taking part in the above-mentioned rituals, precisely owing to their steeds, entered the outworld inhibited by sacral powers. As I will attempt to demonstrate, using horses for such important rituals that shows their „supernatural” abilities, the animal's significance and value in culture.

10 HORSEMAN AND HORSE IN LITHUANIA DURING THE 2ND–14TH C. AD: SIZE, AGE AND ORIGIN OF THE HORSES

**Abstract author(s):** Piliciauskiene, Giedre - Kurila, Lurynas - Simčėnka, Edvardas - Zagurskytė, Aurelija (Vilnius University, Department of Archaeology) - Lidėn, Kerstin (Stockholm University, Department of Archaeology and Classical Studies)

**Abstract format:** Oral

In Lithuania, the first graves of horsemen buried together with the horse appeared in the Early Roman Period. Through the ages, riders and horses were buried in many ways, e.g. warrior together with the whole horse or only with the head and legs of a horse, etc. During the Viking period, horse burials in barrows and huge horse cemeteries with up to 300 horse graves appeared as well. Close relationship between rider and horse can be observed up to the early 15th c. – horses were still buried in the same cemeteries with humans until the Christianization of Lithuania in the late 14th c. Moreover, historical sources report that in the 14th c. Grand Dukes of Lithuania were cremated together with dozens of horses and also dogs and birds of prey.

In our presentation, we will demonstrate dynamics of horseman-horse relationship during the millennium and we will try to answer the questions – when, how and why did the size and age of the buried horses change. The first results of 87Sr/86Sr and 18O/16O stable isotopes analysis of horses and riders from wealthy elite graves dated to the Migration Period will be presented as well. The analysis provided us new data about the migration processes in Europe during the 4th –6th c. and answered the question about the origin of exceptionally large horses of the Migration Period in the territory of the present day Lithuania.

11 HORSE BURIALS FROM RÓWNINA DOLNA, SITE III, NORTH-EASTERN POLAND

**Abstract author(s):** Szubska, Magdalena - Wysocki, Jacek (Cardinal Stefan Wyszyński University in Warsaw)

**Abstract format:** Oral

The cemetery of the West Baltic cultural circle in Równina Dolna, site III, is exceptionally valuable due to a high number of cremated human burials (over 300) and skeletal horse burials (over 70) from the Roman period and the Migration Period. Horse burials included riding equipment. The finds excavated from the horse pits included, among others, snaffle bits (over 60), bridle buckles, large iron buckles, leather strap ferrules, nosebands and iron scissors. Moreover, in two horse graves parade bridles and a highly rare find of a curb bit were found.

The cemetery in Równina Dolna is located in the borderland between the Bogaczewo culture, the Dollkeim-Kovrovo culture and the Olsztyn Group. This allowed us to identify all these influences on the culture of peoples in this area. The long time horizon (from I BC to V AD) and the large number of burials give us the opportunity to learn more about the tangible and spiritual culture (rituals and beliefs of this group of people and the role horses played in its rituals).

12 THE MEROVINGIAN RIDER AND HIS HORSE : IMPACT OF EQUESTRIAN EQUIPMENT ON THE RIDER’S POSTURE AND SKELETON

**Abstract author(s):** Baillif-Ducros, Christèle (INRAP - National Institute for Preventive Archaeological Research)

**Abstract format:** Oral

The Merovingian period offers an ideal archaeological context to address the question of equestrian practice by populations of the past. Within the funeral complexes, the archaeological and archaeozoological data testify to the presence of mounted equine subjects but also those of their riders. There are distinguished from the population buried mainly by the single wearing of a spur on their left heel and sometimes by the presence of parts dedicated to the equestrian equipment of the horse such as the bit, the stirrup and / or the saddle. This one is the link between the rider and his mount. The rider interacts directly with the animal through his equipment (the spur) and that of his equine partner (the saddle and the stirrup (s)). This interaction results in a visible lesional impact on the rider's skeleton called "Horseback-riding syndrome". The results of a doctoral research carried out on the methodological revision of the "syndrome", from osteological collections of the northeastern Gaul dated from the 6th-7th centuries, made it possible to emphasize the influence of the equestrian furniture used on the rider's posture. This interdisciplinary study (horse archaeology, biological anthropology and equestrian sport medicine data) on the rider's posture is a new methodological key for a good understanding and better identification of "Equestrian stress markers" on the skeleton. From statistical analyzes, three criteria could be validated to distinguish rider individuals within Merovingian necropolises : presence of the Poirier's facet at the femoral head-neck junction, ovalization of the acetabulum and joint changes of the hip during a repeated sitting position on the saddle; presence of osteoarthritis on the upper outline of patellar surface in case of use of stirrups.

MOUNTED OR NOT MOUNTED? IDENTIFICATION OF RIDING BY USING ENTHESEAL CHANGES IN HORSES ASSOCIATED WITH THE BURIAL OF CHILDERIC I

**Abstract author(s):** Binde, Marion - Cochard, David - Knüsel, Christopher J. (UMR 5199 PACEA, “De la Préhistoire à l’Actuel: Culture, Environnement et Anthropologie”, Université de Bordeaux)

**Abstract format:** Oral

Childeric I, father of Clovis and first king of the Franks, was buried in 481-482 in the present Saint-Brice district of Tournai (Belgium). Between 1983 and 1986, excavations of a Merovingian necropolis there, directed by Raymond Brulet, revealed three pits containing a total of 20-21 horses. The context of the discovery, their position on the periphery of a large tumulus containing resplendent grave inclusions and the 14C dating suggest that these valuable animals were selected from Childeric’s cavalry, sacrificed, and deposited as part of the obsequies to mark the death of this Merovingian paramount. But were they really used as mounts?

Zooarchaeologists currently have few reliable equine bone markers to identify riding activity. To determine if these horses were used as saddle animals, this presentation aims to fill this gap in knowledge by providing a new approach based on enthesesal changes. They correspond to bone modifications of the interface where tendons and ligaments meet bone (i.e. entheses), and they are widely used in biological anthropology for reconstructing socio-economic activities, division of labor and the health status of past human groups. However, altered tendinous or ligamentous attachments are not as much employed in studies of faunal remains, even if interest in them has been increasing over the past decade.

Twenty-three entheses of the appendicular skeleton were macroscopically recorded on the horses to permit comparison with 53 modern unworked and worked (mounts, draft equids) specimens. Results show that prevalence of altered attachments in these horses is clearly distinct from those of draught equids and closest to those of recent saddle specimens. Combined with archaeological data and palaeopathological investigation, the analysis of enthesesal modifications demonstrates that the horses deposited around the tumulus were probably used as mounts and confirms a hypothesis first proposed by archaeologists.

HORSEMAN-HORSE COUPLE THROUGH TIME AND SPACE. PART 2

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Binde, Marion (Université de Bordeaux; UMR 5199 PACEA) - Bede, Ilona (Université Paris 1 Panthéon-Sorbonne; UMR 8167 Orient et Méditerranée - Monde byzantin) - Csiky, Gergely (Archaeological Institute of the Research Center for Humanities, Budapest)

**Format:** Regular session

Horse riding greatly impacted past societies by increasing mobility and revolutionizing warfare. Horses were also frequently used for sports and hunting. These various practices implied close interactions between riders and their mounts, considered as precious companions. This couple is also strongly linked to wealth and power, therefore social representations. This relationship contributed to raising a figure of the horseman, between myth and reality, often in a positive/negative duality.

A variety of sources provide precious evidence including human and equids bones, harness, archaeological contexts, written sources and pictorial depictions, nowadays ethnographical observations and method of ethology on this special couple across time and space. Their analysis can provide information on equestrian practices, physical interactions and performances of the rider with his mount and methods of training and grooming of these animals. It can also give us an idea of cultural perceptions of horsemen on their horses, of the society on the horsemen.

This session aims to explore the strong horseman-horse relationship by highlighting the multidisciplinary and interdisciplinary approaches. We hope to illustrate the need to share knowledge from different disciplines for a better understanding of this strong link. We expect papers focusing on - or even crossing - different realms as archaeological context analysis, studies on human and equid bones, equestrian material, iconography, social and cultural anthropology, etc. which can document this topic. Works interested in European as well as non-European contexts and on diverse periods are welcome.

ABSTRACTS:

1 BUCKLE UP! A COMPARISON OF LOCAL DECORATION STYLES ON PAZYRYK RIDING GEAR REGARDING SUPRA-REGIONAL EXCHANGE DURING THE 3RD CENTURY BC

**Abstract author(s):** Stümpel, Anna-Elisa (University of Groningen)

**Abstract format:** Oral

It is widely acknowledged that the horse had a key-role in the nomadic life-style of the Scythians situated in the Central Asian and Eurasian steppes. As the archaeological record shows, being able to control the horse through bridle, saddle and hobbles was an important element in Scythian culture, and a vast variety of different kinds of bridle styles indicate that their design was continously optimised.

Particularly the riding gear of the archaeological group of the Pazyryk Scythians is characterized by various types with a local choice of (animal) motifs and designs for the ornaments on it. Some horses were equipped with ostentatious headdresses as well that were similarly decorated as the other equipment. An example of local differences in the ornamental design of the riding gear and

horse headdresses can be found at the necropolis situated in Pazyryk Valley. There, four of the five elite burials are alike while the ornamental style found in Pazyryk-1 is similar to the contemporaneous kurgan Berel’11.

In this paper, the design of bridle, saddle and headdress ornaments found in the elite burials of Pazyryk-1, Berel’11 and Ak-Alakha-3 kurgan 1 burial 2 is examined via a comparative approach. Based on the premise of intensive human-horse-relations, it is argued that the animal motifs shown on the riding gear and horse headdresses found in these burials are linked to a territorial organisation. They were chosen individually for each clan and functioned thus as their “coat of arms”, which were displayed especially via the head-dresses. By additionally considering the different designs of the ornaments on the riding gear and headdresses and their spatial distribution, it might be possible to gain further insight into the Pazyryk Scythian (cultural) relations and exchange at a later phase of their culture in the 3rd century BC.

2 THE INTERPLAY OF MATERIAL, SHAPE AND FUNCTION IN THE SPREAD OF STIRRUPS IN LATE ANTIQUE EURASIA

**Abstract author(s):** Csiky, Gergely (Archaeological Institute of the Research Center for Humanities)

**Abstract format:** Oral

Stirrups considerably influenced horse riding and cavalry warfare during Eurasian Late Antiquity. They not only transformed the way of mounting but also provided greater stability during the ride which facilitated various movements, including mounted archery and the change of weapons on the saddle. In spite of the notion of the second cavalry revolution, this change did not happen at once. The present paper aims to present the long and multi-stage process of the spread of stirrups.

The material, shape, function and geographical distribution of the early stirrups significantly changed from the 4th to 7th century in Eurasia. The first wooden stirrups with metal frame were buried in elite burials in North China and Korea dated to the 4th-5th centuries. Two types of suspension are distinguished: a single stirrup on the left side or pairwise suggesting different functionality. The first to mount the horse and the second to support the rider’s feet. Their geographical distribution overlaps the nomadic - sedentary borderland in an era when dynasties of nomadic origin ruled Northern China.

Iron stirrups became dominant only by the end of the 5th and early 6th century. Their shape changed considerably: stirrups with eye-let-shaped loops and flat stirrups with elongated loops are equally known, the foot of both of these types are narrow and T-shaped in their cross-section. The spread of such artefacts shifted towards the steppes, most of such stirrups occurred in Inner Asia.

The next step in the evolution of stirrups was the broadening of the feet providing better support for the rider. The earliest Avar stirrups represent this final stage of this process which means that they appeared in Europe in a developed form.

3 DID CHIEFS WHO BURIED IN A KOFUN BURIAL MOUND ACTUALLY RIDE HORSES?

**Abstract author(s):** Hashimoto, Hiroko (The Congenital Anomaly Research Center, Kyoto University) - Shimizu, Daisuke (Chubu Gakuin University)

**Abstract format:** Oral

As Japan is an islands country, cultures, domestic animals and cultivated plants whichwere introduced from the Eurasian Continent have always given a great impact to Japanese culture. Japanese horses also originated Mongolian Plateau. Horses were brought to Japan in the fifth century through Korean Peninsula by immigrants during the Kofun Period (third to seventh century). Afterwards horses were bred in Japan, as several pasture remains, and many horse tacks were found mainly inside of Kofun burial mounds. Moreover, number of horse shaped Haniwa clay dolls were ritual artifacts and were arranged around a Kofun burial mound. During Kofun Period, horses were symbols of authority. Central government granted horses to local clans exchanging with fidelity. Naturally, horses were symbol of authority for chiefs of local clans, as well. Some individuals who were buried in a Kofun burial mound had femurs with extraordinary developed linea aspera. The linea aspera is a major insertion of adductor muscles of the thigh. Development of osteo partsis usually lead by muscle development of where the muscles originatedor inserted.Therefore, several morphologists pointed this character was likely to relate with horse-riding.The purpose of this study was to evaluate which muscles were mainly used during horse-riding with Kofun style harness. Subjects for experimentation were six people who had a good horse-riding experience at least 45 years’ career. The subjects rode a horse with Kofun style horse tacksfor two hours. After horse-riding the subjects have been palpated their thigh, and interviewed. All of the subjects always felt muscle pain only on the adductors. They said they needed to hold tighter horse body between their knees when they used Kofun style harness than present harness.Extraordinary developed linea aspera of femur was not common for individuals who buried in a Kofun burial mound. Although the chiefs mounted horses to display the authority, most of them were not riders.

4 LIFE ON HORSEBACK? A STUDY OF THE “HORSE RIDING SYNDROME” IN AN AVAR POPULATION OF THE 7TH-8TH CENTURY

**Abstract author(s):** Bühler, Birgit (Vienna Institute for Archaeological Science - VIAS, University of Vienna; Department of Evolutionary Anthropology, University of Vienna) - Kirchengast, Sylvia (Department of Evolutionary Anthropology, University of Vienna)

**Abstract format:** Oral

The “horse riding syndrome” comprises a number of changes on the human skeleton which, if found in association, could indicate that the individual in question practiced horse riding as a habitual activity during his or her lifetime. In the bioarchaeological literature,

“Poiriers’ Facet” (Reiterfacette) has been referred to as one characteristic trait of the “horse riding syndrome”. Therefore, in archaeological contexts, individuals where “Poiriers’ Facet” (Reiterfacette) is present on one or both femurs could be expected to exhibit a higher prevalence of other characteristics of the “horse riding syndrome”. Firstly, the aim of this paper is to contribute to methodological research on the “horse riding syndrome”, by testing possible associations between different characteristics within the adult population of an Avar cemetery of the 7th-8th century AD from Eastern Austria (Wien-Csokorgasse). Avar populations are ideally suited for methodological research on the “horse riding syndrome”, because – according to historical sources – the Avars were accomplished mounted warriors. Indeed, the results demonstrate a clear association between the presence of “Poiriers’ Facet” on the proximal femur of an individual and the prevalence of other characteristics of the “horse riding syndrome” on the bony pelvis and leg bones of the same individual. Secondly, the aim of this paper is to identify possible differences in activity patterns between different groups within the adult population of Wien-Csokorgasse. This research is expected to contribute to existing knowledge regarding the “way of life” and habitual activities of Avar populations in Eastern Austria. The results suggest differences in habitual activity patterns within the Avar population in question, especially between the sexes, as well as chronological differences.

5 “TELL ME HOW YOU BURY YOUR HORSE, I’LL TELL YOU WHO YOU ARE”

**Abstract author(s):** Bede, Ilona (University Paris 1 Panthéon Sorbonne; UMR 8167 East and Mediterranean, Byzantine World)  
**Abstract format:** Oral  
Funeral practice and social identity in the Avar period.

Horse burial practice has been much extended in the early Middle Ages and especially in Avar period cemeteries. Though it didn’t concern the whole society but a very limited part of it, which has been therefore considered as part of the elite. Killing a horse is actually an important economic sacrifice and not everyone could afford it. Several works has shown already the link between horse burial and men buried with a mounted belt or weapons. Nevertheless deceased buried with a horse (or part of it) aren’t systematically fitted with abundant or wealthy material. On the other side, the overwhelming part of the horses in Avar period cemeteries are harnessed and fitted, but it’s not always the case neither.

The purpose of this communication is to qualify the meaning of both horses’ and human deceased’ burials and their relationship inside the funeral practices, regarding archaeological finds. The bones assemblage, the material, and the positions of the deposits give some criteria to characterise the burials. Funeral practices are highly concerned by normalisation of ritual and differentiation inside the society. The demonstration played in this ceremony is significant for the people involved in it. We should therefore recognise “standard” or “exceptional” elements, which distinguish the individuals buried, the role(s) of the horse’s deposit, as an animal and/or as reified object, it’s meaning in the ritual, for the society in general and for the deceased in particular.

6 NOT EVEN “DEATH WILL DO US PART:” MEDIEVAL CASPIAN NOMADS AND THEIR HORSES IN LIFE AND AFTERLIFE

**Abstract author(s):** Shingiray, Irina (University of Oxford)  
**Abstract format:** Oral  
The importance of horses in life of Eurasian pastoral nomads cannot be overstated. Horses were raised, praised, ridden, eaten, traded, raided, gifted, exchanged, exerted, exhausted, and exalted—representing the soul of its owner or its transporter to the afterlife. In the Middle Ages, horses were buried with male and female deceased; they were sacrificed at ritual sites, and depicted on personal and ritual objects. In my contribution to this session, I will address the role of the horse in life and death of medieval Caspian, mainly Turkic and Mongol, nomads by looking at the archaeological evidence from individual burials, ritual deposits, and a variety of nomadic items of personal and ritual use which depicted horses or were used as parts of a horse tack. I will also explore some medieval nomadic beliefs, mythology, and symbology in relation to horses based on (meager) textual sources that we possess from that time period, but also based on textualized oral histories that have come down to us from the resilient medieval steppe tradition. I will also consider elements of continuity and change in the nomadic religious and ritual practices in relation to the role of the horse when the Caspian nomads began embracing Islamic faith and changing their conceptions of personhood after life.

7 OF HORSES AND MEN: ARCHAEOLOGICAL AND ARCHAEOZOOLOGICAL EVIDENCE FROM ROMAN AND EARLY MEDIEVAL SITES IN SLOVENIA

**Abstract author(s):** Karo, Špela (Institute for the Protection of Cultural Heritage of Slovenia, Centre for Preventive Archaeology) - Tožkan, Borut (Research Centre SAZU Institute of Archaeology)  
**Abstract format:** Oral

For millennia, horses and humans coexisted and interacted. Horses played important role in transportation, labour, diet, religion, and military services. They represented social status and wealth and often received considerable attention from their owners to make them appear elegant and attractive. In the archaeological record, this is most evident in the exquisite equestrian equipment, as well as ritual and burial practices.

Slovenian sites from the Roman period and the Early Middle Ages yielded a fairly large number of equestrian equipment and skeletal remains of horses from different archaeological contexts. However, the evidences of human-horse interaction from the two periods differ considerably. Pieces of equestrian equipment from the Roman period are not very numerous, regardless of the fact

that cavalry was an essential part of the Roman army. Individual pieces are usually found in settlement layers, as parts of hoards or as stray finds. The remains of horse bones discovered in settlements, waste pits, cemeteries and wells, on the other hand, provide information about Roman dietary and ritual practices.

The situation in the Early Middle Ages is even more intriguing. Numerous items of equestrian equipment such as bits, stirrups, strap dividers, saddle parts and spurs come mainly from the hilltop sites and some hoards, but horse remains from these contexts are limited to single bones in the settlement layers. The objects, forged from high-quality metals and elaborately decorated, undoubtedly belonged to the riders of the upper class, but where are their horses?

8 WERE THEY RIDERS? IDENTIFICATION OF RELIABLE HORSE RIDING-RELATED SKELETAL CHANGES FROM THE BIOARCHAEOLOGICAL ANALYSIS OF A HUNGARIAN CONQUEST PERIOD POPULATION

**Abstract author(s):** Berthon, William (Chair of Biological Anthropology Paul Broca, EPHE, PSL University; Department of Biological Anthropology, University of Szeged; UMR 5199 PACEA, CNRS/University of Bordeaux) - Tihanyi, Balázs (Department of Biological Anthropology, University of Szeged; Department of Archaeology, University of Szeged) - Révész, László (Department of Archaeology, University of Szeged) - Coqueugniot, Hélène (Chair of Biological Anthropology Paul Broca, EPHE, PSL University; UMR 5199 PACEA, CNRS/University of Bordeaux; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology, Leipzig) - Dutour, Olivier (Chair of Biological Anthropology Paul Broca, EPHE, PSL University; UMR 5199 PACEA, CNRS/University of Bordeaux; Department of Anthropology, University of Western Ontario) - Pálfi, György (Department of Biological Anthropology, University of Szeged)  
**Abstract format:** Oral

Although some equine skeletal changes are promising for identifying the riding practice, the existence of a direct link between specific human bone changes and this activity has not yet been unarguably demonstrated. This is notably due to various limiting factors, such as the lack of specificity of the markers and the absence of direct contextual evidence.

Archaeological and historical sources attest that armies of mounted archers conquered the Carpathian Basin at the turn of the 9th and 10th centuries. Deposits of riding equipment and horse bones are often found in association with the individuals in graves from Hungarian Conquest period cemeteries. Those populations are, thus, among the most pertinent to perform methodological investigations on horse riding-related skeletal changes.

We selected 67 individuals from the 10th-century Hungarian cemetery of Sárrétudvari-Hízőföld and analyzed them according to the presence or absence of riding deposit in their grave. They were also compared with 47 presumed non-rider individuals from the documented collection of Lisbon.

We performed a broad macromorphological and osteometric analysis and observed significant differences between the Hungarian groups, with or without deposit, and the comparison group. They concerned especially some lower limb enthesal changes, morphological adaptations of the hip region, and intervertebral disc herniations at the thoracolumbar junction. These traits can be explained by the horse riding practice and are promising indicators to evaluate, statistically, the presence of riders in a population of interest.

Besides, comparisons showed that Hungarian individuals without riding deposit in their grave were very likely riders as well. This funerary practice may, therefore, be related to symbolic or social aspects. Our research contributes to shedding light on the role of horse riding and riders in past populations.

This research was supported by the “Árpád-ház Program” of the Ministry of Human Capacities, Hungary, and the Hungarian NKFIH K125561 Grant.

9 HORSE-MAN COUPLE IN WEST SLAVONIC TRIBES OF THE EARLY MEDIEVAL (POLAND)

**Abstract author(s):** Makowiecki, Daniel - Chudziak, Wojciech (Institute of Archaeology, Nicolaus Copernicus University in Torun) - Krajcarz, Maciej (Institute of Geological Sciences, Polish Academy of Sciences, Warsaw) - Janeczek, Maciej (Department of Animal Physiology and Biostructure, Wrocław University of Environmental and Life Sciences) - Wiejacka, Martyna (Institute of Archaeology, Nicolaus Copernicus University in Torun) - Popovic, Danijela (Laboratory of Paleogenetics and Conservation Genetics Centre of New Technologies, University of Warsaw)  
**Abstract format:** Oral

There is a Polish proverb saying that: “everybody can see how a horse looks like”. Written by Benedykt Chmielowski the author in the 17th century encyclopaedia, it indicates commonness of the animal in the Polish Kingdom. At the same time, it confirms a long tradition of the horse-human relationship among the West Slavic tribes occupying the lands of Vistula and Odra basins from the 6th-7th centuries. According to the historical records there is no doubt that horse was significant in the warfare and religion. It was so precious that only the highest elites were its owners. On the other hand, this special character of horse-Slavs relationship is reported by very limited historical records. On the contrary, zooarchaeology permanently collecting horse remains, produces biological and, at the same time, independent data in archaeological and social contexts. Thus, this creates an obvious chance to verify the current historical picture on significance of the animal in the crucial historical stage of Poland during transition from tribal community to Christian European state (6th-13th century). Osteological, biometric, pathological, isotopic and genetic data are just being analysed for this purpose under the project titled ‘Horse in Poland in the Early Piasts and Internal Fragmentation. An interdisciplinary Study\*’. In the paper, the authors will report on chosen issues which are possible to be discussed thanks to the project. Among them are

verification and complementation of the historical knowledge, and in particular the significance of horse in beliefs, rituals and social structure, its external features, biological conditions, sex ratio and size in height at the withers.

\*) The project (2017/25/B/HS3/01248) is financed by the National Science Centre, Poland.

10

WARHORSE – A MEDIEVAL REVOLUTION?

**Abstract author(s):** Benkert, Helene - Creighton, Oliver - Outram, Alan - Ameen, Carly (University of Exeter)

**Abstract format:** Oral

The warhorse was the most iconic animal of the Middle Ages. As distinctive symbols of status, horses were central to the aristocratic image and closely bound up with concepts of knighthood and chivalry. As weapons of war, bred for strength and stamina, warhorses changed the face of battle. But our established understanding of warhorses is based almost entirely on historical scholarship. In contrast, archaeological evidence, which has immense potential to challenge received wisdom and transform knowledge about an animal so critical to medieval life, has remained neglected and untapped.

The AHRC-funded project ‘Warhorse: A Medieval Revolution?’ aims to address this gap in knowledge and, for the first time, brings together several lines of enquiry to explore the medieval horse in all its aspects. Through a multi-disciplinary approach, combining traditional zooarchaeology, geometric morphometrics, and genetic analysis with equine material culture, landscapes, and documents, this research strives to understand the development of this crucial species and how it came to define an entire era.

Presenting preliminary results, this paper examines the zooarchaeology of medieval horses from the 8th through to the mid-16th centuries. Biometrical analyses enable us to study changes in size, shape, and robusticity of the animals resulting from human selection. Through these changes, zooarchaeology has the ability to inform about advances in warfare and to illuminate the place of equine culture in the medieval society.

11

HORSE HARNESS DECORATIONS FROM BOHEMIA AND TRACES OF ITS PRODUCTION IN THE 8TH CENTURY

**Abstract author(s):** Profantová, Nadezda (Institute of Archaeology of the Czech Academy of Sciences in Prague)

**Abstract format:** Oral

The horse harness decorations in the 8th-9th century in Bohemia are mostly connected with the Carpathian Basin. These decorations are often gilded or silvered and represent prestige subjects/goods probably status symbols together with local spurs with hooks. It is important because there are no horseman’s burials (with 3 unrevised exceptions) and also inhumation graves are known from the half of the 9th century. In this time, Carolingian status symbols (e.g. spurs and swords) predominated in male’s graves. New prospections with metal detectors as well as archaeological excavation bring evidence about local production (press-model, unfinished phaleræ, ingots) and local innovation of some types of it (pieces without exact analogies). Some luxurious pieces are very rare in Middle Europe, they have parallels only in west Slovakia and Balaton region in Hungary, some of them belong to the so-called italo-byzantine group. Others are distributed also in southern regions of the Carpathian Basin in Croatia. The finds of harness decoration are concentrated on some hillforts and hilltop sites in Bohemia, the most important are Tismice and Hostim in the Middle Bohemia, both with the area more than 15 ha.

DECORATED HARNESS LIKE A CULTURAL AND SOCIAL WITNESSES OF SCANDINAVIANS AT THE 9TH - 11TH CENTURIES OF ANCIENT RUS

**Abstract author(s):** Novikov, Vasily (The Russian Academy of Sciences Institute of Ethnology and Anthropology - IEA; LCC “Energoproekt”)

**Abstract format:** Oral

The Viking Age fortified settlements in ancient Rus’ are mostly associated with the early medieval trade routes from Scandinavia to Constantinople, from Scandinavia to Caliphate and from Volga to the Sea of Azov. These monuments largely date back to the 9th - 11th centuries AD. It is Scandinavian colonization of new trade routes that is key to appearance finds of horse and rider equipments. Excavations of these settlements and burials have yielded an extensive collection of various elements of bits, bridles, saddles, stirrups, whips, icenails etc. Most of the harness elements are in metal and often were decorated, either with oriental-style or with a Scandinavian one (Borre, Jelling and Oseberg styles).

Osteological data of the horse and the human buried with harness pieces and the distinctive features of the burials allow us to get a foretaste of horse riding’s culture in warrior corps of Viking Age in ancient Rus’.

Horse played a role of high social standing of their keeper, reflected the personal aesthetic and took an important part of the burial practice. Decorated harnesses could be a pattern of ethnic affiliation and religion.

13

HOW FAST WAS THE TRAIN, NEEDED BY THE HEROIC MOUNTED WARRIOR?

**Abstract author(s):** Bauer, Anna (Independent Reseacher)

**Abstract format:** Oral

What are the physiological basiscs question of size draught over long distances? Is the draught and ability to carry heavy burden only a question of size or is race and physique also important? The draught – and the output of the pack animal depend on different factors like the weather, the way, the package and the physical condition of the animals. Mange, glanders, pleuropneumonia, exhaustion, shortage of forage and water as well as wounds due to harness decimated many of animals of the baggage and in some cases also men, if they didn’t run away in time. Using examples up from the Roman Empire till the First World War, it will be explained with which problems every horseman has to struggle when he was going to war. War is not a lot of warriors in a shine armour and his well groomed horse and chivalry. War means dirt and death. In my presentation I will give you the answers to this questions and show you how cruel war was, for animals and humans and how men tried to help their horses and to reduce their suffering. Let me show you how horseman-horse relationship was during warfare.

A CROSSROADS BETWEEN THE CONTINENTS – INTERDISCIPLINARY APPROACHES TO INTERCONNECTEDNESS IN THE ANCIENT MEDITERRANEAN

**Theme:** 4. Globalisation and archaeology

**Organisers:** Mittnik, Alissa (Department of Human Evolutionary Biology, Harvard University; Harvard Medical School) - Eisenmann, Stefanie (Max Planck Institute for the Science of Human History, Department of Archaeogenetics, Jena) - More, Alexander (Climate Change Institute, UMaine; Initiative for the Science of the Human Past, Harvard University)

**Format:** Regular session

Since the first transition of hominins out of Africa, the Mediterranean – with its unique landscape and central position – has served as a pathway between Africa, Asia and Europe. It saw the rise and collapse of vast interaction networks, and has been (and still is) mediating the movement of people, and along with them the exchange of objects, technology and cultural practices. These human interactions took place at different temporal and spatial scales that can be traced by an ever-growing array of methods that in turn require increased integration and communication between disciplines.

The inquiry into Mediterranean interconnectedness is not answered with the mere description of interactions, but encompasses questions about both their catalysts and effects, such as the roles of health – especially technological innovations, social organization, the spread of diseases and pandemics, and climate.

We welcome contributions that use inter- and cross-disciplinary approaches to study connectivity between the regions surrounding the Mediterranean during the main periods of what could be termed “ancient globalization” in the 2ndmillennium BC to the 1st millennium AD: from the emergence of regional kingdoms and first territorial entities with their “international relations” in the Middle and Late Bronze Age, until the intensified mobility and cultural entanglement associated with the trade networks, colonies and imperialist expansions of the Greek, Phoenician and Roman cultures. Such approaches may include, but are not limited to: stable isotope analysis, aDNA of humans, animals and pathogens, proteomics, material source analysis, network analysis, and statistical modelling. In this session, we aim to gather a broad scope of methodological approaches and research questions into the individual and large-scale movements seen in the ancient Mediterranean, their causes and demographic effects, and what this can potentially reveal about the response of societies to demographic, political and environmental changes, as well as to catastrophes and crises.

ABSTRACTS:

1

RETHINKING MEDITERRANEAN CONNECTEDNESS

**Abstract author(s):** Stockhammer, Philipp (LMU Munich; MPI Jena)

**Abstract format:** Oral

For many decades, the Mediterranean has been understood as a world of utmost connectedness through the ages with the sea, landscape and food linking societies. In the last decade, scientific approaches have not only underlined the extent of this connectedness, but also added complexity to our image of the past Mediterranean. Dimensions of human mobility and trade over large distances have become obvious as well as their inherent transformative dynamics. Now, Globalization Studies are forcing us to rethink connectedness and emphasize the duality of dis:connection which means that connection and disconnection always condition each other and that thinking about connection needs to take into account corresponding disconnections.

In my presentation, I will first provide an overview of recently published scientific datasets which have brought to light novel insights into the scales and diversity of mobility of humans and goods in the Bronze Age Eastern Mediterranean. I will then take this as a basis to conceptualize dis:connection and appropriate the related field of debate in Globalization Studies for archaeological thinking. Finally, I will rethink current interpretations of scientific dataset within a framework of dis:connectedness.

2

THE HONEY BEE, HER LIQUID GOLD, AND HER SIGNIFICANCE IN THE MEDITERRANEAN

**Abstract author(s):** Zak, Claire (Texas A&M University)

**Abstract format:** Oral

Honey, as the primary sweetening agent of the ancient Mediterranean world before the introduction of cane sugar, was recognized as a vital commodity among the Egyptians, Greeks, and Romans alike. Some scholars even claim that honey was as important and prevalent in trade as wheat, oil, and wine. The ancient sources, especially the Roman authors Virgil, Pliny the Elder, Columella, and Cato expend many pages to record the characteristics of bees, the craft of beekeeping, and the myriad of uses for honey and beeswax. Beekeeping was enough of a common practice to afford this attention and yet there is little current scholarship regarding the actual trade and distribution of bee products between regions and kingdoms in a cross-Mediterranean exchange. Both the literary and archaeological evidence help to map a vast network of honey and wax exchange, including the insatiable demands of Middle Kingdom Egypt, Bronze Age Israel, classical Greece, and the Roman Empire’s. Evidenced by honey’s status as a medicinal remedy, votive offering with divine connections, and a display of wealth, it is readily apparent why this liquid gold and beeswax were in such high demand throughout the Mediterranean.

This research combines several lines of evidence: literary sources, archaeological sites, reverse engineering techniques, biological characteristics of honey bees, in addition to ceramic and lipid analyses to determine how lucrative the ancient honey and beeswax industry could be. In considering sites that preserved beehives in a fire, it is possible to determine a hive’s productivity and total yields of beeswax and honey for trade.

This project considers questions regarding the uses of honey bee products, their social and economic significance, potential ship-ping containers, how much wax is needed for lost-wax casting of certain bronze objects, and product trade estimates across the Mediterranean.

3

INSIGHTS INTO ADMIXTURE HISTORY AND SOCIAL PRACTICES IN THE PREHISTORIC AEGEAN FROM ANCIENT DNA

**Abstract author(s):** Skourtanioti, Eirini - Gnechchi Ruscone, Guido Alberto (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Ringbauer, Harald (Department of Archaeogenetics, Max Planck Institute for Evolutionary An-thropology; Department of Genetics, Harvard Medical School) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Jeong, Choongwon (School of Biological Sciences, Seoul National University) - Stock-hammer, Philipp W. (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University)

**Abstract format:** Oral

European genetic history went through major transformations during the Neolithic and Bronze Age. Despite the significance of the Aegean for European prehistory, preservation challenges have hindered a comprehensive understanding of human mobility and pop-ulation dynamics in this region through time. In this paper, we present insights from ancient DNA (genome-wide) analyses on Early Neolithic and Bronze Age individuals from Mainland Greece, Crete and the Aegean islands. Our results indicate multi-phased genetic shifts in the Aegean populations since the early Neolithic that can be traced to populations related to Anatolia and then, during the Late Bronze Age, to Central-Eastern Europe. Besides the long-lasting biological connections with these adjacent regions, we also found that Bronze Age Aegeans exhibited endogamy in high frequencies so far unobserved in the rest of the ancient West Eurasia. These close-kin marital practices, likely equivalent to first-cousins unions, were substantially higher in Crete and other Aegean is-lands than in Mainland Greece. Our study highlights the potential of novel biomolecular methods to unravel the interplay of genetic admixture and cultural entanglements in the Aegean and beyond.

4

MOBILITY AND MIGRATION AT THE END OF THE BRONZE AGE IN THE SOUTHERN LEVANT

**Abstract author(s):** Knapp, A. Bernard (University of Glasgow)

**Abstract format:** Oral

Living in ‘an age of migration’ has significantly affected how archaeologists, scientists and social scientists view this very complex phenomenon. Most archaeologists who study prehistoric migrations still believe that the main stimulus behind such movements was human agency, not climatic or environmental change. In fact, human migrations have multiple, complex and often historically specific causes, but archaeological explanations tend to be monothetic. This paper looks critically at migration scenarios proposed for the end of the Bronze Age in the southern Levant. After presenting a brief but critical examination of current archaeological views on the so-called Philistine migration around 1200 BC, I consider the current state of evidence from palaeogenetics (aDNA) and strontium isotope analyses related to this phenomenon. Although such analyses have enabled us to ask — but all too seldom to answer — questions that would never even have been raised a decade ago, in the case of the ‘Philistine migration’ most studies published to date have been inconclusive and are inadequately invested in the wider archaeological, social science and palaeoge-netic literature. The conclusion attempts to look anew at this enigmatic period of mobility and connectivity, of transformation and social change, alongside the hybridised practices of social actors old and new.

5

INSIGHTS FROM ANCIENT GENOMES ON BRONZE AND IRON AGE POPULATION DYNAMICS IN THE LEVANT

**Abstract author(s):** Feldman, Michal (Max Planck Institute for the Science of Human History; Archaeo- and Palaeogenetics group, Institute for Archaeological Sciences, Eberhard Karls University Tübingen)

**Abstract format:** Oral

Recent Archaeogenetic studies have provided first glimpses into genetic interactions between human groups across the Levant from as early as the Mesolithic and up to historical periods. The 2nd and 1st millennia BCE have received a special focus in Archae-ological studies as times of extensive human mobility and cultural change. However, this period remains genetically understudied, mostly due to poor preservation of DNA in the region, with only sporadic and relatively small datasets currently available. While the available data has provided important insights on genetic connections within west Asia as well as with Europe, larger datasets with a denser geographical coverage are needed to capture the complexity of human mobility and inter-connectivity during this time. Here, we present a newly generated dataset of ancient human genomes ranging from the Middle Bronze Age to Persian Period. Our dataset consists of genome wide data from several key sites across the Levant, allowing for a better understanding of the genetic transformations during this time.

6

INVESTIGATING DIETARY PATTERNS IN MEDITERRANEAN LATE ANTIQUITY THROUGH A BAYESIAN META-ANALYSIS OF HUMAN ISOTOPIC DATA

**Abstract author(s):** Cocozza, Carlo (Ludwig-Maximilians-Universität München, Fakultät für Kulturwissenschaften; Max Planck Institute for the Science of Human History, Department of Archaeology, Jena) - Cirelli, Enrico (Alma Mater Studiorum Università degli Studi di Bologna, Dipartimento di Storia Culture Civiltà) - Teege, Wolf-Rüdiger (Ludwig-Maximilians-Universität München, Fakultät für Kulturwissenschaften) - Fernandes, Ricardo (Max Planck Institute for the Science of Human History, Department of Archaeology, Jena; University of Oxford, School of Archaeology; Masaryk University, Arne Faculty of Arts)

**Abstract format:** Oral

The main subject of our research was the interplay between subsistence practices, cultural traditions and population movements within the Mediterranean region of the Roman Empire during Late Antiquity. We employed a meta-analysis of a large collection of bioarchaeological data to determine the extent to which migrating populations impacted local food traditions and subsistence prac-tices.

Our main data sources were the IsoArch and CIMA stable isotope databases that assembled human isotopic data from the Roman and Medieval periods, respectively. Both IsoArch and CIMA are part of the IsoMemo initiative that brings together a network of isotopic databases. This initiative, based at the Max Planck Institute - Science of Human History includes also access to modelling tools to model spatio-temporal archaeological and historical phenomena. We employed the modelling of human isotopic data to visualise spatio-temporal shifts in the diet of late Roman populations and to determine the relationship between dietary shifts, population movements and political crisis. We adopted a transdisciplinary approach in which the modelling of isotopic data was combined with archaeological data to better characterize dietary shifts and their causes.

Results revealed significant changes in dietary habits of populations residing within locations associated with the Western Roman Empire (e.g. Portugal, Spain, Italy, Tunisia), whereas these were mostly absent in the Eastern Roman Empire (e.g. southern Balkans, Greece, Palestina). However, there was an overall decrease in marine protein consumption in Mediterranean areas. Results also re-veal that Longobards migrating from Pannonia into northern Italy maintained dietary traditions that were based on the consumption of large amounts of millet and/or sorghum.

Our results show clear links between dietary traditions in Mediterranean populations and major changes in political systems and broad migratory movements.

7

THE PUNIC MEDITERRANEAN - A NEW ANCIENT DNA PERSPECTIVE

**Abstract author(s):** Ringbauer, Harald (MPI-EVA Leipzig) - Olalde, Iñigo (University Pompeu Fabra) - Mitnik, Alissa (Harvard Uni-versity) - Lalueza-Fox, Carles (Institute of Evolutionary Biology - CSIC-UPF) - Reich, David (Harvard University)

**Abstract format:** Oral

Towards the end of the 6th century BCE, the former colony Carthage in present-day Tunisia emerged as a hegemonial power in the Western Mediterranean. While keeping the Phoenician language as well as many aspects of cultural practices, a new set of “Punic” customs spread rapidly from the Northwest African coast throughout the Western Mediterranean, including coastal sites in Iberia, Ibiza, Sicily and Sardinia. In this study we produced novel ancient DNA evidence from human remains buried in Western Mediterrane-an Punic necropoli. So far, ancient DNA data from Punic sites has been sporadic, and here we generated genome-wide ancient DNA as well as new Radio Carbon dates to fill this gap. Together, this new data allowed us to probe whether cultural links to North Africa are also accompanied by North African genetic ancestry. Moreover, we studied putative genetic connections to the Levant and Aegan. Finally, we investigated the complex interaction with local populations.

8	<p><b>EXPLORING THE GENETIC DIVERSITY OF MAGNA GRAECIA – THE CASE OF CAMPANIA</b></p> <p><b>Abstract author(s):</b> Mittnik, Alissa (Department of Human Evolutionary Biology, Harvard University; Max Planck-Harvard Research Center for the Archaeoscience of the Ancient Mediterranean) - Coppa, Alfredo (Department of Environmental Biology, Sapienza University of Rome; Department of Genetics, Harvard Medical School; Department of Evolutionary Anthropology, University of Vienna) - Sperduti, Alessandra (Bioarchaeology Service, Museum of Civilization, Rome; Department of Asia, Africa e Mediterraneo, University of Naples “L’Orientale”) - Bondioli, Luca (Bioarchaeology Service, Museum of Civilization, Rome; Department of Cultural Heritage, University of Padua) - Gigante, Melania (Department of Cultural Heritage, University of Padua) - Cavazzuti, Claudio (Department of History Cultures Civilizations, Alma Mater Studiorum - University of Bologna; Durham University – Department of Archaeology) - Modi, Alessandra - Caramelli, David (Department of Biology, University of Florence) - Pinhasi, Ron (Department of Anthropology, University of Vienna) - Reich, David (Department of Human Evolutionary Biology, Harvard University; Max Planck-Harvard Research Center for the Archaeoscience of the Ancient Mediterranean; Howard Hughes Medical Institute, Harvard Medical School; Broad Institute of Harvard and MIT)</p> <p><b>Abstract format:</b> Oral</p> <p>Starting in the 8th century BCE, coastal Campania in Southern Italy became a melting pot of various cultures and peoples when Etruscan and Greek colonizers joined local Italic tribes. By establishing cities and trade posts, the contact networks of Campania were further expanded across the Mediterranean and inland.</p> <p>We generated ancient genomes from Campania, spanning the 8th to 3rd century BCE, i.e. the Orientalizing, Archaic and Hellenistic-Roman period in this region. While most individuals can be attributed to a genetic ancestry that arose on the Italian mainland, we also discover descendants of migrants from the Aegean and Eastern Mediterranean. Most notably, an individual dated to the 8th century at the first Greek settlement, Pithekoussai, a site that also yielded the earliest example of writing in the Euboean alphabet, was genetically of Aegean origin, and we find that this type of ancestry persisted at the site for several centuries. We compare the genetic composition of these descendants of Greek settlers to the local Campanians represented by individuals from the site San Marzano and Etruscan immigrants from Pontecagnano.</p> <p>We integrate a thorough analysis of the associated material culture and, where available, strontium isotopes to establish temporal and cultural patterns of mobility, ancestry and admixture that shaped the genetic landscape of Campanian Magna Graecia.</p>
9	<p><b>GLOBALIZING SCENTS AND SPICES. EXCHANGE OF AROMATIC PLANTS ALONG THE INCENSE TRADE ROUTE</b></p> <p><b>Abstract author(s):</b> Huber, Barbara - Larsen, Thomas - Boivin, Nicole (Max Planck Institute for the Science of Human History)</p> <p><b>Abstract format:</b> Oral</p> <p>Some of the most highly desired natural products that moved along ancient trade routes were not substantive, calorie-laden foods, but aromatics, powders and extracts that nonetheless packed substantial flavor and aroma. Not only did these substances possess the ability to transform cuisines or to perfume people and their environment, they also played significant roles in economic, cultural, and ritual contexts. Control over and access to these trade goods became the source of great wealth and political power.</p> <p>Thus, to understand the dispersal of goods and early forms of globalizations, it is key to identify the origins and use of these aromatic substances. Traditionally, it has been difficult to study them in the archaeological record due to their ephemeral nature. Moreover, macroremains of spices or plant exudates are scarce in archaeobotanical assemblages in contrast to more tangible remains such as seeds and fruits. However, recent advances in biomolecular analyses of organic residues in artefacts make it possible to also trace the “invisible” commodities of trade.</p> <p>Here, we present the study of organic remains from objects associated with the use of aromatic substances, such as incense burners, perfume flasks and unguent containers, alongside the Arabian incense road and at destinations in ancient Egypt in the 1st millennium BCE using biomolecular fingerprinting of plant secondary metabolites, lipids and proteins. Our study provides a unique insight into the sensual world of the past by shedding light on the consumption practices of aromatics.</p>

10	<p><b>INSIGHTS INTO ANCIENT EGYPTIAN GENOMES IN THE FIRST MILLENNIUM BC</b></p> <p><b>Abstract author(s):</b> Salem, Nada (Department of Archaeogenetic, Max Planck Institute for the Science of Human History, Jena; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig) - Gneccchi Ruscone, Guido Alberto (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig) - Mötsch, Angela (Department of Archaeogenetic, Max Planck Institute for the Science of Human History, Jena) - Teßmann, Barbara (Museum for Prehistory and Early History, SMPK Berlin; Berlin Society of Anthropology, Ethnology and Prehistory) - Frenzel, Hannah (Institute of Anatomy, Leipzig University) - Spyrou, Maria (Institute for Archaeological Sciences - INA, University of Tübingen) - Francken, Michael (Cultural Heritage Management, Government office of Stuttgart) - Harvati, Katerina (Institute for Archaeological Sciences - INA, University of Tübingen; Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen) - Stockhammer, Philipp (Department of Archaeogenetic, Max Planck Institute for the Science of Human History, Jena; Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, LMU Munich) - Krause, Johannes (Department of Archaeogenetic, Max Planck Institute for the Science of Human History, Jena; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig)</p> <p><b>Abstract format:</b> Oral</p> <p>Egypt provides a privileged location to study historical population dynamics as it is at the crossroads between the ancient civilizations in Africa, Asia, and Europe. In the first millennium BC, ancient Egypt witnessed foreign domination by the neighboring populations including Libyans, Nubians, Assyrians, Greeks, Romans, and others, whose roles vary from trade exchange to invasion and rule. Despite being potential to addressing questions on the population’s demographic, retrieval of ancient DNA from the Egyptian mummies has greatly been challenged by the presence of contamination. Here we report a preliminary, rigorously tested genome-wide dataset from mummies using high-throughput DNA sequencing and targeted capture techniques. The individuals in our study are recovered from Upper and Lower Egypt sites and spanning around 900 years of ancient Egyptian history, from the Third Intermediate to the Roman period. Our study aims to characterize the major ancestry components for ancient Egyptians and to explore the genetic continuation and admixture through times and regions.</p>
11	<p><b>CONNECTING PLACES: THE MATERIAL QUALITY AND PROVENANCE OF ANCIENT PIGMENTS</b></p> <p><b>Abstract author(s):</b> Rodler, Alexandra (Austrian Academy of Sciences) - Baragona, Anthony (University of Applied Arts) - Verbeemen, Eliah - Goderis, Steven (Vrije Universiteit Brussel) - Sørensen, Lasse (The National Museum of Denmark)</p> <p><b>Abstract format:</b> Oral</p> <p>Cinnabar (α-HgS, mercury sulfide) forms a bright red pigment when powdered, was expensive and likely widely traded within the Roman Empire. The provenance of raw materials and the use of pigments can reveal how ancient societies were interconnected. Through a combination of pigment surface- and cross section analysis, as well as trace element analysis, we evaluate pigment preparation, raw material quality and provenance of 29 wall painting fragments from Roman Ephesus (western Turkey). Samples were collected from several rooms and living units of Terrace House 2 and Terrace House 1. They were analyzed using optical microscopy and SEM-EDS on cross sections; additionally, surface topography was studied by SEM-EDS. Elemental analyses (by portable XRF and ICP-MS) hint at a preference for combining cinnabar with Fe-rich pigments (earth pigments) rather than with Pb-rich pigments (minium, red lead), which was also confirmed by SEM-EDS analysis. While ochre was often used as an underpainting layer, EDS measurements exclude the prevalence of pigments other than cinnabar on the top layers. Likewise, EDS was unable to determine statistically relevant variation in the stoichiometry of the cinnabar pigment grains. Optical and scanning electron microscopy revealed that there is significant variation in both pigment morphology and surface distribution. These observations suggest that chromatic variation of the final paint layer is likely due to differences in production and application of the cinnabar paint from a single mineral source. Lead isotope analysis of these samples also hints at the use of cinnabar from a similar source (age, location) and/or consistent mixing of cinnabar from similar sources. This work on the use, quality and provenance of archaeological pigments contributes to reconstructing economic networks that existed between Roman provinces.</p>
12	<p><b>ANCESTRAL ORIGINS AT THE ROMAN DANUBIAN LIMES</b></p> <p><b>Abstract author(s):</b> Carrion, Pablo - Olalde, Iñigo (Institut de Biología Evolutiva-CSIC) - Rohland, Nadin (Department of Genetics, Harvard Medical School) - Grbić, Miodrag (University of Western Ontario) - Miladinović-Radmilović, Nataša (Institute of Archaeology, Belgrade) - Tomanović, Željko - Keckarević, Dušan (University of Belgrade) - Mikić, Ilija (Institute of Archaeology, Belgrade) - Lalueza-Fox, Carles (Institut de Biología Evolutiva-CSIC) - Reich, David (Department of Genetics, Harvard Medical School; Department of Human Evolutionary Biology, Harvard University)</p> <p><b>Abstract format:</b> Oral</p> <p>At its peak, the Roman Empire united all Mediterranean shores under the same rule and law. This, together with great improvements in long-distance communications, brought human mobility across the Mediterranean to an unprecedented scale. From all the areas which were under Roman control, the Balkans is a particularly interesting region as it was the midpoint connecting the Western and the Eastern parts of the Empire; and several peoples groups moved through the region during the Great Migration Period, such as Goths, Huns or Slavs. In this project, we have extracted and analyzed aDNA from ancient Roman and post-Roman individuals (n=69) from 3 settlements located in present-day Serbia: most importantly the capital of Moesia Superior Roman province, Viminacium. Genetic and Radiocarbon dating analyses results point to a high degree of cosmopolitanism in Viminacium during the early imperial</p>

13 period. We observe two major groups of individuals: one with a local ancestral signature likely deriving from Balkan Bronze and Iron Age populations, and other with Near Eastern ancestral origin, suggesting strong population movements from the Eastern parts of Empire impacting not only Rome, but also other major cities like Viminacium. Moreover, we detect remarkable cases of human mobility across the Saharan and the Mediterranean, such as a young male, whose ancestral origins lie in Eastern Africa. These results highlight how dense samplings at specific sites can provide a detailed view on both individual and large-scale human mobility patterns.

13 **FIRST-MILLENNIUM CE PLANT AND ANIMAL EXCHANGE VIA ARCHAEOBOTANY IN COLLABORATION WITH OTHER DISCIPLINES: A MULTI-SCALAR VIEW FROM THE NEGEV HIGHLANDS**

**Abstract author(s):** Fuks, Daniel (McDonald Institute for Archaeological Research, University of Cambridge)

**Abstract format:** Oral

This paper presents three test-cases in which archaeobotanical data deriving from trash middens of 1st-millennium CE Negev Highland sites were integrated with other sources of evidence to track individual and large-scale movement of plants and animals. Although based on the same archaeological contexts, these studies span different temporal and geographic ranges, from millennial-scale Eurasian crop diffusion to micro-regional grazing patterns of individual sheep and goats. First, qualitative changes in crop baskets attest to long-term diffusion, pushing back to Umayyad times introduction of aubergine (an east Asian domesticate) in the Levant, and supporting the Islamic Green Revolution thesis. Yet the plant remains suggest an even greater role for Roman agricultural diffusion, which appears to be a peak period of post-Neolithic, pre-modern crop diffusion in southwest Asia. Second, quantitative changes in key crops attest to the rise and fall of commercial viticulture in the Negev Highlands, centered on the mid-6th century CE, in tandem with ceramic evidence for changing involvement in Mediterranean trade. These results exemplify a globalizing ancient economy’s vulnerability to external shocks like plague and climate change. Finally, a multi-proxy archaeobotanical study analyzed seed/fruit remains, phytoliths and pollen within individual sheep/goat dung pellets to identify grazing season and range. This has potentially profound implications for future research on agropastoral regimes, including aspects of seasonality and mobility. Methodologically, these studies exemplify integration of archaeobotanical evidence with textual, ceramic, and geoarchaeological data, respectively. Together, they offer a more holistic, multi-dimensional view of human-plant interaction from the vantage point of a particular microregion, with relevance to much broader scale movements of plants and animals across the Mediterranean and beyond.

14 **THE FUTURE OF MEDITERRANEAN CONNECTEDNESS STUDIES**

**Abstract author(s):** Hodos, Tamar (University of Bristol)

**Abstract format:** Oral

This presentation outlines future dialogues and future questions pertaining to ancient Mediterranean connectedness as inspired by the papers presented in this panel. Following Stockhammer’s conceptualization of dis:connection, it begins with an assessment of emerging evidence for the balance between connection and dis:connection as highlighted in the panel’s featured case studies.

These focus on two primary areas of evidence: biological data and commodities. Thus, this paper compares emerging biological data for various migrations around the ancient world, extending from the Neolithic and Bronze Age Aegean to the Bronze and Iron Age Levant and Egypt, as well as first millennium BCE Campania and among western Mediterranean Punic communities, and finally Roman Moesia Superior. It also assesses the mobility of specific organic commodities, such as incense, honey, and the pigment cinnabar, and considers the role commodities and diet play in our understanding of migration and socio-cultural and political developments, particularly in the Roman and post-Roman worlds.

Using these case studies, this paper then reflects upon our past interpretations of complex connectivity in these eras. Finally, it considers future avenues of cross-discipline analysis to more fully identify and understand the complex connections between people in the ancient Mediterranean.

513 **PRODUCING POWER: EXPLORING THE RELATIONSHIP BETWEEN PRODUCTION AND SOCIO-ECONOMIC CHANGE IN THE MEDITERRANEAN FROM THE CHALCOLITHIC TO THE IRON AGE**

**Theme:** 6. Material culture studies and societies

**Organisers:** Valenzuela-Lamas, Silvia (Consejo Superior de Investigaciones Científicas - IMF-CSIC) - Trentacoste, Angela (School of Archaeology, University of Oxford) - Nieto-Espinet, Ariadna (Consejo Superior de Investigaciones Científicas - IMF-CSIC) - Guimarães-Chiarelli, Silvia (CIBIO/InBIO - Centro de Investigação em Biodiversidade e Recursos Genéticos; Consejo Superior de Investigaciones Científicas - IMF-CSIC)

**Format:** Regular session

The rise of social complexity in the Mediterranean during late prehistory has been the object of many regional studies. The emergence of increasingly complex social hierarchies took place at different paces in different areas around the Mediterranean – e.g. in the Near East, Cyprus, Egypt, Greece, Italy, Iberia, north Africa – but also different tempos within these sub-regions. What were the socio-economic and political strategies through which these processes were articulated? Did they lead to similar production strategies across the Mediterranean? Are they identifiable in the archaeological record through indicators that are comparable between areas?

This session aims to gather specialists working on settlement patterns, material culture, architecture, and bioarchaeology from the Chalcolithic to the Iron Age from the Near East to the Atlantic façade of Iberia to explore the relationship between production and broader indicators of socio-economic change. Areas of production can include:

- Agricultural strategies, e.g. cereal production, processing, and storage;
- Zooarchaeological evidence for husbandry strategies and animal size;
- Pottery production, e.g. the development and diffusion of standardised forms (cooking vessels, transport vessels, fine tableware);

These will be considered in relation to other indicators of socio-economic organisation, for instance:

- Settlement patterns, e.g. concentrated versus diffuse urbanism, site hierarchies;
- Early evidence for and characteristics of architectural complexity and the internal organisation of sites.

The session aims to facilitate scientific discussion on (1) the effect of socio-economic systems (analysed here through settlement pattern and architectural characteristics) on production, (2) crop and animal husbandry adaptations in different cultural and environmental contexts. We invite papers of any applicable methods that represent farming practices and land management in the region throughout this period (Chalcolithic to Iron Age). Integrative papers drawing evidence from materials studies, bioarchaeological approaches, survey and field excavations are especially welcome.

**ABSTRACTS:**

1 **SOCIAL COMPLEXITY AND COMPLEX SYSTEMS**

**Abstract author(s):** Nakoinz, Oliver (Johanna Mestorf Academy)

**Abstract format:** Oral

Social complexity is a frequently used term in social archaeology. According to the concepts of social evolution, increasing social complexity is assumed which eventually leads to state formation. This process is not driven by continuous optimization of social structures but by an adaption to new conditions, in particular increasing population sizes. But if we understand society as a complex system, what does this mean for social complexity? In complex systems also, complexity is increasing with the population. This seems to fit. But let us look into the details. The complexity in societies understood as complex systems depend on the number of effective contacts of each individual. Due to cognitive capacities, we cannot manage more contacts than a certain threshold (e. g. Dunbars number). If the population exceeds this threshold we fail to remember agreements and to judge people and society becomes unstable. In this case, we need a social organisation that reduces the number of effective contacts. Approaches that limit these effective contacts to specific groups or establish hierarchies are reducing the number of effective contacts and hence reduce complexity. Remembering that social hierarchies are called social complexity we have to admit, that system complexity is not agreeing with social complexity. On the contrary, social complexity is referring to mechanisms to reduce complexity in social systems. These observations lead to an understanding of structures (hierarchies etc.) which enable some people to acquire power much easier as a kind of side effect of the tools used for reducing complexity. Or vice versa ...

2 **COMPLEX BUT EGALITARIAN? ASSESSING SOCIAL EVOLUTION AT THE ORIGINS OF THE NEOLITHIC IN THE NEAR EAST**

**Abstract author(s):** Ibáñez, Juan (Spanish National Research Council - CSIC)

**Abstract format:** Oral

The study of the transition from hunter-gathering to farming societies in the Near East testimonies important social changes that are observed, though not exclusively, in architectural shifts. Small hamlets gathering some dozens of individuals become villages where many hundreds (even few thousands) of people lived. Temporary huts evolved into houses with stone walls, internal compartmentation and solid built floors. Distant exchange of exotic objects manifest the display of complex networks of interaction between villages. The Early Neolithic in the Near East can be considered as a complex socio-economic context in which economic inequality and interpersonal violence is poorly documented. Are we facing a utopic small world of successful cooperation? Was social coercion so effective that living in extended communities was possible without economic dependence? In any case, this model of social organization, as the extended Neolithic villages, seems to decline at the beginning of the 7th millennium cal BC, coinciding with the beginning of the Neolithic diaspora out of the Near East.

3 **VARIATION IN ETRUSCAN POWER PRODUCTION: A SETTLEMENT PERSPECTIVE**

**Abstract author(s):** Zeviani, Camilla (University of Cambridge) - Palmisano, Alessio (LMU Munich) - Stoddart, Simon (University of Cambridge)

**Abstract format:** Oral

This paper analyses the variation in the distribution of power in Archaic Etruria, by examining the distribution of settlement sizes and territories across the region between the Arno and Tiber, using open source data. The settlement organisation of Etruria has generally a strongly hierarchical structure, but this generalisation conceals considerable variation. This variation has recently been outlined in several contributions by Stoddart and Palmisano which draw on both the powerful places at the head of the hierarchy and the sus-

taining rural settlement. More detailed and ongoing work by Zeviani is ground truthing the underlying evidence both to guard against the pitfalls of “statistical theatre” and to reveal more subtle details of power management from the best studied areas. Particular attention will be made to Poggio Civitate and Cerveteri, two contrasting centres, to illustrate both the contrasts in management of landscapes of power and the Quellenkritik which is vital even when dealing with relatively large data sets.

4 **SOCIAL DYNAMICS, URBANIZATION PROCESS AND AGRICULTURAL INTENSIFICATION IN EASTERN IBERIA IRON AGE**

**Abstract author(s):** Grau, Ignacio (Institute of Archaeology and Historical Heritage. University of Alicante)

**Abstract format:** Oral

The Iron Age in Eastern Iberia, between the 6th and the 3rd cents. BC was a period of major socioeconomic changes related to the emergence of urbanism and complex political systems. The political landscape was articulated around a series of urban centres that controlled the exclusive territories in which depending farming sites were placed.

The economic basis of this social dynamics was the agricultural intensification attested by paleobiological data, landscape signatures and settlement patterns. We present archaeological data to propose that farming practices in this region is based in intensive agriculture in which arboriculture had a special role in land management. This specific model of intensive production had as a result, the region presents a social model based in corporate peasant societies with clear signs of social ranking, but less hierarchical that the social models observed in other regions of Iberia during the Iron Age. Data from urban and rural sites in the region will be used to present the socio-economic model.

5 **TRACES OF POWER. ARCHAEOLOGICAL AND BIOARCHAEOLOGICAL EVIDENCE FROM WESTERN CATALONIA BETWEEN THE BRONZE AND IRON AGES (2ND-1ST MILLENNIUM BCE)**

**Abstract author(s):** Nieto-Espinet, Ariadna (CSIC- Institució Milà i Fontanals) - Prats, Georgina - Moya, Andreu - Castellano, Alba - Alonso, Natàlia (University of Lleida)

**Abstract format:** Oral

Between the Late Bronze Age and the First Iron Age (1250-775 cal. BC), important changes in urban planning and architecture are documented in the inland valleys from Western Catalonia. During the Late Bronze Age, the first enclosed settlements appeared, and in the First Iron Age the first fortifications, with a complex urban structure were documented. These changes occurred very prematurely with respect to the rest of the neighboring territories. These first manifestations of power became generalized and consolidated throughout the territory of NE Iberia during the Middle Iron Age (6th-5th c. BC) characterized by a hierarchical system of occupation was implemented and the emergence of what has been called Iberian Culture.

A first hypothesis suggests that it was an incipient and progressive demographic increase and the possibility of accumulating surplus that produced a growing pressure on resources, which increased the competitiveness between communities and the emergence of the first local elites. At this point, coercion would be used as a means of control in a strongly territorialized context. What was the impact of socio-political changes on local economies (livestock, agriculture and exchanges)? How are social changes, and the emergence of social inequalities, reflected in the archaeological record? Which are the most significant, indicative and/or reliable?

In order to evaluate the complexity of the factors that triggered/stimulated these processes, a meta-analysis integrating the different archaeological data available (architecture, archaeozoology, archaeobotany, material culture and storage capacity analysis) will be carried out. The aim of this work is (1) explore the social and economic implications that generated this premature emergence of complex societies in this area; (2) evaluate what evidence (indicators in the archaeological record), the emergence of inequalities and the first complex societies have left us; (3) and how changes in urbanism and architecture are related to changes in production models.

6 **INTEGRATING THE POTTER’S WHEEL IN NARRATIVES OF LONG-TERM SOCIO-ECONOMIC CHANGE IN THE WESTERN MEDITERRANEAN**

**Abstract author(s):** de Groot, Beatrijs (The University of Edinburgh)

**Abstract format:** Oral

The early Iron Age in the western Mediterranean saw the intensification of long-distance trade stimulated by Phoenician commerce. The potter’s wheel is a technological innovation that is tightly bound to such processes of intensification of production and exchange. Pottery workshops were part of a new landscape of production in which agricultural products, oil, salt and garum were produced alongside the wheel-made containers in which they were transported. Wheel-made pottery is therefore an important class of artifacts that reflects socio-economic change and the context in which this technology was first employed marks a radical shift in how pottery production was organised. Despite the significant transformation the spread of wheel-made pottery might reflect, the impact of this technology on the working lives of people across this region remains rarely addressed.

This presentation will discuss different socio-economic motivations underpinning the adoption and spread of the potter’s wheel in the western Mediterranean and consider its impact on the organisation of ceramic production and social divisions of labour. It will

consider how the prevalence of wheel-made pottery reflects regional variation in the response of different groups to the economic opportunities presented by long-distance trade and consider how such responses correspond to social hierarchies.

7 **DIVERSITY AND CHANGES IN THE ANIMAL EXPLOITATION DURING THE NEOLITHIC OF THE LEVANT**

**Abstract author(s):** Gourichon, Lionel (Université Côte d’Azur, CNRS, CEPAM - UMR 7264)

**Abstract format:** Oral

The transformation from a (semi-)mobile hunter-forager way of life into a highly productive and successful system of crop-livestock farming have been a lengthy and complex process. Although the earliest evidence of breeding of goat, sheep, cattle and goat were found in the Early and Middle Pre-Pottery Neolithic B, the role of hunting in the Neolithic societies only decrease progressively and even remains important in some regions until the Chalcolithic period. Nonetheless, because livestock husbandry not only ensures food autonomy all year-round but also allows the creation of surpluses, wealth and prestige from meat-on-the-hoof and the various products that animals can provide during their lifetime (milk, wool, traction, dung), this new human-animal relationship may have contributed, along with the agriculture, to the emergence of new forms of economic, social and symbolic capital.

From this point of view, studying changes in herd management strategies and production goals is a path to trace the evolution of the systems of organization of Neolithic societies. The methodological approaches developed in recent decades to reconstruct and interpret animal mortality profiles, despite their disparity and the need for improvement, offer interesting avenues to address this question.

In this paper, based on the data available for the Levant region between the 10th and 5th millennia BCE, we will particularly present the great diversity of small and large livestock management strategies according to chronology and locations, highlighting the specialised practices and attempting to understand their dynamics in a general perspective.

8 **CROPS AND LIVESTOCK AS A FORM OF EMPOWERMENT IN THE VALENCIAN COUNTRY BETWEEN THE 3RD AND 1ST MILLENNIUM BC**

**Abstract author(s):** Iborra Eres, Maria Pilar (independent researcher) - Pérez Jordà, Guillem (Contractat CIDEAGENT Dept. de Prehistòria, Arqueologia i Història Antiga Universitat de València)

**Abstract format:** Oral

The social and economic structures are diverse in the Valencian Country between the end of the third millennium and the first millennium cal BC. here are alternating periods in which processes of population aggregation associated with apparent social complexity develop, and others in which the population structure is dispersed and in principle more Land ownership together with agricultural and livestock production are interpreted as the inhabitant’s sustenance and also as the elements to explain the emergence of complex hierarchical societies.

The preliminary theme of this paper is to analyse the agricultural and livestock management developed during this time, pointing out the agrarian goods accumulated or controlled by the dominant social groups. Evidence of this control also comes from different elements linked to agricultural production, such as storage structures and agrarian tools.

A significant undertaking in this regard is the presence of storage structures as silos, barns and domestic equipment located in some centres as sings of agrarian production amass or control also noteworthy a differential distribution of labour tools at the end of the third millennium and in established way during the first millennium cal BC.

On the other hand, during most of the 2nd millennium, an essentially domestic production structure was consolidated, with the exception of the areas located to the south of this territory during the last third of the millennium.

9 **ON THE INTERFACE BETWEEN PLANT INTENSIFICATION AND SOCIAL COMPLEXITY IN SOUTHWEST ASIA**

**Abstract author(s):** Arranz Otaegui, Amaia (University of Copenhagen)

**Abstract format:** Oral

This paper provides a long-term perspective of the environmental, social and cultural context in which plant resource intensification developed in southwest Asia (23-5.0 ka cal. BP). It highlights that increased social complexity, manifested in the development of sedentism, stone-made architecture, specialised material culture, and symbolism is attested long before the development of Neolithic farming systems. With the onset of the Pre-Pottery Neolithic period (c. 11.5 ka cal. BP), the earliest forms of intensified plant resource exploitation activities are documented, comprising the cultivation of morphologically wild plant species. The social background behind this major change in subsistence shows a complex society in which social differences are manifested in the burial customs, monumental and communal food-storage buildings are for the first time constructed, and the exchange networks intensify, culminating with the spread of ideas and developments across the region. Once fully-fledged agricultural societies evolved c. 10 ka cal. BP, plant exploitation activities intensified, as evidenced by the use of manure, crop irrigation, and the cultivation of new plant food species. These changes in subsistence are linked to various socio-economic processes such as the expansion of animal domestication and herding practices, and the development of the so-called “mega-sites”. During the Chalcolithic and Bronze Age periods, the first urban settlements bring together new forms of social, political and economic organization, where land-ownership and extensive agricultural production will play a central role.

CHANGES IN AGRICULTURAL PRACTICES AND SUBSISTENCE STRATEGIES THROUGH THE METAL AGES IN NORTHWESTERN ITALY: A MULTI-PROXY AND MULTI-ISOTOPIC APPROACH

**Abstract author(s):** Varalli, Alessandra (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra. Barcelona, Spain.; Department of Archaeology, Durham University) - Gröcke, Darren (Department of Earth Sciences, Durham University) - Church, Mike (Department of Archaeology, Durham University) - Sparacello, Vitale (Dipartimento di Scienze della Vita e dell’Ambiente, Università degli Studi di Cagliari Cittadella Universitaria di Monserrato) - Arobba, Daniele (Museo Archeologico del Finale, Finale Ligure) - Nisbet, Renato (Università Ca’ Foscari, Dipartimento di Studi sull’Asia e sull’Africa Mediterranea) - Starnini, Elisabetta (Soprintendenza Archeologia, Belle Arti e Paesaggio per la città metropolitana di Genova e la provincia di La Spezia; Dipartimento di Civiltà e Forme del Sapere, Università di Pisa) - Dori, Irene (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Verona, Rovigo e Vicenza) - Maggi, Roberto (Laboratorio di Archeologia e Storia Ambientale - LASA, Università di Genova) - Skeates, Robin (Department of Archaeology, Durham University)

**Abstract format:** Oral

Liguria (northwestern Italy) is a region rich in archaeological sites spanning the Metal Ages and beyond. However, comparatively few open-air sites are preserved, and most archaeo-anthropological evidence derives from collective burials in cave deposits, where human remains are generally commingled. Large-scale, multi-proxy isotopic analysis of directly-dated bioarchaeological remains has helped overcome these limitations and allowed for a direct assessment of changes in agricultural intensification, mobility, social inequalities and power relations.

CNS stable isotope analysis was conducted on 86 animals, 124 humans, and 175 botanical samples, from 14 sites spanning the Copper to Iron Ages (3600-400 cal.BCE). Results highlighted an increase over time in nitrogen isotopes in plants, suggesting an overall trend of increased manuring, likely linked to agricultural intensification. However, within the same period, different nearby sites privileged manuring of wheat or barley, hinting at the specialization of farming systems, possibly based on micro-environmental and/or economic factors.

Human diet was mainly based on C3 terrestrial foodstuffs. However, a significant increase in δ15N is detected in the Iron Age, suggesting increased animal protein consumption. Beginning in the late Bronze Age, an increase in δ13C is also apparent due to the introduction of C4 plants (millet). These changes are not shared uniformly among individuals, suggesting differential access to certain food resources, possibly due to the entrenching of social inequalities. Sulphur analysis indicates that these differences are not due to the provenience of the individuals. Indeed, it was possible to clearly distinguish sites and related human groups at a micro-regional level based on δ34S ranges in animals and humans.

Thanks to a stable isotope, micro-regional approach, we have gained insights into the nature and timing of some socio-economic processes that would otherwise have been difficult to discern archaeologically in Liguria, while also adding to broader understanding of subsistence strategies within the Mediterranean region.

RESILIENCE AND LIVESTOCK ADAPTATIONS TO DEMOGRAPHIC GROWTH AND TECHNOLOGICAL CHANGE: A DIACHRONIC PERSPECTIVE FROM THE FIRST MILLENNIUM IN NE IBERIA

**Abstract author(s):** Valenzuela-Lamas, Silvia - Nieto-Espinet, Ariadna (Consejo Superior de Investigaciones Científicas - IMF) - Huet, Thomas (independent) - Trentacoste, Angela (University of Oxford - School of Archaeology) - Guimarães, Silvia (Consejo Superior de Investigaciones Científicas - IMF) - Orengo, Hector (Institut Català d’Arqueologia Clàssica - ICAC)

**Abstract format:** Oral

Economic systems are closely related to their ecological context, and livestock has been an integral part of human economies since the Neolithic, significantly contributing to the creation and maintenance of agricultural anthropized landscapes.

In the frame of the ERC-StG project ‘ZooMWest’ we collected and analysed thousands of zooarchaeological data from NE Iberia (>90,000 NISP). By considering these data in comparison with ecological indicators and archaeological evidence (settlement characteristics and their distribution) we will present changes in animal production and the relationship between people, livestock, and their environment during the first millennium BC.

Results show a shifting relationship with the territory from the Bronze Age to the Iron Age, when the expansion of iron technology and the Mediterranean trade led to significant changes in production and society. The zooarchaeological results demonstrate a significant impact of socio-economic system over animal husbandry, shaping the frequencies of species and the size of the animals, and a smaller influence of the local environment as the technological capacity of humans increased.

SANCTUARIES, HUSBANDRY AND ECONOMY: THE ZOOARCHAEOLOGICAL RECORD FROM THE TARTESSIAN REGION

**Abstract author(s):** Ramos Soldado, José Luis (Independent researcher) - García Viñas, Esteban - Bernáldez Sánchez, Eloísa (Laboratorio de Paleobiología, Instituto Andaluz de Patrimonio Histórico) - Ferrer Albelda, Eduardo (Departamento de Prehistoria y Arqueología, Universidad de Sevilla)

**Abstract format:** Oral

Since the beginning of the Phoenician colonisation in the southwest of the Iberian Peninsula (towards the end of 9th century B.C.), settler activity was partially aimed at exploiting the natural resources of the surrounding territory (agricultural, mineral, etc.), in an

attempt of reproducing customs and traditions from the Ancient Near East – including cooking practices –. The establishment of sanctuaries all over the Mediterranean was a common and successful strategy among these activities, often carried out in relevant locations concerning sailing, trade and resources (Huelva, El Carambolo). Indeed, these sanctuaries constituted a model for further singular buildings and complexes built in indigenous sites all over the next century (Caura, Carmona, Montemolín). In addition, the introduction of a colonial economy entailed not only the exploitation of the colonised territories, but also an increasing demand of products related to exchange and consumption.

In this context, sanctuaries of Phoenician traits identified at the southwest of the Iberian Peninsula during the Iron Age probably constituted both religious and politico-economic centres where settlers and indigenous communities may have carried out agreements of different nature, at least until the beginning of 6th century B.C., when this system seems to have collapsed. Zooarchaeological evidence gathered from both domestic and cultic contexts led us to consider these spaces as engagement centres for the communities, where meat resources were managed and redistributed following a well-defined and structured ritual system. Nevertheless, these sanctuaries also worked as trading centres and strategic sites for the control and management of the territory and its resources, as well as slaughterhouses for the surrounding populations.

PRODUCING NAVAL POWER: SAILS AND ECONOMIC STRATEGIES IN THE AEGEAN, 6TH – 4TH CENTURY BC

**Abstract author(s):** Dimova, Bela (British School at Athens)

**Abstract format:** Oral

Sails and textile technology played a key role in enabling mobility and thus shaping historical phenomena such as migration, trade, the acquisition and maintenance of imperial power in the ancient Mediterranean. This paper examines the demand for sailcloth and different strategies through which it was produced or supplied. A focus on sail manufacture helps to understand the relationship between textile production and broader socio-economic change. Combining insights from weaving experiments, reconstructions of ancient ships, and historical records, we can estimate the labour and material requirements for equipping ancient ships with sails. A consideration of the Athenian navy at Salamis demonstrates that making sails involved significant amounts of labour and resources. As commercial fleets grew during the 5th and 4th centuries BC, they placed significant demands on textile production. In addition to production, managing supplies and reserves of sailcloth constituted another significant challenge. This challenge could be addressed through trade, taxation, and more intensive exploitation of textile workers.

TEXTILES, TABLET WEAVING, ELITES, AND URBAN DEVELOPMENT IN FIRST MILLENNIUM BCE CENTRAL ITALY

**Abstract author(s):** Samuels, Jeffrey (Phillips Exeter Academy)

**Abstract format:** Oral

Textiles are a culmination of agricultural, zoological, ceramic, and craft production processes. Each productive choice made during a textile’s chaîne opératoire – e.g. the weaving technique (loom-based or tablet), fiber (flax or wool), and decoration (dyeing and finishing) used,– is socially and contextually embedded. Furthermore, the longevity and spread of certain textile technologies is tied to their utility as a functional and communicative tool as well as the sustainability of their embedded production networks. Elite textiles, used to reify status and power at the local and regional level, provide one visible materialization of these relationships. Too often, however, these productive choices – and the resulting textiles – are divorced from their settlement context due to particularities in the archaeological record.

In this paper, I contextualize the role of particular elite textile technologies within Italian urbanizing communities and model what the spread of these technologies means for the diffusion of dispersed urbanism amongst Italian elites.

In particular, I use artefactual, excavation, and survey data from the Latin site of Gabii to situate one elite textile technology – tablet weaving – as an important element for maintaining the dispersed urban system present at Gabii. Tablet weaving was a particularly effective economic and symbolic tool at the site, the culmination of diffuse productive networks tying elite and non-elites together.

Moving to a regional level, I examine tablet-weaving’s spread from central Europe down the Italian peninsula during the final Bronze Age and early Iron Age, concurrent with the first wave of Italian urbanism that saw the rise of numerous urban entities similar formally similar to Gabii. This analysis underscores both a central European impetus for the elite systems that drove the first wave of Italian urbanism and the reciprocal relationship between craft production and the establishment of stable urban communities.

SMALL BUT SIGNIFICANT: EXPLORING NEO-ENEOLITHIC MINIATURE REPRESENTATIONS AS MATERIAL OBJECTS

**Theme:** 6. Material culture studies and societies

**Organisers:** Shatilo, Liudmyla (Kiel University, Institute of Pre- and Protohistoric Archaeology) - Marangou, Christina (Independent researcher) - Naumov, Goce (Goce Delcev University of Štip, Institute of History and Archaeology) - Terna, Stanislav<sup>†</sup> (Kiel University, Institute of Pre- and Protohistoric Archaeology)

**Format:** Regular session

A striking category of finds from Neolithic and Copper Age sites in Mediterranean, South-East and East Europe are the miniature items that embody certain aspects of prehistoric life in non-perishable materials. Depictions of humans, animals and means of transportation, architectural entities such as houses or stoves, adornments, clothing or tools, all of them are a valuable source of information for studying non-literate societies.

Miniatures have been traditionally considered as art and religious objects. This approach gave birth to durable paradigms and narratives. On the other hand, miniatures are, above all, artifacts which come from archaeological contexts. Consequently, they could be and should be quantified, contextualized and investigated as material objects.

Our session seeks to address empirical approaches to the Neolithic and Copper Age miniatures from the 7-4 millennia BC in the Mediterranean, South-East and Eastern Europe and focus on the following research questions:

- What are the theoretical aspects of the concept of miniaturism? How can it be used in better understanding of technical, functional and symbolic features of small objects and ‘replicas’?
- How do miniatures occur in the archaeological record? What are the circumstances of their discovery in various archaeological contexts of the Neo-Eneolithic?
- What is the relation between miniatures and other archaeological finds? Are they ‘special’ finds? If so, how ‘special’ are they compared to the ‘usual’ mass finds?
- How and what modern interdisciplinary methods can be applied to study these prehistoric objects? What is their potential for understanding the taphonomy, function and meaning of miniatures?
- What are the social implications of the above-mentioned research questions? If there is a ‘society of miniatures’, to which extent can it mirror a ‘society of people’?

Presentations on various approaches of Neo-Eneolithic miniatures as material things are welcome.

ABSTRACTS:

1

A MATTER OF LIFE AND DEATH. ANTHROPOMORPHIC FIGURINES IN EARLY NEOLITHIC EUROPE – TRANSREGIONAL AND TRANSCULTURAL CONNECTIONS

**Abstract author(s):** Becker, Valeska (Westfälische Wilhelms-Universität Munster)

**Abstract format:** Oral

Anthropomorphic and zoomorphic figurines occur in almost all early Neolithic cultures of Europe, from the Karanovo I culture of Bulgaria in the east to the Linear Pottery culture in the west. The presentation will give a brief overview of early Neolithic anthropomorphic figurines from southeastern, southern and central Europe in terms of the number of their occurrence, their shape, decoration and deposition, and will then highlight some common features on a transregional and also transcultural level such as body shapes, breakage patterns, and means of disposal, but also differences which concern, e.g., decoration and the overall number of figurines. It is striking that some characteristics span hundreds of kilometres and occur in similar fashions, forging far-reaching connections and conservative traditions, whereas other features seem to have been employed to create differences and set boundaries between different regions. Briefly, also other anthropomorphic representations such as anthropomorphic vessels, applications, painted and incised human figures will be regarded as well. The aim is to shed light on the networks of communication between early Neolithic cultures and their respective handling of traditions and innovations regarding the making and use of figurines.

2

ANTHROPOMORPHIC FIGURINES DISCOVERED IN THE SETTLEMENT OF CUCUTENI - DÂMBUL MORII (CUCUTENI, IAȘI COUNTY, ROMANIA)

**Abstract author(s):** Balaur, Radu (Alexandru Ioan Cuza University of Iasi, Interdisciplinary Research Institute - Science Department, Arheoinvest Center)

**Abstract format:** Oral

The archeological site from Cucuteni – Dâmbul Morii has benefited from an increased degree of attention from researchers, since the beginning of the last century. Although not as titrated and published as his older and more intensely investigated sibling Cucuteni–Cetățuie, the settlement of Dâmbul Morii (first mentioned by H. Schmidt under the name Talsiedlung–“the settlement in the valley”) still stands as a milestone of the Romanian archaeological research.

The results of the excavations at Dâmbul Morii are less known in the archaeological literature. Over the years, they limited themselves to presenting a series of objects discovered in this settlement, but without specifying the context of the discoveries. The research is still far from complete.

The present study considers the detailed analysis of the anthropomorphic plastics discovered in this settlement. We consider the analysis of the pieces following the manufacturing canons (raw material, techniques), as well as the decoration. A specific feature of the Cucuteni A-B phase is the elongation of the body and legs. For the purpose of this study, a number of about 150 pieces were considered. Following the decoration, we want to establish the ratio between the number of female statuettes and the number of male statuettes, in a specific context.

3

CRAFT AND MINIATURES: FIGURINES FROM EXCAVATIONS OF POTTERY-MAKING WORKSHOP AT NEBELIVKA MEGA-SITE

**Abstract author(s):** Burdo, Nataliia (Institute of Archaeology NAS of Ukraine) - Videiko, Mykhailo (Kyiv Borys Grinchenko University)

**Abstract format:** Oral

In 2014 at Nebelivka mega-site was excavated part of pottery workshop, which included pottery kilns and a pit. In the explored part were discovered 30 miniatures, 2 from them related to remains of kiln, the other to filling of the pit. Part of female figurine was inside the kiln, the other outside. At the pit were found 29 fragments from 28 figurines.

One figurine divided on top and bottom parts. Fragmented objects presented by 6 top and 23 bottom parts. Fractures allow us to make assumptions how the figurines were molded: from a single lump of clay, from two vertical mirror halves, from the front and back vertical halves. Figurines had different sizes: small, from 5 to 7 cm; middle, from 10 to 12 cm; large, from 15 cm. Different kinds of clay were used to create miniatures. Part of them produced from kaolinite clay, the same that used for pottery making. Other figurines are from red clay with organic admixture. Two realistic type figurines produced from brown clay. The most of items are female, one – male, put part without gender markers. Schematic figurines prevail, 3 figurines are realistic. Most of the figurines are standing, on a spindle-shaped or columnar stem. Figurines with naturalistic details are presented: images of pregnancy, hair, hands.

The discovery of miniatures suggests that rituals are periodically carried out in the workshop. This set of miniatures is distinguished by the technological, stylistic and typological diversity typical to sculpture of the Nebelivka mega-site. The variety suggests that the miniatures were made by different people. The highest quality items can be associated with the workshop. Such a collection of miniatures of different origins suggests participation in the rituals of not only the owners of the workshop but also the neighbors.

4

THE LIFE HISTORIES OF FLAT BONE FIGURINES

**Abstract author(s):** Müller, Michael (Free University Berlin) - Savu, Mihaela (Christian-Albrechts-Universität Kiel)

**Abstract format:** Oral

The archaeological researches carried since 2002 at the Chalcolithic tell and surrounding flat settlement Măgura Gorgana at Pietrele (Romania) have revealed numerous miniatures of all kinds throughout the years. Models of buildings, ovens, furniture, vessels and tools were found along with zoomorphic and anthropomorphic figurines. The latter category, with around 600 complete and fragmentary representations, includes items made of diverse materials, such as ceramic, lithic or of animal origin as well as of different shapes and sizes. In our paper we will explore the biographies of flat bone figurines, a class of miniatures well represented at the site, with specimens in different stages of production, usage, reshaping and conservation. Our research is focused on reconstructing the manufacturing process of flat bone figurines by identifying the operational sequence involved in the transformation of the raw material into the finished objects. In addition, we will evaluate the reshaped specimens, the possible usage traces on flat bone figurines and their integrity status at the time of retrieval. Their discovery contexts as well as the relations to other artefacts from Pietrele, particularly figurines of other types and materials, will also be discussed.

5

ENGAGED TO BE BURIED: WHAT CAN MATERIAL ENGAGEMENT THEORY TELL US ABOUT ANIMAL FIGURINES?

**Abstract author(s):** Gilb, Hannah (Deutsches Archäologisches Institut)

**Abstract format:** Oral

Miniatures are a fascinating and adorable phenomenon of Neolithic-Eneolithic material culture in Southeastern Europe. Their existence and typological diversity betray valuable insight into their manufacturer’s unique perception of their environment, and the finished product serves as a thumbprint embodying this perception. Miniature animal figurines have meanwhile been discovered as a frequent constituent of the material libraries of Copper Age cultures, though the make of these figurines differs enough to render the creation of a working typology useless. There are nevertheless enough morphological similarities to identify recurring types, though the function played by these figurines during their use-lifetime is still undetermined.

Archaeologists have been making pointed efforts to move away from catch-all designations like “cult/sacrificial object” and have instead begun to apply other, more informative rubrics of investigation. Cognitive archaeology, a sub-discipline that has gained traction over the past few decades, has already significantly contributed to material research. In studying the animal figurines, I have found a place for “Material Engagement Theory” (MET), which highlights above all the roles of enactivism, external activism and

material signs. In order to help answer the question of whether and to what extent the application of MET on the evaluation of miniatures and figurines can help us decode their manufacturer’s cognitive participation in their environment, I discuss a case study in which MET is applied to the categorization process of animal figurines from the Neolithic-Eneolithic settlement mound of Măgura Gorgana, located near the modern-day village of Pietrele (jud. Giurgiu) in Romania. Here, MET offers evaluative tools to extrapolate the phenomenological contours of the life of the manufacturer, as well as justification for categorization as “special” finds, but still offers limited conclusions about the active function of the animal figurine.

6

### MINIATURE REPRESENTATIONS OR SMALL VESSELS? SMALL SCALE VESSELS FROM THE CHALCOLITHIC TELL SETTLEMENT MĂGURA GORGANA AT PIETRELE

**Abstract author(s):** Martin, Janine (DAI - German Archaeological Institute, Eurasia department)

**Abstract format:** Oral

Often considered as religious objects, the functional scope of miniature representations is somewhat limited to the use in ritual activities. Given the small dimensions of these objects, there seems to be a decrease in functionality compared to their actual-sized counterparts.

Unlike representations of the animate world, such as anthropomorphic and zoomorphic figurines, miniature vessels are modeled after objects with a clear functional purpose. Depending on the actual size and volume, the functional character as a container is still preserved in most of the miniature variants. To which degree a reduction in size is accompanied by a reduction of function, therefore, is a matter of various factors such as vessel shape, surface treatment, and finishing.

Based on the collected miniature vessels from Pietrele, Măgura Gorgana (jud. Giurgiu, Romania) this group of objects is examined regarding their usability as containers. Stating that miniaturism goes along with an at least partly performed loss of the original functional purpose, characteristic attributes of small scale vessels on the one hand, and miniature representations on the other hand, are defined in order to determine whether they should be seen as objects of a sacred or rather secular purpose.

These considerations are complemented by an exploration of the distribution of miniature vessels within the settlement and the associated house contexts to get a better understanding of the relation between the artifacts and the actual archaeological features.

Taking into account both the stylistic features and the spatial distribution of the miniature vessels from Pietrele, Măgura Gorgana, this paper aims to contribute to the interpretation of miniature vessels, their classification, and their possible use in chalcolithic societies.

7

### MINIATURES AND MNEMONIC DEVICES – A CASE STUDY FROM THE BLACK SEA AREA IN THE 4TH MILLENNIUM BC

**Abstract author(s):** Uhl, Regina Anna (University Leipzig; DAI, Eurasia Department)

**Abstract format:** Oral

In the course of the last 10 years, research in Petreni, a chalcolithic site in Moldova, brought to light a wide range of miniatures: schematic animal figurines, clay images of furniture and further, small geometric and naturalistic clay tokens were found in deep features with ashy layers as well as in architectural features. In research history, many of these objects were conventionally treated as magically charged objects or rather apodictically received a mere religious connotation. But due to their find contexts, whereupon clay tokens can be associated with tally sticks, clay breads (pâini/ χλιῖδες), large quantities of bones and broken zoomorphic miniatures, these assemblages necessitate a re-contextualization and demand to be re-evaluated differently. Especially the association of “miniatures” and tokens with imprinted notches on the fragmented or complete tally sticks imply that those objects shall be contextualized in a sphere of counting or registering and be regarded as mnemonic devices.

In larger quantities, such objects are as well-known from other Cucuteni-Tripolye settlements, but for the first time, these objects were registered together with tally sticks in Petreni and shall be presented here.

8

### WHEEL MODEL OR SPINDLE WHORL? STATISTICAL ANALYSES AS A METHOD OF DISTINGUISHING THE TWO TYPES OF FINDS

**Abstract author(s):** Chub, Nataliia (RGK - Romano-Germanic Commission DAI)

**Abstract format:** Oral

Wheel models are an object category that evidences the knowledge of the function of the wheel within a particular prehistoric community. This makes them a valuable source for the investigation of the innovation of the wagon. However, it is not always possible to distinguish wheel models from other categories of finds. While wheel models with a more or less obvious wheel hub evidence the knowledge of real prototypes relatively clearly, the interpretation of the objects with other shapes as wheel models is very often not sure, as they might represent other object categories as well. Especially the spindle whorls are most likely to be misinterpreted as wheel models.

Objects which can be interpreted as wheel models are known from the area of the Copper Age Cucuteni-Trypillia culture. However, very few of these objects have a definite wheel hub. Observations of the context of the finds, which could support this interpretation, are rare as well. Are there any other possibilities to distinguish these two categories of finds?

In my investigations on the innovation of the wagon in the Trypillia culture, I have applied statistical analysis with this objective. In my paper I will present the results of this analysis and discuss the potentials and the limitations of this method. On the basis of this investigation I will draw a conclusion whether the wheel-shaped objects of the Trypillia culture really indicate the innovation of the wagon in the area of this culture.

### DOES COLOR OF THE NEOLITHIC MATERIAL OBJECTS MATTER?

**Abstract author(s):** Balaban, Radmila (Faculty of Philosophy, Department of Archaeology, University of Belgrade)

**Abstract format:** Oral

The aim of this paper is to provide a possible new interpretation of the role of small objects made of nephrite and/or jadeite, which originated from 14 Neolithic sites (6200/6000-4600/4500 cal BC) on the territory of contemporary Serbia. There are about 100 items of different shapes (axes, chisels, rings, pendants), of small dimensions (between 3-8 cm), made of green stone.

In Serbian archaeology, small green objects had for a long time been considered beautiful and therefore necessary to be found in museums exhibits, while more serious analyzes remained almost on the margins of scientific discussions. Changes in the interpretations of these objects in the Serbian archaeological literature have occurred since the 1980s. Determining the raw materials for making objects and detecting the natural source opened new questions concerning the acquisition of small items. However, the question of symbolism and meaning of this archaeological material in the context of the role that they could have had in the societies that procured, made and used them, remained open. Also, can the color of an object, along with its dimensions, be considered as one of the most important factors of their value and importance?

Why is the emphasis on green important? As Michel Pastoureau (2015) states, production of green paint or pigment was almost impossible in the past (especially in prehistory), and attempts of its production began in ancient Egypt, but it only succeeded from the period of the ancient Rome. In that period, they came up with the solution to soak copper plates in wine to create a green pigment. Thus, during the Neolithic, the only possibility to possess a green object was restricted to the natural resources.

### MINIATURIZING THE BODIES IN THE NEOLITHIC BALKANS

**Abstract author(s):** Naumov, Goce (Center for Prehistoric Research / Goce Delčev University)

**Abstract format:** Oral

The Neolithic Balkans are well studied in terms of the Neolithization process and the material remains of the first farming societies. A number of fieldwork and material studies provided an abundance of anthropomorphic, zoomorphic and architectural representations that demonstrate the symbolic realm of the communities inhabiting this region. A variety of figurines, vessels, models or stamps with human and animal features indicate the complexity of symbolic potency these societies had along with the intramural burials and deposition of animal bones that evidence its involvement in the rituals. Having in mind this spectrum of images and rituals the imagery and performative aspects of its components should be considered. In this regard the small dimensions of these representations should be emphasized as they have significant role in how these items were used and perceived in a variety of actions in which they were involved. Therefore the concept of miniaturism is inevitable to be explored in relationship to the exceptionally small and stylized figural images in the Neolithic. The deliberate reduction of features and preference of minute objects, as well as the actions performed with them will be highlighted in this presentation in order to elaborate the perspectives of symbolic embodiment of the first farming societies in this region.

### TINY WORLD AND NEOLITHIC SOCIETY: NEW INSIGHT FROM THE HOUSE MODEL OF PLATIA MAGOULA ZARKOU/WESTERN THESSALY, GREECE

**Abstract author(s):** Alram, Eva (Mykenische Kommision, Osterr. Akademie D Wissensch) - Cveček, Sabina (Austrian Archaeological Institute)

**Abstract format:** Oral

In the course of the Platia Magoula Zarkou publication project, the well-known house model and its contents have been re-studied, using a 3D scanner. Furthermore, the restudy of the stratigraphy of the site gives new insight into its date at about 5600 calBC and its deposition.

As a result, the most homogeneously produced figurines and the house model belong to a special set produced for a special kind of arrangement and deposition. So, the size, decoration and position of each object in the house model had a certain meaning, from the very beginning of their production, and for sure at the moment of their placement in the container and its deposition.

Furthermore, this house model and the figurines give a most detailed picture of a social group living in a Middle to early Late Neolithic household in the area of the Southern Balkans. The spatial formation and the differences in shape and size most likely relate to the different ages and/or the horizontal social position of the individuals represented by the figurines. So, their containment within the same house model shows them as members of the same household, consisting of an extended family as well as people connected to them by their activities, not necessarily only through kinship.

The house model also points to the important role of women in the household. It has been suggested that this demonstrates that the role of women in society was more active than the one of men. However, this is opposed to the representation of well-decorated men sitting on stools who may have had their major task outside the house. Therefore, from this effigy, we should not conclude

	<p>a matriarchal society, but we should also think of women playing an important role in household societies with a patrilinear social background.</p>
12	<p><b>TRIPOLYE &amp; VINCA: HISTORICAL CONTEXT OF REALISTIC CLAY MINIATURES</b></p> <p><b>Abstract author(s):</b> Shatilo, Liudmyla (Institut fuer Ur- und Fruehgeschichte Kiel; Institute of Archaeology NASU) - Hofmann, Robert (Kiel University)</p> <p><b>Abstract format:</b> Oral</p> <p>Our presentation deals with the emergence and disappearance of representations with realistic characteristics and aims to reconstruct their historical context. We are focusing on prehistoric periods and two different case studies - more precisely on objects from Copper Age Tripolye settlements of the forest-steppe zone east of the Carpathians and from the Late Neolithic tell Vinča-Belo Brdo on the middle reaches of the Danube. We analyse various objects with ‘realistic’ images, associated mainly with clay miniatures. For Tripolye, we focus on house models, sledge models, images of equipment for animal use on the zoomorphic objects (figurines, vessels etc.), ‘realistic modelled’ faces of anthropomorphic figures, and images on anthropomorphic figurines (hairstyles and accessories for them, necklaces, footwear and clothes). Based on the latest findings on chronology, we are attempting to trace the mentioned realistic features in time and space by means of quantifications and mapping. Additionally, we investigate the size development of anthropomorphic figurines. In the case study of Vinča, the frequency of realistic plastic features in the different depths of the tell stratigraphy are put in relation to the total number of figurines and the historical dynamics of the late Neolithic societies. The consideration of different material categories showed that objects with ‘realistic’ characteristics mainly occur in certain periods and geographical regions that are characterized by specific historical developments. These include high population densities in large agglomerated settlements, increased innovativeness, intensive interaction in densified far-reaching communication and exchange networks.</p>
13	<p><b>MINIATURE IMAGERY OF ÇATALHÖYÜK WEST MOUND</b></p> <p><b>Abstract author(s):</b> Biehl, Peter F (University at Buffalo, SUNY) - Naumov, Goce (Goce Delcev University of Štip)</p> <p><b>Abstract format:</b> Oral</p> <p>Çatalhöyük is one of the most well-known and important Neolithic and Chalcolithic sites in Western Eurasia and the Middle East. Settlement at the site encompasses two separate tell mounds known Çatalhöyük East and Çatalhöyük West, with a potentially significant overlap between the occupation of the two mounds, starting in the late seventh millennium BC. This paper discusses the anthropomorphic and zoomorphic imagery from the Early Chalcolithic (6,000-5,500 cal BC) West Mound in Çatalhöyük in Central Anatolia, and scrutinizes the concept of miniaturization in general, and the difference it embodies in two- and three-dimensional representations in the form of figurines, potstands and painted pottery. Furthermore, the paper will explore how we might be able to connect singular images with representations of multiple images on painted pottery, and how this might help us to come to a closer understanding of the meaning and function of this miniature imagery in early farming societies.</p>
14	<p><b>„THE MICRO-UNIVERSE” OF THE HUMAN COMMUNITIES BELONGING TO THE PRECUCUTENI-CUCUTENI-TRIPOLYE CULTURAL COMPLEX. BRIEF ANALYSIS</b></p> <p><b>Abstract author(s):</b> Preoteasa, Constantin - Nicola, Ciprian-Dorin (Neamț National Museum Complex)</p> <p><b>Abstract format:</b> Oral</p> <p>Remarkable for the quantity, quality and diversity of the vestiges within its settlements, the Precucuteni-Cucuteni-Tripolye cultural complex (ca. 5000-3500 BC) presents in its inventory also miniatures (with a rather low frequency) that reflect material and spiritual life of the human communities during the Chalcolithic.</p> <p>Often considered as objects of prestige, with cultic or artistic value, made by specialized craftsmen, the miniatures were also included in the hoards or cult complexes, thus emphasizing their special importance. The artefacts for daily use are not missing, also.</p> <p>Some categories of miniatures are present throughout the evolution of this civilization (vessels, zoomorphic figurines, anthropomorphic statuettes, sanctuary-models), while others are found only in certain chronological sequences: Precucuteni / Tripolye A – Cucuteni A / Tripolye BI (votive axes, pintaderas, cones, discs, rondels, tablets, thrones, monoxyls, ornaments, en violon idols, rhyta) or Cucuteni A-B / Tripolye BII – Cucuteni B / Tripolye CI (sleighs).</p> <p>The variety of raw materials from which the miniatures were made (clay, bone, different rocks, copper, gold, shells, seeds) allows a wide range of analyses, which can provide important data from techno-typological and functional points of view.</p>
15	<p><b>ANIMATING AN INANIMATE WORLD: FROM IMAGES AS PHYSICAL ENTITIES TO TANGIBLE OR INTANGIBLE REFERENTS AND NARRATIVES</b></p> <p><b>Abstract author(s):</b> Marangou, Christina (Independent researcher)</p> <p><b>Abstract format:</b> Oral</p> <p>The Neolithic and Eneolithic (Chalcolithic) material world has been represented physically in miniature in various concrete ways. Imitated originals, comprising living beings -human, non-human and otherwise-, as well as artefacts and structures, may co-exist in an ensemble of similar or different represented subjects. However, all copies, even if in the same material, would not always have been</p>

	<p>used together, while isolated examples also occur. Therefore, all themes and specific contexts were neither necessarily interconnected, nor inevitably forming and comprising miniaturized sets. Moreover, it could be implied either that a missing theme/missing prototype was actually absent, or that presumed originals had not purposely been incarnated in miniature. In fact, not only presence would be important, possibly reflecting the referents’ real or imagined occurrence, but also absence of miniaturized themes might be significant.</p> <p>Conversely, it cannot be excluded that present physical entities were not imitations of reality, but rather materializations of fictional beings, things or associations. Therefore it has to be explored which themes and/or depictions were selected, which of them were correlated, under which circumstances and in what associations or interactions with other images and concrete surroundings, but also with the world(s) of their originals. Obviously, images have their own existence, presumably distinct from their prototypes’ apparent or alleged ways of life.</p> <p>As expected, in the Neolithic and Chalcolithic periods substantial connotations and inferences that would have offered indubitably meaningful readings of miniature representations are lacking. Surviving material and contextual evidence from Greece and neighbouring regions, as well as anthropological and social considerations may suggest conceivable working hypotheses and research perspectives. Among other possible approaches, potential interpretative directions of miniature images might imply alleged fictional or real referents, but also an assumed reality, with possible allusions to metaphorical performances or narratives conceived by the humans behind.</p>
515	<p><b>NEW REALITIES? A CRITICAL APPROACH TO RECREATING OBJECTS FOR EXAMINING AND PRESENTING THE PAST</b></p> <p><b>Theme:</b> 5. Assembling archaeological theory and the archaeological sciences</p> <p><b>Organisers:</b> Miller Bonney, Emily (California State University Fullerton) - Adams, Sophia (SUERC, University of Glasgow)</p> <p><b>Format:</b> Session with presentation of 6 slides in 6 minutes</p> <p>The advent of 3-D printers, experimental archaeology, cultural heritage parks, community archaeology and even Virtual Reality and archaeological computer games have created new ways of exploring and thinking about the past. These processes of replicating, reproducing and recreating provide unique ways for archaeologists and students to investigate how people engaged with materials and artefacts across time. While we can make multiple copies of an artefact with a 3-D printer to take the past into the schoolroom we can also attempt to revive the techniques of the past as a way of replicating not just the object but the practice. Reproduction is no longer just about filling museum shops but about extending the life of the object. At the same time all these activities risk separating the object from its cultural context. If we turn the bust of Nefertiti into a t-shirt design or a piece of street art, what are the consequences for the original? How does that prototype now fit into our present? At the same time can such replicas provide ways to remedy colonial appropriations retaining the replica in the museum where the plunder was housed and returning the original to the descendants of that first crafter? From resources for teaching to tools for analysis this session encourages presenters to take a critical approach to different types of recreated objects in presenting and discussing the past. In papers of no more than six minutes in length and using only six slides participants are invited to reflect on the issues raised by the reproduction of the past and to consider doing so by focusing on a single object.</p>

ABSTRACTS:

1	<p><b>REPRODUCING THE PAST IN MULTIPLES: SHAPING PAST AND PRESENT NARRATIVES</b></p> <p><b>Abstract author(s):</b> Miller Bonney, Emily (California State University Fullerton)</p> <p><b>Abstract format:</b> Oral</p> <p>In this session we reflect on reproduction as ways for thinking about how people have engaged with materials and artefacts across time, yet in many respects this not a new issue. In 1901 Arthur Evans excavating the site of the palace at Knossos on Crete found fragments of a faience figurine for which only the torso and the upper hips were preserved. The raised right hand appeared to hold a bit of cord. Twenty-five years later in the wake of significant restorations the fragment emerged as the snake-wielding votary of Evans’s Snake Goddess from the Temple repositories. Though only designated as a votary the figure has quickly superseded the Goddess in power and prevalence and has become one of a half dozen iconic images for the Bronze Age culture of Crete, the so-called Minoans. Replicated in a broad array of media including Barbie dolls and earrings the figure even made an appearance at the opening ceremonies of the Olympic games in Athens and is a foundational icon for various iterations of the goddess movement such as the Ariadne Institute. She has become the Snake Goddess in the popular imagination. The journey of this fragment calls us to reflect on the power of recreations to recast the past in both trivial and politically significant ways. The figurine was deployed not only to comment on a particular narrative of Minoan religion but was a device in tying Crete through Athens as the foundation of western civilization.</p>

THE LINDHOLME TRACKWAY

**Abstract author(s):** Griffiths, Mark (Independent researcher)

**Abstract format:** Oral

In the winter of 2018 myself and Dr Henry Chapman were approached by Natural England to remake the Neolithic Lindholme trackway on their site on the Thorne Moors close to the location of the original find. Henry had worked on excavating the original after its discovery in 2004. One of the oldest trackways found in the UK it measured 50 metres long by 3 meters at its widest point. We would be working with members of Natural England and a team of around ten volunteers.

As we would be working with volunteers, and the wetland site was open to members of the public strict health and safety practices would need to be observed at all times. Henry and I wondered how we could create an authentic recreation of a two and a half thousand-year-old structure using flint axes yet make the process safe, inclusive and fun?

As the month’s past, working on the bleak but beautiful moore, and the work on the trackway progressed, both Henry and I came to the conclusion that our preconceived ideas on the importance of the structure itself were starting to be challenged. The unforeseen importance working, sharing and forming bonds could be the true story behind the original Lindholme trackway.

FIT FOR A PRINCESS: RECREATING THE DOMESTIC SPACE OF KATARINA JAGELLONICA IN TURKU CASTLE, 1562

**Abstract author(s):** Gonzalez, Joseph (California State University, Fullerton)

**Abstract format:** Oral

Turku Castle was an important Swedish royal residence and the seat of the Duke of Finland, Prince Johan, 1556-1563. Considerable scholarship has been devoted to the reconstruction of the architectural layout of the castle during Johan’s time and, to a certain extent, the appearance of his apartments. However, far less attention has been paid to the chambers of his wife, Princess Katarina Jagellonica. The inventory of the princess’s dowry provides the opportunity to reconstruct the appearance of her apartments and to examine the ways in which the décor served to define a feminine space. Similarly, in an age when clothing, architecture, and interior design were all fields of carefully constructed rhetorical power, the interiors of a princess offer a glimpse into the construction of feminine royal power and offer insight into the ways that the apartments functioned as a ritual space where the princess and her ladies would have engaged in actions that contributed to the representation and exercise of that power.

DINNER IS SERVED BUT WE ARE 250 YEARS LATE

**Abstract author(s):** Reppo, Monika (University of Tartu)

**Abstract format:** Oral

In 2020, a number of pottery and glass vessel fragments were found from a cellar on Toompea hill, Tallinn. Whilst processing the finds, it was discovered that a large number of the vessels can be reconstructed partially or fully. Perhaps these plates, bowls, bottles and drinking glasses once formed a high dinner set? What did dinnertime look like in this upper-class household? Wouldn’t it be wonderful to know how it was all laid out? Reconstructing vessels from fragments and using editing software to rebuild the missing parts, a potential dinner scene from the second half of the 18th century is recreated. From discarded fragments to ornamented manganese delft plates, bowls and platters, British creamware plates, glazed redware bowls, delicate porcelain cups and saucers to glass bottles, tumblers and stemware, the table is set. Zooarchaeological remains allow us to show what meats are on offer. Some storage vessels hint at other food options. But what is missing? What are the obstacles? How much is fantasy and how much can we plausibly recreate? This paper reflects on the challenges of recreating a Czarist Russian high society dinner scene.
- 5

VR GAME SIMULATION OF A ‘GULAG CAMP’ AS AN EFFECTIVE EDUCATIONAL TOOL: REFLECTION ON THE CRITICAL STAGES OF DEVELOPMENT

**Abstract author(s):** Holata, Lukáš (University of South Bohemia; Gulag.cz) - Brošta, Josef - Černoušek, Štěpán (Gulag.cz) - Novik, Andrej (Scio)

**Abstract format:** Oral

The paper will provide a critical reflection on developing an educational tool using the 3D visualization of the Gulag camp. Specifically, game simulations in Virtual Reality are a highly effective way to provide contemporaries (and young generations especially) with an authentic ‘insight into the past’ and thus offer them an (almost) real impression and experience with the restrictions of totalitarian regimes. Such an effort responds to a long-standing critique of the teaching 20th-century history, which is reflected in the young generation’s knowledge and attitudes. At the same time, the curtailment of democracy is re-emerging issue in Central and Eastern Europe. However, creating a truly effective learning model widely used in schools is an extremely challenging task. Its developing process consists of three critical stages. 1) Gulag camp reconstruction: it is based on the archaeological survey and documentation of the correctional labour camp’s remnants – unique archaeological sites that are in few cases remarkably well-preserved in Siberian taiga and tundra. 2) Recreation of the camp’s everyday life: especially prisoner’s memoirs are exploited to add all living aspects and original dynamics into the camp scenery. Nevertheless, both stages have considerable implications in archaeological theory and methodology, such as structural vs. eventful approach, theoretical modelling, transformation processes, or de-facto refuse. 3) Inte-

gration with the pedagogy, didactics, and ethics state-of-the-art to validate the game simulation content and ensure its relevance to education.

- 6

GOING ROUND IN CIRCLES: DIGITALLY RECREATING EARLY BRONZE AGE AEGEAN ROLLER SEALS

**Abstract author(s):** Finlayson, Sarah (Universität Heidelberg)

**Abstract format:** Oral

Roller seals made of clay or wood were used relatively widely in Early Bronze Age Greece to decorate hearths and pithoi; they were a part of the aesthetic enrichment of everyday objects, their patterns of use across mainland Greece giving us an insight into the movements of travelling potters and the choices of their customers.

Only two fragments of a terracotta roller have survived, but we can derive its likely original dimensions, as well as get some idea of the clearly handmade, rather wobbly nature of these objects.

The Corpus of Minoan and Mycenaean Seals, University of Heidelberg, holds casts of one of these fragments, as well as a range of casts of roller seal impressions; as part of our ongoing research into Aegean sealing practices in the Erkon3D project, we have scanned a selection of these impression casts, in order to digitally recreate the size and shape of the roller seals used to make them.

These digital objects have been 3D-printed, and we are now using the modern replicas to explore how to handle a roller seal, making impressions that can be compared to the originals’ casts.

From both digital and experimental archaeology perspectives, this kind of ‘closing the loop’, from impression to object and back again, is innovative and exciting; it enables us to recreate the long-gone artefacts from the material traces they left behind, as well as providing to-scale and accurately replicated objects for experimental use.
- 7

EXPLORING TECHNOLOGICAL VARIABILITY OF LONG-HANDLED COMBS AND THE IMPACT ON ANALYTICAL METHODOLOGIES

**Abstract author(s):** Beamer, Jennifer (University of Leicester)

**Abstract format:** Oral

Experimental archaeology affords the opportunity to use replicas of archaeological objects without risking damage to the original artefacts. In recent experiments examining the role of textile tools in the operational sequence of Iron Age cloth production, three long-handled combs made of antler were commissioned. One nearly complete comb from Danebury hillfort, Hampshire, UK, was selected to serve as the model. Though the craftsperson was instructed to make a comb with specific parameters, the use of two thicknesses of saws for cutting the tines resulted in one comb appearing visually different. The following presentation discusses the impact of this decision at the time of crafting the comb in terms of functionality. Such a decision may influence the suitability of combs for the intended function, which can impact the nature of use-wear. The propagation of this effect is problematic for the analytical methods designed to investigate functional features of archaeological examples. Furthermore, assessing technological variation with a larger comb assemblage may produce misleading results.
- 8

“OH... BUT IT LOOKS SO MODERN AND COLOURFUL?” – CLOTHING AND EXPECTATIONS OF ATTENDEES AT PREHISTORIC LIVING HISTORY EVENTS

**Abstract author(s):** Girotto, Chiara (Ludwig-Maximilians-University Munich)

**Abstract format:** Oral

Creating functional prehistoric attires for museum events is always a challenging task. Whilst complete ensembles have survived from the Nordic Bronze Age, the same cannot be said for the Central European Urnfield Culture. Whilst textile’s survivability is generally limited due to their organic nature, the predominant burial custom of the time – cremation – complicates the matter. Drawing inspiration from analogies and the most contemporaneous evidence the goal is to create clothing that is functional with the personal adornments recovered from graves whilst embracing the little textile evidence that has survived.

Certainly not helped by depictions of the Bronze Age, or Prehistory in general on film many visitors at such events presume these reconstructions to be all natural colours, saggy and generally unflattering. In my short presentation I want to talk about the impact of clothing as a background for reconstructed artefacts and people’s perception of the past. . I wish to focus my presentation on a dress based on a reconstructional drawing by Bartel & Voss 2005. This rare inhumation grave in the Urnfield Culture Cemetery of Grunfeld (Germany) offered new insights as the burial attire left an impression in the sandy soil. As most remaining textiles of this culture were dyed it was reconstructed in woad blue and tends to spark a lot of debate due to its perceived „modernity“. Whilst the original colour is not known and even the style is a debate this one example of a new reality highlights the importance of clothing and associated replicas to educate the public in an easily accessible and direct way.

9 REPLICATION, REIMAGING AND THE REAL: THE CHANGING NARRATIVES OF A PREHISTORIC GODDESS’

**Abstract author(s):** Gearey, Benjamin (Prehistoric Society) - Power, Orla-Peach (UCC)

**Abstract format:** Oral

The Pallasboy Project was conceived of as an experimental project that engaged with the practical and physical aspects of the archaeological process but also incorporated digital methodologies and artistic approaches to augment these traditional modes of engagement. Drawing from an experienced multidisciplinary team of photographers, artists, crafters, archaeological and digital heritage specialists, The Pallasboy Project explored the process involved in the crafting of prehistoric wooden artefacts from a range of contexts across Europe. In this paper we present on the second phase of this project which focused on the recrafting of an Iron Age wooden figure known as ‘The Ballachulish Goddess’, sometimes known as the ‘Goddess of the Straits’, a wooden anthropomorphic figure unearthed in a peat bog at North Ballachulish in 1880. We consider the changing narratives and perspectives that surrounded this evocative figure in the digital and physical record, and consider the ephemeral passing values that each record can manifest.

10 A DESIGN APPROACH TO IRON AGE TEXTILES: RECONSTRUCTING A WOVEN CLOAK FROM BURTON FLEMING, EAST YORKSHIRE

**Abstract author(s):** Farley, Julia (British Museum)

**Abstract format:** Oral

One of the most complex textile constructions from Iron Age Britain is represented by small fragments preserved in corrosion products on an iron brooch found in the grave of a young man (25–35) buried at Burton Fleming, East Yorkshire (c. 350 BC). The brooch was clasped behind his neck, and the textile fragments were likely part of a rectangular cloak which had been used to wrap the body and, perhaps, worn in life.

This paper explores the design and construction of the cloak, including the spin direction of individual yarns, potential use of colour, and the creation of a complex weave structure incorporating a diamond twill centre and decorative border. The border was further embellished by the addition of embroidered inserts, one of the earliest known examples of embroidery in Britain. As part of this project, a large-scale version of the border pattern was re-created on a modern loom with commercial yarns. In addition, handspun yarn was used to create 1:1 scale samples of the diamond twill and border patterns, investigating the effect of twist direction on the visual and tactile properties of the finished textile.

Approaching this exceptional textile from an overarching design perspective reveals the creative and carefully planned use of a wide range of materials and techniques, undoubtedly executed by an accomplished weaver (or weavers).

11 THE TANGY SMELL OF BRONZE: IGNITING THE SENSES TO LEARN WITH THE PAST

**Abstract author(s):** Adams, Sophia (University of Glasgow)

**Abstract format:** Oral

Thirty children sitting in a circle sniffing a Bronze Age bronze axe. They are learning about prehistory. At the same time I am encouraging the children to understand the world through all their senses. In this time of virtual classrooms and online learning we are becoming ever more reliant on the visual, often to the detriment of other senses. Feel the weight of an object, be careful of the sharpness of an edge, hear the rattle of components, smell the honey flavour of warm beeswax, hear the resonance of sonorous hollow bronze. This paper exalts in the value of connecting with the past through original objects and recreation work.

Increasingly archaeologists are engaging with the sensory aspects of past material culture from experimenting with recreating objects to incorporating the knowledge of makers, re-enactors and others who experience ancient artefacts in a physical way. We may provoke our senses in different ways dependent on experience, physical abilities, our environment and cultural conditioning. Our experience is not identical to those of people in past but neither is an illustration of axe-typology representative of how prehistoric people interacted with the world around them. Here I share with you how and why I think an approach that engages a range of senses improves our knowledge of and learning about the past.

516 FROM CRITIQUE TO SYNTHESIS: TRANSCENDING THE GENOMIC DIVIDE WITHIN ARCHAEOLOGY

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Makarewicz, Cheryl (Kiel University) - Nativ, Assaf (Zinman Institute of Archaeology, University of Haifa) - Furholt, Martin (Dept. of Archaeology, Conservation and History University of Oslo; Institute of Prehistoric and Protohistoric Archaeology, Kiel University)

**Format:** Discussion session

It is difficult to exaggerate the impact of ‘ancient genomics’ on our understanding of human prehistory. Offering a host of sweeping narratives on migration, conflict, ethnicity, and kinship, aDNA provides us with accounts that are easy to identify and empathize with. For many, it is a dream come true: prehistory reconfigured to a human scale.

However, these benefits of ancient DNA also resulted in the reproduction of old and often troubling narratives, burdened with heavy Eurocentric, racial, and biological flavors. They also tend to reduce human cultural dynamics to a handful of explanatory mechanisms, including mobility and population turnovers. Moreover, rather than producing durable and mutually-beneficial relations, the division of

labor between the participating disciplines tends to create a hierarchical relationship, where archaeology is systematically relegated to a position of servitude: it provides the means, the conditions, and the conceptual framework, but the narrative is generated by the geneticists.

This session asks to initiate a mutually constructive dialogue between archaeologists and practitioners of ancient genomic, proteomic, and related sciences. This dialogue will earnestly address the deep-seated problems at hand and seek to build new explanatory frameworks to overcome them, fusing anthropologically-informed models with archaeological, archaeological science, and genomic data sets. In doing so, the aim is to refocus efforts on tracing mechanisms that underscore the formation, diversification, crystallization, and transformation of human behaviors. Among others, these may include experimentations with plant and animal management, translocation and uptake of domesticates, generation of new forms of socio-political organization, and the formation of urban communities. Ultimately, this session seeks to move beyond recent debates about the incommensurability of anthropological, archaeological, and genomic modes of knowledge in order to actively develop new venues that transcend these divides.

ABSTRACTS:

1 DOES THE ADNA - ARCHAEOLOGY DIALOGUE INVOLVE DIALOGUE AMONGST ARCHAEOLOGISTS FIRST?

**Abstract author(s):** Vander Linden, Marc (Bournemouth University)

**Abstract format:** Oral

The advent and ongoing generalisation of ancient DNA analyses in archaeology has triggered extensive discussions in the discipline, addressing both old and recent topics (examples include migration, demography, identity, kinship). In this sense, it is worth restating that, from a formal point of view, aDNA analyses inform us about biological evolution, defined here as change in frequency of DNA sequences in a population across several generations. Various processes either generate (e.g. mutation, migration) or sort this variation (e.g. natural selection, genetic drift) and archaeology has a potentially key role to play in elucidating the factors shaping these processes. However, this ambition will only be fulfilled if archaeologists rise above their - arguably important - personal research interests and rather invest into concerted efforts to integrate aDNA and archaeology in theoretical, methodological and ethical terms. These questions will be discussed through evaluation of recent examples drawn from the literature on Later European Prehistory.

2 BETWEEN TWO PREMISES OF HISTORY

**Abstract author(s):** Nativ, Assaf (University of Haifa)

**Abstract format:** Oral

Two premises seem to underly historical research. One asserts that the present provides access to the past; the other insists that the past constitutes the present. Both premises are equally valid, and most scholars are likely to hold both to be true. However, these premises articulate positions that are incommensurable and mutually exclusive. For one, time and temporality are properties that emerge out of an otherwise atemporal present. For the other, time is a pre-existing causal force with explanatory power. Moreover, while the former is geared towards the formulation of truthful propositions, the latter seeks to produce historical representations (à la Frank Ankersmith). For our discussion, I would like to suggest that we use the two premises as an analytical device to engage the question of archaeogenetics. For instance and in order to start the discussion going, we may begin with the hypothesis that many of archaeogenetics’ struggles emerge from the effort to marry the two premises, consequently divulging dubious effects.

3 TRANSDISCIPLINARITY IN THE ARCHAEOGENETIC DISCOURSE

**Abstract author(s):** Furholt, Martin (University of Oslo)

**Abstract format:** Oral

From the perspective of a European archaeologist, the ‘archaeogenetic revolution’ has had a strong impact on our overall understanding of prehistory. It has created a lot of tensions, often along old science war demarcation lines, but has at the same time also sparked several initiatives for more transdisciplinary efforts. In the early days, the identification of migration processes on a continental scale was the most prominent as well as the most contentious topic. Misunderstandings about concepts, such as populations, cultures, and human migration caused heated exchanges, but also laid bare conceptual weaknesses which had troubled much of prehistoric research since the early days of Prehistoric Archaeology in the late 19th century. This led to a (partial) re-direction of the overall debate towards more regional and local reconstructions of social group composition, and forms of mobility between communities and thus a more differentiated debate about the concrete forms the summary term migration actually can take. At the same time, a broader spectrum of topics which include an integration of bioarchaeological and archaeological information is now being discussed, focusing on, among others, human biological relatedness and kinship systems, biological sex, gender and related social norms as well as human engagement with plants and animals. Key to these advancements is the willingness to engage in a transdisciplinary approach, which takes a more explicit and critical approach to the biological and social perspectives on past lived worlds and is willing to integrate the rich corpus of anthropological theory. This should be the model for the further advancement of the field of archaeogenetics.

4      **CONSTRUCTING ANCIENT IDENTITIES WITH GENETICS AND ARCHAEOLOGY**

**Abstract author(s):** Frieman, Catherine (Australian National University)

**Abstract format:** Oral

As a social archaeologist who frequently works closely with scientists, I am interested in the process through which scientific data is created, given meaning and used to interpret human practices or describe human society. A key critique of archaeogenetics (and one I’ve made myself) is that the credibility accorded to scientific data as an objective and higher form of truth mean that biologizing models of society drawn from naïve interpretations of genomes and molecules—rather than people and relations—are taken to be indicative of a higher truth. Neither archaeologists nor geneticists, I believe, find this entirely satisfying. Moving forward, I think it will benefit both of our entwined disciplines to reconceive of archaeogenetic data as itself a product of social action (in this case the practice of science). All archaeological data is fragmented and biased – through taphonomy but also through our collection methods, the techniques of analysis and interpretation we apply and our own contemporary filter through which we are forced to interpret them. As we build up our sense of past people’s identities, social networks, and relations, we are lucky to have genomic profiles to incorporate in our model building, but we can be more flexible in our use of these datasets in we accept they are just as fragmented and biased as the rest of the archaeological record.

5      **FROM CRITIQUE TO SYNTHESIS VIA THEORY**

**Abstract author(s):** Crellin, Rachel (University of Leicester)

**Abstract format:** Oral

Recent years we have seen a boom in both aDNA research in archaeology and (relatedly) critical papers highlighting problems that archaeologists have identified with the historical narratives that have emerged from aDNA research. There has been critique of the scale and scope of the narratives and of their political and ethical consequences in the present.

One of the key steps in developing more nuanced and sustainable narratives is to consider the theoretical foundations that underpin this research. All narratives about the past contain theoretical assumptions and frameworks – in the case of aDNA research these are rarely explicitly addressed. One of the key theoretical issues to address is the binary opposition between genetic and archaeological data in many of these papers: how do we write more complex and nuanced narratives where both sets of data can be given equal weight? How can we better entangle the two kinds of data together in our narratives whilst still being able to appreciate that they may be revealing very different things? To move forward archaeologists and geneticists need to develop more collaborative relationships: ones where we make time to dialogue and to listen to each other.

6      **ANCIENT LIVESTOCK GENOMICS AND HUMAN AGENCY**

**Abstract author(s):** Bradley, Daniel - Daly, Kevin (Trinity College Dublin)

**Abstract format:** Oral

Genomic analysis of ancient domesticates provides a case of how genetics can be informed by and in turn inform archaeological hypotheses. For ancient livestock estimates of kinship, recent population size, and uniparental markers can help reveal the breeding patterns of ancient herds, and the relative fecundity of male and female animals. As control of breeding is a key element of domestication and herd management, genomics can thus help indicate how and when human societies in the past interacted with their partner species, and possible traits which they valued. One question is: can human agency be inferred with the help of genomic information? Along with human genomics the inference of migration requires detailed dialogue between archaeologists and geneticists. This term has a value-laden usage and particular history of interpretation in archaeology, with an entirely different tradition in genetics. One main issue in interdisciplinary study is the communication of which aspects of inference from new evidence are secure and which are speculative.

7      **KINMAKING AS SOCIAL PRACTICE**

**Abstract author(s):** Bruck, Joanna (University College Dublin)

**Abstract format:** Oral

This contribution picks apart the assumptions that underpin recent archaeogenetic studies of kinship and marriage in the past. Bio-genetic formulations of kinship are not only reductive, but are the legacy of our own colonial histories, and run the danger of imposing androcentric and heteronormative models of relating onto the past. In contrast, anthropological approaches argue not only that concepts of kinship are highly variable, but that kinmaking is a social process: practices such as exchange, ritual and the sharing of food are what create and maintain relationships between people who consider each other to be kin. So too Indigenous theorists describe the act of being in relation – which can encompass both human and non-human kin. The significance of these insights is that they call into question the relegation of archaeological data to a subsidiary position relative to genetic science. Archaeologists are, in fact, in a particularly good position to understand how kin were made in the past, for we can examine kinmaking as a technology that leaves material residues of a sort that are particularly amenable to archaeological analysis.

8      **ANCIENT DNA AND ZOOARCHAEOLOGICAL APPROACHES TO ANIMAL DOMESTICATION**

**Abstract author(s):** Brunson, Katherine (Wesleyan University)

**Abstract format:** Oral

Ancient DNA research on non-human animals is expanding rapidly. Ancient DNA provides access to genomic data covering hundreds of thousands of years, allowing for the investigation of evolutionary, ecological, social, and environmental questions in deep time, especially regarding the ways that humans have interacted with other species and modified past ecosystems and environments. In particular, the insights gained from paleogenomic studies have great potential to contribute to ongoing archaeological debates about the origins of domesticated species. As the discipline continues to develop, it will be critical to integrate ancient DNA data with other sources of information from zooarchaeology, stable isotope studies of diet, and archaeological context in order to address remaining methodological, ethical, and interpretive challenges. I will discuss possibilities for the future of ancient DNA studies of domesticated animals, focusing on the importance of zooarchaeological perspectives. Zooarchaeological collections harbor abundant sources of ancient DNA for studying past human-animal interactions, but must be sampled and analyzed critically and ethically.

9      **USES AND ABUSES OF ANCIENT GENOMICS? TOWARDS A FULL INTEGRATION OF ADNA AND ARCHAEOLOGY**

**Abstract author(s):** Fernandez, Eva (Durham University)

**Abstract format:** Oral

Thanks to recent advances in sequencing techniques, “ancient genomics” has become a mainstream tool to study the past of human populations and address long-standing debates in Archaeology. However, despite the obvious mutual benefits for both disciplines, they are far from being fully integrated. In a survey taken in 2018 about the role of ancient DNA in Archaeology among archaeologists at different stages of their career, the main issues arising were 1) Genomics papers being too technical and difficult to understand non-specialist audiences, 2) lack of engagement of geneticists with the archaeological background of samples and 3) destructive sampling and samples used as commodities in genetic studies. Among the actions highlighted to lessen the divide between both disciplines, were 1) Educate archaeologists in the uses and interpretations of ancient DNA, 2) Educate geneticists in the importance of the archaeological context for the interpretation of results, 3) Foster dialogue between experts in both disciplines through the organisation of courses and discussion forums, 4) Regulate the destructive nature of material and 5) Disclose all the material tested for DNA analysis, including negative results.

During this session I will use this survey as a starting point to identify areas of concern and think of actions to be taken to work towards a fully integration of ancient DNA and Archaeology.

10      **ONTOLOGIES, ETHICS AND PERSPECTIVISM: CAN WE MAKE ARCHAEOGENETIC NARRATIVES MORE ANTHROPOLOGICAL?**

**Abstract author(s):** Arbuckle, Benjamin (University of North Carolina)

**Abstract format:** Oral

This timely session addresses the uneasy and evolving relationship between archaeology and ancient genomics. I begin from the position that archaeology and ancient genomics are actually working rather well together but that both suffer from similar weaknesses linked to positivism, gender bias and Eurocentrism which have been explored in the archaeological literature since the 1980s. I focus on three related critiques which can be applied to both disciplines especially in the process of narrative construction. The first focuses on the ontological diversity (or lack thereof) deployed in building narratives about prehistory and the resulting categories we use to organize our temporally and spatially diverse data. What are the consequences of linking genomes to specific economic strategies (forager vs farmer) and geographic places when we know these variables are ever-changing? What do we miss by labeling nonhuman animals as either domestic or wild, hunted or herded? Second, what are the political implications of current trajectories of archaeogenetic explorations of prehistory? Whose narratives are being lifted up and celebrated as ‘human history’ and whose narratives remain untold on this platform? Moreover, who is involved in the collection, curation, and destructive analysis of the remains of human and nonhuman persons? Finally, what does acknowledgement of perspective do to the presentation of narratives which often seek to present the past as a series of ‘facts’. How can we situate genomic narratives, often perceived as the ‘real’ answers to human history, within understandings of the past which emphasize the importance of themes of multi-species co-creation, meaning-making, inequalities, social networks, etc?

11      **ARCHAEOLOGY AND GENETICS – A NOTORIOUS TROUBLEMAKER OR A MATCH MADE IN HEAVEN?**

**Abstract author(s):** Haak, Wolfgang (Max-Planck Institute for the Science of Human History; Max-Planck Institute for Evolutionary Anthropology)

**Abstract format:** Oral

In this discussion session I will provide an archaeogeneticist’s view on the developments revolving around the “genetics-infused narratives” over the last couple of years, in particular the ‘genomic’ era. Engaging with many colleagues and stakeholders in archaeology and anthropology, and genetics, I have naturally become aware of the multitude of different views, attitudes and approaches to

science and the accumulation of knowledge in general. More often than not, an apparent rift between humanities and natural sciences has been brought forward as obvious reason to explain the discordance over archaeogenetic data, whereas I do agree with the session’s title that the genomic divide might lie elsewhere, and in fact might not be an insurmountable obstacle for future research. Critical engagement from all sides will be needed to build frameworks for a fully informed, holistic archaeology, that should not be afraid to touch on highly complex or sensitive topics, including the field’s own troubled past.

12 EXPLORING PRESTIGE, ENTITLEMENT AND HUMILITY WITHIN AND BETWEEN ACADEMIC DISCIPLINES

**Abstract author(s):** Larson, Greger (University of Oxford)  
**Abstract format:** Oral

Conversations and controversies surrounding the relationships between archaeologists and geneticists tend to take as read a presumed hierarchy between the two fields. A common refrain holds that ancient geneticists vacuum up archaeological remains, apply fancy methods, arrive at the same conclusions, and then publish those results as if they are novel in higher profile journals than archaeologists tend to aspire to.

Power differentials, where one field is assumed to take precedence over another is a common phenomenon in academia writ large. Fighting against the perceived bias that favours animal studies over plants, Rieseberg coined the “zoological retardation index” which compared publication dates of major biological discoveries in plants and animals. In a review article he stated: “Major botanical advances often suffer the worst of fates - the scientific community ignores them until they are independently ‘discovered’ or confirmed by zoologists.” In the case of archaeology and genetics, it has been argued that at times, archaeologists have been complicit in their own subjugation by providing material to ancient genetics labs and in so doing, relinquishing claims to credit or contribution.

I am curious about how these dichotomies emerge, and more importantly, how the biases can become baked into, and internalised by practitioners on both sides of these divides. By explicitly considering this phenomenon, the hope is that we can identify and eliminate these emergent biases which will ultimately lead to better collaborations, deeper insights, and superior science.

13 ‘WHERE DO WE COME FROM? WHAT ARE WE? WHERE ARE WE GOING?’: ARCHAEOLOGY, ARCHAEOGENETICS, AND ARCHAEOLOGICAL SCIENCE FUTURES

**Abstract author(s):** Makarewicz, Cheryl (Kiel University)  
**Abstract format:** Oral

A tension exists between genomic narratives, constructed from datasets generated independently of theoretically-informed model building and hypothesis testing, and archaeological discourses that variably participate in often divergent anthropological theoretical currents while simultaneously attempting, with varying degrees of success, to draw together a wealth of multi-scalar datasets derived from the stratigraphic, material cultural, faunal, botanical, and biomolecular records. This unease is further exacerbated by real or perceived differences in how archaeogenetics and archaeology incorporate local communities and cultural heritage issues into their research programmes, realize the potential of new practitioners from countries where laboratory and funding opportunities may be limited, and address concerns about the commodification of human skeletal resources.

These debates between archaeology and archaeogenetics have been stridently vocalized on both sides, garnering much attention within the academy and in the public sphere, but they mirror more silent currents that churn deep within the archaeological sciences as whole. The archaeological sciences collectively achieves new methodological advancements at an increasingly quickened pace which increases the analytical resolution of dietary, mobility, and technological histories to dizzying heights, but appear to abet picayune particularism that stymies broader discourses on human evolution and cultural dynamics.

This discussion hopes to help decipher the disquiet between archaeology, archaeogenomics, and other archaeological sciences by tracing ‘where we come from’ in terms of our theoretical foundations, remembering ‘what are we’- anthropologists interested in understanding ‘how’ and ‘why’ novel human behavioural strategies emerge, intensify or disappear, and figuring out ‘where are we going’ – what pathways can we take that will build a more integrated Archaeology and ensure our collective archaeological, archaeogenetic, and archaeological science futures?

517 CONSIDER THE COLLECTIONS: RETHINKING APPROACHES TO COLONIAL MUSEUMS FOR THE 21ST CENTURY

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Boza Cuadros, Maria Fernanda (Museum am Rotherbaum - Kulturen und Künste der Welt; Centro Peruano de Arqueología Marítima y Subacuática) - Lans, Aja (Syracuse University)

**Format:** Regular session

Museums across Europe and other parts of the world house archaeological and ethnographic collections that are embedded in decades-long reifications of the colonial world order and racist human hierarchies. More recently, debates have raised questions regarding the positionality of museums, the authority of curators, and the legitimacy of retaining certain collections in detriment of descendant communities calling for their repatriation. Within a context of widespread political unrest, global pandemics, and a looming climate catastrophe, visions of reparative justice must include deep reflections on the future of museums and their collections

and the questions that researchers ask of them, as well as the role that restitutions of cultural goods play in these scenarios. At this juncture, museums should stop being mere reflections of their context, and instead embrace an active role in shaping anti-colonial, anti-racist and sustainable future agendas. The papers in this session take these ideas to task, and critically re-consider museum collections, their origins and their legacies. Importantly, the future of museum-based research is portrayed for its potential to aid in the disarticulation of colonialism in the years to come. We raise here new questions, including who gets to conduct research, and who grants permission to conduct it? Who decides what artifacts are to be repatriated, reburied, and displayed? How do research methodologies incorporate decolonial objectives? And, how do partners interact equitably in the context of a museum?

ABSTRACTS:

1 THE NATIONAL MUSEUM OF ARCHAEOLOGY (MUNA) IN PERU: A WAY FORWARD FOR OVERCOMING COLONIALIST AND NATIONALIST ENTANGLEMENTS?

**Abstract author(s):** Uribe Chinen, Claudia (University of Tsukuba)  
**Abstract format:** Oral

This paper discusses a possible paradigm shift potentially represented by the project of the National Museum of Archaeology (MUNA) amid the celebrations of the Bicentennial of the Peruvian Independence. The history of National Museums in Peru demonstrates a close relationship with nation-building processes and State-run initiatives to glorify the nation through the make-up and display of a past of grandeur. Since the beginning of the Republican era in Peru in the early 19th century, National Museums officially functioned as the temples of the national identity and the public gates to encounter the origins of the modern nation-state in the prehispanic past as revealed by archaeology. Prehispanic objects represented the symbolic capital of the national being, which systematically justified the symbiotic relationship of museums and archaeology, and their entangled dimensions of colonialism and nationalism, within national agendas. However, nowadays the cultural agenda calls for awareness on cultural diversity, anti-racism and sustainability. Therefore, a reflexive position towards the praxis and roles of museums, and archaeology, is more than a priority. I argue that the ongoing project of the MUNA holds a particular momentum to overcome past injustices in terms of culture, heritage and history, where the centralism of the ‘othered’, stereotyped and exoticized cultures of the prehispanic past legitimized invisibility, racism and marginalization. A National Museum of Archaeology in a reality like Peru may ultimately provide the means to raise awareness and a sensitive lens to understand cultural diversity and reconcile a pluricultural society.

2 DECOLONIZING THE AFRICAN COLLECTIONS AT MOA: FROM PROJECT TO PROCESS

**Abstract author(s):** Porto, Nuno (Museum of Anthropology - University of British Columbia)  
**Abstract format:** Oral

Decolonizing the African Collections and Displays at the University of British Columbia Museum of Anthropology is a two-year project designed to re-write catalogue entries for the museum’s African Collections, while training undergraduate students in object based, museum-oriented scholar research. Along 4 terms, working with 34 UBC undergraduate students, the project has consistently refined decolonial gestures, epistemologies and ethics, drafting new understandings and new horizons of museum practice and curatorship, while promoting an experimental academic practice based in forms symmetrical authority and empowerment of indigenous knowledge producers.

On this paper I will focus on the transformative nature of this project as a practice that has called for a reconceptualization three key concepts of museum culture. One: that collections are forms of social relations materialized in things and must be addressed as such. Two: that cataloguing is by definition an open-ended process, because catalogue entries refer to dynamic and in-the-making social and historical entities. Three: that museums should act less as sites and more as hubs, experimenting and distributing forms of knowledge and practice structured by principles of social justice.

3 DECOLONIZING HUMAN REMAINS HOUSED IN MUSEUMS: APPLYING BLACK FEMINIST PERSPECTIVES TO THE HUNTINGTON COLLECTION

**Abstract author(s):** Lans, Aja (Syracuse University)  
**Abstract format:** Oral

Human skeletal remains housed in museums have long been a cause of controversy. Many remains were sourced from marginalized populations, acquired through dubious means, and illustrate the slippage between dualisms such as subject/object. In addition to pathways for repatriation and reconciliation, I argue that to decolonize such collections, curators and anthropologists must engage with scholarly contributions from people of color, especially Black women. Work must also be done to actively diversify the academy and encourage the perspectives of individuals with multiple-consciousnesses. To illustrate this, I reflect upon my work with the National Museum of Natural History’s Huntington Collection, which originally consisted of the skeletal remains of some 3600 individuals who died and were dissected in New York City between 1892 and 1920. More specifically, I consider the history of the collection and its namesake, Dr. George Sumner Huntington (1861-1927), the Smithsonian Institution and its benefactor, James Smithson (1765-1829), and the life and death of a Black British woman named Eleanor, whose remains are now curated in said collection.

- 4

Using a black feminist framework, I explore their life histories and postmortem careers in an effort to decolonize this collection and to offer new perspectives on human remains curated in museums.

### PATHS TOWARDS WIDENING APPROACHES: SELK’NAM ANCESTORS, REPRESENTATIVES AND RESEARCHERS

**Abstract author(s):** Schattke, Constanze (University of Vienna; Natural History Museum Vienna) - Olivares, Fernanda - Molina, Nancy (Fundación Hach Saye) - Berner, Margit - Eggers, Sabine (Natural History Museum Vienna)

**Abstract format:** Oral

When provenance research is initiated in a museum, worlds sometimes collide. This happens especially if there is little will to integrate new world views. Herein we present an example of a proactive provenance research, where persons with different backgrounds, expertise and experience are finding a way to face and share distinct worldviews. Inspired by a summer course in the Department of Anthropology of the Natural History Museum, Vienna (DA-NHMW), the student among us (CS) decided to widen her biologically based studies to an interdisciplinary provenance approach that is now culminating in her master’s studies. In a joint process with the museum researchers (SE and MB), a focus on the human remains from the Natives of Tierra del Fuego was chosen. Besides the details of the ancestors bones themselves, the provenance research is a centerpiece of her work. The researchers started to seek contact to representatives of Native groups. The descendants of the Selk’nam (NM and FO) and their group have yet to fight to have the genocide of their ancestors recognized by the Chilean government. They are struggling to preserve and protect the dignity of her ancestors. Now, researchers and representatives are cooperating while working through the history of the ancestors remains located in the DA-NHMW. How can all parties successfully work together? What are the difficulties to overcome - and where can we learn the most from each other? All of this will be addressed here from different perspectives. Can the widening of worldviews lead to successful joint endeavors?
- 5

### FORMACIÓN DE COLECCIONES ARQUEOLÓGICAS Y ETNOGRÁFICAS: NOTAS SOBRE LAS TRAYECTORIAS DE OBJETOS LATINO-AMERICANOS

**Abstract author(s):** Bernal, Vanessa (Ecole du Louvre)

**Abstract format:** Oral

Los objetos arqueológicos y etnográficos procedentes de América Latina que encontramos actualmente en las salas de los museos europeos despiertan en el público una serie de preguntas, muchas de las cuales están relacionadas sólo al valor y a la función que estos artefactos desempeñaron en la vida de las culturas y sociedades ancestrales. Sin embargo, ¿imaginan estos visitantes en algún momento que dichos objetos han experimentado varias “vidas”? Cada una de estas “vidas” comienza en el momento de su fabricación y continúa incluso después de su (re)descubrimiento. Estas historias de vida, los diferentes viajes realizados hasta llegar a Europa, los lazos establecidos con diferentes personajes que intervinieron en sus desplazamientos y, especialmente, el momento en el cual ingresan a las instituciones museales europeas, son elementos importantes en el análisis y el estudio de la formación de colecciones extra-occidentales. En este contexto, esta investigación se enfoca en las trayectorias que han seguido cinco objetos precolombinos, procedentes de Perú y de México, que forman parte actualmente de las colecciones públicas de museos de Francia.
- 6

### DISPLAY OR RETURN? A RAJA AMPAT ALTAR AND A MAORI WAKA

**Abstract author(s):** Veys, Fanny (National Museum of World Cultures)

**Abstract format:** Oral

A group of ten 19th-century figures from Mayalibit Bay on Waigeo, the largest of the Raja Ampat Islands in West Papua, Indonesia, featured prominently in the exhibition ‘A Sea of Islands’ at the Museum Volkenkunde, part of the National Museum of World Cultures (the Netherlands) that opened on 20 February 2020. It was the latest halt in the travels of the group after stopovers in Manokwari, Amsterdam, New York, London and Paris. One female member of the group even spent more than 80 years in Spain. That same year, the museum was celebrating its tenth anniversary of having custodianship over a Maori canoe, a waka. This long-term loan and active exchange resulted from the return of a tattooed head to the National Museum of New Zealand.

The paper will trace the politics behind displaying and returning, demonstrating that these two case studies are actually two sides of the same coin. A different answer to the question whether ancestral remains should be on display or should be returned can be equally enriching experiences for all parties involved. I will advocate for respect as the guiding principle when museums are making decisions around these contested objects.
- 7

### THE SKULL IN THE ATTIC: PRACTICAL CONCERNS FOR UNEXPECTED FINDS IN MUSEUM COLLECTIONS

**Abstract author(s):** Boza Cuadros, Maria Fernanda (Museum am Rotherbaum - Kulturen und Künste der Welt; Centro Peruano de Arqueología Marítima y Subacuática) - Dau, Jamie (Museum am Rotherbaum - Kulturen und Künste der Welt)

**Abstract format:** Oral

Since 2017, the Museum am Rothenbaum – Kulturen und Künste der Welt (MARKK, Hamburg) has been undergoing a comprehensive repositioning process under new management. This includes, among other things, the critical examination of the museum’s own history and the reappraisal of its colonial entanglements and legacies. Quotidian tasks such as the inventory of previously neglected

- collections result on occasion in unexpected circumstances that raise new and critical questions. Here, we discuss one such scenario. On January 12, 2021, the partially mummified skull of a human being was discovered in one of the museum’s storage facilities during inventory procedures. At the time of its discovery, nothing was known about the provenance of these human remains other than limited information that it originally stems from Peru. In this paper, we present the current state of research based on the visual inspection and non-invasive examinations performed on the cranium, as well as the associated historical contextualization. We further elucidate on the potential ramifications of this case, including devising procedures consistent with the museum’s new ethical stances.
- 518

### WORTH THE EFFORT: EVIDENCE OF PREHISTORIC CROSS-CRAFT INTERACTIONS

**Theme:** 6. Material culture studies and societies

**Organisers:** Dzhanfezova, Tanya (University of Oxford) - Grębska-Kulow, Małgorzata (Regional Historical Museum - Blagoevgrad)

**Format:** Regular session

This session aims to stimulate a discussion on the theoretical and methodological premises for identification of cross-craft interactions. The latter will be considered in the context of various technical, technological and social developments in the Neolithic communities.

Finding evidence of the links between various prehistoric technologies is not always straightforward. However, it is probable that the highly-skilled and practical artisans would have saved their time and efforts in all possible ways, and at each stage of the production chain.

This may have referred to: (a) the coincidental use of the same raw-materials to make various categories of artefacts and decorations, (b) the specific techniques applied at different stages of the chaîne opératoire based on transferred knowledge and skills, (c) the successful approaches borrowed from other productions’ technological cycles, (d) the handling of synchronous and common (firing) events for various objects production, amongst others. Yet, in so many cases, there is still a question to be resolved: how genuine cross-craft interactions could be detected?

The transfer of materials between different production cycles in prehistoric times is a well-known practice worldwide – e.g. figurines made of stone tools debitage, small finds made by application of specific architectural techniques; puncture approaches adopted from older technologies and adapted to new materials, etc. However, how we interpret these - as evidence of practicality, as results from technology transfer or as direct indicators of cross-technologies needs further debate.

We welcome papers and posters concerned with the detection of the interplay between different prehistoric techniques and technologies based on various raw-materials (e.g. clay, bone, flint, marble, organic materials, etc.), that explore cross-craft interactions in prehistoric context.

### EVIDENCE OF TECHNOLOGICAL BORROWING IN THE NEOLITHIC OF THE VOLGA REGION

**Abstract author(s):** Doga, Natalia (-) - Vybornov, Alexander (-) - Gilyazov, Filat (-)

**Abstract format:** Oral

Complex technological borrowing in making ceramics and stone artifacts could only occur as a result of direct interaction between craftsmen from different cultures. The most ancient ceramics from the North Caspian Sea region are without ornament and made of silt with impurities. Crockery with different technology of production, shape and ornamentation, which are typical for potters of Surskaya culture, were found in these complexes. Borrowing of these techniques contributed to the development of the ceramic tradition of this area. The earliest ceramics in the Lower Volga region were made according to the North Caspian Sea formulas and the geometric microliths are similar in shape and processing to the complexes of the Northern Caspian region. Orlovskaya formula reached the forest-steppe Volga region and became a basis for technology formation of the Middle Volga culture ceramic tradition, i.e. ceramics made of silt with complex geometrical ornaments. Syncretic ceramics with a southern technology of production and northern typological features were discovered in the Orlovskaya culture. With the emergence of the Caspian culture, the technique of forced pressing, borrowed from the craftsmen of the Lower Don, became current in the steppe Volga region. The forward movement of the bearers of the Caspian culture to the south of the forest-steppe led to technological borrowing by the local population and the formation of the Samara culture. Technologies of jewelry making from wild boar’s tusk become common for the cultures of the Mariupol region. The local societies of the Kama culture borrowed from the newcomers of making a special design of the upper parts of the vessels, i.e. collar crockery and the technique of forced pressing. Arrowheads of Kelteminar-type appeared among bearers of culture with collar ceramics. Thus, the signs of technological borrowing indicate the active interaction of craftsmen in the Neolithic era.

2 THE LATE BRONZE AGE POTTERY MAKING IN THE SOUTHERN URALS: SRUBNAYA-ALAKUL CONTACTS AND CROSS-TECHNOLOGY INTERACTIONS

**Abstract author(s):** Mukhametdinov, Vadim (Bashkir state univercity)

**Abstract format:** Oral

In the Late Bronze Age, the Southern Urals is the area where Srubnaya and Alakul cultures meet. Having close origins (the Poltavka and the Abashevo cultures), subsistence patterns and systems of communication, they also share significantly similar material culture. This results in a very complicated cultural characterization of ceramics in the sites that belong to the zones of interaction. Respectively, it makes it difficult to explore the directionality and the dynamics of the interrelations.

Detailed analysis of pottery technology can still help solve some of the issues. On the basis of technological examination, the two groups bearing the typical characteristics of the Srubnaya and the Alacul culture were established. Then the ceramics from the ‘syncretic’ sites were analyzed, allowing us to deduce the changes that have occurred as a result of intercultural contacts.

The characteristic pottery traditions of the Srubnaya culture in the Middle Volga region were studied by N. Salugina, and those of Alacul in Central and Northern Kazakhstan – by V. Loman. Whereas the former associate with shell or grog added to the clay, the coiling technique and the bottom-and-wall approach; the latter reveals the addition of talc or grit, and the patch construction using convex-molds. Moreover, some common features were still less presented (shell temper used by the Alacul potters or the patch technique applied by the Srubnaya craftsmen).

The analysis showed that it is sometimes difficult to determine the Srubnaya or Alakul origin of pottery traditions at the ‘mixed’ sites and the data should be considered in the broader context, taking into account all materials from an archaeological complex.

3 CO-OPERATIVE LABOUR AND THE POOLING OF DIVIDUAL SKILLS

**Abstract author(s):** Chapman, John (Independent scholar) - Gaydarska, Bisserka (Durham University)

**Abstract format:** Oral

There is a sense that specialists in technological studies of Neolithic craft practices are more at home with the ‘chaine opératoire’ itself than with the persons operationalizing those practices. In the 25 years since Igor Kopytoff’s ground-breaking chapter on the biography of things, prehistorians have been more likely to work on object biographies than on the biographies of the persons making the things. In this paper, we look at the ways that Neolithic craftspeople worked through and materialised some key cognitive processes and explore the impact of ‘Team Neolithic’ on various crafts and their inter-relations with other crafts.

We assert that most of the significant innovations in the Neolithic, including mixed farming, building, weaving and metallurgy, required co-operative labour from groups of different genders and ages, thus combining the personal skills learnt by those individuals into a productive and effective practice. The integration of any team’s variety of skills and knowledge would have led to the higher probability of cross-craft applications in the household context of maintenance activities.

These ideas are discussed in the context of the interplay of two sets of practices – rectangular practices (house-building and weaving) and rotary motion (spinning, bow-drill perforation, wheeled transport and even the lap-wheel). Husserl’s characterization of building as a ‘geometric praxis’ is equally true of weaving, with successively more complex mathematical patterns required to make decorated cloth. To what extent did builders and weavers interact? The high level of labour required from all members of the family each day to create enough yarn for clothing made spinning the quintessential co-operative labour. Why did it take so long for spinners to transfer their understanding of rotary spindle-motion to stone-making and transport?

4 DISC BEADS OF THE EARLY NEOLITHIC: RAW MATERIALS AND MANUFACTURING TECHNOLOGIES

**Abstract author(s):** Boroneant, Adina (Vasile Pârvan Institute of Archaeology, Romanian Academy) - Mărgărit, Monica (Valahia University, Târgoviște)

**Abstract format:** Oral

Disc beads spread with the first farming communities in Europe but they seem to be quite rare in the archaeological record (perhaps related to excavation techniques) and details of their contexts have rarely been published. The present paper reviews the known finds from Romania and integrates them within the broader context of the Starčevo culture in particular, and the Early Neolithic in general. Various types of raw material were used for manufacturing such beads: shell, bone, stone and ceramic. Several Early Neolithic sites in Romania attributed to the Starčevo culture have yielded such beads. Similar finds occurred in other geographical regions covered by the Starcev culture. The number of such occurrences is small compared to the number of identified sites. Most likely this does not reflect the true archaeological situation but merely the state of publication. It is thus difficult to assess the significance of disc beads within a community, and their link to a particular social, age or gender group. Their use seems to have been connected with the everyday life of Early Neolithic communities in the Balkan and Carpathian regions, but also to funerary practices in Central Europe.

5 NEOLITHIC BEAD MANUFACTURING: CONTEXT, EXPERIMENT AND TECHNICAL INSIGHTS

**Abstract author(s):** Gurova, Maria (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences) - Bonsall, Clive (School of History, Classics and Archaeology, University of Edinburgh)

**Abstract format:** Oral

Bulgarian prehistoric culture and the incomparable finds from the Varna cemetery (V mill. BC), in particular, offer some remarkable examples of craft specialization, including beads and necklaces made of various minerals. Their sophisticated manufacture and use of very hard materials such as carnelian and nephrite remain enigmatic from the technical point of view.

The Varna finds were part of a tradition of bead manufacturing that appeared in the Balkans more than a millennium earlier – at the beginning of the Neolithic. Archaeologically, two categories of objects are recognized as having been involved in prehistoric drilling activities as an element of craft specialization of various prestigious items production.

The first comprises toolkits of micropiercers found in the flint assemblages of several sites among which Kovachevo and Ilindentsi in southwest Bulgaria represent particularly interesting case studies. The morphological characteristics of the micropiercers and the contexts in which they occur suggest they were used for making perforations. Use-wear analysis of the large series of micropiercers from the above mentioned sites reveals used examples (with variable development of microtraces), pieces that were broken (possibly through utilisation), as well as unused examples.

The second category is represented by beads and other decorative and prestigious objects made of bone, shell, pottery and various rocks and minerals such as marble, serpentinite, malachite, nephrite and jadeitite.

This paper revisits the results of an experimental programme aimed at clarifying the various practical and technical aspects of disc bead production as represented in Southeast European Early Neolithic sites. These results shed light on various aspects of prehistoric technological skills, craft specialization and interaction, high level expertise vs common household activity, etc.

6 LITHIC AND OSSEOUS INDUSTRIES IN THE LATE NEOLITHIC: MUTUAL RELATIONS AND INTERCONNECTIONS

**Abstract author(s):** Vitezovic, Selena - Antonovic, Dragana - Dimic, Vidan (Institute of Archaeology, Belgrade)

**Abstract format:** Oral

Lithic and osseous industries represent very important technologies among Neolithic communities; they were principal raw materials for production of everyday tools, used also for decorative and other non-utilitarian objects. However, current archaeological practice in majority of projects is to sort portable finds according to their raw material and to study them separately, and this is why wider studies of technological systems are very rare. In this paper, we will explore mutual relations and connections of the ground and abrasive stone and osseous technologies within the Late Neolithic Vinča culture in the central Balkan area (with particular focus on the assemblages from the sites of Vinča-Belo Brdo and Pločnik). Ground and abrasive stone tools were used for production of osseous artefacts; in fact, the abundance of abrasive stone tools is closely linked with the osseous technology, since abrasion was widely used technique for manufacturing and especially for repair of osseous tools. Osseous raw materials were, in turn, used for production of handles and hafts for stone axes, adzes, chisels, etc. There are multiple other aspects of mutual connection and inter-dependence: tool kits for certain activities and craft include both lithic and bone tools for diverse stages of production (for example, woodworking); there are cases of skeuomorphism – morphologically identical or similar artefacts produced from both lithic and osseous tools, such as small chisels, axes, etc. Tight connections between these two technologies show that traditions and innovations in one technology cannot be understood without the studies of the other, and that studies of technological systems are very much needed for comprehensive studies of prehistoric economy and craft production.

7 BONES, BRONZES AND OTHER STUFF. CROSS-CRAFT INTERACTIONS AT THE BRONZE/IRON AGE SETTLEMENT IN GRZYBIANY (POLAND)

**Abstract author(s):** Baron, Justyna (University of Wroclaw)

**Abstract format:** Oral

The archaeological evidence produced by a small community living in a lake settlement in Grzybiany in SW Poland at the turn of the Bronze and Iron Age (8-6th c. BC) thrillingly illustrates interactions between various traditions and innovations. Due to wet environment, the site provided rich data on many everyday activities. We consider some of them to have been innovative (metallurgy) while the other to have represented stable, long-lasting, domestic traditions (pottery manufacturing, bone and antler processing) or even vanishing crafts (flint knapping). My theoretical model of cross-craft interactions assumed that dynamic development in one of the activities (such as the high-temperature technologies in metallurgy) must have influenced the other (such as the temperature in pottery firing).

The final interaction pattern was, however, far from the initial model. It showed that, even in a single settlement, we can observe differing dynamics of technological development depending on the type of worked raw material.

8

PECULIAR WHETSTONES FROM THE PREHISTORIC SITE OF KAIMENSKA CHUKA, BULGARIA

**Abstract author(s):** Hristov, Pavel (Regional Museum of History - Blagoevgrad)

**Abstract format:** Oral

The production and maintenance of everyday tools in prehistoric times often required gear specifically designed for the task. The multi surfaced elongated whetstones found during the excavations at Kaimenska Chuka, in the southwestern region of Bulgaria, are an example of a single piece of tool-making gear used for the production and maintenance of different tools employed during the daily routine of the prehistoric craftsman.

As stated above, each of the whetstones has at least a few working surfaces (usually between three and five), a feature which appears to be a testament to their regular use and importance for the inhabitants of the prehistoric village. With the exception of a few very large examples, most of the stones have a similar elongated shape. However, while some of them possess flat working surfaces used for the maintenance of tools with cutting edges, others have fullered sides most probably needed for production of bone awls and needles. Interestingly enough, a few of the whetstones have both flat and fullered sides, most certainly used for the working of different types of tools, and perhaps even tools made from different types of materials. Furthermore, the widest sections of the tapering fullers vary from thin (less than 1cm) to quite wide (about 3cm). These differences are undoubtedly related to different stages of bone tool production, and perhaps to the production of different types of bone tools designed for different purposes.

The research into these still insufficiently studied stone tools brings to light the prehistoric person’s ingenuity of simplification and easing of everyday crafting activities.

9

STRANGE INHABITANTS OF PREHISTORIC HOUSES IN THE MIDDLE STRUMA VALLEY, SOUTHWEST BULGARIA

**Abstract author(s):** Kulow, Malgorzata (Regional Museum of History-Blagoevgrad)

**Abstract format:** Oral

In the traditional technique of building prehistoric houses on the Balkan Peninsula, clay mixed with organic substances (mainly chaff) is used for the construction of walls which gave them elasticity, greater stability, and at the same time lightness. It seems that this specific technology was not limited to house building but was also used to make certain items related to the interior of a house. These are specific human heads made of similar clay dough mixed with chaff. They were stationary, attached to an inner stake or beam, and only the front was intended for viewing. These figurines are larger than usual, , with clearly defined eyes, lips and nose, apparently in order to be seen from afar. The faces of most of them are additionally decorated. These types of figurines have been found in several early Neolithic settlements in the Middle Struma valley, Southwestern Bulgaria: Kovachevo, Ilindentsi and Balgarchevo. A figurine of this type is also known from the site of Madzhari in Northern Macedonia. Through these specific items we touch a hitherto unknown ritual and the intertwining of the intangible and tangible worlds by adapting similar technology in the manufacture of quite distinct objects but unified by the idea of the protection of the house and its inhabitants.

10

RED FROM BELOW: LATE NEOLITHIC HAEMATITE PIGMENT PRODUCTION AND RED PAINTED POTTERY IN WESTERN SYRMIA (NE CROATIA)

**Abstract author(s):** Botic, Katarina (Institute of Archaeology, Zagreb) - Buric, Marcel (Department of Archaeology, Faculty of Humanities and Social Sciences, University of Zagreb)

**Abstract format:** Oral

Dark and red pigment based decorations applied on ceramic vessels and other objects appeared very early in the Neolithic of the Balkans. Mostly manganese and iron based decorations, rarely cinnabar based, appear from the early stages of the Vinča culture as well. Over a century old theory of the production of cinnabar based colouring pigment in specially shaped ovens/kilns at the Vinča – Belo Brdo site is still debated today. Some recently published research indicates use of iron based ore in these ovens/kilns resulting in hematite colouring pigment as a final product, mostly used on vessels, while cinnabar pigment was confirmed mostly on ceramic figurines at the turn of the sixth to the fifth millennium BC.

New excavations at Bapska tell site (Western Syrmia, late Vinča and Sopot phases) in 2013 and subsequent years uncovered one of the similar ovens/kilns and the preliminary results show hematite traces in its interior as well. It was also suggested in the preliminary report that the bog iron could have been used as a source for this particular production. In this paper, we present a discussion about ore origin, production of pigment and techniques of its application on vessels and other ceramic objects at two sites (Bapska and Bršadin – Pašnjak pod selom) in the Western Syrmia region adding new data to the ongoing discussion.

11

INVESTIGATING TECHNOLOGICAL PROPERTIES OF BONE-TEMPERED CERAMICS IN PREHISTORIC EUROPE

**Abstract author(s):** Palacios, Olga (Laboratory of Quantitative Archaeology, Universitat Autònoma de Barcelona) - Hein, Anno (Institute of Nanosciences and Nanotechnology, National Center of Scientific Research 'Demokritos')

**Abstract format:** Oral

This study investigates the role of bone temper for the manufacture of ceramic vessels in the Neolithic period from a technological point of view. There is currently a vibrant debate in research surrounding the potential benefits and advantages of using particular tempers over others as Neolithic ceramics in Europe were tempered with both organic and inorganic materials. This variability and observed preferences are investigated from three different perspectives: the temper material's benefits during the manufacturing process (e.g. availability, easy to prepare), the technological properties that can provide to the ceramics (e.g. higher thermal shock, lower porosity) or the meaning and significance of using this material from a social perspective (e.g. social differentiation). The present study focuses on the second hypothesis and explores the potential mechanical and physical properties of bone temper as it is found across European prehistoric ceramics.

The principal objectives of this research are to define the technological properties of bone-tempered ceramics when different temperatures are applied and various tempering percentage is added. The ultimate goal is to explore whether a specific reason for adding this singular material to the clay can be identified and gain new insights into the role of temper on ceramics. To accomplish this, specimens mixed with bone material were prepared and standard material tests were performed for characterising thermo-mechanical properties of bone-tempered ceramics, such as strength, toughness and thermal conductivity. This study answers some questions regarding the thermo-mechanical properties of Neolithic tempering options and aims to contribute towards a further debate concerning the use of specific technologies and their potential cross-craft significance.

12

SEARCHING FOR THE RAW MATERIALS: THE EARLY NEOLITHIC QUARRYING FOR OCHRE AND OBSIDIAN

**Abstract author(s):** Kosciuk-Zalupka, Julia (Jagiellonian University)

**Abstract format:** Oral

The issue of mapping of the raw material quarries, together with their further juxtaposition to the prehistoric sites seems to create new challenges and paths of development in archaeology. Beside the general recognition of the geology of a terrains, the main issues would be: (1) assigning the quarry with the archaeological material and (2) assuming the frequency of utilizing such spots. It should also be kept in mind, that the raw materials could have been acquired due to an exchange action, if their spot of origin lies far from the site. Moreover, there could also be considered the role of the information flow on the best quarries in the vicinity.

In that context, the material from Aşıklı Höyük and Musular, in Turkey, were analyzed. Under consideration there were taken both: obsidian and ochre pieces. The main aim was to check, if those societies, living close by, were using the same quarries. Another aim was to ascertain, if the same group of people was capable of bringing both obsidian and ochre during a single quarrying event — that would be possible, if the outcrops were lying nearby. The final results showed, that the spatial proximity of those societies did not imply choosing of the same quarries, at least in the case of the pigments. On the contrary, the obsidian quarries were the same, localized in Nenezi Dağ and Göllüdağ.

13

THE COMPLEXITY OF SIMPLICITY: DECODING CROSS-CRAFT INTERACTIONS FROM EARLY NEOLITHIC BALKAN POTTERY

**Abstract author(s):** Dzhanezova, Tanya (University of Oxford)

**Abstract format:** Oral

Exploring why a pot was made the way it was, and the processes and people behind this, involves a detailed multi-layer and cross-disciplinary examination of preserved material remains. Considered within cultural, social, technological and environmental context, these allow for a better understanding of plain practicalities or more complex aspects such as: transfer of knowledge; level of experience and flexibility; oftentimes belonging and, possibly, personal/specific background, amongst the rest.

Understanding cross-craft interactions is thus essential for interpretation of Neolithic pottery production. Exemplifying the simple assumption that time and efforts would have been saved in all possible ways, however, may sometimes be more complicated. Here, the question of how to detect genuine cross-craft interactions is tackled by archaeometric analysis at macro- and micro-scale, using examples from Neolithic pottery production.

Going beyond the linear perspective, the analysis reveals not only a spectrum of choices (decision-making at different stages of the productive chain), but also the interplay between different prehistoric techniques, technologies, everyday and craft activities. Understanding ‘transferable’ knowledge and skills in such context thus broadens in a new way our research horizons.

\*This project has received funding from the European Union’s Horizon 2020 research and Innovation Programme under the Marie Skłodowska-Curie Grant Agreement No 798143.

INTEGRATING ALL DIMENSIONS: 3D-APPLICATIONS FROM EXCAVATION TO RESEARCH TO DISSEMINATION

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Hostettler, Marco (University of Bern, Institute of Archaeological Sciences, Prehistoric Archaeology; University of Bern, Walter Benjamin Kolleg, Graduate School of the Arts and Humanities) - Drummer, Clara (Orthodrone GmbH, Kiel) - Emme-negger, Lea (Freelancer) - Reich, Johannes - Stäheli, Corinne (University of Bern, Institute of Archaeological Sciences, Prehistoric Archaeology)

**Format:** Regular session

3D-technologies are increasingly shaping the way archaeologists work and think. The fact that 3D recording techniques are becoming part of the standard toolkit in archaeological fieldwork opens up enormous opportunities for research and public outreach. As archaeological excavations are seen to be destructive, conventional documentation techniques have been shaped over decades if not centuries to mitigate as much information loss as possible. This includes the development of fitting tools and workflows as well as best practices in archaeological data collection, long-term archiving, research and dissemination.

As new tools, 3D-Technologies need to be implemented into these existing best practices and workflows. In order to take full advantage of the new possibilities, we consider an integrated approach from the beginning of a project to be essential. This enables the successful implementation of 3D-technologies in all stages: it is not only important during fieldwork, but also later during research or public outreach. There, for instance, challenges concerning interoperability or quality may arise and have to be coped with. Also, the irreversibility of archaeological excavations has to be met with the functioning of long-term archiving of mostly large and complex datasets.

Despite the increasing implementation of 3D-technologies in everyday archaeological practice, the overall experience of knowing what decisions to make and how they will affect the later possibilities and limitations is still developing. Nevertheless, there are ever more successful projects showing how 3D-techniques can be fully integrated into archaeological practice.

This session aims to bring these examples of integrated research projects to a broader archaeological audience. As these potent documentation techniques have found their way into everyday practice, a broad dissemination and discussion of their possibilities and arising challenges is urgently needed.

ABSTRACTS:

1

CERAMICS 3D: DIGITAL DOCUMENTATION AND DISSEMINATION OF CERAMIC FINDS FROM GUADALUPE, HONDURAS

**Abstract author(s):** Fecher, Franziska (University of Zurich) - Lyons, Mike (University of Bonn; German Archaeological Institute) - Reindel, Markus (German Archaeological Institute) - Fux, Peter (Museum Rietberg Zurich; University of Zurich) - Mara, Hubert (Mainz University of Applied Sciences) - Bayer, Paul (University of Graz) - Gubler, Brigitte (Lucerne University of Applied Sciences and Arts)

**Abstract format:** Oral

In our project we use a digital approach for the 3D-documentation of ceramic finds from Guadalupe, Honduras, including low-cost structured light scanning and automated generation of profile drawings with the 3D software GigaMesh. By linking the 3D and contextual data to the open access Arachne object database of iDAI.world, the models are made accessible online in the iDAI 3D viewer. This results in an interactive ceramic catalog that can be used as a basis for future studies in the little explored region of northeast Honduras. Here, the documentation and illustration of finds in publications and their accessibility are particularly important, as there are hardly any representative and descriptive publications on the material culture to date. The investigations focus on the Cocal period (AD 1000-1525) coastal settlement of Guadalupe. Numerous well-preserved finds, especially pottery, were found during excavations. In order to document these on-site as efficiently as possible and to ensure usability for later off-site investigations, a workflow was developed that combines 3D technologies with traditional drawing techniques to achieve an optimal result in terms of quality and quantity.

2

ACCURACY AND MECHANICAL STRENGTH OF LATE PREHISTORY BALANCES: A 3D-MODELLING-BASED APPROACH

**Abstract author(s):** Poigt, Thibaud (UMR 5607 Ausonius - Univ. Bordeaux Montaigne; UMR 5608 TRACES - Univ. Toulouse Jean Jaurès) - Comte, Florent (Independent researcher)

**Abstract format:** Oral

This contribution aims to present the results of new 3D applications in the field of ancient metrologies. They bring insights about weighing precision and balances mechanical properties during the Late Bronze Age (LBA) in Western Europe. Northern France and Southern England share the particularity of providing tiny balance beams and weights dedicated to weigh small quantities. It is traditionally accepted that most of the Bronze Age weights found in Western Europe correspond roughly to a same practice built around

one metrological system. Nevertheless, the deviations observed between several weights which should correspond to the same values in the metrological system raise questions about the accuracy of the Bronze Age balances.

This paper will present new mathematical and digital protocols – sensitivity analysis, 3D modelling, simulation, and finite element analysis – which highlight the main mechanical features of the LBA balances, the accuracy expected with them and their mechanical strength to use. Our purpose will be to question, through 3D applications, the ancient balances accuracy and solidity. This method is based on the modelling of balances from drawings of the best preserved bone or antler beams (~ 10 artefacts). The models obtained are considered as idealised objects aiming to understand the main characteristics of LBA balances. They provide the basis for two types of analysis. The first one uses the calculation of the centre of gravity of the beam and forces mechanics to estimate the balances sensibility and accuracy, based on a scale visualization of the beam defection according to its different loads. The second one relies on original uses of finite element analysis to approach the strength and rupture points of the beams. Our results allow to understand better the properties and limitations of ancient weighing instruments and their consequences on metrological practices.

3

DEER ANTLER STORIES – COMBINING 3D-TECHNOLOGIES, ARTISTIC RESEARCH AND ARCHAEOLOGY TO BRING MESOLITHIC STORYTELLING PRACTICES BACK TO LIFE

**Abstract author(s):** Ahola, Marja (Helsinki University) - Lassila, Katri (Aalto University) - Davidow, Elviira (Independent artist)

**Abstract format:** Oral

Throughout history, humans have been telling stories. While historical societies have used the written word or moving pictures to share their stories, prehistoric communities relied largely to oral tradition. Although these stories have largely gone missing during the course of time, they have nonetheless left material remains e.g., in the form of rock art. However, rock art might not be the only materialization of past storytelling practices. On the contrary, if made mobile again, prehistoric artefacts might also bring past storytelling practices back to life.

In this presentation, we introduce a novel, multidisciplinary project that relies on 3D-technology, artistic research and archaeology to 1) explore further materializations of prehistoric storytelling, and 2) to bring them back to life. As a case study, we present a single artefact – an 8000-years-old ornamented deer antler object from Finland. Even though the artefact has not been modified intensively, the form of the item resembles an animal or a combination of several animals. Remarkably, these animal forms seem to be especially well present in the shadows the artefact casts, suggesting that this item might have been used as a storytelling device. Indeed, when the antler artefact is rotated against light source, it is capable of casting shadowy forms of different animals that appear, disappear and merge along with the movement.

To study the phenomenon further, we have 3D modeled and printed the artefact. This digital approach has allowed us to approach storytelling by experimenting with the art of shadow play while safeguarding the actual item. In this presentation, we will tell where this multidisciplinary experimental archaeology has led us.

4

LOOKING BACK GOING FORWARD: LEARNING FROM 100 YEARS OF PROCESS IN THE DIGITAL TURN

**Abstract author(s):** Pantos, Alexis (Freelance) - Murray, Owen (The Epigraphic Survey - Oriental Institute of the University of Chicago)

**Abstract format:** Oral

The Epigraphic Survey began documenting inscriptions of temples and tombs in Luxor in 1924. At the time, most documentation was highly selective and hand illustrated – with the standards and quality of documentation varying greatly between researchers. The promise that photography would level the playing field and speed up the process loomed in the air, and yet the Survey chose to adopt a system of facsimile documentation that paired large format photography with traditional pen and ink illustration. Developing an integrated workflow from capture through to publication, and a truly multidisciplinary approach relying on skilled photographers, artists and Egyptologists, this distinctive recording methodology came to be known as the “Chicago House Method”.

Since 2014 this workflow has become increasingly digital, substituting photogrammetric 3D capture in place of large format B&W photography, and iPads, Wacoms, and styluses for paper, pencils and rapidographs. With exciting new possibilities for presentation, analysis and delivery of data on the horizon the project finds itself at a virtual crossroads. This talk presents some of the questions that have arisen from considering the transformation to the next form of integrated workflow: how the opportunities map to the aims of the project, and what lessons are to be gleaned about integrated workflows from the previous 100 years of a tried and true multidisciplinary approach.

5

DEVELOPMENT AND INTEGRATION OF 3D-APPLICATIONS IN JAPANESE ARCHAEOLOGY

**Abstract author(s):** Loftus, James (Kyushu University; Japan Society for the Promotion of Science) - Noguchi, Atsushi (Nara National Research Institute for Cultural Properties; JCSACH)

**Abstract format:** Oral

Despite the gradual adoption of 3D technologies in other fields, applications within archaeology in Japan have been much slower in comparison. However, it seems that Japanese archaeology is now experiencing a gold rush of adoption of these technologies; and within this recent wave of government and public interest has come many difficulties as well. Lack of resources and training at local governmental institutions, gaps in the dissemination of data, and certain fundamental issues related to open access and security

policies has begun to create a dead-stock of available data at research centers and museums across the country. Despite these challenges, and due to the still relatively underdeveloped nature of 3D data in archaeology, the time to rectify these situations is now. Several labs and individuals across the country are working feverishly to create an environment of openness, incorporating established scholars, local institutes and students in the adoption of 3D technologies. This paper seeks to summarize the nature of Japanese archaeology, the problems related to applications of 3D data within Japan, and the current attempts by scholars to rectify the situation. The authors hope to open the field of Japanese archaeology to an international stage, and in doing so, other scholars both domestically and abroad may come to encourage a more open and holistic approach to 3D data.

6 **IMPLEMENTING A 3D DOCUMENTATION WORKFLOW FOR CONTEXT-BASED EXCAVATIONS: THE CHALCOLITHIC SETTLEMENT AT TELL YUNATSITE, BULGARIA**

**Abstract author(s):** Whitford, Brent (University at Buffalo)

**Abstract format:** Oral

At the chalcolithic settlement of Tell Yunatsite, Bulgaria, a from motion photogrammetry 3D documentation methodology has been implemented since 2013. Our explicit aim was to utilize photogrammetry as a means of documenting complex stratigraphic relationships between archaeological contexts and to ultimately surpass the methodological limitations of the Wheeler-Kenyon box grid system. In this paper, we first discuss the practical and theoretical challenges that we faced when integrating our methodology into the existing context-based excavation practice. Second, we elaborate on some technological issues that arose in terms of cost, storage, upkeep, and data-quality as is relevant to long-term projects. And third, we provide concrete examples of the scientific benefits that have been derived from our method—benefits that go beyond mere visualization techniques—from analysis to public dissemination. To date, our efforts have been met with great success. Over eighty individual five by five meters excavation sector models have been produced at less than 1 cm3 resolution within which nearly 700 individual contexts are represented in full alongside their 3D stratigraphic boundaries, allowing the production of stratigraphic cross-sections at any location over the entire excavated surface of the site—integrating all dimensions, from practice, to analysis, to dissemination. In conclusion, our 3D documentation method, we believe, allows for a more accurate and detailed estimation of the elusive 4th dimension—time.

7 **3D DOCUMENTATION AS BUILDING BLOCKS FOR RESEARCH ON PREHISTORIC SITES IN THE BALKANS – VISUALIZING SVINJARIČKA ČUKA AND BIJE LJINA**

**Abstract author(s):** Petschko, Irene - Gavranović, Mario - Horejs, Barbara (Austrian Archaeological Institute, Austrian Academy of Sciences) - Klein, Michael (7reasons)

**Abstract format:** Oral

The focus of the project “Visualizing the Unknown Balkans” is on the survey, excavation and visual presentation of prehistoric archaeological sites in Bosnia-Herzegovina and Serbia in cooperation with local partners. By application of modern methodologies, the main aim is to provide comprehensible reconstruction of sites and ancient landscapes and to create a starting point for future investigations.

In this paper we will present documentation and results of two case studies, the sites Svinjarička Čuka (Serbia) and Bijeljina (Bosnia-Herzegovina). Svinjarička Čuka is a multi-phase settlement in the South of Serbia in the hinterland of the South Morava valley. The settlement started with the first Neolithic settlers, while younger occupation involves Bronze and Iron Ages. In Bijeljina (in North-east Bosnia, near the river Drina) the tumulus Novo Selo was excavated and revealed traces of human activity in the Copper Age, Middle Bronze Age and the Middle Ages, with inhumation and cremation burials. Both case studies cover about 5000 years of human history in the Western-Central Balkans.

The workflow for the 3D photogrammetric documentation in the field was developed before the excavations with its requirements (quality standards, documentation resolution and further utilization of the data) in mind. It was fully integrated in the excavation process and replaced the occasionally highly time-consuming traditional analogue field drawings, offering a higher level of detail and the third dimension.

In combination with tacheometric surveying, the 3D models and derived orthophotos were georeferenced and the basis for drawing maps in GIS, analysis, and the subsequent visualization of research results. Depending on the state of preservation of the structure, the models were used as foundation of the reconstruction of the sites by serving as reference or guides. Moreover, the photogrammetric documentation provided also an excellent basis for the accomplishment of illustrations for publications.

8 **3D TECHNOLOGIES FOR ARCHAEOLOGICAL RESEARCH AND PUBLIC OUTREACH IN THE TROPICAL FOREST OF THE MAYA AREA**

**Abstract author(s):** Munoz Cosme, Gaspar (Universitat Politècnica de València; C.I. PEGASO) - Vidal Lorenzo, Cristina - Aliperta, Andrea (Universitat de València; Departamento de Historia del Arte)

**Abstract format:** Oral

Laser scanning and photogrammetry, applied in combination with traditional systems, are powerful tools that are opening new horizons in the analysis and interpretation of archaeological excavations. Since 2012 we have introduced this technology, for the first time in the Maya area, in all stages of the archaeological research in La Blanca and Chilonché, two important ancient Maya urban

centres in the rainforest of Petén, Guatemala. The 3D models produced after field data collection and data processing at both sites have therefore contributed to archaeological interpretations since they have increased our knowledge of the entities scanned and helped to establish the spatial connections between the archaeological finds. We have also developed an innovative method consisting in the day-to-day digital documentation of the digging operations. Data collected in the field and processed on the same day, acquiring plans, sections and elevations to help us in the interpretation of the remains as they came to light, represent a profoundly effective support tool to generate discussions among the excavators, establish or modify the excavation strategies according to the results obtained every day and avoid unnecessary earthworks. The advantages and improvements of this new method, one of the most successful approach of our project, is described in this contribution, as well as the difficulties we faced in such an extreme environment. Our project has also integrated 3D technology in public dissemination through digital media and educational programs, bringing the results of this research to a much wider audience. Finally, it should also be taken into account the wide range of options that this technology offers for future actions, especially for the conservation of Cultural Heritage, making it possible to virtually revisit previous stages of the excavation and the whole archaeological process. The next challenge to face is the preservation of these amount of data.

9 **SETTLEMENT, FORTIFICATION AND FLUVIAL CHANNEL. INTEGRATION OF 3D PHOTOGRAMMETRY AT POHANSKO NEAR BŘECLAV**

**Abstract author(s):** Prištáková, Michaela - Dresler, Petr (Masaryk University)

**Abstract format:** Oral

Application of the 3D documentation is a relatively common procedure employed at particular archeological excavations. In praxis we sometimes encounter various challenges that make us think about the practicality of its use. From one perspective, there are possibilities to amend the fieldwork methodics in order to collect the necessary 3D data, from another perspective we contend with a time-consuming post-processing of the data collected and its further use, be it for scientific or representational purposes.

We started to gather the data used in 3D photogrammetry at Pohansko, near Břeclav, in 2012. Over the years this became an inseparable part of documentation of various scientific projects employed at the site. With the development of 3D visualization tools the output of the data became also a way to better understand and observe the investigated objects. In the paper we will provide examples of application of the 3D documentation in investigation of a settlement, a fortification and a river basin. We will focus on situations in which the use of 3D photogrammetric data proved useful and the specific ways how to implement and visualize the data in GIS programme.

10 **3D DOCUMENTATION IN SAARI MANOR EXCAVATION 2020**

**Abstract author(s):** Paukkonen, Nikolai (Muuritutkimus Oy) - Uotila, Kari (Muuritutkimus Oy; University of Turku; University of Helsinki)

**Abstract format:** Oral

During the year 2020 Muuritutkimus Company conducted an excavation inside Saari mansion in Mynämäki in Southwestern Finland. The layers between the vaulted cellars and the 1st storey floor were excavated archaeologically, revealing the remains of wooden floor beams and other structural features from the 17th century. The project was initiated by the need of renovating the building, which is still in active use. As such, everyday workings required active communication with affiliated parties, such as conservators and engineers.

The conditions were ideal for using several different 3D-documentation technologies. A Riegl VZ-400i laser scanning system was used to document different phases of the excavation process on almost a daily basis. Additionally a Faro Freestyle 2 handheld scanner was used for some smaller features, supporting and supplementing the data gathered with the larger Riegl scanner. The third 3D documentation tool used during the project was a Matterport Pro2 3D camera, which allowed us to present up-to-date visualization to the other members of the project. An Oculus Quest 2 VR headset was tested as an optional way of inspecting and interacting with the material.

This paper examines the results and differences of these various methods. The results are promising, although there are still some unresolved questions. Comparisons between accuracy, resolution and ease of use between the technologies are presented. Furthermore, we provide details of the workflow used, including some applications of VR technology for planning.

A. **THREE-DIMENSIONAL SEEDS. IMPLEMENTING 3D TECHNOLOGIES IN ARCHAEOBOTANY**

**Abstract author(s):** Aquaro, Antonella (DAI - Deutsches Archäologisches Institut; Freie Universität Berlin)

**Abstract format:** Poster

In this poster I discuss the application of 3D rendering to the field of Archaeobotany. I will show how we can create 3D models of archaeobotanical material and why it is needed. There are different approaches to document samples in 3D. Idealised models only need drafting skills and a suitable software, such as Adobe Photoshop. Things are different when it comes to real samples. The procedure I apply starts with a new generation digital microscope. Thanks to an accurate Z axis scanning, one side of the sample is directly modelled in 3D. More views are needed to obtain a complete model. Remashing and alignment can be achieved with a 3D

mesh processing software system, such as MeshLab. The possibilities offered by 3D technologies in the botanical field are multiple and coherent with archaeological purposes.

Firstly, the photographic documentation of samples is enhanced by the third dimension: 3D allows to record data of difficult cases and better share them with other scholars. In addition, 3D images provide a more complete dataset for samples later to be destroyed, e.g. for dating purposes.

Similarly, a 3D model can substantially enrich the experience of consulting identification atlases. This is particularly relevant for those researchers who do not have access, temporarily or permanently, to a physical reference collection.

Finally, 3D simplified models show standard characteristics of taxa and render shapes and volumes, thus complementing drawings in the task of training students in the identification practice.

For these reasons and more, the integration of the third dimension is a wished improvement of the archaeobotanical praxis for scholars, students and wider public.

521

SHAPING A DISCIPLINE: KNOWLEDGE TRANSMISSION AND EXCHANGE IN THE HISTORY OF ARCHAEOLOGY. PART 1

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Coltofean-Arizancu, Laura (University of Barcelona) - Martins, Ana Cristina (IHC-FCSH NOVA – Pólo Universidade de Évora and Uniarq-UL) - Arnold, Bettina (University of Wisconsin-Milwaukee)

**Format:** Regular session

The circulation of concepts, ideas, theories and methods was essential to the development of archaeology since its early days. Evolutionism, the three-age system, diffusionism, culture history, processual archaeology, radiocarbon dating, behavioural archaeology, the Harris matrix, post-processual archaeology and new materialism, among many other, have all shaped archaeological theory and practice as we know it today. However, their impact on and absorption in the discipline was geographically and chronologically uneven. This session explores knowledge transmission and exchange throughout the history of archaeology in Europe and elsewhere, from the nineteenth to the twentieth century. We welcome papers that examine any of the following topics: the trajectories followed by concepts, ideas, theories and methods during their dispersal within the archaeology of different regions; the dissemination channels (e.g. correspondence, congresses, publications) through which these were transmitted and the role of social and academic networks in this process; and their use as devices for propaganda purposes, attaining personal prestige (including through appropriation) and establishing power relationships and hierarchies. We would also like to encourage discussions on the reception or rejection of various intellectual frameworks in the archaeology of different countries, and the political, economic, social and cultural contexts in which these attitudes occurred; the ways in which conceptual and methodological schemes influenced the practice of archaeological actors and institutions, and fostered multidisciplinary and interdisciplinary encounters.

ABSTRACTS:

1

CELTIC AND VIKING: HOW KEY CONCEPTS IN 19TH CENTURY EUROPEAN ARCHAEOLOGY WERE DEVELOPED WITH REFERENCE TO THE SCOTTISH NATIONAL COLLECTION

**Abstract author(s):** Goldberg, Martin (National Museums Scotland)

**Abstract format:** Oral

The activities, knowledge and networks of antiquaries working with the Scottish national collection during the second half of the nineteenth century (formerly National Museum of Antiquities of Scotland, now National Museums Scotland) were pivotal in defining key concepts for understanding prehistoric European archaeology and the earliest historical periods. This paper will explore how during the 1850's the chronological ordering of the Scottish national collection for display, using the Scandinavian inspired Three-Age system, resulted in the recognition of distinct classes of material and one of the earliest definitions of Celtic art(s) by Sir Daniel Wilson. Further Scandinavian connections, and the identification of international comparisons for Scottish material culture in the 1870's, resulted in precocious use of the concept of the Viking Age by the Keeper of the museum Joseph Anderson.

2

MISCONCEPTIONS OF THE CLOSED FIND APPROACH IN PRE-AND PROTOHISTORY IN SCANDINAVIA, GERMANY, ENGLAND, AND FRANCE 1808-1860

**Abstract author(s):** Sasse-Kunst, Barbara (Albert-Ludwig-Universität Freiburg, Institut für Archäologische Wissenschaften)

**Abstract format:** Oral

In central and western Europe, the first half of the nineteenth century is considered a formative period during which enduring differences in methodologies, research directions and concepts emerged. The analysis of selected archaeological works by German, Scandinavian, English and French investigators indicates that the invention and adoption of Thomsen's Three Age System was only possible in Scandinavia. At that time this was the only area of Europe in which controlled empirical excavation methods, precise documentation and stable long-time museological standards already existed, thanks to special royal sponsorship and an archaeological school with scientific traditions (medicine) since the early Enlightenment. In the decentralized German-speaking areas of Europe,

the dominant paradigm in societies referred to as "Geschichts- und Altertumsvereine" was a non-teleological historical approach to antiquities. There archaeology emerged, but closed finds with precise documentation were not a primary concern, and the principle of Thomsen's system was not understood. In regions that had experienced an extensive Roman occupation and that also had a strong antiquarian tradition, such as France, parts of England and south-west Germany, a protohistoric, Roman and Early Medieval Three Age System was characterized by a historical chronology and some well-documented early medieval closed finds. However, this methodological approach had not been generally adopted and Thomsen's system was rejected not only for his problematic approach to protohistoric chronology using myths instead of history, but also because Thomsen had delegated the theoretical and graphic explanation of his method to future generations. This led to the misconception that "the method" consisted of typology and not the sequence dating of closed finds.

3

MEDIUMS OF ARCHAEOLOGICAL KNOWLEDGE. SOME REMARKS FROM THE GERMAN MARKET OF JOURNALS AND ENCYCLOPEDIAS

**Abstract author(s):** Grunwald, Susanne (RGK/JGUniversity Mainz)

**Abstract format:** Oral

The circulation of archaeological knowledge was never only a question of terminology and networks. From the very beginning it was always also an economic question – was a regional archaeological society able to collect enough membership fees to edit a journal, was a topic interesting enough to print expansive illustrations and maps, were enough buyers available to defray publishing costs? While the book market exploded in the 19th century archaeology became established as a new field in Europe and North America. The representatives of that new science learned to publish and to share knowledge from the most successful publishers of their time– from historians, encyclopedists, and novelists. So archaeological publications were always also products and their authors and editors acted and competed on the publishing market. That influenced publishing strategies, archaeological terminology, and topics as well as strategies to get money for the publishing process or to promote books. To illustrate the potential of that perspective, examples from the German Prehistoric Archaeology of the 19th and first half of the 20th century will be discussed.

4

HERODOTUS AND ARCHAEOLOGICAL APOLOGETICS IN AN AGE OF SECULARIZATION

**Abstract author(s):** Marchand, Suzanne (Louisiana State University)

**Abstract format:** Oral

In the early modern era, scholars frequently turned to Herodotus for secular confirmation of the historicity of the Old Testament. The presumption in histories of archaeology and oriental studies is that as decipherments proceeded and as archaeological work began in earnest in the 19th century, Herodotus lost his salience, and apologists their foundations. But if we look at many figures in the later nineteenth century, we can see that this tradition did not die out, and indeed was reinvigorated by Egyptological and Babylonian finds that seemed to confirm Herodotus' accuracy. This paper underscores the persistent use of Herodotus in archaeological work in Egypt and the Near East into the very late 19th century as a means to illuminate the heretofore understudied tradition I will call 'archaeological apologetics.' I hope to show that Herodotus' champions by no means disappeared, and were not necessarily 'unscientific' in their approaches. Many were themselves ardent Christians, eager to use Herodotus (as had early modern scholars) in combination with recent finds to shore up the historical and ethnographic reliability of the Old Testament. Figures to be discussed include Fulcran Vigoroux, Georg Ebers, Edouard Naville, and Charles and Francois Lenormant.

5

WHOSE DISCOVERY? RECOGNITION OF THE LEPENSKI VIR SITE AND CULTURE BETWEEN ARCHEOLOGY AND ART HISTORY

**Abstract author(s):** Cosic, Natalija (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

**Abstract format:** Oral

Eureka! This is a word that is often associated with the moment of discovery and innovation in a scientific field. However, from a constructivist perspective, studying a scientific discovery is focused on the processes, not moments. The viewpoint emphasizes the importance of a series of invisible and visible events, encounters, and collaborations that eventually result in a change in a given scientific context. In this paper, I will explore the specific circumstances that led to the recognition of Lepenski Vir culture during initial archaeological research in the 1960s. Based on Bourdieu's field theory, I want to problematize the notion of archaeological discovery, through analysis of the academic and societal circumstances that influenced the announcement and naming of a new archaeological site and culture.

The past, like heritage, does not exist in itself but is the result of a combination of different mechanisms and practices of recognition, selection, and codification in contemporary settings. The re-examination of the historical and epistemological bases of archaeological interpretations contributes to a critical consideration of the way in which knowledge about the past is constructed. The interpreted past emerged from archaeological practices of excavation, discovery, and recording appears in various formal representations. The end result depends entirely on individuals and institutions that act as regulating authorities in shaping and naming processes. In a combination of different socio-political and academic circumstances, the site of Lepenski Vir was discovered and interpreted as a new culture in European prehistory for which the archaeologist Dragoslav Srejović is credited. The essential turning point in that process took place with the discovery of the famous sculptures from this renowned site.

6 PRESTIGE AND PROTOSTORIA: EXAMINING PROTO-ETRUSCOLOGY AS A “BOUNDARY SPACE” IN THE LATE 1800S

**Abstract author(s):** Gustavsson, Anna (Dep of historical studies, Gothenburg University)

**Abstract format:** Oral

In the mid- to late 19th century, Northern Italy became a hot spot for European archaeologists and geologists. Many new discoveries in the region provided excellent geographical –and intellectual- grounds for an emerging new discipline: Paletnologia, or Prehistoric archaeology. For the late Italic prehistoric faces, the additional term Protostoria was implemented. At the same time, the Etruscan culture sparked a great interest among the international scholarly community of prehistorians. The Etruscans became a key element in discussions about the origins of the Bronze Age. They were suggested as the transmitters of the Bronze Age from the South of Europe to the North, by Scandinavian archaeologists like Oscar Montelius (1843 –1921), Hans Hildebrand (1842–1913) and Ingvald Undset (1853–1893). This paper is promoting the idea of perceiving proto-history, or even “proto-Etruscology” as an important academic space bridging the gap between prehistory, history and art history, and as a common ground and international platform for multidisciplinary debates, knowledge exchange, positioning, prestige and networking and among European scholars in the late 19th century. Drawing on theoretical and methodological inspiration from Science and Technology Studies (STS) and microhistory, these issues will be examined by zooming in on the correspondence between the Italian scholars Luigi Pigorini (1842–1925) and Edoardo Brizio (1846–1907), and their Scandinavian colleagues Oscar Montelius and Ingvald Undset, in the early 1880s. The archive material derives from archives in Italy and Sweden.

7 WETLANDS AS A LABORATORY. KNOWLEDGE EXCHANGES AND THE FOUNDATION OF PREHISTORIC ARCHAEOLOGY IN NORTHERN-ITALY (1854-1976)

**Abstract author(s):** Pizzato, Fedra Alessandra (University of Verona)

**Abstract format:** Oral

After discovering the existence of the lake-dwelling civilization in Switzerland (1854), the search for the lacustrine people across the Alps assumed particular importance for many European scientists and archaeologists. By the end of the 1860s, several Italian scholars, including eminent scientists such as Antonio Stoppani, started to visit Italian wetland sites to investigate the development of the lake-dwelling civilization. Scholars based in Verona, such as Pierpaolo Martinati and Stefano De Stefani, were particularly active in this research program. Incidentally, they were also in close contact with Luigi Pigorini, dominus of Italian archaeological research. Precisely by virtue of these contacts, Verona (and the nearby city of Vicenza) quickly became an informal center for Italian studies of lake-dwellings. Scholars, collectors from the local upper class, and amateurs based in the area were rapidly involved in a transnational network of relations with Swiss colleagues and Italian patriotic associations, such as the Italian Alpine Club (CAI). By reconstructing the scientific exploration of Northern-Italian wetlands as a case study, this paper aims to shed new light on the dynamics of knowledge circulation across national borders, scientific fields, different levels of expertise, and the center-periphery in the second half of 19th century Italy.

8 KNOWLEDGE TRANSFER AND EXCHANGE BETWEEN GERMAN AND HUNGARIAN ARCHAEOLOGISTS IN THE TWENTIETH AND TWENTY-FIRST CENTURIES

**Abstract author(s):** Coltofean-Arizancu, Laura (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts)

**Abstract format:** Oral

This paper discusses the main elements of archaeological theory, method and interpretation that have been exchanged and transferred between Hungarian and German archaeologists in the twentieth and twenty-first centuries, and have made an impact on the overall development and evolution of the discipline in both countries. Using archival documents, scientific publications and oral history interviews, the paper examines the complex mechanisms underlying these interactions, as well as the various factors that have shaped them (i.e., political, ideological, socio-economic, personal). The paper derives from the hypothesis that these interactions were a complex process of bilateral knowledge transfer, in which not only did German archaeologists influence Hungarian archaeology, but Hungarian archaeologists also influenced German archaeology. The paper is built around the case study of one of the most important institutions in German archaeology, the Romano-Germanic Commission (Römisch-Germanische Kommission [RGK]; Frankfurt am Main) of the German Archaeological Institute (Deutsches Archäologisches Institut), and its collaboration with scholars and scientific bodies involved in Hungarian archaeology. Since its foundation in 1902, the RGK has been acting as hub for research and networking on the prehistory and early history of Europe, as well as on Roman provincial archaeology in Central Europe. Throughout the years, the institution has attracted numerous international scholars, it has conducted pivotal archaeological projects, and has established key collaborations with archaeologists and institutions across the globe.

9 TRANSFER OF ARCHAEOLOGICAL POWER/KNOWLEDGE DURING WORLD WAR II IN SERBIA

**Abstract author(s):** Bandovic, Aleksandar (National Museum in Belgrade)

**Abstract format:** Oral

With the beginning of WWII and the occupation of Serbia, the German military administration closed the University of Belgrade, recognizing it as a hotbed of communist and liberal elements, after which its reorganization began, in accordance with the ideological

principles of Milan Nedić’s collaborationist government. Prompted by these circumstances, devotees and graduates of archeology, art history, law, architecture and ethnology gathered at the Museum Course (Lehrgang für Museumsbeamte) which was organized at the National Museum in Belgrade. Between 1942 and 1944, the Museum Course became a place of informal education for future curators and museum youth, in which a significant number of relevant Serbian experts participated. Conceived and initiated under the protectorate of Johann Albrecht von Reiswitz, a major at the Military Administrative Headquarters in charge of cultural heritage protection, the course nurtured future experts and museum workers. Participating students of archeology acquired practical knowledge through the archeological excavations of Kalemegdan led by Wilhelm Unverzagt, and through the process of comprehensive cataloging of museum collections led by Ahnenerbe’s associate SS-Obersturmführer Kurt Willvonseder both financed by the Ahnenerbe in the interest of German science. The transfer of theoretical, practical and “tacit” knowledge, and the process of systematic shaping of future collaborators, took place in the wake of the “New Europe” led by the Third Reich. Through a critical analysis of sources, personal testimonies and publications, we will look at the ways in which knowledge/power was transferred, but also the questions of whom and what it served.

10 BETWEEN WORDS AND IMAGES: (RE)SHAPING ARCHAEOLOGY IN PORTUGAL DURING THE 60S

**Abstract author(s):** Martins, Ana Cristina (IHC - Polo da Universidade de Évora; UNIARQ - Universidade de Lisboa)

**Abstract format:** Oral

The 1960s were of intensity in a Portugal that balanced between the still dominant politics of the ‘Estado Novo’ and a growing demand for freedom of thought and action by the challenging voices that were multiplying. A need for change was also reflected in the country’s scientific activity, archaeology being no exception.

In fact, the 1960s seem to constitute, as far as archaeological activity is concerned, a moment of confluence between those who pursued culture-historical analyses; those who acknowledged its limitations but could not overcome them; and those who absorbed new ideas and brought to the national archaeological research epistemological novelties that were generated, discussed, accepted, and used abroad.

It was, no doubt, a transition period that ended in the middle of the democratic process. What were the new ideas arriving to Portugal? How did these theoretical and methodological novelties reach the country? Who introduced them? How were they introduced? How were they received? What projects and ways of looking at the past did they initiate? How and to what extent did they coexist (or not) with previous approaches and methods? How did they enhance exercises (conscious or not) of personal and collective, public, and private prestige in the country’s archaeology?

These are a set of questions that we will try to answer in our presentation, taking as starting points the archaeological meetings organized in Portugal during the 1960s, as well as the inherent proceedings and temporary exhibitions prepared during some of them, as privileged spaces and vehicles of knowledge transmission and exchange, and of new power relations and hierarchies.

11 THE ARCHAEOLOGICAL PICNIC: GROUPS AND MOVEMENTS IN ARCHAEOLOGY

**Abstract author(s):** Zubrow, Ezra (University at Buffalo; University of Toronto)

**Abstract format:** Oral

This paper focuses on some of the informal mechanisms that have helped create contemporary archaeology. I use the term groups for an assortment of friends or colleagues who come together informally as in a picnic. They have little formal organization but cooperate in various ways and resemble in some respects a proto think tank. Most thrust their members toward intellectual, artistic, and scientific radicalism. They reject the status quo and normality. They accumulate followers and fans as well as critics. The principles that unite the group usually are not codified. But, they are distinguishable and eventually a manifesto is produced. Some connect themselves to larger changes in the society; some do not. The most successful become parts of movements in the sense that their ideas and actions influence policy. Frequently future oriented their legacies are controversial. In this presentation a few examples of these small groups are considered in detail, including the Cambridge Group, an anti-post-modernist group of the early 1990s that helped to establish cognitive science; the Bay Area group, which had a major impact on environmental and evolutionary studies; and the Pan Vernon group, with its impact on the New Archaeology, part of the new science movement.

12 ARCHAEOLOGY AND INTERDISCIPLINARITY BEYOND THE RHETORIC

**Abstract author(s):** Kristiansen, Kristian (University of Gothenburg)

**Abstract format:** Oral

Archaeology is a creative, borrowing discipline, which has throughout its history successfully applied many methods and theories from a variety of disciplines from social anthropology, history and philosophy to various branches of science from geology, zoology and physics to genetics. However, to practice interdisciplinarity beyond the rhetoric demands two things often missing. The first is knowledge about the other disciplinary field, especially its methodology. The second is theoretical reflection about the limits of interpretation of each participating discipline. In this contribution I shall exemplify and discuss how to effectively develop such interdisciplinary collaboration. The paper takes its point of departure in the observation that every discipline has its own methodological and interpretative demands, and that these need to be respected. To combine is therefore not always easy, and a first step may be to create a narrative, that is less rigorous, but can be used to formulate new research questions.

DEALING WITH THE DEAD: TRANS-ATLANTIC INTELLECTUAL EXCHANGE NETWORKS AND THE DEVELOPMENT OF 21ST CENTURY MORTUARY ARCHAEOLOGY

**Abstract author(s):** Arnold, Bettina (University of Wisconsin Milwaukee)

**Abstract format:** Oral

As one of the more ubiquitous and salient sources of information about past human cultures, mortuary archaeology has been the focus of theoretical and methodological innovations since the Three Age System was tested against burial contexts in Scandinavia by Christian Jürgensen Thomsen in the 1830s. This paper will compare and contrast approaches to the archaeology of death on both sides of the Atlantic between 1945 and the present in order to reveal areas of mutual influence as well as discordances in approaches to mortuary archaeology. In spite of the fundamentally different foundations of the disciplines -- grounded in the humanities in the case of European archaeology and in the social sciences in the case of North American archaeology --as well as socio-political developments emerging out of the historical contexts within which these fields developed -- on the one hand the Civil Rights movement and NAGPRA, on the other attempts at Vergangenheitsbewältigung on the part of nationalist regimes -- mutual influences can be traced in the publications of a group of scholars with links to both intellectual traditions. The ease and speed with which research results can now be disseminated have facilitated information exchange and many fruitful collaborations have resulted. However, a magpie approach has also emerged, attracted to the new and shiny but without the foundational grasp to apply these innovative ideas in a systematic and critical fashion. Without a deeper understanding of the intellectual roots and rules of these theoretical frameworks an emerging trans-global mortuary archaeology cannot develop into a mature subfield.

MAKING THE ARCHAEOLOGY OF TEXTILE PRODUCTION VISIBLE AGAIN: EXPLORING ITS KNOWLEDGE TRANSMISSION AND METHODOLOGY IN THE IBERIAN PENINSULA (SPAIN)

**Abstract author(s):** Morgado-Roncal, Leyre (University of Granada)

**Abstract format:** Oral

Although the archaeology of textiles has clearly been influenced by archaeometric studies, the formation, transmission and dispersal of this rigorous methodology has not been homogeneous throughout Europe. Indeed, the study of textile fibers and dyes in Spain is relatively recent, especially with respect to archaeometric analyses of ancient textiles. This type of study should ideally include not only the physical remains of the textiles themselves but the chaîne opératoire, the tools used to produce the textiles, the raw materials procured and so on. As a result, this paper will explore the introduction of textiles studies in the Iberian Peninsula (Spain), the reason behind the relatively late arrival of this approach to textile studies and the current state of this field of research. By doing so, we hope to discuss the influence of knowledge exchange, the particular evolution of archaeology in Spain and how is reflected in the study of ancient textile production. Finally, this methodological case study will enable us to contribute to textile research more generally by showcasing the historical and archaeological importance of these perishable remains.

INTERPRETING THE CONSERVATIVE PURITY: IRISH ARCHAEOLOGY AND THE POST-PROCESSUAL CRITIQUE

**Abstract author(s):** Whitefield, Andrew (National University of Ireland, Galway)

**Abstract format:** Oral

This paper examines the limited impact of theoretical developments in the second half of the twentieth century on archaeological scholarship in Ireland. While the discipline embraced many of the scientific methods and techniques of the post-war era, engagement with theoretical advances was muted. This was not simply a matter of resources, as the extensive deployment of palaeoenvironmental techniques and the long-term funding of the Discovery Programme research institute demonstrate. Rather, it will be argued, a consistently conservative disciplinary elite has been reluctant to challenge the interpretive paradigm established at the time of the founding of the modern institutional discipline.

The newly independent Ireland of the 1920s and 1930s naturally sought to differentiate itself from colonial Britain. As in many European countries during the interwar years, institutional archaeology was established as a means of providing scientific credence for a distinct and immemorial national identity. In Ireland, the national myth centred on the survival of ethnically-pure Gaelic farming communities in the west of Ireland, whose folk-wisdom and traditional way of life had endured through centuries of colonial rule. Archaeologists traced the continuity of Irish rural traditions back through the mists of ‘Celtic’ prehistory to the settlement of Ireland by Neolithic farmers.

An opaque system of excavation licencing established in the 1930s helped shelter the discipline from external criticism by allied disciplines and international archaeology. The attendant control over excavation data has enabled the results of scientific analyses to be published according to their agreement with what the leading Irish prehistorian Peter Woodman described as the ‘canon of Irish archaeology’. Post-processual interpretive approaches allowed for the possibility that the assumptions that underpinned the ‘canon’ might be wrong. My aim is to explain why such approaches were seen as heretical, and the pervasive insularity of archaeological thought that endured as a result.

THE PROTECTION OF INNOCENCE: THE MARGINALIZATION OF PROCESSUAL ARCHAEOLOGY IN TURKEY

**Abstract author(s):** Dikkaya, Fahri (TED University)

**Abstract format:** Oral

The methodological framework at the heart of archaeology is still the description of data in Turkish archaeology. In recent years, new theoretical frameworks and interdisciplinary perspectives are becoming more common in the studies of the young generation, but the core descriptive archaeology still plays a dominant role in the archaeological research carried out by the Turkish archaeologists. In the 1960s, the rigorous use of the scientific method claimed by the processual archaeologists was discussed and applied by some Turkish archaeologists, especially in prehistoric archaeology, but the anthropological goals of processual archaeology were completely rejected. In later years, scientific method known as archaeometry was perceived as an auxiliary area for the archaeologists in the different scientific disciplines such as physics, chemistry, or biology, but not in the archaeology. This paper aims to discuss the history of processual archaeology in Turkey and its marginalization as a scientific study on the margins of archaeological practise.

GEOGRAPHIES OF SCIENCE: THE CONTRIBUTION OF ANGLO-AMERICAN AND EUROPEAN SCHOLARS AND RESEARCH OUTPUTS IN THE DEVELOPMENT OF COGNITIVE ARCHAEOLOGY

**Abstract author(s):** Sinclair, Anthony (University of Liverpool)

**Abstract format:** Oral

Traditional approaches to an analysis of theoretical developments in archaeology or its history in general have been based upon the close reading and critical analysis of published documents in the form of theoretical, methodological and analytical studies and of unpublished materials revealing links between scholars and institutions. However, the quasi-exponential growth in archaeological literature has made it almost impossible for anyone to read but a small percentage of the current literature, let alone the corpus of literature produced within any field over the last 30 years. Histories are inevitably local studies even though they may be examinations of more general developments in a discipline. Bibliometric data, readily-accessible in abundant quantity through the online search engines of the major citation indexes (Web of Science, Scopus, Google Scholar, etc.) on the other hand, seems to provide way into examining the conceptual development and geographical history of archaeological ideas. Bibliometric data -- the meta data of individual documents -- can provide data for each document on its authors, their institutions and the conceptual nature of their work revealed through keywords in titles and abstracts. The literature cited in each allows the further network analysis of the impact through time of scholars, places and ideas. In this paper I shall explore the development of cognitive archaeology from 1980 to the present day and examine the potential for bibliometric data to help write a distant reading account that explores the relative contributions of scholars and institutions from within and without the Anglo-American world.

SHAPING A DISCIPLINE: KNOWLEDGE TRANSMISSION AND EXCHANGE IN THE HISTORY OF ARCHAEOLOGY. PART 2

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Coltofean-Arizancu, Laura (University of Barcelona) - Martins, Ana Cristina (IHC-FCSH NOVA -- Pólo Universidade de Évora and Uniarq-UL) - Arnold, Bettina (University of Wisconsin-Milwaukee)

**Format:** Regular session

The circulation of concepts, ideas, theories and methods was essential to the development of archaeology since its early days. Evolutionism, the three-age system, diffusionism, culture history, processual archaeology, radiocarbon dating, behavioural archaeology, the Harris matrix, post-processual archaeology and new materialism, among many other, have all shaped archaeological theory and practice as we know it today. However, their impact on and absorption in the discipline was geographically and chronologically uneven. This session explores knowledge transmission and exchange throughout the history of archaeology in Europe and elsewhere, from the nineteenth to the twentieth century. We welcome papers that examine any of the following topics: the trajectories followed by concepts, ideas, theories and methods during their dispersal within the archaeology of different regions; the dissemination channels (e.g. correspondence, congresses, publications) through which these were transmitted and the role of social and academic networks in this process; and their use as devices for propaganda purposes, attaining personal prestige (including through appropriation) and establishing power relationships and hierarchies. We would also like to encourage discussions on the reception or rejection of various intellectual frameworks in the archaeology of different countries, and the political, economic, social and cultural contexts in which these attitudes occurred; the ways in which conceptual and methodological schemes influenced the practice of archaeological actors and institutions, and fostered multidisciplinary and interdisciplinary encounters.

ABSTRACTS:

1 BETWEEN EAST AND WEST: FRANCIS BALODIS AND THE FORMATION OF LATVIAN ARCHAEOLOGY IN THE 1920S AND 1930S

**Abstract author(s):** Sne, Andris (University of Latvia)

**Abstract format:** Oral

In the Baltic region, archaeological research was conducted by several literary societies and amateur archaeologists since the mid-19th century. The establishment of the national states Estonia, Latvia and Lithuania after the First World War led to rapid development of national culture and research including also archaeology. The development of Latvian archaeology throughout the 1920s and 1930s found its basis in Russian, German and Scandinavian archaeologies absorbing various trends and methodologies of archaeological research and reasoning from neighbouring regions. The achievements and contradictions of those intellectual and political processes were clearly reflected in the life and work of Francis Balodis (1882-1847) usually considered the ‘founding father of Latvian archaeology’.

Clearly, Balodis was one of the most significant and influential Latvian archaeologists who had received good education (Universities of Tartu, Moscow and München) and extensive practical training. The first part of his life was connected with the Russian Empire, later with the early years of Soviet Russia, where he established prolific academic career in fields of the Oriental art and history and eventually was appointed professor at the Universities of Saratov and Moscow. In these years he conducted wide-scale research in the Volga Tatars archaeological sites that resulted in major publications about Old and New Sarai, capitals of the Golden Horde.

Following the invitation from the recently founded University of Latvia, Balodis returned to Latvia in 1924. Soon he became a Professor, obtained a doctoral degree in history and was appointed Head of the Department of Archaeology of the Faculty of Philology and Philosophy. Balodis put a lot of effort into the formation of Latvian archaeology, leading numerous survey and excavation expeditions and actively publishing about Latvian archaeology and prehistory. His studies were based on detailed artefactual analyses while interpretation of archaeological material mainly incorporated the concepts of invasion, diffusion and migration.

2 THE ARCHAEOLOGICAL SITE OF NOIN-ULA. ONE HUNDRED YEARS OF COOPERATION BETWEEN RUSSIA AND MONGOLIA

**Abstract author(s):** Sutiagina, Natalia (The State Hermitage Museum) - Medvedeva, Maria (The Institute for the History of Material Culture, Russian Academy of Sciences)

**Abstract format:** Oral

This study was funded by RFBR and MECSS as Project Number 20-59-44005.

About a hundred years ago, in the Noin-Ula in northern Mongolia, the elite barrows of the Xiongnu were excavated in a cooperative project carried out by Russian and Mongolian scientists. The excavations were conducted in 1924–1925 by the Mongolia-Tibetan Expedition led by P.K. Kozlov. Fantastic objects dating from the 1st century BC to the 1st century AD were found in the well preserved graves of the leaders and representatives of the Xiongnu nobility: Chinese silks, lacquered items, jade plates, horse harness, Bactrian woollen embroidery, and nomadic household items. During the excavations, significant scientific material was obtained and at the end of field research, leading Russian scientists engaged in analytical processing of the unique finds and preparation of the final publication, which unfortunately was never completed. The collections and documentary material were divided among several museum and archival depositories, a process during which some finds have lost their provenance. It was not until the 1990s that specialists began to actively talk again about the Mongol-Tibetan expedition. Historiographic publications and catalogues of the collection appeared and excavations at the site resumed. Currently, a new joint project is supported by the Russian Foundation for Basic Research and the Ministry of Education, Culture, Science and Sports of Mongolia. The year 2024 will mark the centennial of the inception of Noin-Ula’s Russian-Mongolian exploration. Thanks to the research presented in this paper, it has been possible to systematize and introduce the whole complex of finds and documents into wider scientific circulation by preparing publications, exhibitions and presenting results on the Internet.

The collaboration of Russian and Mongolian scientists marks a new era in the exchange of scientific knowledge, which will provide new opportunities for understanding the cultural heritage of Mongolia and Central Asia.

3 ARCHAEOLOGICAL KNOWLEDGE TRANSMISSION AT THE AMERICAN COLLEGE FOR GIRLS AT CONSTANTINOPLE (1890-1927): CHANNELS, AIMS AND CHALLENGES

**Abstract author(s):** Garcia-Ventura, Agnes (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The American College for Girls at Constantinople (ACGC) was an educational institution originally linked to the American Board of Commissioners for Foreign Missions. In 1890 the institution began a new solo stage and after several years became a renowned centre in its milieu. This transformation took place under the direction of Mary Mills Patrick (director 1889-1924). Patrick worked side by side with Isabel Frances Dodd (teacher at the ACGC 1882-1945). Dodd travelled extensively throughout the Middle East to enhance her knowledge of art and archaeology, the specialties she taught at the ACGC. In the words of Patrick, “Dodd devoted her energies to archaeological study in the Near East. She gradually attained the position of an authority on the subject”. An analysis

of the channels, aims and challenges used and faced by Dodd allows us to reflect on archaeological knowledge transmission in contexts beyond academia and universities. It also makes possible a gender analysis given that Dodd’s experience as a woman in a men’s world influenced her strategies. Dodd made use of a variety of channels to disseminate the knowledge she had acquired, including her teaching in the ACGC as well as the founding of a museum cherished by staff and visitors alike. Moreover, she was in touch with many of the leading scholars of her time, such as Archibald H. Sayce and William M. Ramsay, and she suggested hypotheses that were discussed in first-rate academic publications. Despite all of these achievements, however, Dodd was gradually forgotten. Taking this last circumstance into account with this communication we also vindicate her, as people perceived as peripheral in certain historical narratives are key to gaining a better understanding of the bigger picture.

4 THE CONTRIBUTION OF SEMNI KAROUZOU TO THE STUDY OF CLASSICAL POTTERY

**Abstract author(s):** Pateraki, Kleanthi (Independent Researcher)

**Abstract format:** Oral

The aim of the oral presentation is to present the contribution to the study of classical pottery of the pioneering Greek archaeologist Semni Papaspyridi-Karouzou, curator of the ceramic collections of the National Archaeological Museum of Athens (1933-1964). Attention will be focused on her contributions as an archaeologist, from excavation techniques through the analysis and presentation of results at Greek and international conferences and their publication in conference proceedings, archaeological journals and monograph series. In addition, Karouzou’s difficult but courageous struggle as a woman fighting against prejudices, stereotypes and limitations will be highlighted. The crucial role that scholarly networks played in spreading her ideas will be discussed, including her study of specific ancient painters, such as the Amasis Painter, about whom the archaeologist wrote a “scholarly and valuable study”, according to R.M. Cook. Furthermore, it will be mentioned how Karouzou’s presentations and publications introduced new ideas to Greek archaeology while allowing her to have an impact on Classical studies outside Greece. The result of all these efforts on the part of this pioneering Greek archaeologist was her international recognition as a scholar.

5 ENGENDERING NETWORKS DURING THE SPANISH TRANSITION (1975-1980S) AND THE RECEPTION OF GENDER ARCHAEOLOGY IN SPAIN

**Abstract author(s):** Zarzuela, Paloma (Universitat de Barcelona - UB) - Díaz-Andreu, Margarita (ICREA, Universitat de Barcelona - UB)

**Abstract format:** Oral

This paper aims to contribute to our understanding of the context in which women archaeologists worked in Spain from the 1970s to the 1990s, how this affected the reception of gender archaeology in Spain and of gender concepts, ideas and theories and their transmission to the new generations. This period was marked by the end of the fascist dictatorship and the configuration of a new democratic regime that came together with a series of social and cultural changes. During this period there was an unprecedented growth in the overall number of women working within the discipline. The need of lecturers to cope with increasing numbers of students in universities and the birth of commercial archaeology in Spain created many new jobs that facilitated the incorporation of women into the profession. Based on a literature review and interviews this research examines the formal and informal networks of female archaeologists in these unparalleled decades and the partnerships women developed to create a supportive environment in which to pursue their work. We will then consider whether these networks facilitated the reception of gender studies in Spain. The influence of networks in women’s contribution to archaeology in general, and of gender studies in particular, and how this shaped the discipline in the following years is also assessed. This research is part of the ArqueólogAs project (full title ‘Retrieving Memory: Women’s Pathways in the History of Spanish Archaeology’, www.ub.edu/arqueologas). ArqueólogAs aims to critically assess the role of Spanish female archaeologists from the 19th century until today. Despite a burgeoning literature on gender studies, little attention has been paid to the contribution of women to the discipline in Spain and the impact of female networks on its development and reception of gender studies.

6 FROM PRODUCTION TO CONSUMPTION: A CRITICAL MAPPING OF THE ARCHAEOLOGICAL PRODUCT IN GREECE

**Abstract author(s):** Daravigka, Klea - Chourmouziadi, Anastasia - Stavridopoulos, Yiannis (Aegean University)

**Abstract format:** Oral

Although a lot has been written and discussed occasionally about several distinct aspects of the existing system of production and management of the “archaeological product” -as both the material and immaterial representations of the past- no systematic attempt has ever been made to compose it all in a broad, comprehensive frame.

We have currently embarked on such an attempt, forming a small group of two practicing archaeologists and a professor in Museum Studies with a shared interest in Public Archaeology. We choose to employ critical mapping as a practice of putting in context each one unit, motive, procedure, dominant concepts, dissemination channels and interrelations of this multidimensional process of archaeological production. By doing so, we hope to reveal a panoramic view, through a critical prism, that bears the potential of uncovering intellectual patterns that define participants’ role and determine the image of archaeological discipline and historic culture of Greek society, but also the defining mechanisms of the actual product and its consumption.

7 THE ‘WESTERN GAZE’ AND ITS ROLE IN INTERPRETING LANDSCAPE – EXAMPLES FROM CROATIA

**Abstract author(s):** Iglic, Sara - Kulenovic, Igor (University of Zadar)

**Abstract format:** Oral

In recent decades, there has been a growing interest in the way ‘gaze’ impacts studies of landscape and heritage. ‘The Western Gaze’ puts emphasis on the active observing subject in whose mind all the knowledge and perception are located. It expresses a certain view of the world and the way it is perceived. Said ‘gaze’ positions itself in the authorized heritage discourse and presents a certain mentality and set of values that have vastly impacted archaeology as we know today. It assumes that certain characteristics are more worthy of preservation and presentation as heritage than others. Given the highly visual aspect of landscape, the ‘Western Gaze’ has become imbued in landscape studies that divide ‘culture’ and ‘nature’. It is based on Cartesian principles and consequently, the ‘Western Gaze’ assumes scientific objectivity in its research methodology and aspires to retain as much distance from the embedded cultural values of every researcher as possible. It represents a series of dualisms, nature-culture, subject-object, mind-body and male-female. In recent years, theoretical approaches in archaeology have explored how various ‘gazes’ (male, Western, imperial...) have affected landscape studies and its development. This paper will present how said discourse and gaze have impacted landscape studies using as a proxy a part of Croatia that extends from the northern Dalmatian coast to the slopes of South Velebit.

8 THE TRANSMISSION OF WESTERN KNOWLEDGE AND THE CONFIGURATION OF MUSEOLOGY: THE CANARIAN EMBALMED BODIES AS A CASE STUDY

**Abstract author(s):** Farrujia de la Rosa, Jose (Universidad de La Laguna)

**Abstract format:** Oral

Since the 19th century, archaeological museums have contributed to the display of hierarchical representations of the world that reflect Western structures of power. Thus, museums have actively contributed to the cultural construction of human remains.

This paper explores how the circulation of concepts, ideas, theories and methods developed in French anthropology in the late 19th century, in particular the exhibition of Indigenous embalmed bodies, was essential to the development of Canarian museology.

In the case of the Canarian archipelago, Ethnographic sources from the 16th and 17th centuries as well as archaeology indicate that Canarian Indigenous people took great care over the burial of corpses, reflecting their belief in the continued existence of individuals after death and worship of the dead. Embalmed bodies in well-kept graves have been found in caves, wrapped in various types of skins and arrayed in abundant garments and goods. The corpses were placed on planks, and bead necklaces, canes, lithic punches, knives and pottery with food were deposited with them as funeral offerings.

The display of such anthropological and archaeological remains, including embalmed bodies and other human remains, has been a significant aspect of museographic discourse in the Canary Islands from the 19th century to the present. Nevertheless, the original role of Indigenous remains in religious rites, funerary practices or in ancestor cults no longer carries the same meaning nowadays.

In this sense, this communication also deals with the role of evolutionism, diffusionism, culture history and colonial thinking in Canarian museology, and explores how this Western knowledge has influenced the conception of the ancient, embalmed Canarian bodies, by presenting them as cultural symbols of great scientific value, while emphasizing a construction of “otherness”.

9 FATHER WILHELM SCHMIDT, THE VIENNA SCHOOL AND THE INFLUENCE OF INDIGENOUS BELIEFS IN THE VATICAN MUSEUM

**Abstract author(s):** Aigner, Katherine (The Australian National University)

**Abstract format:** Oral

In a biography of the history of Pacific archaeology, Father Wilhelm Schmidt (1868–1954) is a notable contributor with a wide sphere of influence, both within secular academia and missionary networks. He demonstrated the entwined nature of the roots of ethnographical, anthropological and archaeological research in the early stages where disciplines engaged with remote and largely unknown Indigenous peoples. In 1906 he wrote: ‘one can no longer write a world history without mentioning those groups who were till now thought to be without history because they had no writing or left no traces of themselves hammered in stone. History is interaction! In comparison how unimportant it is whether groups have writing or not’ (Schmidt 1906:600).

Schmidt desired to learn, not only from a written history, but from the living cultures—a call echoed by Indigenous peoples still today. His earliest ethnographic writings ushered in a new era of study of so-called ‘hunters and gatherers’; he stressed their similarity, ‘true humanity’ and ‘intelligence’. Initially interested in linguistics, he could speak at least 17 languages and coined the term ‘Austronesian’ (which is still used today) in 1899 to indicate a family of four related linguistic groups. While British anthropologists embraced the evolutionary idea of Darwin, the ‘dynamic and interactionist’ diffusion ideas of cultural growth promoted by Schmidt influenced German-speaking thinkers. His 12-volume monumental work *Der Ursprung der Gottesidee*, (The Origin of the Idea of God) challenged evolution and the popular view that monotheism came at the end of the religious development of humanity. This paper

profiles his thinking and influence in what he tried to achieve at the time in relation to bringing awareness of Indigenous cultures to Europe, through the Great Exhibition of 1925 and objects from Oceania held in the Vatican Museums’ *Anima Mundi – Peoples, Arts and Cultures*.

523 SETTLEMENTS OUT OF NOWHERE – THEORY AND PRACTISE OF DETECTING SETTLEMENTS BY MEANS OF COMBINED AERIAL ARCHAEOLOGY, GEOPHYSICS, PREDICTIVE MODELLING

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Segsneider, Martin (NIhK Wilhelmshaven) - Mauritsen, Esben (Arkeologi Vestjylland; Ringkoebing-Skjern Museum)

**Format:** Regular session

Theoretically, the approximate number of settlements to be expected through time and space in a given region or local entity (e.g. islands) can be estimated by natural preconditions like area size, soil quality, topography, travel and transport links and other landscape information as well as archaeological indicators like graves, surface finds, place names etc. Anyhow, typically only a small fraction of these settlements is actually known. In order to detect the missing settlement remains effectively and to estimate their number, methods like aerial archaeology including LIDAR, geophysics like geomagnetism and soil radar, field surveys like fieldwalking and predictive modelling using landscape parameters and known information about archaeological features are applied all over Europe. These studies give insight of what and how much is actually there, when it comes to find and evaluate the “missing” settlements. We invite contributions, which approach this topic with a combined set of methods from both the theoretical and practical point of view.

ABSTRACTS:

1 SITE DENSITY AS A FUNCTION OF RESEARCH INTENSITY: THE CASE OF THE CONTRADA DAMALE – PORTIERI (CALABRIA, ITALY)

**Abstract author(s):** de Neef, Wieke (Ghent University) - van Leusen, Martijn (University of Groningen)

**Abstract format:** Oral

Meaningful spatiotemporal comparisons of site density, as the foundation for demographic analysis and interpretation, require confidence that we have obtained reasonably accurate measurements of those site densities. This can in theory be achieved through a spatially stratified sampling strategy if no significant geomorphological or visibility biases are present - conditions that probably apply only in a small minority of cases. In all other cases, the observed site density is a function of research intensity. We present the case of the circa 1.5 sq km Damale-Portieri study area (northern Calabria, Italy), where a combination of fieldwalking surveys, geomagnetic surveys, and geoarchaeological studies conducted by teams from the Groningen Institute of Archaeology between 2002 and 2013 resulted in a relatively secure estimate of LBA site density. We discuss how this estimate is affected by increasing research intensity over time, and quantify the remaining uncertainties. The results of this research have important implications for models on protohistoric settlement patterns in this part of Italy.

2 THE PERAIA OF SAMOTHRACE PROJECT: NEW ARCHAEOLOGICAL INVESTIGATION IN AEGEAN THRACE

**Abstract author(s):** Avramidou, Amalia (Democritus University of Thrace) - Donati, Jamieson (Laboratory of Geophysics – Satellite Remote Sensing & Archaeoenvironment - FORTH; Democritus University of Thrace) - Garyfalopoulos, Apostolos (Aristotle University of Thessaloniki; Democritus University of Thrace) - Karadima, Chrysa (Ephorate of Antiquities of Rhodope) - Pardalidou, Chrysafenia (Ephorate of Antiquities of Evros) - Sarris, Apostolos (Laboratory of Geophysics – Satellite Remote Sensing & Archaeoenvironment - FORTH; University of Cyprus) - Papadopoulos, Nikos (Laboratory of Geophysics – Satellite Remote Sensing & Archaeoenvironment - FORTH)

**Abstract format:** Oral

The Peraia of Samothrace Project (PSP) is a multi-disciplinary archaeological fieldwork project to investigate the diachronic settlement patterns of the coastal and inland landscape opposite the island of Samothrace in Aegean Thrace. The area has been only sporadically studied in the past, in part due to its relative isolation far from any major ancient settlements and archaeological attractions that might spur more scholarly interest. A well-protected rocky environment alternates with agricultural plains, forested hills, and small coves, composing a varied landscape rich in natural resources. Clusters of prehistoric activity and habitation are attested around the area, and ancient sources mention trading posts, cities, and forts in connection to Greek colonization, Persian military campaigns, and the Macedonians. Various Roman stations are named along via Egnatia, which crosses through this region, while byzantine and post-antique remnants have also been detected. Yet despite the rich layers of human occupation opposite Samothrace, there has never been a systematic study. The project adopts a range of methodological tools, including satellite and aerial remote sensing, large-scale geophysical prospection, and intensive pedestrian field survey. For this paper, we present the initial results of our investigations, in particular the remote sensing and spatial analysis in GIS, as well as field data from geophysics and the field survey. We highlight also our digital, paperless approach to collecting field data and the use of GNSS receivers for quickly establishing survey grids.

3 THE NORTH FRISIAN ISLANDS (GERMANY) IN THE 1ST MILLENNIUM CE: A MULTI-METHOD PROSPECTION APPROACH TO A CHANGING SETTLEMENT LANDSCAPE

**Abstract author(s):** Majchczack, Bente (Christian-Albrechts-Universität zu Kiel; ROOTS Cluster of Excellence) - Mauritsen, Esben (Arkeologi Vestjylland; Ringkøbing-Skjern Museum) - Segschneider, Martin (Niedersächsisches Institut für historische Küstenforschung) - Wilken, Dennis - Wunderlich, Tina (Christian-Albrechts-Universität zu Kiel)

**Abstract format:** Oral

The North Frisian Islands, located in the Northern Wadden Sea area of the German North Sea coast, consist of elevated, flood-safe moraine cores, surrounded by fertile marshlands. These favorable settlement conditions, together with an easy access to maritime traffic routes, provided for a dense settlement and a high archaeological record stretching as far back as the Neolithic. In past archaeologic research, much attention has been given to the numerous grave sites and burial mounds of the Roman Iron Age, Migration Period and Early Medieval Period, whereas evidence for settlement sites was scarce. Since 2006, an integrated multi-method research approach was conducted to gain an new understanding of the settlement dynamics of the 1st millennium CE with a focus on the island of Föhr. Yearly aerial reconnaissance led to the discovery of settlement sites in large parts of the island, followed by in-depth prospections with geophysical methods. Magnetic gradiometry provided the large-scale mapping and was coupled with Ground-Penetrating Radar, geoelectric and seismic methods on selected settlement features to improve the archaeological interpretation. Archaeological field survey and systematic metal-detecting allowed a quick initial dating of the sites. Based on the prospection data, archaeological excavations in the Early Medieval settlement sites of Witsum, Goting and Nieblum aimed to sample representative parts of the settlement to gain an overview on the settlements' structures, dynamics, dating and economic activities. In combination with geoarchaeological investigations of the surrounding landscape and agricultural traces (e.g., anthrosols), it was possible to trace the development of small villages and dispersed farmsteads through the 1st-5th century CE until a probable settlement hiatus through the 6th and early 7th centuries. Afterwards, the emergence of earliest settlements of the Frisian immigration quickly evolved into thriving, craft- and trade-based trading sites, well connected within the North-Sea communication networks.

4 FROM THE SKIES TO THE UNDERGROUND. ON AERIAL ARCHAEOLOGY AND NON-INVASIVE METHODS IN DENMARK

**Abstract author(s):** Mauritsen, Esben (Arkæologi Vestjylland / Ringkøbing-Skjern Museum; Fortiden set fra Himlen / Holstebro Museum)

**Abstract format:** Oral

From 2008-2018 the project An aerial view of the past – Aerial archaeology in Denmark was carried out. The aim was to test the potential of various airborne remote sensing methods, such as LiDAR, drone 3D survey, and especially aerial reconnaissance by air plane, in a Danish context. The aerial surveys were mainly made in the summer months. When vegetation is stressed by draught it can lead to the creation of cropmarks over buried archaeological features. Over the years this lead to the discovery of almost 1300 archaeological sites, most of which were hitherto unknown. The finds comprise a wide variety of categories such as longhouses, pit houses, ditches, fences, wells, cemeteries, levelled burial mounds, celtic field systems, causewayed enclosures, sunken roads, castle mounds and other defensive earthworks. Many sites were subsequently investigated in cooperation with metal detectorists, or through targeted test excavation. In cooperation with the Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology a handful settlement sites was further investigated through high-resolution geophysical survey using motorized ground-penetrating radar and magnetometer systems. This paper will present examples of what can be achieved through aerial prospection, especially when combined with other remote sensing methods.

5 HOW MUCH IS STILL OUT THERE? A SETTLEMENT MODEL COMBINING ARCHAEOLOGICAL FIELDWORK, METAL DETECTING AND HISTORICAL MAPS (WEST JUTLAND, DENMARK)

**Abstract author(s):** Søvsø, Morten (Museum of Southwest Jutland)

**Abstract format:** Oral

Just a few decades ago, Danish archaeologists searched for settlements from the past using place-names, pollen analysis, phosphate mapping and field walking.

The 2001-implementation of the Malta-convention in Danish heritage legislation brought about an enormous increase in archaeological fieldwork. No one anticipated the vast scale and number of hitherto unknown settlements appearing in the trial trenches all over Denmark.

During the same period metal detectors and their users grew in both number and efficiency. This led to year by year growing numbers of finds coming into the museums. Logically this curve must top at some point, but when?

The third revolution in settlement history is the use of GIS-systems with access to both historical maps, orthophotos and LIDAR scans. Most/all Danish museums have adopted this powerful tool. Thousands of unknown sites have been found by both museum professionals and amateur archaeologists. The otherwise lost pre-modern agrarian landscape can easily be reconstructed on the computer screen.

6 DISCOVERING A HIDDEN SETTLEMENT LANDSCAPE IN CONTEXT OF A SACRED LANDSCAPE

**Abstract author(s):** Sjögren, Karl-Göran - Axelsson, Tony (Dep. of Historical Studies, Gothenburg University) - Rassmann, Knut (Deutsche Archäologische Institut, Frankfurt)

**Abstract format:** Oral

The Falbygden plain in southern Sweden is unique with a concentration of at least 255 passage graves on an area of approx. 980 km2. In recent years, archaeological research has set new accents and is increasingly looking at the connection between graves, enclosure sites and settlements. In contrast to the graves, finding Neolithic enclosures and settlements is more difficult. In today's intensively agriculturally used plain, fields and meadows offer different possibilities for detection of Neolithic features.

In addition to the surface surveys successfully carried out in recent years, geophysical methods, remote sensing and drone images are employed in the "Hidden Landscapes" project, started 2020. The work is embedded in long-term research by the University of Gothenburg and supported by the German Archaeological Institute. The aim is primarily to search for Neolithic enclosure sites, but also to test the feasibility of these methods in a moraine geology containing large amounts of magnetic stones of various sizes.

The methods are used at different scales. Remote sensing data from satellites and airplane photos examine the landscape as a whole. Among others, WorldView and TerraSAR-X microwave radar images are used. Drones with conventional photosensors and multispectral imagery check smaller windows of 5-20 km2. In 2020, ca 3.9 km2 have been surveyed. Large-scale magnetic surveys are used to investigate windows in the landscape with a size of 1-5 km2. So far 5.8 km2 have been prospected. Based on magnetic prospection and predictive modeling, smaller suspected areas are checked with ground penetrating radar. The final stage of the prospection is the verification of structures by drilling and test excavations. The selection of areas is accompanied by predictive modelling.

In the talk, we will present the methods employed and some of the results from the first season of work.

7 JUST A DROP IN THE OCEAN? HOW ISLAND ARCHEOLOGY CHANGED THE VISION OF LATE IRON AGE SETTLEMENTS IN NORTHWEST FRANCE

**Abstract author(s):** Duval, Hervé (CReAAH) - Peres, Thibaut (LETG; CReAAH)

**Abstract format:** Oral

In the last decades, island archaeology made significant progress in the northwest part of France. Those spaces that used to be neglected and apart from considerations brought crucial information's about many late Iron Age occupations. For a long time though, researches were mostly focused on Cross-Channel connections and the potential of the Atlantic shore remained underestimate. Due to the progress of new technologies, it has been possible to set up methods in order to study this particular geographic area. Results not only brought to light settlements that remained unknown, but also maritime nodes that were unexpected.

This communication presents the methods (airborne LiDAR, photogrammetry, field surveys, etc.) used in northwest France in order to detect and study Late Iron Age settlements. Moreover, by putting them in context within the Atlantic-Channel area, it also aims to describe a new maritime landscape, by considering what was missing until now. A closer look on fortified settlements will also be given in order to support this view. Thus, it appears that the natural preconditions of islands brought several strategic locations for settlements used in the development of maritime routes and dated from the late Iron Age. Field surveys also indicate that islands were highly dependents from external influences as well as their relationship with the coastal environment.

524 MEDIEVAL GLOCALISATION: LOCAL MANIFESTATIONS OF GLOBAL CONNECTIONS

**Theme:** 4. Globalisation and archaeology

**Organisers:** Cartwright, Rachel (University of Minnesota, Department of Anthropology) - Górkiewicz Downer, Abigail (University of Chester, History and Archaeology)

**Format:** Regular session

'Glocalisation' is a combination of the terms 'globalisation' and 'localisation', which coalesce into a concept that refers to global impact on a local scale. In Eurasia, the interconnections established in prehistory continued to develop, with the first millennia seeing the rise and fall of vast empires, such as the Assyrian, Hunnic, Kushan, Macedonian, Parthian, and Roman. By the beginning of the Medieval Period (5th-15th centuries) globalisation had reached new heights, with large migrations, religious pilgrimages, and extensive trade networks weaving Eurasia together. Examples include, but are not limited to, the Viking Age trade networks, the spread of Christianity and Islam, and the establishment of emporia along the Silk Road. Apart from the large-scale exchange of goods, materials, people, and ideas occasionally traversing thousands of kilometres, global connections frequently manifested in particular ways at the local scale, resulting in 'glocalisation'. While research into glocalisation is growing within the humanities and social sciences, it

has remained under examined in archaeology, with the Archaeological Review from Cambridge in April 2018 providing one of the first real discussions on the topic within the field. Within medieval archaeology it has remained rather ignored altogether. This session aims to explore the exemplification of the impact of globalisation on local communities in the Medieval Period. The examination of the glocal not only highlights the heterogeneity of societies across Eurasia, but also illustrates the ways in which communities adapted to outside influences, reflected in several ways such as in the appearance of local examples of hybridisation or creolisation. We encourage the submission of papers that explore how globalisation manifests in medieval archaeological contexts, and how it was variously acquired and negotiated at a local level from sites throughout Eurasia. This includes papers exploring all medieval contexts ranging from settlement and living-spaces, to emporia, burial grounds, and sanctuaries.

ABSTRACTS:

1 GLOBALIZATION AND EARLY CHRISTIANITY: THE CASE OF KOSOVO EARLY CHRISTIAN ARCHITECTURE

**Abstract author(s):** Hoxha, Zana (Institute of Albanology)

**Abstract format:** Oral

The new religion, Christianity, through the work of the apostles spread in every corner of the Roman Empire and beyond. Considering the large scale of the empire, it is astonishing how Christianity became “global” in such a short period of time. Since 313 AD, with the Edict of Millan, Christianity was preached freely, thus the number of believers grew exponentially. Moreover, at the same pace, Christian art and architecture was developing globally. Through comparative analysis of the design method and construction techniques of Christian architecture, we can observe how these buildings were subject to globalization process of this period. All over the empire, churches were being built based on the same principals and were being decorated with similar programs. Considering the above, this paper focuses on Early Christian architecture in the territory of Kosovo in a global context. Kosovo lies on the southeastern part of Europe, precisely on the Balkan Peninsula, putting the country at a favorable geographic and geopolitical position. Consequently, the process of Christianization reached this region relatively early, although a suburb of the empire. The objective of this paper is to present concrete examples of Christian architecture in Kosovo under the lens of globalization. Concluding, through these examples we can acquire a greater understanding on the ways that the global trends of this period in architecture were adapted to local conditions in form of new shapes and styles in the beginning and how the ambitions of the emperor Justinian affected the architecture in quantity and quality centuries later.

2 AGRICULTURAL ‘GLOCALISATION’ AT NINCH, A CASE STUDY FROM EASTERN IRELAND

**Abstract author(s):** Crowley-Champoux, Erin (University of Minnesota; University of Southern Maine)

**Abstract format:** Oral

In the first millennium AD, communities in Ireland became increasingly enmeshed in widespread changes occurring in Britain and the European Continent. This was particularly true for eastern Ireland, whose ports and harbors connected the island to the rest of Europe. It was during this period that the coastal community at Ninch, Co. Meath developed and grew. At this site, there is evidence for a range of activities, including agriculture, metalwork production, habitation, and burial. Artifactual and isotopic evidence demonstrates that the community at Ninch engaged with broader European networks and that this engagement transformed the community. From a zooarchaeological perspective, evidence from this site indicates increased agricultural experimentation and changing butchery practices. In this paper, I explore the ways in which participation in both local and long-distance trade networks impacted community development and agricultural production at Ninch, Co. Meath and how the developments at Ninch are representative of impacts felt across eastern Ireland.

3 FUNERARY GLOCALISATION: COWRIE-PROVISION IN ALSATIAN INHUMATION GRAVES

**Abstract author(s):** Górkiewicz Downer, Abigail (University of Chester)

**Abstract format:** Oral

Sixth- and seventh-century inhumation burial in Alsace incorporates objects originating well outside the region. Non-local objects deposited in Alsatian burials range from Baltic- and/or North-Sea amber to Burgundian-style ceramic vessels. Yet the most ‘exotic’ items are cowrie shells. Cowries belonging to the genus *Cypraea* are believed to dwell in far-off waters, including the Red Sea and the Indian Ocean; their presence in burials reflects long-distance trade likely via both the Byzantine Empire and Lombard Italy to the wider Frankish realm of which Alsace was one part.

Cowries are not common in Alsatian inhumation burials and appear at first glance to be uniformly deposited with female individuals in similar spatial positions. I apply my original ‘CCA-approach’, which explores spatial position and composition of object-clusters in inhumation burials and which was previously applied to amber-bead deposition in Alsace, Kent, and East Anglia, to show that cowrie use in graves was not completely uniform. I argue that their variable deployment in mortuary ritual may be tied to localised individualisation as well as expressions of communal identities forged through shared social networks.

4 VIKINGS GO EAST: GROBINA ARCHAEOLOGICAL COMPLEX AND THE BEGINNINGS OF THE SCANDINAVIAN EXPANSION EASTWARDS IN THE PRE-VIKING AGE

**Abstract author(s):** Sne, Andris (University of Latvia)

**Abstract format:** Oral

An archaeological complex situated in present-day town Grobina (Latvia) on the eastern shore of the Baltic Sea bears significant information about the earliest wave of the Scandinavian overseas activities in the Pre-Viking Age and cultural hybridisation of local and incoming communities and cultural elements. Grobina archaeological complex includes a hillfort with adjacent settlement and four cemeteries that were used throughout the Iron Age and Middle Ages. A number of studies carried out since 1920s into the topics of cultural contacts in the Baltic Sea region reveal the persistent activity of Scandinavians in the east and south Baltic Sea region reaching the highest point during the Viking and post-Viking Age. But in the history of Grobina the preeminent role is played by the pre-Viking Age Scandinavian settlers who came from various places in Scandinavia (Gotland and Lake Malar area) and established their colony in this sparsely inhabited area already in the 7th century.

Archaeological finds, as well as few existing fragmentary written sources describe Viking Age Scandinavian and Curonian communities as dynamic, expansion-focused societies that are open to innovation and networking. At the same time there are no signs of Scandinavian political dominance during these centuries in East Baltic region, although evidence of Scandinavian presence in the Eastern Baltic region in pre-Viking Age has been found on the Estonian Island of Saaremaa (Salme burial site), as well as on the Baltic coast of present-day Lithuania (in surroundings of Palanga and Klaipeda), reflecting short-term expansion activities.

In Grobina, the coexistence model between Scandinavians and local people, the Couronians, was developed since first half of the 7th century. It gradually ceased to exist in the middle of the 9th century, but probably the experience of this local interactions formed basis for the Scandinavians in their further ways of interactions along Austrvegr (Eastern way).

5 VIKING AGE GLOCALISATION: EXAMPLES FROM SCOTLAND AND ICELAND

**Abstract author(s):** Cartwright, Rachel (University of Minnesota)

**Abstract format:** Oral

Widespread mobility and communication networks were key aspects that defined the Viking Age. The connections formed during this period spanned not only the North Atlantic heartland of the Viking World, but also vast expanses of Eurasia and North Africa. These long-ranging connections illustrate the globalisation of the Early Medieval Period. In examining the impact of this globalisation on the local sphere, the resultant glocalisation can be evidenced in hybridized material culture and the use of goods obtained through long- and short-distance trade in locally characteristic items and practices. This paper examines the concept of glocalisation from a theoretical perspective and then uses case studies from Scotland and Iceland in order to examine the degree to which globalisation and its local impact were exhibited in Scandinavian communities. In particular I will focus on sites in the Scottish Isles, looking primarily at Orkney and the Outer Hebrides, and western Iceland. The primary sources of data will be derived from material culture found in both settlement and funerary contexts from archaeological sites that illustrate the glocalisation of Viking Age communities.

6 GLOBAL CONNECTIONS AND LOCAL MANIFESTATIONS IN THE GALLOWAY HOARD

**Abstract author(s):** Goldberg, Martin (National Museums Scotland)

**Abstract format:** Oral

The Galloway Hoard (discovered in 2014) juxtaposes the silver bullion familiar from many other Viking Age hoards with a surprising array of other materials and objects not normally found in such hoards - gold, rock crystal, minerals, glass, Anglo-Saxon jewellery, as well as the rare organic preservation of silk, linen, wool, leather and wood. As the research and conservation programme continues many of these objects and materials are proving to have exotic origins and connections stretching halfway around the world. Part of the collection contained separately in a wrapped and lidded vessel features heirlooms accumulated over generations, some of which pre-date the Viking Age. Even the silver bullion has an unusual local element to it with Anglo-Saxon runic characters carved into Hiberno-Scandinavian broad-band silver arm-rings. The multiple identities, and the temporal and geographic range represented by this collection present an unusually rich example of global connections, albeit with numerous idiosyncrasies.

7 HOT SPOTS AND HINTERLANDS: PREMODERN ‘PROTO-INDUSTRY’ AND ALTERNATIVE TRANSITIONS TO CAPITALISM

**Abstract author(s):** Thurston, T L (University at Buffalo, SUNY)

**Abstract format:** Oral

Historical economists of Europe have identified a process that they call proto-industry as a pre-modern phase of economic conditions in which the productive choices of peasants drive new forms of economic development. They further predict that the strongest proto-industrial effects occur where agricultural potential is low - an archaeological and historically observable phenomenon. Precarious environments emerge as landscapes bristling with producers who funnel their ‘surplus from below’ through the hinterlands to the ‘hot spots’ of premodern urban centers. This connection appears to be the unlikely conduit through which a charcoaler’s hut and the engines of colonial-era mercantilism are connected across oceans and continents. Can archaeology shed further light

on the connections between so-called marginal environments, the relationships of certain forms of subjecthood to particular forms of rulership, and the entry of smallholders into international markets? More broadly, can parallels be drawn between the far north and the far south of Europe?

525 OF THE WATER: FISH AND MOLLUSCS IN THE ANCIENT EASTERN MEDITERRANEAN

**Theme:** 6. Material culture studies and societies

**Organisers:** Tsouparopoulou, Christina (University of Cambridge) - Recht, Laerke (University of Graz)

**Format:** Regular session

This session will examine the role of fish and molluscs in everyday life as well as in terms of their impact on social structures, and as part of ideological and symbolic expression. Given the prevalence of and dependence on water in various forms in all regions of the eastern Mediterranean, it is no wonder that fish and other aquatic species made an impact on human lives, yet this topic remains rather understudied. With this session, we would like to explore questions related to fishing practices and technologies, social status, human-fish/mollusc relations (also any potential over-exploitation), and fish/molluscs in ritual practices (e.g. as temple offerings, festival consumption, burial offerings), and ideology and religion (e.g. associated with supernatural beings or sacred space, as hybrid creatures, and as represented in luxury goods). Another set of questions would revolve around aquatic species as a non-alimentary resource, for example for jewellery, inlays, dyeing and medicinal purposes. Material under investigation can include faunal remains (worked and unworked), fishing gear and related tools, iconography and, where available, written sources. We particularly encourage papers that integrate multiple lines of evidence. The geographical area included here is the eastern Mediterranean broadly defined: papers using material from the Aegean, Cyprus, Anatolia, Levant, Mesopotamia and Egypt of any time period are welcome.

ABSTRACTS:

1 ENDLESS ROWS OF FISH! AQUATIC LIFE IN URUK PERIOD MESOPOTAMIA

**Abstract author(s):** Sieckmeyer, Kristina (Heidelberg University, Heidelberg Center for Cultural Heritage)

**Abstract format:** Oral

The exploitation of fish and other aquatic wildlife played an important role in everyday life of Ancient Mesopotamia. Fish, fisheries and related commodities are mentioned as early as the first written documents appear – being featured in administrative documents as well as in a lexical list dedicated exclusively to fish.

4th millennium BC greater Mesopotamia saw the formation of previously unknown urban complexity, indicating extensive settlement and communication networks. The dispersion of material culture, technical and economic improvements, but also the transmission of knowledge and cultural practices created an extensively cross-linked cultural landscape. The key technologies of that period clearly are the implementation of writing and the introduction of the cylinder seal, the latter offering the potential for a broader narrative and thus a new platform for visual communication. In this formative period of writing, seal imagery transported messages that could not yet be transmitted differently. Finally, by the end of the 4th millennium, writing itself pushed communication to a completely new level.

What kind of information on aquatic life can be traced through these early records and do these observations coincide with the actual archaeological findings? This question also applies to the information placed on the documents themselves – the seal imagery. What do the seals tell us? One of the most striking examples of early cylinder seal designs is the type “rows of fish”. How are these seals distributed geographically, in which contexts have they been found and can we tell what they were used for in administrative terms?

This paper aims to examine the role of aquatic life in Uruk Period Mesopotamia in a holistic approach by combining textual witnesses, pictorial evidence and the rather scarce zooarchaeological data, shedding light on this specific aspect of early human-environment relations.

2 THE USE OF INGREDIENTS FROM FISH BY THE MESOPOTAMIAN THERAPIST

**Abstract author(s):** Chalendar, Véréne (Collège de France)

**Abstract format:** Oral

Assyriologists have paid particular attention to therapeutic rituals that use aquatic animals as a medium for the disease. Notably because they highlight the capacity of these animals to evolve in spheres inaccessible to humans and thus, make it possible to reject the disease as far as possible from the patient. On the other hand, the most “trivial” uses of fish in therapy are, to date, less well studied. However, there are many therapeutic prescriptions that mention either the generic term fish (ku6/nūnu) or specific species, whether they are currently identified with certainty or not (e.g. arsuppu, purādu, kuppū, girītu, ziqqatū). These texts document the use by Mesopotamian health specialists of a varied pharmacopoeia from fish (eyes, entrails, scales, fat, fins, gall bladder, etc.) to produce remedies for multiple diseases. Our paper aims to explore the therapeutic uses of fish, focusing on the possible specificities of each species, but also to examine whether there is a more global, more federative therapeutic concept of “fish” for the Mesopotamian physician. This subject will enable us to illustrate the richness of the therapeutic approach in Mesopotamia, in

particular the different mechanisms which can lead to the use of an ingredient. It can also bring, through the examination of this aquatic pharmacopoeia, reflections of a more general nature concerning daily life and the practical and material conditions of the therapist’s practice in the ancient Near East.

3 CORRELATION BETWEEN STONES AND ICONOGRAPHY: FISH-CLOAKED FIGURE ON NEO-ASSYRIAN AND NEO-BABYLONIAN SEALS

**Abstract author(s):** Ftaimi, Tiffany (Ruprecht-Karls-Universität Heidelberg)

**Abstract format:** Oral

During the Neo-Assyrian and the Neo-Babylonian periods protective and apotropaic creatures were commonly depicted on ritual and adoration scenes in Mesopotamia. These creatures played a big role in ritual practices, such as purifications scenes in front of stylized trees, adoration scenes in front of deities as well as in front of deities’ symbols. Genii, hybrid creatures and figures cloaked in animal skins could be identified as protective and apotropaic creatures. Numerous representations of these creatures were depicted on Neo-Assyrian and Neo-Babylonian cylinder and stamp seals. Seals were used not only as a mark of ownership or to protect what was so marked but also as amulets that had a protective value for a wearer of a seal. Precious stones had a valuable meaning in the ideology and religion of Mesopotamian people. They used specific stones as amulets and seals for particular functions such as cure and protective objects.

The methodology applied in this study focuses on fish-cloaked figure on the Neo-Assyrian and Neo-Babylonian seals and seal impressions. An examination of stones’ types on which fish-cloaked figure has been depicted will be presented in this study as well. Additionally, the research aims to clarify the correlation between selected stones for seals’ production and depicted fish-cloaked figure for cure and protection purposes. The research based on iconographic aspects and available written sources.

4 MEDITERRANEAN CLAMOUR! REVISED DATING AND PATTERNS OF DISTRIBUTION OF ENGRAVED TRIDACNA SQUAMOSA MOLLUSCS

**Abstract author(s):** Schlegel, Valery (University of Zurich)

**Abstract format:** Oral

In the first millennium BC, engraved Tridacna squamosa were used as ornamented containers for cosmetics as far west as Vulci and as far east as Susa. Rolf Stucky’s dissertation of 1974 is to date the most comprehensive collection of engraved Tridacna dedicated to sanctuaries as well as enclosed in burials. In the 50 years since then, new finds have been published in various articles and another compilation is long overdue. This contribution not only seeks to provide this compilation but also presents a never adequately published and almost complete specimen in Leiden. Furthermore, a Tridacna found in Tomb I of the Northwest-Palace at Nimrud has been recently published and is herein dated to 730-694 BC, pushing back the old dating of engraved Tridacna (650/30-600/580 BC) by several decades.

Previous research concluded the provenience of engraved Tridacna either via stylistic considerations or via cumulative finds of polished Tridacna, which contradict each other. The new finds and revised dating enable to reevaluate the provenience via a new approach called Topographic Profiling: A short term for mapping the finds of now over 140 specimens across the Mediterranean via their revised dating and stylistic groups to draw conclusions on their provenience, distribution patterns as well as iconographic differences and symbolism.

5 SHELLS IN MIDDLE KINGDOM EGYPT JEWELLERY

**Abstract author(s):** Patrevita, Maria (University of Naples “L’Orientale”)

**Abstract format:** Oral

An interesting aspect of Egyptian maritime activities of 12th Dynasty in the Red Sea is the impact on craft and jewellery. During this period, shell-shape pendants made out of a sheet of gold or electrum became very common in goldsmithery, such as the cowri-shell girdles found in the tombs of the 12th Dynasty of royal ladies, at Lahun and Dashur.

Used as ornaments from Badarian times, cowri-shells were as fertility amulets with meanings linked to female sexuality and hathoric symbolism, but also a kind of insignia for members of maritime expeditions around the Red Sea. The metallurgical study of these reproductions of shells in precious metals is the instrument to research and know the techniques, the tools and the ancient world of metallurgy.

The experimental archeology can help us to research the metallurgical processes behind this precious and symbolic artistic expression, connected to human-environment relations. We will try to understand what kind of technology was used for the creation of shells’s reproduction through experimentation of lost wax technique or the use of stone burins and chisels.

6 **ENDURING LOVE? SHELL ORNAMENTS AND LANDSCAPE INTERACTIONS DURING THE TRANSITION TO SETTLED LIFE**

**Abstract author(s):** Baysal, Emma (Ankara University)

**Abstract format:** Oral

The human-shell ornament relationship began in the Palaeolithic when mobile hunter-gatherer groups visited the shore to gather mollusc shells to use as beads. Evidence from around the Mediterranean suggests that the choices these groups made were consistent and deliberate and that meaning was attributed to the shells and their use. In the eastern Mediterranean, the Epipalaeolithic – Neolithic transition was a slow process that saw human groups become increasingly tied to certain localities. This had the potential to disrupt existing patterns of procurement practice and landscape engagement. Even though many new settlements were located far from the shore, marine shells continued to be employed as personal ornaments. This suggests that the interactions of early Neolithic communities with the landscape underwent gradual adaptive transformation that allowed them to maintain their connection with these marine resources throughout this period of change, possibly through the development of new or modified procurement mechanisms.

Archaeological data from a wide range of sites in Turkey spanning the Epipalaeolithic – Neolithic transition period offers us an opportunity to examine how the human-shell ornament relationship adapted and changed with increasingly sedentary lifestyles, at localities both close to and far from the sea. This presentation uses the data to explore to what extent communities were engaged with shell use, and how their preferences in type, processing and ornament use changed through time. The possible implications for the construction of identity of this dependence on the use of marine resources in ornamentation practices in different periods of prehistory are considered in the light of this evidence.

7 **EXPLORING PAST EXPLOITATION STRATEGIES OF GROUPERS IN THE LEVANT USING SIZE RECONSTRUCTIONS**

**Abstract author(s):** Winter, Rachel - Çakırlar, Canan (University of Groningen)

**Abstract format:** Oral

Groupers are large, solitary, apex-predator fishes which inhabit tropical and subtropical rocky reef ecosystems. They have been highly valued cuisine in the eastern Mediterranean for millennia, and retain high commercial value today. Due to their preference of shallow waters and close proximity to shores, only rudimentary fishing technology is required for their exploitation. Alongside their potential to grow to large sizes (>1 metre in total length), this contributes to their abundance in archaeological finds throughout the Mediterranean. This talk utilizes size reconstruction of groupers from archaeological sites along the Levantine coast from the Early Bronze Age through to the Middle Ages to explore fishing strategies and assess the potential long term impacts of their exploitation. Preliminary analysis from Bronze and Iron Age Kinet Höyük in Turkey, and two Lebanese sites, Iron Age Tell-el Burak and Bronze Age Tell Fadous-Kfarbida, suggests geographic and cultural differences in exploitation strategies. At Kinet Höyük, the dominant size category is between 61 to 80 centimeters (standard length) from the Bronze Age until the Middle Ages whereas further down the Levantine at Bronze Age Tell Fadous-Kfarbida and Iron Age Tell-el Burak the fish were more evenly distributed between 21 to 70 centimeters. Interestingly, the only finds of groupers over 1 metre in standard length comes from Bronze and Iron Age Kinet Höyük with no groupers of such length during later occupational phases nor at Tell-el Burak or Tell Fadous-Kfarbida.

8 **FRESH INSIGHTS INTO THE CONSUMPTION OF PRESERVED MOLLUSKS IN THE BYZANTINE AND EARLY ISLAMIC PERIODS OF THE SOUTHERN LEVANT**

**Abstract author(s):** Ktalav, Inbar (Zinman Institute of Archaeology, University of Haifa) - Lehnig, Sina (Johannes Gutenberg Universität Mainz)

**Abstract format:** Oral

Mollusk shells originating from the Mediterranean, the Red Sea and the Nile River, were uncovered in Byzantine and Early Islamic sites in the southern Levant.

Two widely spread shellfish taxa are the small clam, *Donax trunculus*, commonly found in the exposed sandy wash zones of the Eastern Mediterranean coast; and the large freshwater mussel, *Chambardia rubens*, whose habitat stretches from the Nile River to western Africa. A third species is less common, the large conch, *Lambis truncata*, commonly found in the shallow waters of the Red Sea. The breakage and abrasion patterns of the shell fragments of these species suggest that they were collected as live specimens intended for consumption, and not as empty shells washed ashore. The shellfish were desired for their nutritional value and medicinal purposes. Their occurrence at inland sites in the southern Levant indicates that these species had been preserved to survive long distance transport. Some of the sites were central trade centers, like Jerusalem, but others were humble monasteries or farms, and do not fit the common conception of luxury food. The mollusks from the southern Levant offer a prime example of the transportation of food derived from seas and rivers to distant inland locations and provide important new insights on the nutritional importance of shellfish and its availability to a wide range of population during the Byzantine and Early Islamic periods.

9 **EXPLORING THE MULTI-DIMENSIONAL SYNTHESIS OF FISHING ACTIVITY: THE CASE STUDY OF CYPRUS**

**Abstract author(s):** Michael, Maria (University of Southampton; Honor Frost Scholar)

**Abstract format:** Oral

The current paper highlights fishing as an activity and life-style involving interdependent economic, cultural, technological and environmental aspects. It strives to present the tradition of fishing activity on the island of Cyprus from Neolithic to Early Christian periods. The research presented here is based on the results developed during my PhD research project, which is the first attempt to gather all the available evidence for fishing activity in Cyprus in a single body of evidence.

Thus, my research attempts to examine the main indicators of fishing activity, which are the archaeological finds of fishing technology (e.g. harpoons or spears, hooks, traps, stone, clay and lead weights for the net or line weirs, fish-tanks) and fishbone assemblages recovered in a variety of archaeological sites in Cyprus. The iconographic and written sources, the environmental and ethnographic data are a supporting class of evidence.

This examination does not lead only to the creation of diachronic catalogues or typological arrays of archaeological finds, but it also demonstrates how cultural and physical contexts of Cyprus determined the presence or absence of fishing activity in Cypriot maritime landscape. In addition, this examination contributes towards a more holistic understanding of the relationship between fishers and their maritime cultural landscape.

According to available evidence, Cypriots have been involved in fishing activities diachronically. The systematic mapping of the archaeological sites, where finds of fishing gear and fish remains have been recovered, demonstrates regional and chronological patterns. Neolithic, Late Bronze Age and Hellenistic-Roman periods yielded more prominent evidence. Consequently, the results of the examination of these chronological periods will be discussed further in this paper.

10 **UNDERREPRESENTED RICHES FROM THE SEA**

**Abstract author(s):** Yamasaki, Mari (GRK 1876 “Early Concepts of Man and Nature”, Johannes Gutenberg-Universität Mainz)

**Abstract format:** Oral

In the Late Bronze Age, fish and molluscs have played an important role in the diet and in the economy of Eastern Mediterranean coastal societies. Fish-roe cakes and dried splits feature in the list of goods traded over long distances, whilst textiles coloured with the purple dye obtained from murex shells were considered among the most luxurious items of their time and would continue to be so for centuries to come. Accordingly, the ancient textual and iconographic sources deal with these final products as objects of value, in terms of international gift exchanges and temple donations. However, despite their undeniable importance, marine faunal resources, the raw materials from which these valued products were obtained, rarely surface in the discourse of those who profited from them. Surprisingly few ancient sources explicitly deal with either fish or molluscs, nor are the activities related to their procurement and processing described in much detail, if at all. This paper aims at investigating the ancient conceptualization of these resources by combining the analysis of the archaeological remains with the textual and iconographical evidence, and addresses the question as to why these riches from the sea were consistently underrepresented in the sources.

11 **“PONTON ICHTHYOENTA”. MARINE CREATURES ON AEGEAN AND CYPRIOT PICTORIAL POTTERY AT THE END OF LATE BRONZE AGE**

**Abstract author(s):** Lekka, Anna (Greek Ministry of Culture)

**Abstract format:** Oral

The figurative motifs of Aegean and Cypriot Pictorial Pottery at the end of Late Bronze Age derived mainly from the animal kingdom and includes marine creatures such as fish, octopuses, seahorses.

Fish represents one of the most common themes of Mycenaean IIIc pottery and Pictorial White Painted Wheelmade III ware. Fish and octopuses decorate a great number of vases from the Greek mainland and the Aegean, mostly of the Octopus Style. Eastern traditions, Mycenaean pictorial motifs, and local practices contributed to the establishment of a fish iconography in Cyprus. The motifs most usually appear isolated, while there is also an attempt for narration, as can be seen in examples of fishing scenes. Both in the Cypriot examples and in the Aegean ones the bodies of the animals are decorated in a similar manner with various types of linear motifs.

A symbol of life and rebirth, with chthonic, apotropaic, and purifying properties, the fish has a long tradition and it is associated with religious beliefs. Although, the interpretation of the images starts from the environment and its relation to human activity and the dietary habits, images visualize ideas. The study of a vast number of myths and traditions leads to interesting conclusions concerning the religious syncretism.

FISHING IN VERGINA. FISHING GEAR AND BURIAL RITUAL FISH REMAINS FROM THE MACEDONIAN HINTERLAND

**Abstract author(s):** Stamatopoulou, Vasiliki (The Greek Ministry of Culture /Ephorate of Antiquities of Thessaloniki City; Aristotle University of Thessaloniki Vergina Excavation Project; The Hellenic Open University)

**Abstract format:** Oral

This paper presents recent excavation finds that document fishing activity in the ancient city excavated in Vergina illuminating an unknown to date aspect of daily life, diet, and interaction with the natural environment. The closest fish habitat to Vergina is the lower reaches of Haliakmon River, located about 5 km north of the ancient city. The finds examined here are, on the one hand, fishing gear of the second half of the 2nd century BC. found next to the city-wall and on the acropolis of Vergina and on the other hand, fish fauna remains found among the other remains of animals and birds that were offered to the funeral pyre for the occupant of the main chamber of the famous tomb II of the Vergina Great Tumulus, a burial ensemble considered by many as royal. The fishing gear from the excavations of the fortification of Vergina comes from well-dated layers and is an archaeological testimony that fills a gap in our knowledge of fishing in inland sites of northern Greece located in the vicinity of rivers or lakes. This set of data is co-examined with information from written sources as well as fishing finds from the wider region of Northern Greece, so that in addition to revealing fishing practices and ritual, to investigate the social status of fishing and fishers as well as the human-environment relations. The importance of fishing in the economy and nutrition of the local inhabitants and the role of river and lake resources of Macedonia in everyday life are topics that this paper will also address.

SHIFTING THE FOCUS: MOUNTAINS AS CENTRAL PLACES IN (PRE-)HISTORY

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Brisset, Elodie (Institut Méditerranéen de Biodiversité et d'Ecologie; CNRS, University Aix-Marseille, Inuiversity Avignon, IRD) - Ricci, Andrea (Cluster of Excellence ROOTS, Kiel University) - Balatti, Silvia (Institut of Classical Studies, Kiel University) - Djamali, Morteza (Institut Méditerranéen de Biodiversité et d'Ecologie; CNRS, University Aix-Marseille, Inuiversity Avignon, IRD)

**Format:** Regular session

Mountainous regions, sometimes considered remote and marginal areas, have always hosted a variety of human activities. Indeed, the importance of altitudinal gradients, climatic conditions and repartition of the ecosystem resources create different constraints and opportunities. This session aims to bridge an interdisciplinary community (i.e. Archaeologists, Historians, Ethnographers, Palaeoecologists and Palaeoclimatologists) in order to discuss the diversity of Human-Environmental interactions and perceptions associated with mountain environments during prehistorical and historical periods. In particular, we will welcome highly interdisciplinary approaches, time-transgressive investigations, and comparisons of studies of different mountain areas that will look at:

- Perceptions and experiences amongst human groups (e.g. sedentary farmers, hunter-gatherers, mobile pastoralists, urban citizens);
- Mobility (e.g. vertical, horizontal, migrations, invasions);
- Cultural niche construction (impacts of human activities on landscapes and ecosystems);
- Socio-economic activities (e.g. agriculture, arboriculture, pastoralism, transhumance, mining, way of life, including ritual practices);
- Interaction with geomorphic and climate hazards (e.g. erosion, snow cover duration, drought, river flood).

ABSTRACTS:

WHOSE PASTURE IS IT? OVERLAPPING ETHNOLOGICAL AND ARCHAEOLOGICAL RECORDS FROM PREHISTORIC LANDSCAPE OF SOUTHERN VELEBIT MOUNTAIN, CROATIA

**Abstract author(s):** Grguric, Maja (University of Zadar)

**Abstract format:** Oral

Velebit mountain is a part of Dinaric Alps and the largest mountain range in Croatia. Stretching along the eastern Adriatic coast it forms a natural border between the Mediterranean and continental regions, as well as climates. A distinctive karst topography, harsh climate, sparse vegetation and water resources of the southern coastal area of Velebit make it a marginal landscape today, attractive only to hikers and tourists. But up until a few decades ago scattered highland summer pastures provided for transhumant pastoralists from surrounding coastal areas as well as for those from the inland. In this paper ethnographic records as well as archaeological field survey and limited data sets collected from rare archaeological excavations conducted in this area are combined in attempt to explain the presence and placement of prehistoric hillforts in southern Velebit region. This paper provides arguments that ethnographically recorded seasonal migratory routes might corelate with economically interdependent prehistoric communities in the coastal, highland and inland region of Velebit mountain.

PATHWAYS AND MOBILITY IN UPLAND LANDSCAPES. THE RELATIONSHIP BETWEEN TRANSHUMANT ROUTES AND SETTLEMENT POSITION IN MOUNTAIN AREAS OF WESTERN EUROPE

**Abstract author(s):** Garcia Casas, David (Institute of Heritage Sciences - Incipit-CSIC; Centre Camille Jullian, Aix Marseille University, CNRS) - Cesarini, Roxanne (Aix Marseille University, CNRS, LA3M) - Mocci, Florence (Hors-Classe CNRS - Centre Camille Jullian, Aix Marseille University, CNRS) - Walsh, Kevin (University of York)

**Abstract format:** Oral

This study aims to investigate the role of human mobility in the construction of pastoral landscapes in two areas in the French Alps, the Byasse and Fournel valleys in the Parc National des Ecrins and the Ubaye Valley. The approach is informed by previous research in Parc Nacional d'Aigüestortes (Central Pyrenees, Spain). The new investigation is part of the PATHWAY project which investigated the emergence and development of long-distance transhumance in the Western Alps from the Iron Age to the Middle Ages.

In this context, we are conducting research on the ancient routes taken by shepherds and their flocks and herds. We employ several data types in the reconstruction of ancient pathways. Some of these clues are topographic, such as elevation, slope or insolation, the others are linked to the, social and economic contexts or to the physical conditions of humans and animals. Consequently, we collect different data in a multidisciplinary approach. We first collect ethnographic and historical data by studying ancient cadastres and review studies undertaken by ethnographers since the 20th century. These data facilitate the visualisation of ancient pathways. These pathways are integrated to a GIS. We then compare the location of archaeological sites with the layouts of pathways to verify possible connections. Thanks to this regressive approach, we try to select the most relevant elements which determine pathways according to the chronological period. The next step is the integration of environmental data like hydrography, and forest clearance. Finally, we test these elements using spatial analysis to postulate the networks of ancient pathways. In summary, we aim to determine ancient transhumant routes derived from topographical, historical, ethnographic and environmental data. The results of this study will be used to improve the knowledge about the long-term evolution of pastoral activities in mountain landscapes.

CENTRALITY, MARGINALISATION AND MOBILITIES IN EASTERN TIGRAY (ETHIOPIA): MODERN AND CONTEMPORARY PERIODS AS ANALOGUES TO HELP UNDERSTAND THE PAST

**Abstract author(s):** Blond, Ninon (Université Lumière Lyon 2, Archéorient - UMR 5133; École Normale Supérieure de Lyon - ENSL, EVS - UMR 5600) - Benoist, Anne (CNRS, Archéorient - UMR 5133) - Callot, Yann (Université Lumière Lyon 2, Archéorient - UMR 5133) - Gajda, Iwona (CNRS, Orient & Méditerranée - UMR 8167) - Jacob-Rousseau, Nicolas (Université Lumière Lyon 2, Archéorient - UMR 5133) - Schiettecatte, Jérémie (CNRS, Orient & Méditerranée - UMR 8167) - Barge, Olivier (CNRS, Archéorient - UMR 5133)

**Abstract format:** Oral

In northern Ethiopia, the villages of Sewne and Wolwalo form the centre of two areas surveyed by the French archaeological mission in the Eastern Tigray which revealed pre-Aksumite, Aksumite and post-Aksumite settlements. Around Wolwalo, the study zone is on the Tigray plateau, at an altitude of 2700 m. Around Sewne, the site of Wakarida and the surveyed area extend on a topographic spur at the altitude of 2400 m, forming a transition zone between the plateau and the valleys plunging towards the Danakil Depression. The relations maintained by the sites of the two regions with the central powers during pre-Aksumite, Aksumite and post-Aksuite periods are still unclear, as well as the relationship between the two spaces (spur/plateau), and ancient agricultural practices.

Geographically, it is a margin area with a shifting relationship to political centrality, which can be apprehended on various spatio-temporal scales, thanks to an interdisciplinary approach, combining archaeology, geoarchaeology, geohistory and ethnogeomorphology. Our geographical analysis relies on the concepts of centrality, marginalization and mobility and is part of a diachronic reflection, essentially based on the modern and contemporary periods.

During the modern period, this space is subject to erosion caused by anthropogenic activities from the 14th century onwards but is nevertheless absent from travellers' accounts and early cartographies. Marginalised at the regional scale and away from the main itineraries, the studied space remains locally active and continues developing. Today, the Sewne spur constitutes a central margin: its marginal location makes it a contact zone, an interface area, where the distance from the centre leads to the creation of a new centre. This area becomes a porous and dynamic borderland between sedentary agricultural practices and nomadic or semi-nomadic agro-pastoral practices of the neighbouring Afar populations. These contemporary data provide analogues allowing to question past periods through a regressive approach.

IMPACT OF PREHISTORIC PASTORALISM ON ALPINE ECOSYSTEMS AT DIFFERENT SPATIAL AND TEMPORAL SCALES: A CASE-STUDY FROM VAL DI SOLE (ITALY)

**Abstract author(s):** Carrer, Francesco (Newcastle University) - Angelucci, Diego (University of Trento)

**Abstract format:** Oral

Archaeological and palaeoecological research in mountain environments has long shown that the impact of pastoralism on alpine and subalpine ecosystems dates back to prehistoric times. Forest clearances have permanently changed the vegetational composition of the montane uplands. Thousands of years of intense animal grazing has changed the local soilscape and contributed to soil erosion. Different proxies enable these dynamics to be investigated at different spatial and temporal scales. Pollen data and the analysis of soil profiles reveal the slow transformation of vegetation and soil, associated to the growing human pressure on

5

local environments. On the other hand, archaeological contexts at high altitude provide unique ‘snapshots’ of the impact of pastoral activities at local scale and within the lifetime of the investigated site. The analysis of archaeological contexts has the potential to unravel how and why pastoral strategies contributed to the long-term landscape transformations disclosed by palaeoecology and soil science.

In this paper we discuss the case of MZ051S, a Bronze Age (ca. 1900-1400 BC cal) pastoral site at 2250 m asl in Val di Sole (Italian Alps). Evidence of the activation of slope processes in the site following its first occupation might indicate an early human impact on alpine ecosystem in the area. In order to validate this hypothesis, the analysis of the archaeological context have been compared/contrasted with palaeoecological and geoarchaeological data from the area (and surrounding areas). A computer modelling framework has been used to integrate and examine data with different spatial and temporal resolutions. Preliminary results highlight the benefits (and challenges) of using multi-proxy approaches and working across scales to assess human impact on mountain environments.

5

## ARCHAEOLOGY IN THE CANTABRIAN MOUNTAINS (NW IBERIA): AN INTERDISCIPLINARY EXPERIENCE TO DELVE INTO THE CULTURAL BIOGRAPHIES OF UPLAND LANDSCAPES

**Abstract author(s):** Gonzalez Alvarez, David (Institute of Heritage Sciences - Incipit, Spanish National Research Council - CSIC)

**Abstract format:** Oral

Mountainous landscapes constitute an exciting meeting point for archaeologists aiming to engage with other academic disciplines, such as Geography, Anthropology, Earth Sciences, History, or GIScience. Interdisciplinary research developed on the uplands has grown substantially within the last few decades, deconstructing traditional views on the mountains as barely anthropized and peripheral landscapes through history. Since 2017, we have conducted archaeological research in the upland region of Babia (León, Spain), in the Cantabrian Mountains (NW Iberia). Aiming to fill the voids in the archaeological knowledge about the diachronic occupation of these mountains, we have carried out extensive remote sensing surveys, field-walking and geophysics prospections, and archaeological excavations. The data gathered flagship the relevance of the anthropogenic impact in these considered ‘remote’ or ‘marginal’ areas, in addition to the complexity of the anthropization processes. In this paper, we will reflect on how interdisciplinary research on upland landscapes driven by archaeological questions can widen our horizons on relevant debates for Iberian history such as the earliest spread of agriculture and pastoralism in Late Prehistory, the Roman conquest, the economic basis for the Medieval and Modern expansion of the Spanish cities, the impact of globalized contemporary markets in the decline of rural Spanish areas, or the recent climate crisis.

6

## LIVING AND DYING IN THE MOUNTAIN : INTERDISCIPLINARY APPROACH OF HUMAN-ENVIRONMENTAL INTERACTIONS IN THE FRENCH ALPS (SAINT-PIERRE 2, THORAME-BASSE)

**Abstract author(s):** Lattard, Alexia - Isoardi, Delphine - Mocci, Florence (Aix Marseille Univ, CNRS, CCJ) - Huguet, Céline (Direction Archéologie et Muséum de la Ville d'Aix-en-Provence) - Cenzon-Salvayre, Carine (Independant Researcher) - Talon, Brigitte (Aix Marseille Univ, Avignon Université, CNRS, IRD, IMBE) - Ollivier, Vincent (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA) - Martin, Lucie (Laboratoire d'Archéologie préhistorique et anthropologie, Université de Genève, Suisse / Edytem UMR 5204) - Sirdeys, Nais (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA; Aix Marseille Univ, CNRS, IRD, INRAE, Coll France, CEREGE) - Veyron, Robin (Aix Marseille Univ, CNRS, CCJ)

**Abstract format:** Oral

In the Southern Alps, in the heart of the upper Verdon valley (Alpes-de-Haute-Provence, Thorame-Basse), an interdisciplinary research program has led to the discovery of an unpublished site located on the Saint-Pierre Plateau (alt. 1300 m). Since 2019, the archaeological operations have revealed protohistoric and ancient built structures, and a funerary space from the High Empire and a second one dating from late Antiquity. During Antiquity, the site took place in the civitas of Etramina extended in the Issole Valley. Mentioned as the diocese’s chief town in the year 442 AD., this locality nevertheless disappears from the texts although we know of the existence of an ephemeral bishopric that existed for a short time during the 5th century. No remains relating to this ancient city have been clearly identified in the valley, raising questions about the forms of the human occupation and the settlement dynamics over time in this sector.

This project aims to maximise our understanding of the site in mountain, through interdisciplinary research: paleoenvironmental approaches (anthracology, archéobotany, pedo-anthracology, geomorphology, geoarchaeology), as well as geophysical survey in order to discuss the diversity of Human-Environmental interactions and perceptions associated in alpine valley. Our approach will study the forms and evolution of human settlement and the natural environment’s management. The geomorphological approach revealed the existence of a paleovallon and an interfluve which conditioned the first settlement (774-480 cal. BC), in a dominant position and, then, developed toward the paleovallon which was gradually filled during Antiquity. The first paleoenvironmental results confirm landscape opening and offer the first markers for the reconstruction of the species, wild and cultivated, exploited locally by these communities.

The diachronic occupation suggests that this vast plateau may have been an essential settlement point for the valley due to its topographical configuration and dominant position during Protohistoric time and Antiquity.

7

## AN INTERDISCIPLINARY INVESTIGATION OF THE LONG-TERM PROVENÇAL AND ALPINE LIVESTOCK MANAGEMENT: THE INTERSECTION OF BIOARCHAEOLOGY, PALAEOECOLOGY AND CULTURAL ARCHAEOLOGY

**Abstract author(s):** Knockaert, Juliette - Dulias, Katharina (Department of Archaeology, University of York) - Giguet-Covex, Charline (Laboratoire EDYTEM, CNRS, Université de Savoie) - Isoardi, Delphine (Centre Camille Jullian, Aix Marseille Univ, CNRS, CCJ) - Pike, Alistair W.G. (Department of Archaeology, University of Southampton) - Suméra, Franck (Aix Marseille Univ, CNRS, Minist Culture, CCJ) - Unsain, Dianne (Centre Camille Jullian, A\*MIDEX, Aix Marseille Univ, CNRS, CCJ; LA3M, Aix Marseille Univ, CNRS) - Magniez, Pierre (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA) - Mocci, Florence (Centre Camille Jullian, Aix Marseille Univ, CNRS, CCJ) - Walsh, Kevin (Department of Archaeology, University of York)

**Abstract format:** Oral

From ritual, commercial to pastoral activities, domestic animals have played a major role in the use and trajectories of mountain landscapes over the last seven millennia in the Alps. However, for two decades, alpine archaeological research has rarely moved beyond the simple identification of past human activities, rather than their characterisation and the concomitant assessment of practices and techniques. The reasons for this are many; perhaps most significant is the relative dearth of archaeological and zooarchaeological evidence in the high-altitude zones.

The European research project PATHWAY (A\*MIDEX-France and ARHC-UK) focuses on studying the diversity of past livestock management strategies and their impacts on landscapes from the Iron Age to medieval times, from the Western Alps to the Provençal plains. In this interdisciplinary study, the intersection of bioarchaeological (studies of fauna, isotope analyses) and paleoenvironmental (sedDNA, palynology) methods, combined with cultural archaeology, aims to highlight: (1) the animal resources exploited, (2) the mobility patterns of domesticated species (3) the high altitude areas exploited as mountain pastures and the responses (e.g. degradation, resilience, resistance, adaptation) of the vegetation communities and erosion dynamics in these grazing areas and finally, (4) the farming techniques and practices of the agro-pastoral communities of transalpine Gaul to the societies of Medieval times. This communication will present our analytical and integrative frameworks and the first results obtained, with a view to contributing to the history of Alpine pastoralism; a productive strategy that is a significant keystone agricultural undertaking of central importance not only for the Alps but for abutting European regions.

8

## HUMAN SETTLEMENT IN THE HIGHLANDS OF SOUTHERN CAUCASUS DURING CHALCOLITHIC AND BRONZE AGE THROUGH ARCHAEOZOOLOGY, STABLE ISOTOPES AND CEMENTOCHRONOLOGY

**Abstract author(s):** Vautrin, Adeline - Balasse, Marie - Berthon, Rémi - Fiorillo, Denis (AASPE UMR 7209, Muséum national d'Histoire naturelle, CNRS, Paris) - Gambashidze, Irina - Gogochuri, Giorgi (Georgian National Museum, Tbilisi) - Gourichon, Lionel (CE-PAM UMR 7264, Université Côte d'Azur, CNRS, Nice) - Lemoine, Michel (AASPE UMR 7209, Muséum national d'Histoire naturelle, CNRS, Paris) - Stöllner, Thomas (Ruhr-Universität, Bochum) - Mashkour, Marjan (AASPE UMR 7209, Muséum national d'Histoire naturelle, CNRS, Paris)

**Abstract format:** Oral

The exploitation of montane ecosystems by agro-pastoral communities has played an important role in the development of these societies in the Caucasus. Mountains can be constraining in winter as snow prevents access to pastures and constrains animal husbandry, but they also provide access to natural resources such as copper ores, obsidian and pastures. As human occupation in the Caucasus mountains is still very little studied, the archaeozoological approach makes it possible to test the hypothesis that zoot-echnical innovations have led to a more substantial implementation of human communities in the montane ecosystems. The study of faunal remains makes it possible to account for the species that has been exploited (domestic or wild). Cementochronological analyses of herbivores teeth will allow us to determine the seasons of occupation of the sites. Finally, it will be possible to investigate pastoral mobility (horizontal, vertical, etc.), herd feeding (use of fodder) and births seasonality with isotopic ratio analyses in bioapatite (carbon, oxygen, strontium) and collagen (nitrogen, carbon). The first results from various Georgian Chalcolithic and Early Bronze Age archaeological sites will be discussed in this presentation.

## PASTORAL LANDSCAPES OF THE NURATAU MOUNTAINS IN CENTRAL ASIA

**Abstract author(s):** Luneau, Elise (Deutsches Archäologisches Institut, Eurasien-Abteilung) - Avanesova, Nona Armaisovna (Samarkand State University)

**Abstract format:** Oral

Mountains, while accounting for a large proportion of the territory, have been neglected in Central Asian archaeological research for a long time. Growing research in the recent past decades in these areas showed that mountains have been however essential in the acquisition of resources and exchange networks. At the far western point of the Pamir-Alay system, the Nuratau Mountains, located in the Samarkand province of the present day Republic of Uzbekistan, has also been largely unexplored up to now. Mostly covered by mountain steppe, the Nuratau ridge does not reach very high altitudes and, thus, was particularly suitable for the occupation by pastoralists.

Recent investigations in the region, through a collaboration between the German Archaeological Institute, Eurasia Department and the Samarkand State University, aims at better defining population movements and cultural evolution in prehistory. The surveys

have revealed a dense occupation through time and showed that the area is strategically placed for the study of the movements of people through Central Asia. Various archaeological features attest cultural links with remote areas and highlight the specificity of cultural and socioeconomic practices in the mountainous areas over a long period. Preliminary outputs drawn from patterns of distribution of the various sites and structures in the area participate in highlighting diverse cultural topographies and interactions with the environmental setting. The research contributes to define various aspects of the pastoral landscape, and ultimately, to reconsider these areas, previously viewed as peripheral or marginal areas, as fully integrated within complex societies with various communities over time.

10 THE ROLE OF GOATS IN THE DEVELOPMENT OF PREHISTORIC AND PROTOHISTORIC SOCIETIES IN THE ZAGROS. A VIEW FROM THE ARCHAEOZOOLOGY

**Abstract author(s):** Mashkour, Marjan (CNRS-UMR 7209 AASPE- MNHN- Paris)

**Abstract format:** Oral

This paper aims at presenting an overview of archaeozoological studies in the highlands of western Iran and the importance of goats, wild or domestic, in the past subsistence economies of the Zagros, a strategic region in South West Asia.

The development of archaeological studies from the 1960s in the Zagros region and the intensification of archaeological investigations during the last decades have highly contributed to shifting the role of the Zagros mountains in the narrative of plant and animal domestication, from a marginal area to one of the centers of Neolithisation. In this frame, goats have had a crucial role from the Paleolithic to the dawn of Neolithic and beyond within the mobile or sedentary communities that inhabited these highlands and adjacent regions.

We will present a selection of sites where goat hunting and herding were important in the subsistence and discuss morphological features and demographic structure of goat populations regarding their wild or domestic status. Finally, we will address the articulation of this archaeozoological information and the evidence for the integration of the goat figure into the symbolic sphere and human artistic production on the Iranian Plateau.

11 THE EARLY BRONZE AGE ZAGROS INTERACTION SPHERE (CA. 3100-2500 BCE): ORGANIZING ACCESS TO DISPERSED RESOURCES IN A FRAGMENTED LANDSCAPE

**Abstract author(s):** Renette, Steve (University of British Columbia)

**Abstract format:** Oral

Relying on a combination of ethnographic accounts and Mesopotamian cuneiform records, archaeologists have characterized prehistoric and early historical Zagros societies as pastoral nomadic tribes. Such mobile peoples are credited with facilitating the circulation of goods and long-distance exchange of resources through their annual migration between high-altitude valleys and low-land plains. However, archaeological data supporting such a reconstruction of ancient Zagros mountain peoples is largely lacking. Instead, absence of evidence attributed to methodological difficulties in identifying temporary, ephemeral habitation away from mounded sites is often used to support the existence of nomadic tribes. This is particularly the case for the Early Bronze Age, which archaeologists persistently failed to detect in surveys of Zagros valleys and plains.

In this paper, I will present new evidence from the Mahidasht Survey Project in Kermanshah Province (1975-78) and the site of Kani Shaie in Sulaymaniyah, excavated between 2013-16, that demonstrates continued settled occupation within the central Zagros during the Early Bronze Age. This forces a reconsideration of local strategies to obtain non-locally available resources in this mountainous landscape and the formation of shared cultural practices between dispersed communities. I will argue that following the degradation of Late Chalcolithic directional exchange networks, Early Bronze Age communities reorganized into cultural constellations based on ecological-latitudinal zones as a risk-buffering strategy. In order to obtain non-locally available resources, periodic gatherings structured through feasting events provided the opportunity for exchange and the fostering of social ties with distant communities. I propose that this Zagros Interaction Sphere produced a gradual ethnogenesis, based on a close relationship between communal identity and the inhabited environment, that gave rise to the peoples and polities attested in Mesopotamian cuneiform records of the later third millennium BCE.

12 LIVING THE MOUNTAIN LIFE: THE PASTORAL SOCIETIES OF THE SOUTHERN ZAGROS AND THEIR ENVIRONMENT IN ANTIQUITY

**Abstract author(s):** Balatti, Silvia (Institute for Classical Studies, Kiel University) - Brisset, Elodie - Djamali, Morteza (Institut Méditerranéen de Biodiversité et d'Ecologie; CNRS, University Aix-Marseille, University Avignon, IRD) - Ricci, Andrea (Cluster of Excellence ROOTS, Kiel University)

**Abstract format:** Oral

Pastoral societies have inhabited the Southern Zagros Mountains since at least the early 1st millennium BCE. Their lifestyle and its transformation through time offer us a vivid example of the engagement of people with the surrounding mountainous environment in a semi-arid region of Southwest Asia.

Based on a synthesis of the ethno-historical knowledge that has been gathered over the last decades (Balatti, 2017) and how this evidence interrelates with the paleoecological and archaeological data, this presentation will:

1. characterize what were the traditional socio-political structures and ways of life of the mountain peoples of the Zagros (e.g. pastoralism, hunting, arboriculture, agriculture, craft production, religion) in antiquity, with a special focus on the 1st millennium BCE;
2. discuss the various resources of this specific mountainous environment (opportunity/risk) and people ecology-driven stereotypes amongst the different groups (e.g. lowland authorities versus autonomous mountain dwellers).

We will finally use the ethno-historical evidence to provide some insights into the on-going interdisciplinary research carried out in the Southern Zagros in the framework of the project “HighStepLands” (DFG-SPP “Iranian Highlands”), that aims to investigate how human occupation strategies and subsistence patterns have interacted with the surrounding environment at the different altitudes, and how it has interplayed with the lowland socio-cultural-political organizations.

13 COMPLEXITY BEYOND NEO-EVOLUTIONISM: SOCIAL ORGANIZATION IN “MARGINAL” ENVIRONMENTS AS SEEN FROM THE RIM OF THE TIBETAN PLATEAU

**Abstract author(s):** Hein, Anke (University of Oxford)

**Abstract format:** Oral

In spite of decades of criticism on the teleological, and colonialist-western-centric nature of neo-evolutionist models, these ideas still loom large in archaeological debates of social organization. Such debates tend to concentrate on early centers of “civilizations” and “states” located in fertile low-elevation plains and river valleys lending themselves to agricultural modes of subsistence. When high-altitude and rugged terrains are discussed, they are usually referred to as “marginal” and explained in relation to so-called “centers” within center-periphery frameworks or more recently zomia, places of retreat for people escaping the reach of nation states. Within grand narratives of human societal development, these areas are usually described as hampered by their geographic locations, forced to remain in a “less-developed”, non-complex state of development.

Being seemingly inaccessible and “marginal”, the rim of the Tibetan Plateau is particularly suited as a case study and starting point to help shake these old narratives. The aim is not merely to deconstruct them but to place them on their head and argue that social organization in mountainous regions can be highly complex, albeit in a dispersed manner that does not fit with traditional lowland agrarian narratives of power built on centralization. Based on archaeological material combined with ethnographic and to a lesser extent textual evidence from the Hengduan Mountain range, this paper shows how social networks extending over long distances and seemingly inhospitable terrain can provide a framework and basis of power expressed on a local level. Instead of trying to control the behavior of everyone in the network directly through administration, laws, and sanctioned violence as a nation-state would, local communities and individuals tap into the framework of knowledge, material resources, and behavioral codes to establish and maintain their claim to power and control.

A. NEW INTERDISPLINARY REFLECTIONS ON THE FUNERARY PRACTICES IN THE FRENCH ALPS

**Abstract author(s):** Lattard, Alexia - Isoardi, Delphine - Mocci, Florence (Aix Marseille Univ, CNRS, CCJ) - Sacchetti, Federica (Aix Marseille Univ, CNRS, Minist Culture, CCJ)

**Abstract format:** Poster

For more than one century, the French alps were studied by the material cultures, known by the important and unique artefacts found in the grave or deposit dating from the Iron Ages. A major part of these masterpieces came from graves, which are unfortunately known only by brief descriptions and fortuitous discoveries. Since the last two decades, this mountainous area has been reinvested by researchers, who defined southern Alps as a central place of trade and socio-cultural exchanges. The new synthesis about the funerary practices highlights how much the graves are different from the southern borders, from the Iron Age to Classical Antiquity. Our approach includes the socio-cultural parameters in the dead treatment and deposit linked to the population flow, allowed by an interdisciplinary study involving archaeology, biological anthropology and epigraphy. These new data obtained by a systemic approach has generated a new reflection and contributes to improve our understanding of the socio-cultural history and its evolution of these populations.

529 ADDING FLESH TO THE BONES: THE INTEGRATION OF BIOCHEMICAL AND BIOMOLECULAR TECHNIQUES IN THE STUDY OF HUMAN-ANIMAL RELATIONSHIPS

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Brusgaard, Nathalie (University of Groningen) - Mannermaa, Kristiina (University of Helsinki; University of Tartu) - Çakırlar, Canan - Raemaekers, Daan (University of Groningen)

**Format:** Regular session

Understanding past human-animal relationships has been advanced by the development of new methods and techniques in archaeology, the so-called third science revolution. In particular, the study of interactions between humans and animals in hunter-gatherer and early farming and pastoral communities has been revolutionized by the application of new biochemical and biomolecular anal-

yses. The current challenge is to how bring together both theoretically and methodologically a widening array of complex data (e.g. aDNA, eDNA, isotopes, lipids on ceramics, material culture patterns) with models from cultural anthropology to refine our narratives and ask nuanced questions.

This session brings together case studies from various regions and periods to discuss the ways in which these broad ranges of sources and methods can be integrated to study human-animal relationships in hunter-gather and early and pastoral farming communities. The session welcomes papers on these narratives and the theoretical implications of new techniques, as well as papers on the methodological challenges of interdisciplinary research, such as questions of big data, data representation, and ethical sampling.

ABSTRACTS:

1 EXPLORING THE RELATIONSHIP BETWEEN HUMAN ANTIQUITY AND PLEISTOCENE MEGAFaUNA EXTINCTIONS IN NORTHWESTERN SOUTH AMERICA

**Abstract author(s):** Ziegler, Michael - Roberts, Patrick (Max Planck Institute for the Science of Human History)

**Abstract format:** Oral

South America was the last continental landmass to be colonized by Homo sapiens during the Pleistocene and their spatio-temporal presence on the landscape overlaps with one of the largest regional megafaunal extinctions of the Quaternary. As the gateway between North and South America, the northwestern region of South America facilitated an intercontinental dispersal of early human settlers as well as fossil taxa and represents an important area for exploring initial human-animal interactions. Moreover, this region is composed of a diverse environmental gradient (i.e., coasts, savannahs and lowland, Sub Andean and Andean tropical forests) which provides an important proving ground for exploring the capacity of our species to adapt to varied environments and their impacts on resident large mammals. Although the palaeontological record at archaeological sites across South America is growing, direct evidence of human-animal interactions remains fairly limited. Nevertheless, as demonstrated elsewhere in the Late Pleistocene archaeological record, advances in stable isotope analysis and a developing chronology at select localities can help to identify changes in megafaunal diet from these shared environments as well as provide insights into ecological and anthropogenic pressures. Here, I introduce the multidisciplinary approach of the ERC-funded LASTJOURNEY project, to show how palaeontology, ecological modelling, and biomolecular processes can add ‘flesh’ to the bones of our current knowledge of human dispersals and megafauna population dynamics in the region.

2 RECONSTRUCTING HUNTER-GATHERER PREY-SPECIES BEHAVIOUR: IMPLICATIONS FOR HOMININ ECOLOGICAL PLASTICITY DURING THE CENTRAL EUROPEAN PALAEOLITHIC

**Abstract author(s):** Heddell-Stevens, Phoebe (Max Planck Institute for the Science of Human History; Friedrich-Schiller-Universität) - Roberts, Patrick (Max Planck Institute for the Science of Human History; University of Queensland)

**Abstract format:** Oral

Comparisons between Homo sapiens and our nearest hominin relatives have largely focused on high impact presentations of fossil morphologies, material evidence for technological and social complexity, symbolism, and genetic data. However, taphonomic limitations, non-linear appearances of ‘modern’ cultural traits, and increasing evidence for genetic admixture continue to complicate interpretations of our species’ evolutionary narrative. In other regions, a growing response to these challenges has been to focus on exploring the varying adaptive flexibility exhibited by different hominin populations as they entered new environments or faced climate stresses. However, hominin palaeoecological adaptations across the Middle-Upper Palaeolithic transition in mid-latitude Western-Central Europe have yet to be integrated in these discussions. This avenue of research presents an exciting opportunity to test hypotheses of Homo sapiens’ unique ecological plasticity. This is becoming increasingly urgent given the growing evidence for variety and flexibility in Neanderthal subsistence behaviour. Increasingly, a developing suite of biochemical techniques are enabling in-depth investigations into the ecological niche of H. sapiens and Homo neanderthalensis. This paper provides a critical discussion of ‘on-site’ archaeological scientific methods alongside more traditional approaches utilised in determining hominin subsistence and behaviours ecological tolerances. Focus is placed on the application of these techniques to reconstructions of prey-species palaeoecology as a largely underutilised line of investigation. Establishing plasticity in dietary and ranging behaviours of these fauna in response to broader climate and environmental shifts is key to interpreting flexibility in hominin hunting adaptations. We provide our own contribution, involving multiple isotope analysis of serially-sampled herbivore prey-species tooth enamel from Palaeolithic sites in Central Germany to investigate hominin ecological tolerances. We advocate greater use of these approaches in combination to enable higher resolution reconstructions of hominin palaeoecology, and emphasise the need for establishing local palaeoclimatic and environmental parameters in interpretations of evidence for animal-human behavioural adaptations.

3

TRACING ENVIRONMENTAL STABILITY AND FAUNAL RESOURCE USE AT VLAKNO CAVE (CROATIA)

**Abstract author(s):** Radovic, Sinisa (Institute for Quaternary Palaeontology and Geology, Croatian Academy of Sciences and Arts, Zagreb) - Pilaar Birch, Suzanne (Department of Anthropology, Department of Geography, University of Georgia) - Vujević, Dario (Department of Archaeology, University of Zadar)

**Abstract format:** Oral

Vlakno cave is located on Dugi Otok (Long Island) in northern Dalmatia (Croatia). Recent excavations have revealed rich stratigraphy indicating the use of the cave from at least the late Pleistocene to the Early Holocene. These deposits are divided into several chronological strata attributed to the Epigravettian and Mesolithic. In this paper we focused our attention to the Mesolithic sedimentary complex, divided into two phases (Strata 2 and 3). Stable isotope analysis of faunal remains (n=24) from Vlakno suggest a relatively consistent environment between the two strata. There was no significant difference in average δ13C or δ15N values among all taxa.strata. Small carnivores such as fox and marten along with a wild boar had elevated δ15N as expected for trophic position and slightly more positive δ13C values than herbivores. Deer and hare had relatively lower δ15N and δ13C values, reflecting a diet of C3 vegetation, likely in a wooded environment. Three birds of indeterminant species fell within this range, suggesting they were also herbivorous. Recorded changes in the taxonomic composition of faunal assemblages between the two strata suggest that something other than environmental change may have triggered the evident change in the subsistence economy of Vlakno’s inhabitants. It has previously been speculated that patterns in the faunal assemblage may be the result of a change in topography, i.e. the postglacial sea level rise that caused Dugi Otok to become. The new stable isotope data combined with faunal evidence seem to support this hypothesis.

4

HUMAN DIET DURING CA. 7000-500 CAL BC IN SOUTHEASTERN BALTIC ACCORDING TO CARBON AND NITROGEN STABLE ISOTOPE DATA: AN UPDATE

**Abstract author(s):** Simcenka, Edvardas (Archaeology Department, Lithuanian Institute of History) - Kozakaitė, Justina (Faculty of Medicine, Vilnius University) - Piličiauskienė, Giedrė (Faculty of History, Vilnius University) - Piličiauskas, Gytis (Archaeology Department, Lithuanian Institute of History) - Robson, Harry (Department of Archaeology, the University of York)

**Abstract format:** Oral

In 2009 and 2017, several studies have been undertaken which have discussed the diets of prehistoric populations in Lithuania according to δ13C and δ15N stable isotope data. These studies, based on the analyses of 32 human and 81 faunal samples, showed that inland hunter-gatherers (ca. 7000-3000 cal BC) had consumed a mixture of freshwater and terrestrially derived protein, whilst Subneolithic groups (ca. 3000 cal BC) residing on the coast had consumed aquatic derived protein from estuarine and lagoonal environments. With the arrival of animal husbandry during the Early Neolithic Corded Ware culture (ca. 2800-2400 cal BC) a change in diet was observed. Indeed, these early farmers had consumed terrestrial derived protein, whilst the consumption of millet was evidenced a thousand years later during the Late Bronze Age (ca. 1000 cal BC). In 2020, we analysed a further 14 human and 40 faunal remains, including 10 freshwater fish, for δ13C and δ15N stable isotope analysis, the latter of which have not been previously analysed before. Moreover, we have 14C dated 16 humans of a presumed Stone or Bronze Age date. In light of these new data, we will verify or disprove previous interpretations concerning the diets of prehistoric populations in the southeastern Baltic region during the period from ca. 7000-500 cal BC.

5

THE EMERGENCE AND EVOLUTION OF NEOLITHIC CATTLE FARMING IN SOUTHEASTERN EUROPE: ZOOARCHAEOLOGICAL AND STABLE ISOTOPE DATA FROM DŽULJUNICA-SMĀRDEŠ, IN BULGARIA

**Abstract author(s):** Kamjan, Safoora (Groningen Institute of Archaeology, University of Groningen) - de Groene, Donna (University of Reading, Archaeology Department) - van den Hurk, Yuri (Groningen Institute of Archaeology, University of Groningen) - Zidarov, Petar (Eberhard-Karls Universität Tübingen, Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters) - Elen-ski, Nedko (Regional Museum of History, Veliko Tarnovo) - Patterson, William (Saskatchewan Isotope Lab, University of Saskatchewan) - Çakirlar, Canan (Groningen Institute of Archaeology, University of Groningen)

**Abstract format:** Oral

Domestication of cattle (Bos taurus) and its subsequent spread into Europe led to unprecedented economic, biological and social transformations. Little is known about the early interactions of humans with this animal in Neolithic Bulgaria, a key region with connections to north-western Anatolia (via Thrace or the Black Sea coast), the Aegean world (via the Struma and Mesta valleys), and central Europe (via the Danubian corridor).

Integrated zooarchaeological and stable isotope analysis of faunal remains from Džuljunica, one of the earliest and most well-stratified Neolithic settlements in the southern Danube catchment, spanning the end of the 7th millennium BCE and the first half of the 6th millennium BCE provides us with ample opportunity to contribute to this discussion. In this paper we use biometry, age at death data, and stable isotope analysis (δ18O, δ13C, δ15N) of collagen and tooth enamel to obtain insights into the modalities of cattle farming, cattle grazing environment, slaughtering patterns, and calving seasons in relation to the environmental and cultural settings of this initial Neolithic settlement. The results of this study contribute to understanding the Neolithisation itineraries of Europe, and modes of adaptation and experimentation in early cattle farming in the Balkans.

6 INVESTIGATING THE BEGINNING OF ANIMAL HUSBANDRY IN THE DUTCH WETLANDS THROUGH ZOOARCHAEOLOGY, PALAEOGENOMICS, STABLE ISOTOPE ANALYSIS, AND HIGH-PRECISION RADIOCARBON CHRONOLOGY

**Abstract author(s):** Dreshaj, Merita (Groningen Institute of Archaeology, University of Groningen; Centre for Isotope Research, University of Groningen) - Brusgaard, Nathalie - Erven, Jolijn - Çakırlar, Canan (Groningen Institute of Archaeology, University of Groningen) - Dee, Michael (Centre for Isotope Research, University of Groningen) - Peeters, Hans - Raemaekers, Daan (Groningen Institute of Archaeology, University of Groningen)

**Abstract format:** Oral

The beginning of animal husbandry is a pivotal development in human history. The pace and nature of this development in the Dutch wetlands is debated, with two competing models for the emergence of farming: (1) a slow integration model starting around 4700 cal BC, and (2) a rather abrupt introduction around 4000 cal BC. In both models, the appearance of small-sized cattle (*Bos* sp.) and pig (*Sus* sp.) bones and teeth in the archaeological record is traditionally considered to mark the beginning of animal husbandry. This univariate approach, coupled with the lack of direct dates on probable domestic specimens has hampered the investigation of the variety of ways in which humans and animals interacted during this transitional period.

Our project ‘The Emergence of Domesticated Animals in the Netherlands’ investigates this issue with a holistic approach. We analyze cattle and pig remains in their archaeological and palaeoenvironmental context using a combination of biomolecular and biochemical analyses.

In this paper, we present the first results of our study of the Swifterbant culture sites at Hardinxveld-Giessendam in the Rhine-Meuse delta of the western Netherlands. These sites, which were occupied during the 6th and 5th millennium BC, yielded evidence for the introduction of pottery production and domesticated animals. They, therefore, represent a unique case study for the investigation of what this evidence means in terms of the possibility, nature, and scale of animal husbandry in this region at this time. We present new data from a zooarchaeological, aDNA, stable isotopic, and high-resolution Bayesian chronology study of the Hardinxveld sites and discuss how these techniques can shed light on the biocultural and economic development of early animal husbandry in the Netherlands.

7 PATHS TO POWER? INVESTIGATING NEOLITHIC ANIMAL MANAGEMENT PRACTICES AND DIETARY BEHAVIOUR ACROSS PASSAGE TOMB REGIONS OF THE IRISH SEA ZONE

**Abstract author(s):** pigiere, fabienne (University College Dublin - School of Archaeology) - Olet, Lilly (University of Bristol - School of Chemistry) - Mainland, Ingrid - Downes, Jane (University of the Highlands and Islands) - Faillace, Katie (Cardiff University, Department of Archaeology and Conservation) - Madgwick, Richard (Cardiff University, School of History, Archaeology and Religion) - Evershed, Richard (University of Bristol - School of Chemistry) - Buckley, Michael (University of Manchester- Department of Earth and Environmental Sciences) - Smyth, Jessica (University College Dublin - School of Archaeology)

**Abstract format:** Oral

The Passage Tomb People project (PTP) aims to identify the social drivers of passage tomb construction along the northern Atlantic Façade, focussing on three key zones – Orkney, Ireland, and north Wales. The connectedness of passage tombs in these areas has long been recognised, but to date there has been no integrated research on the societies that built them. Erected several centuries after the arrival of farming in each region, these ‘mega’ tombs may be responses to economic stress or, equally, the result of surplus and increasing social competition.

The large-scale datasets that are being generated to investigate the topics include molecular and multi-isotope analyses on ~500 pottery sherds, and ~450 human and animal teeth/bone and reference vegetation from the archives of upwards of 20 sites across Ireland, Orkney and North Wales. Programmes of oxygen, carbon and nitrogen isotope analyses of animal tissues along with proteomic analyses of enamel for sex determination are designed to investigate animal management strategies: diet, foddering, seasonal herding, and manipulation of birth season. Further, molecular and isotopic analysis of lipid residues in pottery and human tissues as well as single-compound radiocarbon dating are carried out to explore changes in subsistence strategies and human diet. Sample collection and analysis is ongoing and the present paper focuses on observed husbandry practices and dietary behaviour in Ireland and several islands of the Orkney archipelago, synthesising published data from settlements and tomb sites. This review of evidence is used to frame the wider research questions of the PTP project.

8 FIDO IN THE FIELD: NEW MORPHOMETRIC AND STABLE ISOTOPE EVIDENCE FOR HUMAN-DOG RELATIONSHIPS IN PREHISTORIC CROATIA

**Abstract author(s):** Zavodny, Emily (University of Central Florida) - Welker, Martin (Arizona State Museum) - McClure, Sarah (University of California Santa Barbara)

**Abstract format:** Oral

The development of seasonal transhumance as an economic strategy in the coastal and mountainous areas of prehistoric Croatia was part of a larger cultural readjustment to changing demographic and environmental conditions; namely, growing populations and a more intensively managed landscape. While most archaeological studies of this phenomenon have focused on the scale, composition, and movement of livestock, other equally important practices or human-animal partnerships may have also formed during

this time. New linear morphometric and stable carbon and nitrogen isotope analyses of prehistoric domestic dog remains from the regions of Dalmatia and Lika suggest increasing human manipulation of canine size, physical proportion, and diet from the Neolithic period (ca. 6000-4000 B.C.) onwards. The appearance of these more robust dogs in later prehistory could indicate the emergence of dogs that were adapted specifically for livestock management and worked closely with humans to move herds between valleys and mountain pastures throughout the year.

9 LIVING ON THE EDGE: A SEQUENTIAL MULTI-ISOTOPIC APPROACH TO UNDERSTANDING NORSE CATTLE HUSBANDRY PRACTICES IN THE WESTERN ISLES OF SCOTLAND

**Abstract author(s):** Griffith, Jacob (Vrije Universiteit Brussel - VUB) - Mulville, Jacqui (Cardiff University)

**Abstract format:** Oral

Domestic cattle held a prominent role within the Norse subsistence economy at Mounds 2 and 2a, Bornais; a multi-period site on the island of South Uist, Scotland. Inhabitation of this site was constrained by its liminal environment and as such, the determination of how the Norse managed and utilised their cattle is an important element of understanding how they subsisted and survived. This study performed sequential multi-isotopic analysis on the dentine and enamel of the first and second molars of five cattle individuals taken from the Norse phases of the site. The aim was to recreate an oxygen, carbon and nitrogen isotopic biography of the early life of these cattle; oxygen biography from in utero through the first twelve/thirteen months of life and a nitrogen and carbon biography of the first twenty-four to twenty-five months. The results patterned isotopic values against ascending age, revealing ratio changes intrinsic with human-mediated interactions and provided evidence for husbandry practices previously unobservable. Practices included; autumn birthing rhythms in the Middle Norse period, human-mediated early weaning, seasonal transhumance during the spring/summer to in-land pastures and the supplementation of fodder during the winter, which was collected off-site. It also provides evidence suggesting that domestic cattle of that time may have lactated for longer periods than first presumed. The study therefore concludes that the cattle husbandry practices of the Norse occupants centred on the environment in order to maximise yield from their herd.

10 A DOG’S PURPOSE: INTEGRATING ZOOARCHAEOLOGICAL STUDIES AND ADNA ANALYSIS TO ESTABLISH POSSIBLE RELATIONS BETWEEN FUNCTIONS AND CHARACTERIZATION OF DOGS IN ANDALUSIA

**Abstract author(s):** Lupiáñez Corpas, Natividad (Conservation and Evolutionary Genetics Group. Estación Biológica de Doñana - EBD-CSIC) - García Viñas, Esteban (Laboratorio de Paleontología y Paleobiología. Instituto Andaluz del Patrimonio Histórico - IAPH) - Villalón Torres, David (Sistemas de Información. Instituto Andaluz del Patrimonio Histórico - IAPH) - Cornellas, Anna (Conservation and Evolutionary Genetics Group. Estación Biológica de Doñana - EBD-CSIC) - Bernáldez Sánchez, Eloísa (Laboratorio de Paleontología y Paleobiología. Instituto Andaluz del Patrimonio Histórico - IAPH) - Leonard, Jennifer (Conservation and Evolutionary Genetics Group. Estación Biológica de Doñana - EBD-CSIC)

**Abstract format:** Oral

Since their domestication, dogs have been used for diverse purposes as reflected in the different contexts their remains have been found in archaeological sites.

In order to understand the place of dogs in early human communities, we review Andalusian sites with published zooarchaeological studies from Paleolithic to Bronze Age. In spite of the existence of more than 15,000 archaeological sites in this region of the Iberian Peninsula, barely 100 of them have fauna studies published. Despite the lack of published data from this area and the difficulty of finding these studies, we see dogs in foundation rituals, funerary offerings, and even for human consumption.

By integrating these archaeological records with biomolecular data (aDNA analysis), we aim to establish the possible relation between the different purposes of dogs and their characterization from a genetic approach. To do so, we will select nuclear genes related to traits that could have been associated with some of the uses of dogs in these communities. These genes are related to morphological (coat color, hairlessness, size...), metabolism (starch digestion), sensory (olfactory receptors) and behavioral traits. Through mitochondrial DNA analysis, we will firstly verify if the studied remains actually belong to dogs or to another wild canid species. Then, we will attempt to determine if dogs used for certain proposes were local or imported from other regions.

11 BURROWING INTO THE BIO-CULTURAL HISTORY OF RABBITS

**Abstract author(s):** Doherty, Sean - Ameen, Carly (University of Exeter) - Alves, Joel - Granja Martins, Sofia - Larson, Greger (University of Oxford) - Sykes, Naomi (University of Exeter)

**Abstract format:** Oral

Rabbits (*Oryctolagus cuniculus*) are one of the most recently domesticated animals, yet remarkably little is known about the timing or location of their domestication. Native to the Iberian peninsula and southwest France, they have been transported by humans to all corners of the globe to live in diverse relationships with people: as pets, pests, sources of food and laboratory animals. The AHRC-funded project ‘Exploring the Easter E.g.’ is integrating historical and linguistic techniques with traditional zooarchaeological and biomolecular methods (including full-suite osteometric, geometric morphometric, isotope and genetic analysis) to examine the dynamics of varying human-rabbit relationships. In this paper we present our results of the integration of zooarchaeological, isotopic and geometric morphometric data for deciphering the management strategies of British rabbits after their reintroduction in the

Middle Ages. We demonstrate how the combination of these complementary approaches is necessary to decipher the complex processes surrounding both rabbit domestication and subsequent husbandry practices, and unpick this animal’s unique bio-cultural history.

12 **ANIMAL LIFE HISTORIES: BIOCHEMICAL ANALYSES AS PROXIES FOR DIET AND MOBILITY AMONG DOGS AND CAMELIDS IN NORTHERN ARID PERU**

**Abstract author(s):** Alaica, Aleksa (University of Toronto) - Gonzalez La Rosa, Luis Manuel (Archaeology Centre, University of Toronto) - Knudson, Kelly (Arizona State University)

**Abstract format:** Oral

Animal life histories serve as proxies for human daily and long-term strategies. As a particularly powerful set of analyses, biochemical methodologies provide effective datasets to quantify the types of resources on which animals fodder and graze, but also their mobility patterns. Stable and radiogenic isotopes are compared among dog and camelids from the 1st millennium CE site of Huaca Colorado on the northern coast of Peru. Examining the variable dietary and mobility trends among these species allows for the elucidation of their role in trade labour, as pastoral tools and as companions. This paper examines the variation in carbon, nitrogen and strontium isotopes among dogs and camelids ensuring spatial control for each specimen. Most dog and camelid remains that are analyzed by isotope analyses are from dental samples that have associated age details. By considering the age of each animal, their spatial context and their chronological association, this paper determines that dogs were locally raised and interred at Huaca Colorado, while camelids were traveling from distant regions to bring valued trade goods from highland and other coastal locations. The variable evidence of dogs and camelids in herding strategies in arid northern Peru attests to the integral role of dogs as pastoral companions and herding tools and camelids as key labour capital.

13 **AN OSTEOBIOGRAPHY OF CHOPPERS THE ‘PG TIPS CHIMP’**

**Abstract author(s):** Davis, Olivia (Department of Archaeology, University of Exeter) - Capponi, Giovanna (Department of Department of Life Sciences, University of Roehampton) - Chidimuro, Blessing (Department of Archaeology, University of Reading) - Cooper, David (National Museums Scotland) - Thomas, Virginia (Department of Sociology, Philosophy and Anthropology, University of Exeter) - Dobbs, Phillipa (Twycross Zoo) - Doherty, Sean (Department of Archaeology, University of Exeter)

**Abstract format:** Oral

There is expansive literature about the history of zoological gardens, and what these institutions represent in terms of human-animal relationships. However, with the exception of a few celebrity individuals, the animals’ stories have never been told. Many zoos donated specimens of deceased zoo animals to natural history museums (e.g. those of Paris, London and Edinburgh) and these skeletons have the potential to reveal the lived experiences of zoo animals. The creation of osteobiographies is a well-established method for reconstructing life/death histories from human remains, but the approach is seldom applied to animals. Using detailed skeletal (osteology, pathology) and biomolecular analyses (stable isotope analysis, elemental analysis), combined with archives that include her medical and social histories, we will narrate the life of one particular zoo animal, ‘Choppers’, a chimpanzee who featured in advertisements for the British brand of tea, PG Tips. This first osteobiographical analysis of a zoo animal provides a first step in the wider analysis of how chimpanzees have adapted to a life in captivity, including the impact of feeding on their development and health in comparison with wild chimpanzees. We conclude that zooarchaeological techniques can be deployed to benefit modern zoo-animal management.

530 **BREAKING POINTS. MEDIEVAL AND MODERN SOCIETIES IN TRANSITION THROUGH MATERIAL CULTURE**

**Theme:** 6. Material culture studies and societies

**Organisers:** García-Porras, Alberto - Busto-Zapico, Miguel (Universidad de Granada) - Cirelli, Enrico (Università di Bologna) - Zavagno, Luca (Bilkent University) - Teixeira, André (Universidade NOVA de Lisboa)

**Format:** Regular session

This session focuses on different events and stages of the Medieval and Modern era as by-product of transitional processes. For instance, technological and technical changes stem from dynamics of impulse, progress, advance, and extraction or resistance to other cultur-al forms; these will be examined mainly through the lenses of archaeology and material culture.

Indeed, material culture could shed light on different issues in the longue durée spanning from the end of the Classical world to the beginning of the Modern era. These included: the rise of the State, the birth of a global economy and the cross- cultural transactions between the Latin Christian, Byzantine and Islamic world.

One can notice the occurrence of changes in the different uses and forms of material cul-ture as well as opposition or resistance. They allow us to grasp the ability of social groups to accept, assimilate or even reject external influences. In this light, one should admit that historiography has slanted towards single key-studies rather than approaching the general tendencies and trends characterizing the material culture of the periods under scrutiny here.

As a result, the proposed session includes papers which analyse different transition pro-cesses through the study of material culture. It will aim to provide an opportunity to com-pare and discuss these developments and lay the foundation for further theoriza-

tion in the studies of material culture as approached from different epistemological perspectives. Lastly, this session stems from the idea that an interdisciplinary approach could dwell on specific trends to be debated and discussed across the historiographical board.

**ABSTRACTS:**

1 **TRANSFER OF CRAFTSMANSHIP KNOWLEDGE IN LATE ANCIENT-EARLY MEDIEVAL MEDITERRANEAN SOCIETIES: PRODUCTION OF GLAZED CERAMICS AND DEVELOPMENT OF NEW TECHNOLOGIES**

**Abstract author(s):** Cirelli, Enrico (Università di Bologna)

**Abstract format:** Oral

Between the fifth and the eight centuries an extraordinary development of new forms start to be produced in various regions of the Mediterranean Sea within Western and Eastern artisans’ workshops, first standing on Late Roman tradition, inherited by byzantine and muslims societies. Glazed vessels appear to be produced in northern Adriatic ateliers with a restrict formal repertory and in a certain moment at the end of the 7th cent. Start to be produced with same characteristics, such as mortars, but adding also new forms, most of them imitating Sasanian dishes and other vessels, but also inventing a synthesis of eastern and western form that will become a marker for the byzantine early medieval community. In this paper I will try to follow the movement of different techniques and vessel repertories from Ravenna to Constantinople and from Syria to the New Rome, to better define this new revolutionary craftsman tradition based on ancient methods but developing new models.

2 **BYZANTINE ISLANDS IN TRANSITION (CA.600-CA.900): AN ARCHAEOLOGICAL PERSPECTIVE**

**Abstract author(s):** Zavagno, Luca (Bilkent University)

**Abstract format:** Oral

This paper examines the economic and political role played by some large islands of the Byzantine Mediterranean in the passage from Late Antiquity to the early middle ages (ca. 600-ca. 900 CE). Although literary sources (both Byzantine and Arab and western) dismiss islands of the western and eastern Mediterranean simply as places of exile or distant military outposts along maritime frontiers, archaeology and material culture have recently shed light on the role they played as “spaces of connectivity”. This is due not only to their strategic locations along the commercial shipping routes crisscrossing the Mediterranean, but also because islands often presented unique opportunities for cultural encounters.

Indeed, this paper tries to briefly document how some Mediterranean islands such as Sardinia, the Balearics, Malta, and Cyprus were not simply caught in the crossfire of a “Pirennian” faultline between two (or more) polities; they rather consistently acted as places where local elites adjusted the tone of their daily socio-economic, cultural, and even religious interaction.

Coins (Arab-Byzantine, Byzantine, and Islamic), lead-seals (both Byzantine and Arab), inscriptions (boasting Greek, Latin, and Kufic characters), as well as the results of the analysis of production and circulation of ceramics chime with the literary sources to present a comparative picture of the relationships between the Byzantines and the Muslims. This in order to oppose to the idea of the so-called Dark Ages as a chronological breaking point but rather to analyze the construction of a Mediterranean maritime “frontier” as not simply pierced by cycles of raiding and warfare.

3 **“EVERYTHING MUST TO CHANGE SO THAT NOTHING CHANGES”: THE TRANSITIONAL CONTINUITY OF THE ȚŪR ‘ABDĪN REGION**

**Abstract author(s):** Sommella, Virginia (Bilkent University)

**Abstract format:** Oral

This paper focuses on the history of the frontier along the river Tigris- and in particular on the region of the ȚŪr ‘Abdĭn located in south-eastern corner of modern Turkey, in the longue durée spanning the Medieval and early Modern Era. Indeed, in the Late Roman, Byzantine, and early Umayyad period, the ȚŪr Abdĭn preserved the area’s genius loci, resulting in what scholars described as the “Pompeii premise” (the chance to remain in touch with both the present and the historical past). So, by its very nature one should regard the ȚŪr ‘Abdĭn as a frontier outpost, constantly peripheral to its centers, and at the same time far away from the border itself. In this light, the ȚŪr ‘Abdĭn constitutes a privileged viewpoint in consideration of both its relationship with the frontier as a macro-transition zone, and its peculiar micro-ecology.

Therefore, this paper will aim at shedding some light on ȚŪr Abdĭn’s subsistence economy through the lens of the agricultural material culture. It thus aims to present an overview of photographic records from previous investigations of so-called exploratory archaeology over the last one hundred and fifty years, in a comparative perspective. It will include, among others, samples from the Gertrude Bell’s Archive (1905, 1911) and an unpublished fieldwork image collection of the mission run during the 1980s under the auspices of the University “La Sapienza” in Rome. This will allow me to dwell upon the resilience of the peculiar human landscape of the ȚŪr ‘Abdin region, with a persistence of rural customs and practices which closely resemble those described by Early Byzantine and Medieval sources. The detection and analysis of long-lasting cultural specificity, namely the historical continuum of the ȚŪr ‘Abdĭn, and its resistance to the external vicissitudes, will help to identify a continuous and fluid transition between cultures.

4 CERAMIC PRODUCTION AND SOCIAL CHANGE IN THE SOUTH-EAST OF THE IBERIAN PENINSULA BETWEEN THE ISLAMIC AND CHRISTIAN PERIODS

**Abstract author(s):** Busto-Zapico, Miguel - García-Porras, Alberto (University of Granada)

**Abstract format:** Oral

The major social and political shifts undergone by the south-eastern Iberian Peninsula, and specifically Granada (Spain) between the fourteenth and seventeenth centuries brought about clear changes in the ceramic repertoire. This work analyses these changes through the comparative analysis of three archaeological sites: the Castle of Moclin, the Palace of the Abencerrajes and the Fortress of Lanjarón. These sites present a clear transitional sequence spanning Nasrid repertoires and Early Modern Castilian productions, including instances of both continuity and rupture.

The pieces under analysis were classified first by function and second by shape. A further subdivision considers formal variants within each shape group. After characterising the typologies, the standardisation of production within a sample of materials from the Palacio of Abencerrajes was estimated through the coefficient of variation. The resulting CV is a measure of standardised dispersion, which reflects the degree of craft specialisation. A number of constants established by ethnographic and ethno-archaeological studies were taken into account to detect patterns in production, degree of specialisation, random factors, scale of production, and production volume, assuming that these variables change over time.

This work aimed to offer a wide overview of the changes documented in ceramic repertoires in the Kingdom of Granada between the fourteenth and the seventeenth centuries, through the detailed analysis of three distinct archaeological sites. The shifts attested in the ceramic record were related to the profound social transformations undergone by the south-eastern Iberian Peninsula during this period. These transformations had far-reaching consequences on ceramic types and production techniques. Workshops and workshop practice also changed significantly, either through the substitution of former production models or by their adaptation to new market demands. From this point on, workshops implemented novel techniques, such as the finishing of pot bases on the wheel, and standardised their wares to increase productivity.

5 FROM MAJOLICA TO SLIPWARE: THE LONG TRANSITION TO THE MODERN ERA IN THE PISAN CERAMIC PRODUCTIONS

**Abstract author(s):** Giorgio, Marcella (Soprintendenza Archeologia, Belle Arti e Paesggio per le province di Pisa e Livorno)

**Abstract format:** Oral

The study of Pisan ceramic production between the 15th and 16th centuries is the basis of the doctoral research that I conducted at the University of Pisa. This analysis has brought new results to better understand the evolution and change of city ceramic production between the Late Middle Ages and the Early Modern Age.

The revision of old contexts and the union of new data both from excavations and written and archaeometric sources has allowed me to reconstruct the evolution of Pisan ceramic workshops in a time of long transition between the 15th and the early 17th century.

This transition, in an important moment in the history of Pisa both at a political, social, economic and cultural level, allows us to see an important transformation in the local ceramic production: from the mid-fifteenth century the introduction of sgraffito slipware technique will accompany and, slowly, replace the production of archaic majolica. This slow change was influenced by the particular historical moment experienced by the city and the new sgraffito slipware ceramics for almost a century will maintain characteristics common to the last archaic majolica (shapes and decorations).

Only at the end of the 16th century, when new historical scenarios influenced the politics and economy of Pisa, the city workshops stopped producing majolica to produce sgraffito slipwares only that were so successful thanks to the trades to northern Europe and the American countries.

6 CROSSING CONTEXTS. THE SYNCHRONIC AND DIACHRONIC ROUTES OF MEDIEVAL POTTERY TO RECONSTRUCT LOCAL CONTEXTS AND HISTORICAL PROCESSES

**Abstract author(s):** Panetta, Alessandro (University of Genoa)

**Abstract format:** Oral

This paper addresses the contribution that the study of a specific ceramic class, the archaic thyrranian sgraffito produced in the Savona area in the late middle ages, can give to challenging generalist historical reconstruction, both in a diachronic and synchronic sense.

On the one side, the “horizontal” contextual role of this pottery within the assembly of the material culture of 13th and 15th c. settlements in north-western Sardinia (Italy), highlights how localised archaeological analysis may face synthetic and large-scale traditional frameworks (the crusades, the maritime republics, the rise of medieval communes, the “Renaissance of the 12th century”, etc.).

On the other, through the cultural biography approach, the study of a ceramic class allows us to identify the “active” role that pottery played in the long term, both before and after its conventional period of use, assuming that objects can be analysed both referring to their “original” context of use, as in their “afterlife” reuse ones.

In the first case, pottery and other materials assemblages will be analysed, highlighting unexpected relationships. In the second one, the contribution analyses the pottery relationships with other social and political actors (noble families and private individuals) which were involved at an entrepreneurial and mercantile level, as such as the social groups that used them, i.e. questioning if it’s possible to use this ceramic as an indicator of overseas communities (as past studies demonstrated for example in the case of Hanseatic League towns in the Baltic Sea).

7 PLATES YOU CAN EAT: ARCHAEOMETRICAL CHARACTERIZATION OF BUCARO POTTERY FROM PANAMA

**Abstract author(s):** Inanez, Javier (University of the Basque Country UPV/EHU)

**Abstract format:** Oral

Panamá Viejo was founded in 1519 by the Spanish expeditionary Pedrarias Dávila. At the time, it was the first permanent settlement in the Pacific Ocean, becoming a city by a royal decree in 1521. Shortly after its creation the city became an important base for the trade with Spain. Unfortunately, in 1671, the English pirate Henry Morgan attacked and sacked the city, resulting in a fire that destroyed the entire city. Thus, a new settlement was built a few miles west, which would become the origin of the modern Panama City.

Roja bruñida pottery, also known as bucaro pottery, is a very characteristic typology of ceramic within colonial contexts in America that is distinguished by a red/brownish clay paste with a shiny reddish thin slip. This study piles up information on the archaeometrical characterization of the so-called Roja Bruñida pottery from Panama unearthed in archaeological excavations at Panama Viejo and Casco Antiguo. A set of 45 ceramics have been characterized by means of chemical (NAA), mineralogical (XRD) and microscopical (SEM) analyses. The archaeometrical study of these wares will shed light into the understanding of the technological influence by European and local potting traditions within the cultural frame of societies in contact in a colonial context. Additionally, the supply of raw materials for the potting industry in colonial Panama is assessed diachronically considering the important historical disrupting episode that eventually ended in the relocation of the city. Differences in red slip technological choices can be track down archaeometrically, suggesting different workshops or traditions, while consume habits are presented in detail, like the associated bucaro-phagy practice related to these pots and documented in ancient literature. Larger archaeological and historical implications of this important ceramic in the Spanish colonial market within the region are also assessed.

8 THE CHANGE IN TEXTILE PRODUCTION IN AL-ANDALUS (8TH-13TH CENTURIES): A PROCESS OF SPECIALISATION FROM THE ARCHAEOLOGICAL PERSPECTIVE

**Abstract author(s):** Moreno Narganes, José María (University of Alicante)

**Abstract format:** Oral

The changes generated in the Iberian Peninsula since the conquest of the Umayyad state of Damascus in the 8th century materialised in a host of elements, both ideological (politics, society, etc.) and material. From the time of the conquest onwards, the archaeological record shows a profound change in the architecture, ceramic and metallurgical production systems and also in textile production.

From the 8th century onwards, the forms of production in both spinning and weaving were to change radically in the Mediterranean, where forms and instruments such as the weight loom were to disappear in favour of others that would now become the majority, such as the frame loom or the horizontal or pedal loom. In spinning techniques, the changes were equally important. From the 10th century onwards, the use of new materials for the manufacture of tools is documented, both in the production of spindle whorls and spindles.

This participation seeks to demonstrate how al-Andalus, as in ceramics and so many other productions, the textile industry underwent a process of productive complexity (ss. VIII-XIII) in parallel with the extension of a tax-based state that would be strengthened by the development of a market-based economy. This process will generate a productive specialisation, both in spinning and weaving, where new, more specific working tools will appear, leading to an increase in production. In addition, textile production is articulated in different production sites/workshops. In this research, special attention will be paid to working tools related to domestic spaces.

To explain these changes, textile working tools from different excavations (Tolmo de Minateda, Cordoba, Almeria, etc.) will be presented to demonstrate this process of change. The study will be completed with textual sources such as “hisba” treatises, historical or legal chronicles (apprenticeship contracts, etc.).

9 DRESS - DESIGNING FASHION FROM 16TH-CENTURY SOURCES. AN ARCHAEOLOGICAL FOOTWEAR STUDY

**Abstract author(s):** Garcia, Ana Catarina - Pinto, Carla (CHAM - Center for Humanities)

**Abstract format:** Oral

Integrated within the scope of DRESS project, which aims to contribute to the understanding of the historical, tactile and material dimension of women’s elite clothing in Portugal during the 16th century, this paper’s goal is to present a study focused on Portuguese and Iberian footwear. Starting from archaeological footwear finds recovered during underwater or interface interventions, namely shipwrecks and riverside contexts, the purpose is to address some of the identified and well-preserved leather collections. We aim

A.

POTTERY PRODUCTION AT THE TOWN OF QUART (CATALONIA, SPAIN): AN EXPONENT OF CRAFT EVOLUTION BETWEEN MEDIEVAL AND MODERN TIMES

**Abstract author(s):** Travé Allepuz, Esther (Universitat de Barcelona) - Vicens Tarré, Joan (Universitat Oberta de Catalunya)

**Abstract format:** Poster

The town of Quart (Catalonia, Spain) has a long-lasting tradition of greyware pottery production known at least since the end of Middle age and still active today. Grey or black pots fired until reducing atmosphere were a daily ceramic product used in medieval Catalonia, being the most common artefact found in archaeological sites of this period. While they used to disappear progressively in most scenarios since the Late Medieval period, some areas kept an enduring craft tradition that made greyware production survive. In this context, Quart is a beautiful example of how potters managed to keep their production alive, to protect their economic interests, and to spread their expertise and techniques to nearby areas.

Analysing pottery production at this place from a global approach has provided a powerful insight about the processes that lead to vessels’ functional adaptation and technological change during the transition period from late medieval to modern era. The goal of this contribution is to offer preliminary results of an on-going research project focused on the understanding of crafts modernization and social organization of artisans at the dawn of Modern Age. The study included formal and technical characterization of vessels, the exploration of written sources, and the ethnographic approach to present day production. In doing so, we gathered useful data and exploited them from an archaeological landscape perspective in order to determine the networks of distribution, the raw material supplies and the spread of innovation in vessel’s shape and paste recipes.

Through this contribution, we aim at strengthening the interdisciplinary character of pottery analyses, and the global interpretation of cultural issues outlining the genuine character of local and regional production systems. The combination of micro- and macro-scales of observation lead us to a better perspective of greyware pottery evolution in transition periods.

B.

MEDIEVAL SPACES OF VERANES (ASTURIAS, SPAIN). ANALYSIS OF A DOMESTIC STRUCTURE FOUND IN THE NORTHERN COURTYARD OF A ROMAN VILLA

**Abstract author(s):** Busto-Zapico, Miguel (University of Granada) - Gil Sendino, Fernando - Fernández Ochoa, Carmen (Universidad Autónoma de Madrid) - Gutiérrez González, José Avelino (Universidad de Oviedo)

**Abstract format:** Poster

The Roman villa of Veranes (Gijón, Asturias, Spain) is located about 800 meters from the road that connected the Roman enclave of Gijón with Asturica Augusta (Astorga), capital of the Conventus Asturum. Archaeological excavations here in 2002 and 2003 excavated a wooden Medieval house, which is the subject of this study. The associated ceramic material has allowed us to trace the continuities and breakages between Roman and distinctly Medieval horizons.

Veranes has a long historical trajectory, beginning with a first rural nucleus built during the second half of the 1st century A.D. Between the end of the 3rd century A.D. and the second half of the 4th century A.D., the enclave underwent a total remodeling that transformed it into a luxurious Late Antique rural site. It functioned in this capacity throughout the 5th century A.D. and the first half of the 6th century A.D. The Medieval phase is first defined by the reuse of some of its outbuildings as a religious center during the second half of the 6th century.

The north courtyard of the villa contains the remains of wooden structures associated with habitation spaces. These elements are the negatives of post holes of a cabin made of wood and clay, which has a circular shape and a central hearth. The radiocarbon dating carried out on these remains places the structure’s use between the end of the 7th century and the last quarter of the 9th century.

The study of the ceramic material has allowed us to observe some characteristics of the Early Medieval domestic assemblage. The technological and technical analysis of 2306 fragments identified 12 groups with a very limited number of forms. Although these forms did contain some characteristics of the preceding periods, it clearly comprised an Early Medieval repertoire.

BIOARCHAEOLOGICAL APPROACHES TOWARDS UNDERSTANDING THE IMPACT OF DIFFERENT FORMS OF CRISES ON HUMAN LIFEWAYS

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Michael, Dimitra (School of Archaeology, University College Dublin) - Fibiger, Linda (School of History, Classics & Archaeology, The University of Edinburgh; School of Archaeology, University College Dublin)

**Format:** Regular session

Throughout human history, cycles of growth and decline have succeeded one another. Periods of turbulence, hardship or even destitution – e.g. the end of the Late Bronze Age in South-Eastern Europe, the Fall of Roman Empire, the Justinian Plague, the Mayan Collapse, the Great Irish Famine, the Great Recession in the United States of America, the Dutch Famine - are manifestations of different forms of crises. Brought about by climate change, natural disasters, pandemics, socio-economic decline, political turbulence or wars/conflict, these periods of change and upheaval elicit diverse cultural and biological responses. Aiming to better comprehend the complex and varied responses to crisis and change throughout human history, this session brings together scholars from a range of bioarchaeological sub-disciplines to explore the impact of different forms of crises on human lifeways as expressed through funerary practices, health, diet, mobility, subsistence strategies and activity patterns. We invite case studies using interdisciplinary approaches to address research questions related but not confined to: 1) the dual role of human mobility as a possible cause but also a response to change and crisis, 2) the interaction of cultural and environmental factors as a cause of hardship and destitution, 3) the impact of crisis on gender relations and social organization and 4) cultural resilience and socio-economic responses to health crises. Throughout, we will consider how biocultural responses of crises in the past can inform us about challenges we face in the world today.

1

THE EFFECTS OF SOCIETAL COLLAPSE ON HEALTH: EXAMINING RECENT HISTORY TO CONTRIBUTE TO UNDERSTANDINGS OF LATE ANTIQUITY IN GAUL

**Abstract author(s):** Quade, Leslie (Masaryk University) - Gowland, Rebecca (Durham University)

**Abstract format:** Oral

Late Antiquity (c. 300-700 CE) has often been conceptualized as a period of socio-political rupture marked by the collapse of the Western Roman Empire and the transition to the Medieval period. The nature of this transition and whether it was marked by either catastrophic or more gradual change has been much debated. Societal collapse results in structural breakdowns and instability, which can impact life expectancy and population health. As such, bioarchaeological studies should be well-suited to contribute to debates over Late Antique ‘collapse’ or ‘continuity’.

However, previous bioarchaeological studies have sometimes struggled to relate observed patterns in skeletal indicators of morbidity and mortality with socio-political changes. Therefore, a critical aspect of the present research was to consider the type of health changes occurring during societal collapse, based on a modern example (The Soviet Union). These observations were operationalized into a ‘model’ and applied to data from the Roman and Late Antique periods in Gaul to identify the more subtle effects of collapse on health in the past. While contextually far removed from the Roman Empire, the Soviet Union is the only example of a large-scale union of multiple countries for which clinical data relating to its collapse is available.

Femoral lengths and height-for-age (HAZ) Z-scores from non-adult and adult skeletal remains (269 individuals) from northern and southern Gaul were analyzed as a proxy for health. Although some of the tenets generated from health patterns observed during the collapse of the Soviet Union were met, the ‘model’ was found to lack sufficient specificity to identify if populations in Gaul experienced societal collapse during Late Antiquity. However, the model provided specific criteria that link bioarchaeological and modern analyses of health, well-being, cultural and social influences, and provides a novel framework for researching health in relation to historic trends.

2

SOCIO-ECONOMIC AND GEOPOLITICAL IMPLICATIONS OF CLIMATE CHANGE – A CASE STUDY FROM NORTHWESTERN CHINA

**Abstract author(s):** Cheung, Christina (UMR 7206, Eco-anthropologie - EA, Muséum National d’Histoire Naturelle, CNRS, Université Paris Diderot; UMR 7269, Aix Marseille Univ, CNRS, Minist Culture, LAMPEA) - Hepburn, Joseph - Zhang, Hua (Department of Archaeology, Simon Fraser University)

**Abstract format:** Oral

A recent meta-data analysis using mainly stable carbon isotope and dental health data revealed that a global climatic event – the Holocene Event 3 (beginning c.4200 BP) was likely a main contributing factor for wheat’s adoption across Northern and Northwestern China towards the end of the Neolithic period. Throughout the Neolithic period, millet, a C4 crop, was the staple crop in the region, where wheat and barley, both C3 crops, were introduced sometime during the late Neolithic period. Isotopic data revealed that between 4500 – 4000 BP, communities along a 2000 km transect switched from a predominately C4-based diet to a mixed C3/C4 diet almost simultaneously, thus it is suggested that C3 crops such as wheat and barley were incorporated to help alleviate

the pressure of resources shortage caused by this climatic anomaly. However, a closer examination at how different cultural groups responded to this crisis reveals a much more complex picture. In this study we focus on discussing the collapse of the Machang Culture (agricultural) and its subsequent branching into Qijia (agricultural), Xindian (agricultural), and Siwa (mixed pastoral-farming) cultures between 4500 – 3000 BP in Northwestern China. The groups evidently coped with resources shortages very differently, where some continued with a predominantly agricultural lifestyle, some adopted a mixed pastoral-farming economy. By combining isotopic, general health, and traditional archaeological evidence, we demonstrated that the Holocene Event 3 has caused much more than just a shift in subsistence economies across Neolithic China, but also instigated extensive socio-political and economic reorganizations in the region.

3 **EXPLORING TEMPORAL AND GEOGRAPHICAL DIFFERENTIATIONS IN LATE BRONZE AGE GREECE: A COMPARATIVE BIOARCHAEOLOGICAL APPROACH**

**Abstract author(s):** Michael, Dimitra - Molloy, Barry (School of Archaeology, College of Social Sciences and Law, University College Dublin)

**Abstract format:** Oral

The Late Bronze Age (LBA) of the Eastern Mediterranean was a highly networked center of intercultural interaction. Reaching a zenith in the 14th to 13th centuries BC, social upheavals in the decades around 1200 BC led to a collapse of elite political and economic networks. Climate change, earthquakes, environmental collapse, social revolts, mass migrations, changes in warfare, disease, or economic over-specialization have been proposed as causes of the collapse of the Mycenaean palatial system in Central and Southern Greece. In contrast, in northern Greece political systems and population levels appear to have been largely uninterrupted, while in Crete at 1200 BC many defensible villages were established showing thriving signs into the first millennium BC. The objectives of this paper- which lie at the heart of The Fall of 1200 BC project (European Research Council GA #772753) - are a) examining the relation between specific social characteristics of LBA sites in Greece with lived reality, through a comparative geographical bioarchaeological analysis and b) exploring potential temporal differentiations, during before and after the 1200 BC period, by implementing a comparative bioarchaeological approach. Skeletal assemblages spanning from Macedonia and Epirus to the Peloponnese and Crete, ranging from LBA to Early Iron Age were analyzed using health, lifestyle and stress indicators. Novel data will be critically evaluated and compared with published results towards a contextualized comparative approach.

4 **THE MIGRATION PERIOD AT BASEL (SWITZERLAND): TRANSFORMATION OR CONTINUITY?**

**Abstract author(s):** Depaermentier, Margaux (Department of Prehistoric, Early Historic, and Provincial Roman Archaeology, Vindonissa Professur, University of Basel) - Gerling, Claudia (Integrative Prehistory and Archaeological Science, Departement of Environmental Sciences, University of Basel) - Hajdas, Irka (Laboratory of Ion Beam Physics, ETH Zurich) - Krause-Kyora, Ben (Institute of Clinical Molecular Biology, Christian-Albrechts-University Kiel) - Schwarz, Peter-Andrew (Department of Prehistoric, Early Historic, and Provincial Roman Archaeology, Vindonissa Professur, University of Basel)

**Abstract format:** Oral

The so-called ‘Fall of the Western Roman Empire’ and the transition to the Merovingian Period is often described as a sequence of crisis and socio-cultural transformation. The ‘Migration Period’ was long associated with the scientific narrative that foreign people with foreign cultural perspectives deliberately and violently invaded a local (Roman) society and triggered its collapse. However, these ideas are mostly built from ancient written sources or were racially motivated from 18th-21st century political discourses.

In this context, Basel is a particularly interesting research object, because the city is located at the River Rhine, which formed the administrative boundary of the late Roman Empire – a socio-cultural melting pot during the Late Antiquity. Due to this location and the archaeological record the late antique Basilia and the early medieval Bazela provide a unique possibility to study societal development during this important transformation period in Central Europe at the periphery of the former Roman administration. The local society can be traced primarily through cemeteries, which are geographically distributed over the entire urban area of modern Basel covering the period between the 4th and the 8th centuries AD. Although the theory of the Rhine representing a sharp cultural boundary until the end of the 5th century AD is outdated, the burials on the right bank of the river are still addressed as ‘Germanic’, while those buried on the left bank are referred to as ‘Romans’.

Integrating isotope, aDNA, radiocarbon and archaeological analyses, we want to explore these traditional narratives and investigate continuities or discontinuities in mobility patterns, subsistence strategies, lifestyles, and funerary practices in Late Roman to Early Medieval North-western/NW Switzerland. We will present a profound archaeological evaluation and critically discuss the scientific results of a first group of analysed burials.

5 **THE SHAMROCK SHORE: ANALYSING THE HEALTH AND DISEASE OF IRISH IMMIGRANTS DURING THE GREAT IRISH FAMINE**

**Abstract author(s):** Strang, Sheridan (Durham University; University of Iowa Office of the State Archaeologist) - Caffell, Anwen (Durham University)

**Abstract format:** Oral

The Great Irish Famine, that lasted from 1845 to 1849, was one of Ireland's most disastrous periods in history. Ireland's reliance on the potato crop led to devastating effects to Ireland socially and economically. By the end of the Famine, half of Ireland's population

was gone, either through emigration or death. Those who did emigrate during the Famine were met with continuous challenges along their journey. Overcrowded and disease-ridden ships led to a high mortality before arriving to Great Britain or North America. Irish migrants in both Great Britain and North America, live in overcrowded and unsanitary neighbourhoods and mostly worked dangerous and unattractive jobs.

This study examines the health and disease from two predominately Irish migrant sites from Great Britain and North America through the macroscopic analysis of skeletal remains. Through a comparison between the health of Irish migrants with 19th century locals from Ireland, Great Britain, and North America, it was determined what aspects of migrants living and working environments had negatively impacted their health. This study examined 268 adults from Lukin Street London and 369 adults from Third Street Dubuque Iowa. These individuals were chosen due to isotopic and historic evidence linking these cemetery sites to those that emigrated during the Great Famine. High prevalence rates of dental disease, infection and trauma were observed within both Irish migrant communities. Similarities and differences in health statuses could be observed between sites. However, specific aspects such as living environment and occupation severely impacted the health statuses observed in both migrant sites.

Based on health patterns observed within Lukin Street and Third Street, this data can later be utilised in future studies to analyse and identify similar health trends in other possible migrant sites that emigrated in the 19th century.

6 **UNLOCKING THE POTENTIAL OF STABLE ISOTOPES ANALYSIS TO UNDERSTAND THE DIET IN THE EARLY MIDDLE AGES IN NORTHERN ITALY**

**Abstract author(s):** Marinato, Maurizio (Dipartimento dei Beni Culturali Università degli studi di Padova)

**Abstract format:** Oral

Diet is a central aspect of human life, but it can also be a proxy to have more information on social structures, economy, impact of climate changes through the course of history. Dietary choices and cooking practices can also be influenced by the arrival of new populations thanks to migrations / invasions. These are key factors in early medieval northern Italy, to better understand a period characterised by a multifaceted crisis: political (end of the Roman Empire and arrival of the ‘Barbarians’), social, climatic, economic. However, the potential of the study of diet for this aim, has been undervalued until recently. Bioarchaeology and stable isotopes can play a central role in understanding diet, but most of the studies haven't accounted for the distinctive meaning of the different topographic locations (e.g. urban/rural, connection with economic routes), or haven't contextualized the isotopic data within the archaeological site.

This paper analyses six late antique and early medieval cemeteries located in different areas of northern Italy (regions of Lombardy and Emilia Romagna). It investigates trends in food consumption, evaluating the limits of interpretation in relation to the availability of local resources, political changes (i.e. the arrival of the Lombards), social structures. The Carbon and Nitrogen analyses performed in this study resulted in heterogeneous data, reflecting more the local resource ecosystems, than deliberate cultural choices.

Overall, the paper will call for caution when dealing with small set of data, which risk to result in biased interpretations.

7 **“WE DON'T EAT, WHAT YOU EAT”: CAN ISOTOPE-BASED DIET RECONSTRUCTION DETECT THE MOVEMENT OF CELTIC AND GERMANIC INVASIONS INTO ITALY?**

**Abstract author(s):** Schmidtova, Dominika - Klontza-Jaklova, Vera (Faculty of Arts, Masaryk University) - Fernandes, Ricardo (Faculty of Arts, Masaryk University; Department of Archaeology, Max Planck Institute for the Science of Human History; School of Archaeology, University of Oxford)

**Abstract format:** Oral

Overpopulation, economic crisis, armed conflicts, climate change, or their combination are some of the causes that can lead to mass migrations. As migrant populations encounter a new physical and cultural environment their traditional lifestyle may undergo changes. In our project, we investigated the impact of spatial mobility on the dietary habits of migrant populations during the Iron Age and the Migration Period.

Our main research goal was to assess processes of dietary acculturation by Germanic and Celtic migrant populations arriving in northern Italy. During the 4th century BCE, the Etruscan region of Emilia Romagna (Northern Italy) witnessed the arrival of Celtic populations from Central Europe while during the 5th and 6th century CE the region was one of the main clusters of Germanic settlement in the Po valley.

Our methodological approach combined archaeological and historical evidence with isotopic analyses to reconstruct subsistence and spatial mobility patterns of local and migrant populations. We relied on human assemblages from well-dated burial contexts. Oxygen stable isotopes measured on tooth enamel are employed to detect individuals that were not born at the place of burial while carbon and nitrogen isotopes measured in collagen extracted from different teeth and skeletal elements are employed to build individual dietary iso-biographies. From this and from isotopic comparisons with local populations it becomes then possible to investigate dietary acculturation processes.

During our presentation, we will present preliminary research results.

8 DIET MIGRATION AND HEALTH IN THE CONTEXT OF MEDIEVAL MORTALITY CRISES

**Abstract author(s):** Beaumont, Julia (University of Bradford) - DeWitte, Sharon (University of South Carolina) - Montgomery, Janet (Durham University)

**Abstract format:** Oral

Crisis mortality, a dramatic but temporary increase in mortality rate resulting from a single factor, is an important phenomenon in many populations. This project integrates paleodemographic and isotope analyses to examine temporal changes in diet and migration at the time of the 14th-century Black Death and the interactions among diet, migration, demography, health, sex, and socioeconomic status in the context of the medieval mortality crises of famine and plague. This project will highlight the cultural and social aspects that affect crisis events and their outcomes. Clarifying how dietary resources were distributed in the medieval period will allow for an examination of the ways in which general resource availability in a population does not necessarily translate into widespread benefits in the face of socially-, economically-, or politically-prescribed patterns of access to those resources (Baro and Deubel, 2006; Wisner et al., 2004). This project will also contribute to an understanding of long-term changes in immigration in the context of disaster and particularly the health consequences thereof. The results of this project can aid predictions about what might happen in future demographic crises. This project will be the first large-scale integration of hazard analysis-based paleodemography and isotope analyses, and will thus move the field forward in exciting and innovative ways. This approach will address the theoretical and analytical issues of heterogeneous frailty and selective mortality that substantially complicate reconstructions of life and health in the past using human skeletal remains (Wood et al., 1992). Application of the best paleodemographic analytical methods for assessing heterogeneous frailty and selective mortality in the context of medieval mortality crises is particularly important given that mortality crises are still experienced in many populations today, and thus it is crucial to examine how these crises have affected human populations and how people have responded to them throughout history.

9 THE MORTALITY OF CHILDREN UNDER FIVE YEARS OF AGE AT MONTE ALBÁN, MEXICO, DURING THE CLASSIC PERIOD (200-700 AD)

**Abstract author(s):** Camacho, Miriam (Physical Anthropology at Escuela Nacional de Antropología e Historia)

**Abstract format:** Oral

Monte Alban during the Early Classic Period (200-500 AD) experienced population growth and is related to the time of greatest flowering. During the Late Classic (500-700) Monte Albán experienced a population growth but at the same time had a decrease in its political power, due to the rise of Teotihuacan (Márquez et al., 1994; Joyce and Winter, 1996; Blanton et al., 1999). The population growth and its political crisis caused an unequal distribution of food among its inhabitants. In addition to this situation, the city suffered from a shortage of water, poor management of organic waste that caused the proliferation of infectious diseases. Children under five years of age were the most vulnerable to these situations, it is known that the first three years of life are critical stages of development that will determine their future health and probability of reaching adulthood (Bogin & Smith, 2012; Frenk, Bobadilla, Stern, Frejka, & Lozano, 1991; Hochberg, 2012). Therefore, their analysis makes it possible to measure the consequences of the social, political, environmental, cultural and economic context in which they lived. The present study aims to analyze the burials of children under five years of age buried in the housing units of the Monte Albán site during the Classic (200-700 AD), where their social position (burial location) will be evaluated along with their health conditions. and nutrition. The explanatory framework is based mainly on the biocultural approach, which provides the necessary tools to reveal the relationship between mortality and the factors that contribute to its incidence, since it sees the human being not only as a biological being but also as a social being that interacts with culture throughout his life (Kelso, 1978; Stinson, Bogin, O'Rourke, & Huss-Ashmore, 2012).

10 CONTESTED SPACES: A RE-INTERPRETATION OF THE EARLY IRON AGE MASS GRAVE FROM GOMOLAVA, SERBIA

**Abstract author(s):** Fibiger, Linda (School of History, Classics & Archaeology, University of Edinburgh) - Koledin, Jovan (Museum of Vojvodina, Novi Sad) - Molloy, Barry (UCD School of Archaeology, University College Dublin)

**Abstract format:** Oral

Since its excavation in 1971 the Early Iron Age Mass grave from Gomolava, Serbia, has been interpreted as the result of an epidemic. Located in a bend of the river Sava, between the Carpathian Basin and the Balkans in Western Serbia, the Gomolava mass burial is located at the border of different culture historical traditions and competing lifeways of the early 1st millennium BC. This period of change involved cultural and population changes that impacted on social networks and life experiences. How did these highly transformative processes express themselves in the remains of those who lived through them? A recent re-analysis of the human skeletal remains from Gomolava as part of The Fall of 1200 BC project (European Research Council GA #772753) considered health, disease and lifeways indicators to explore the reasons for the burial of at least 77 children, women and men. Based on the bioarchaeological findings, this presentation is going to re-evaluate the story of the grave and the role that conflict and violence played in negotiating the contested spaces of the Carpathian Basin in the 1st millennium BC.

11 BRING OUT YOUR DEAD – WHO LIVED AND WHO DIED DURING THE LAST RESURGENCE OF PLAGUE IN BASEL, SWITZERLAND

**Abstract author(s):** Rindlisbacher, Laura (Integrative Prehistory and Archeological Science, University of Basel; Archäologische Bodenforschung Basel-Stadt) - Flatscher, Elias (Kunsthistorisches Institut, University of Zurich; Archäologische Bodenforschung Basel-Stadt) - Krause-Kyora, Ben (Institute of Clinical Molecular Biology, Kiel University) - Leder, Cora (Faculty of Archaeology, Leiden University) - Moser, Daria (Institute of Clinical Molecular Biology, Kiel University) - Spichtig, Norbert (Archäologische Bodenforschung Basel-Stadt) - Pichler, Sandra (Integrative Prehistory and Archeological Science, University of Basel)

**Abstract format:** Oral

The Early Modern period in Europe was characterized by catastrophic events. War, social unrest, a deteriorating climate, and numerous epidemics left their mark. The plague regularly descended onto Europe till well into the second half of the 17th century. It usually arrived in Switzerland and Italy through the border city of Basel, which had joined the Old Swiss Confederation in 1501.

Recent excavations on the grounds of the former Franciscan monastery in Basel, the so-called Barfüsserkloster, unearthed a number of early modern skeletons in multiple burials. Since none of these individuals showed any evidence of perimortem violence, they were suspected to have died because of an epidemic. To test this hypothesis selected individuals were sampled for pathogens. In five of the nineteen individuals analysed, genetic evidence of infection with *Yersinia pestis* was detected. The associated archaeological finds linked the burials with the last recorded plague wave in Switzerland, occurring from 1665 to 1670.

During an earlier plague outbreak in the years 1610/11 the local Stadtarzt Felix Platter (1536-1614) had documented the infections and collected detailed data on the number of the infected and recovered in the city of Basel. While the morbidity patterns differed between the two plague events, a comparison of the historical and osteological demographic data still provides a new perspective on the selection mechanisms of the plague.

The combination of bio-molecular and osteological analyses as well as the archaeological and historical records enables us to draw a nuanced picture of living conditions in Basel during the 1665-1670 plague epidemic. Moreover, by using a life course approach we hope to reconstruct the socio-economic backgrounds of the people buried in the cloister of the former Barfüsserkloster. Because there is certainly a strong social component to who lives and who dies during an epidemic, as present events clearly demonstrate.

12 WHAT DOES NOT KILL YOU, DOES NOT MAKE YOU STRONGER: ASSESSING THE IMPACT OF STRESSES IN A MODERN OSTEOLOGICAL COLLECTION

**Abstract author(s):** Batista-Goulart, Luana (Université Côte d'Azur, CNRS, CEPAM - UMR CNRS 7264) - Séguy, Isabelle (Institut national d'études démographiques - INED; Université Côte d'Azur, CNRS, CEPAM - UMR CNRS 7264) - Tzortzis, Stefan (Ministère de la culture; DRAC, service régional de l'archéologie de PACA; Aix Marseille Université, CNRS, Etablissement Français du Sang, Anthropologie bio-culturelle, Droit, Ethique, santé - ADES) - Quatrehomme, Gérald (Université Côte d'Azur, Institut Universitaire d'Anthropologie médico-légale, Faculté de Médecine; Université Côte d'Azur, CNRS, CEPAM - UMR CNRS 7264)

**Abstract format:** Oral

The city of Martigues (south of France) was affected by the last major plague epidemic in France, the Great Plague of Marseilles, which affected Provence and Haut Languedoc between 1720 and 1722, killing nearly a quarter of the inhabitants. This epidemic took place after a succession of crises (climatic problems, wars, famines and/or epidemics), attested by historical data, that have contributed to the fragility of the population. Considering the effects that famines, epidemics and chronic malnutrition can have on the development and health of individuals, we sought to measure the impact of food difficulties and/or epidemics that affected the inhabitants of Martigues at different times of their life cycle. Our study is based on a corpus of skeletons of victims of the plague of 1720, from Martigues. The observation of experienced stresses is based on the analysis of physiological stress markers (cribra orbitalia, porotic hyperostosis of the cranial vault and linear enamel hypoplasia). Our study thus demonstrated a link between birth around the years where crises occurred and the observation of a higher proportion of physiological stress markers on immature individuals. We have not observed the same phenomenon in adults, who were more evenly affected by stress. We attribute these results both to the effect of a natural selection, that adults may have experienced, and also to a vulnerability in the beginning of life.

13 HOLOCENE DIETARY AND BEHAVIORAL TRANSITIONS TRANSFORMED HEALTH AND WELL-BEING IN THE PAST, PRESENT, AND THE FUTURE

**Abstract author(s):** Larsen, Clark (Ohio State University)

**Abstract format:** Oral

The transition from foraging to farming beginning in early Holocene western Asia, followed by similar transitions in eastern Asia, Europe, North America, and South America, provided the basis for a pattern of highly dynamic evolution of modern humans. Simply, farming and its food products, activity associated with production, nutritional quality, and newly emerging settled communities shaped human social, behavioral, and health circumstances. The study of human remains from archaeological contexts globally over the last 40 years reveals that change in diet from full dependence on foods that were hunted and collected to foods that were cultivated was a central force in shaping our collective past, present, and future biology, well-being, and behavior. This paper tracks the challenges to health, with focus on the rise of infectious diseases (e.g., malaria, osteoperiostitis, dental caries) and nutritional deficiencies (e.g., iron deficiency anemia), and transitions in activity and workload (osteoarthritis, cross-sectional geometry) doc-

umented in contextualized archaeological settings globally (North and South America, Europe, Asia). These challenges created and shaped the complex circumstances of poverty, undernutrition, and morbidity in an increasing number of the world’s communities in the last 10,000 years, including for the majority of the nearly eight billion human inhabitants of our increasingly challenged world in the early twenty-first century. The bioarchaeological record of the human condition provides the context for understanding the dynamics of long-standing and future health outcomes, including novel viral infectious diseases having pandemic consequences.

A. **MASSACRES, CULTURAL CRISES AND ONTOLOGICAL INSECURITY**

**Abstract author(s):** Martin, Debra - Edmonds, Emily (University of Nevada Las Vegas)

**Abstract format:** Poster

Massacres represent one of the most visceral and horrific forms of violence practiced by humans. It is a very ancient behavior, going as far back as we have archaeological data. What is unique about this form of violence is that the goal is to annihilate in totality some defined transgressor group including infants, children and all adults. The oldest case from North Africa 12,000 years ago, the massacres found throughout western Europe and later in central Europe in the early Neolithic, and those in North America, represent early massacre sites. These are examined to reveal the patterning as well as to reconstruct the cultural context within which these massacre sites are located. Moving the analysis from the victims to the broader political and cultural context necessitates using social theories about the nature of massacres. If massacres are seen as a process, that is, the unfolding of nonrandom patterns or a chain of events that preceded the massacre itself and continue long after, it shifts the focus permitting a more nuanced approach. And if assumed to be the response to a cultural crisis leading to ontological insecurity massacres may be seen as coherent and explicit attempts to bring the world back to order and to restore ontological security. The symbolic and ritualized nature of 80% of the massacres in the past demonstrate that massacres are not deviant events, rather they are performative and discursive and remain a part of collective memory over many generations.

B. **INTERDISCIPLINARY APPROACH TO THE JUSTINIAN PLAGUE IN GAUL: THE EXAMPLE OF THE “CLOS DES CORDELIERS” BURIAL GROUND (SENS, FRANCE)**

**Abstract author(s):** Holleville, Marion - Castex, Dominique - Deguilloux, Marie-France - Kacki, Sacha (Université de Bordeaux, CNRS, MC, UMR 5199 PACEA: De la Préhistoire à l’Actuel: Culture, Environnement et Anthropologie)

**Abstract format:** Poster

The *Yersinia pestis* bacterium has caused dozens of millions of deaths during three historical pandemics, which have deeply marked European societies. Among these, the “Plague of Justinian” took place between 541 and 750 AD in the Mediterranean Basin. Although this pandemic has been the subject of some works in recent decades, it remains poorly known due to a lack of textual records and archaeological evidence.

In 1989, archaeological excavations carried out at the « Clos de Cordeliers » site in Sens, Central France, revealed a large number of multiple burials, all dated from this pivotal period. A recent reexamination of the 80 skeletons excavated from the site has been conducted to confirm the cause of death and to assess the health status of individuals prior to infection, which could have caused a predisposition to plague. These questions were tackled using a multidisciplinary approach, primarily based on the examination of various bone and dental markers that may reflect episodes of stress or disease (dental enamel hypoplasia, endocranial lesions, porotic hyperostosis, cribra orbitalia, periosteal reaction on long bones and ribs). Oral hygiene was also considered in order to better assess the general health status. Moreover, paleogenomic analysis has been carried out on samples from dental pulp in an attempt to detect DNA from the plague bacillus. The correlation of these approaches reveal some specificities in the composition of the sample, which may reflect differences in susceptibility to plague infection according to age group, gender, and possibly preexisting health.

Acknowledgments: This research received support from the French Research National Agency in the framework of the PSCHEET project (PI: D. Castex; grant ANR-19-CE27-0012).

537 **HUMAN-ENVIRONMENT INTERACTION IN NORTHERN EURASIA FROM MICRO- TO MACRO-REGIONAL LEVEL**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Vyazov, Leonid (Kazan Federal University) - Ponomarenko, Elena (University of Ottawa) - Ryabogina, Nataliya (Tyumen Scientific center SB RAS) - Ershova, Ekaterina (Moscow State University) - Blinnikov, Mikhail (StCloud State University)

**Format:** Regular session

Since the very beginning of human occupation, Northern Eurasia was a challenging region for the economic development of the societies of the past, resulting in creation of diverse and unique systems of human subsistence and land use. Land-use technologies of prehistoric societies reflect both general subsistence strategies adopted in specific climatic conditions and cultural traditions, making paleoecological research highly relevant to the reconstruction of cultural and historical processes. Recent developments in pedomorphology, ichnology, phytolith analysis and palynology, combined with a drastically increased number of reliable radiocarbon dates and new statistical methods for processing multidimensional data, significantly expand opportunities for the reconstruction of past land use systems and associated dynamics of anthropogenic landscapes. We aim to discuss methods and methodological approaches to reconstruction of land use systems practiced from the Neolithic to the Late Middle Ages, north from the southern

boundary of modern steppes region. We are looking for papers describing certain types and components of land use, their combination in the landscape, and methods of their identification. Examples include, but are not limited to fields, swiddens, pastures, nut and fruit groves, firewood and sacred wood groves.

**ABSTRACTS:**

1 **FIVE PERIODS OF AGRICULTURAL TRANSFORMATION IN MIXED FOREST ZONE OF EUROPEAN RUSSIA AS THEY REFLECTED IN POLLEN DIAGRAMS**

**Abstract author(s):** Nosova, Maria (Main Botanical Garden RAS) - Ershova, Ekaterina (Biological Faculty, Moscow State University)

**Abstract format:** Oral

During the last two decades, Russian palynologists accumulated several well 14C-dated sequences for Central European Russia. That pool of diagrams from Moscow, Tver, Smolensk, and Pskov regions allows some conclusions and generalizations over a large area. Preliminary we distinguished five evident milestones of human induced changes:

1. The conventional period of the “Neolithic-Bronze age” (3000) 4000-4500 BP and earlier (to 6000 BP), when anthropogenic indicators (AI) reflect the “Forest Neolithic” type of economy with the minimum deforestation. At this time, zonal vegetation in discussed regions was represented by mixed and broadleaved forests. Findings of *Cerealia* pollen are very rare and insufficient to confirm arable farming.
2. Late Bronze (2500-2700 BP). Cereal pollen grains as well as AI remain sparse but appear regularly. Crop cultivation was evident from that time and was accompanied by the small-scale deforestation.
3. Late Iron Age (1500-1800 BP). This stage of landscape transformation resulted from the colonisation wave that occurred during the Dark Ages. Some of the diagrams show significant decline of broadleaved trees and *Alnus*-decline.
4. Middle Ages (1000-1200 BP) stage began when arable lands expanded, and new technologies were brought by the Slavic tribes. *Cerealia* and AI reach their empiric limit ( their graphs become continuous ). Primary forests declined significantly. Several diagrams have a period of 500-800 BP when the agriculture declined, and primary forests temporary recovered despite the Little Ice Age. Possibly, it was due to the socio-economic reasons and great depopulation of 13th-17th cent.
5. The New Times (400-100 BP). Diagrams show the maximum of AI and grassland indicators, caused by the population growth and agriculture expansion following the end of the Times of Troubles in the 17th century. It was accompanied by the ultimate decrease of spruce and broadleaved forests.

2 **MORPHOLOGICAL SIGNATURE OF PASTORAL ACTIVITIES IN PEATLANDS OF THE FOREST ZONE**

**Abstract author(s):** Ponomarenko, Elena (University of Ottawa) - Tomson, Pille (the Estonian University of Life Sciences) - Bakumenko, Varvara (Tallinn University of Technology) - Kuzmina, Svetlana (Paleontological Institute RAS) - Ershova, Ekaterina (Moscow Lomonossov University)

**Abstract format:** Oral

Given the sparsity of meadows in the forest zone, utilization of peatlands for pastures could be widespread from the beginning of livestock husbandry millennia ago. Currently, pollen and non-palynomorph markers of pastoral activities are applied to confirm this type of land use at the site and layer level. However, such high-precision reconstructions are always localized. We searched for morphological indicators that could allow surveying past episodes of pastoral activities in peatlands at the landscape level. We studied soil morphology in historical peatland pastures of 19th century in Estonia and Canada, with Pre-European layers in the latter serving also as a “ blank sample” due to the absence of pastoralism. The morphology of grazed layers reflected land clearance techniques (burning and, in recent pastures, draining) and movement of ungulates that trampled and destratified peat for the depth of hoof penetration and transferred mineral particles from mineral soils of driveways to peatlands. Grazed peat layers had no layering typical for natural peat tiers and contained charcoal, reoriented wood fragments, and unsorted mineral grains of sand to small gravel sizes. The lower contact of destratified tiers had undulated pattern, typical for trampling by hooves. As the scale of transfer of mineral particles on hooves was not described in detail earlier, we estimated the maximum distance and maximum size of transported materials in field experiments with sheep, horses, and cows.

While undulation could be documented only in test pits, destratification and presence of unsorted mineral particles were visible even in very small (<1 cm-3) peat samples available from deep augering of ancient layers. Several paleoecological analyses were applied to confirm association of the morphological indicators with pastures. Poaceae pollen and phytoliths, Chenopodiaceae seeds, and cocoons of earthworms were common attributes of grazed peat layers.

3 MODERN PHYTOLITHS AS A PALEOENVIRONMENTAL PROXY IN THE ARMENIAN HIGHLANDS AND THE SOUTHERN CAUCASUS

**Abstract author(s):** Jarl, Johan (University of Connecticut) - Kandel, Andrew (Research Centre ‘The Role of Culture in Early Expansions of Humans’ - ROCEEH at University of Tübingen) - Gasparyan, Boris (Institute of Archaeology and Ethnography, National Academy of Sciences, Yerevan) - Bruch, Angela (Research Centre ‘The Role of Culture in Early Expansions of Humans’ - ROCEEH at Senckenberg Research Institute and Natural History Museum, Frankfurt)

**Abstract format:** Oral

The Armenian Highlands and Caucasus lie at the border between Europe and Asia, constituting a biodiversity hotspot of widely varied environmental regions – covering most of the spectrum from lush warm-temperate forests to deserts. With evidence of hominin occupation since at least 1.8 Ma, the region is of great importance for understanding the development and migrations of the genus Homo. Archaeobotanical methods have a long history of shedding light on the environmental and climatic conditions in which our early ancestors lived. However, the research in the region suffers from poor preservation of pollen and macrobotanical remains. These first results of a pilot study reveal how phytolith analysis might aid as a proxy in paleoenvironmental reconstruction in Georgia and Armenia. In total, 143 surface soil samples across all modern vegetation units in Georgia and Armenia were analyzed. Through thorough morphological analysis, it is shown which phytolith morphologies occur in the region, and how they relate to modern taxa. The application of multivariate statistics on the dataset will uncover, if, and to what degree, the phytolith assemblages correlate with distinct vegetation units. Furthermore, this study investigates methodological issues of preservation and identification of phytoliths in the region. The obtained statistical vegetation-phytolith relationship will then be tested on archaeological samples from the Upper Paleolithic site Aghitu-3 Cave, Armenia, to assess the potential of using phytolith assemblages to reconstruct paleo-vegetation in the Armenian Highlands and southern Caucasus.

4 TRACES OF EARLY PLEISTOCENE HYDROMORPHIC SOILS IN EARLY PALEOLITHIC SITES OF DAGESTAN (NORTHERN CAUCASUS, RUSSIA) AND ARMENIA (LESSER CAUCASUS)

**Abstract author(s):** Stolpnikova, Ekaterina (A. N. Severtsov Institute of Ecology and Evolution; Lomonosov Moscow State University, Faculty of Soil Science) - Kovaleva, Natalia (Lomonosov Moscow State University, Faculty of Soil Science)

**Abstract format:** Oral

The understanding of climatic and landscape conditions of first Early Pleistocene settlements on Eurasian continent remains open now. Were these conditions similar to ancestral homeland Africa? Indeed, it is well known that the climate of the early Pleistocene remained favorable for the existence of rhinos, elephants, and Stenon’s horses.

Archaeological sites of the Early Paleolithic in Armenia (Lesser Caucasus, Lori Plateau, sites Karakhach, Aghvoric) in Dagestan (North Caucasus, Russia, Mukhai II) were investigated at mid-altitudes of 1600-1800 m above sea level. The data on the isotopic composition of organic carbon and the distribution of n-alkanes, biomarkers of terrestrial vegetation, did not reveal the predominance of steppe biocenoses. Morphological data (Fe-Mn spots and grayish color) and values of magnetic susceptibility, as well as a large proportion of medium-chain alkanes, the predominance of even alkanes indicate the presence of waterlogged conditions. According to the signs of the proximity of water bodies, such as streams, sea lagoons or lagoon lakes, it is likely that the predominant type of vegetation was meadow, in some places - tree and shrub. Since there are pebble layers with findings in all objects (Amirkhanov et.al., 2014; Lubin et al., 2015), it can be assumed that ancient humans used mainly stone beaches, but periods of habitation on soils are also possible during the period of their automorphic or semi-hydromorphic existence.

Acknowledgments: Research is supported by Russian Science Foundation (project nr. 17-14-01120).

5 ECOLOGICAL NICHE AND ENVIRONMENTAL ADAPTATION FEATURES IN NEOLITHIC (SOUTH OF WESTERN SIBERIA)

**Abstract author(s):** Ryabogina, Natalia - Enshin, Dmitry - Skochina, Svetlana (Tyumen Scientific Centre SB RAS)

**Abstract format:** Oral

We intend to present new paleoenvironmental data and discuss life-supporting strategies of Neolithic groups in the forest-steppe of Western Siberia. Shores of flow-through lake Mergen was attractive for the settlement since the end of the 7th millennium BC; one of the earliest stationary settlements in the region (Mergen 6) and several later Neolithic settlements were investigated here. Unlike other regions of Eurasia, in Siberia, neolithization is not associated with the introduction of agriculture or livestock breeding but manifests as the emergence of the first long-term settlements, ceramic production and the complication forms of exploitation of the surrounding landscapes. But knowledge of the climate, landscape and living environment around Neolithic settlements in the region are extremely scarce. To fill this gap, we studied the dynamics of sedimentation, pollen, charcoal and geochemical markers in the bottom deposits of Lake Mergen. In addition, the pollen and phytoliths from cultural layers were studied to characterize the residential surroundings at different stages of habitation. Correlation between off- and on-site data allowed us to restore the sequence and specificity of environment changes over 9.5 ka years, including the conditions during the occupation phases. Studied Neolithic villages were located close, but at different relief heights, and they also sometimes changed the residential environment from open to the forest. This is due to the dynamics of the lake level and reflects experience in adjusting to changes in the resource base in the lake-channel-river system. The diversity in the paleoichthyo- and zoological collection, as well as in stone and bone toolsets,

confirms the active year-round exploitation and the formation of a kind of adapted system of complex resources use of the lake and the surrounding land.

Thus, the chosen ecological niche ensured optimal seasonal productivity of hunting and fishing, which managed to maintain despite environment challenges throughout the Neolithic.

6 CHANGING LIFESTYLES IN THE NORTHERN STEPPE – STUDIES ON MAN-ENVIRONMENT INTERACTIONS OF BRONZE AGE SOCIETIES IN THE TRANS-URALS, RUSSIA

**Abstract author(s):** Stobbe, Astrid - Rühl, Lisa - Gumnior, Maren - Stolarczyk, Eliza (Goethe University Frankfurt) - Burger, Joachim (University Mainz) - Koryakova, Ludmila (Ural Division of Russian Academy of Sciences, Ekaterinburg) - Krause, Rüdiger (Goethe University Frankfurt)

**Abstract format:** Oral

Located at the northern fringe of the Eurasian steppe, the Trans-Urals have been a transfer zone and centre of economic and socio-cultural innovations during the Bronze Age, such as the fortified settlements of the Sintashta-Petrovka period around 2000 BC. The subsistence economy of their inhabitants has been discussed for long, and it was considered plausible that the onset of arable farming coincided with the establishment of the permanent settlements. However, our archaeological excavations and archaeobotanical analyses have shown that the Middle Bronze Age population did not engage in plant cultivation but consumed meat and milk as well as fish and wild plants; a phenomenon that is particularly noteworthy since cereal cropping was already prominent in neighbouring regions. The Sintashta-Petrovka pastoral system was obviously well adapted to the specific socioeconomic and environmental conditions. Our palynological studies prove that the fortified Sintashta-Petrovka settlements were erected during a relatively humid phase that resulted in a high biomass production, especially in the wide floodplains of the perennial rivers that offered ideal conditions for grazing. For the Late and Final Bronze Age, however, a more mobile lifestyle and the consumption of wheat and barley have been hypothesized. We are currently investigating whether a shift in subsistence strategy has taken place in our study area as well, and if it was triggered by climatic and ecological changes. Our interdisciplinary research project focuses on this evidently unique situation in the Trans-Urals, and involves archaeologists, archaeobotanists, geographers and geneticists.

7 ANCIENT POPULATION ON THE SHORES OF THE SYSTEM FLOW-THROUGH LAKES: THE DYNAMICS OF DEVELOPMENT AND LIFE SUPPORT SYSTEM (WESTERN SIBERIA)

**Abstract author(s):** Zimina, Oksana (Tyumen Scientific Centre SB RAS) - Idrisov, Ildar (Tyumen State University) - Sizov, Oleg (Institute of Oil and Gas Problems RAS) - Ryabogina, Natalia (Tyumen Scientific Centre SB RAS)

**Abstract format:** Oral

On the basis of complex paleogeographic studies, we have created a large-scale paleo-landscape map covering the territory of the Andreevskoye lake flow system, in-between the Tura and the Pyshma rivers (Western Siberia). We created a digital model of the relief of a vast territory, on this basis we simulated fluctuations in the levels of water bodies and, then, built paleolandscape maps for a series of chronological sections. The basis for the reconstruction of vegetation and climate were two complete high-resolution records of lake and peat deposits of 16000 and 9000 years old, the sequence of geochemical, palynological and paleobotanical data from them was analysed taking into account the age-depth model of sedimentation, based on 13 AMS dating. It was established that the driest conditions were about 7100-5500 BP, and the most humid and cool - started from 2850 BP. According to the results of paleolandscape mapping, we determined the ecological capacity for each stage of development of the territory, and we calculated the possibilities of bio-productivity of plant and animal resources, based on modern analogues. We traced the dynamics of the development of the territory of the Andreevskoe lake system based on the analysis of the spatial distribution of ancient settlements of different periods. The possible number of inhabitants was calculated by the resource supply of the territory around lake system in different periods. We reconstructed the area of pastures on the territory for 3200-2850 BP (Bronze Age) and 1000-500 BP (Middle Age) and showed, that these lands could provide from 800 to 1600 people engaged in animal husbandry. The natural resources, including wild bird, animals and fish, varied slightly and could provide approximately, both in the Neolithic and the Middle Ages - 100-130 people per year. The most significant amount of food could be provided by the fishery.

8 ADAPTATION, MIGRATION AND CULTURE TRANSFORMATION IN CHANGING ENVIRONMENT DURING THE IRON AGE AND MIGRATION PERIOD IN WESTERN PRE-URALS (MIDDLE KAMA)

**Abstract author(s):** Pereskokov, Mikhail (Perm State University) - Shumilovskikh, Lyudmila - Schmidt, Monika (Georg-August-University, Göttingen) - Sannikov, Pavel (Perm State University)

**Abstract format:** Oral

The world of the Early Iron Age (EIA) cultures of mid-Urals forest zone of the Eastern Europe consists of the cultures maintaining traditions of the Bronze Age. A transformation of the Ananyino culture to Glyadenovo culture in 5th-4th century BCE was triggered by the socio-economic factors with a gradual evolution of the socio-economic traditions in the same area. In contrast, Glyadenovo settlements were abandoned in the 5th century CE, which may have been triggered by environmental changes. In order to reconstruct vegetation and environmental changes in the middle Kama, palynological investigations on the sediment core Chernaya were carried out. The received results are synchronized with the archaeological data for the reconstruction of the economy type, adaptation mechanisms, and migration processes. Palynological data indicate a strongly increased anthropogenic impact on the

environment since the Early Iron Age. Human activity included deforestation, potentially crop cultivation and grazing. The phases of high anthropogenic activities are reflected in the pollen diagram with a high proportion of *Artemisia* and other ruderal plants, spores of coprophilous fungi, spread of pioneer birch forests and high concentration of microcharcoals in sediments. The phases of anthropogenic activity alternate with the phases of restoration of the taiga forest with spruce, pine and fir. Non-pollen palynomorphs and the rate of carbon accumulation indicate a relatively dry period between 2300 and 1300 years ago, which occurred during the prosperity of the Glyadenovo culture. Subsequent moistening coincides with abandonment of the Glyadenovo culture of the Middle Kama region and migration of population from a wide Kama valley to narrower and drier valleys valley of Kama tributaries. At the final stage, with the application of GIS tools we will calculate the ecological capacity of the territory and create a dynamic model of population adaptation.

9 **ALLUVIAL AND VEGETATION DYNAMICS IN THE CONTEXT OF HUMAN ACTIVITIES IN NOVAYA KIREMET, MIDDLE VOLGA REGION: GEOMORPHOLOGY, SEDIMENTS AND POLLEN**

**Abstract author(s):** Cordova, Carlos (Oklahoma State University; Kazan Federal University) - Vyazov, Leonid - Salova, Julia (Kazan Federal University)

**Abstract format:** Oral

Our study sheds light on scarcely studied environmental dynamics and human influence on the landscape of forest-steppe in the Trans-Volga Region. Earliest traces of population in this region date back to Early Holocene with some peaks of population in Bronze Age, Migration Period, the 11th-13th and 18th-20th c. CE. We studied an off-site area of a 3rd c. CE settlement on the small inland river by several floodplain sections.

The recorded stratigraphy in the context of geomorphological features presents an interesting case of the evolution of a meadow-type stream. The fluvial valley of the Kiremet river began as a postglacial small lake that later was filled in with sequences of alluvium and peat. Pollen data suggested that this floodplain fluctuated from a wet meadow to a forest and back, apparently as a response to climatic shifts and human intervention. The latter seems to have been strongest in the Late Holocene, particularly as fire and grazing altered the slopes of the valley. Signs of fire appear not only by high concentrations of microscopic charcoal but also in the forest composition, particularly with abundant pine and birch. In the most recent historical period, the system was altered and the stream began to create channels. In the mid-20th century, with the construction of a dam upstream and widespread erosion, the channels concentrated in one cutting the floodplain and exposing the stratigraphic sections studied here.

10 **LANDSCAPE DEVELOPMENT OF THE OKA RIVER VALLEY FROM THE BRONZE AGE TO THE MIGRATION PERIOD: NEW MATERIALS**

**Abstract author(s):** Syrovatko, Alexander (Kolomna Archaeological Center; State social and humanitarian university, Kolomna) - Panin, Andrey (Moscow State University; Institute of Geography of the Russian Academy of Sciences) - Gol'eva, Alexandra (Institute of Geography of the Russian Academy of Sciences)

**Abstract format:** Oral

The report is devoted to a comprehensive study of the archaeological site found in the floodplain of the Oka River (right bank, 8 km to the city of Kolomna, 120 km to the city of Moscow). The excavation discovered 3 horizons covered with river alluvium of the 17th-20th centuries. This situation is unusual for the Oka River, because, as a rule, the Holocene soil is destroyed by the floods of the Little Ice Age in the low floodplain. The atypical stratigraphy of the floodplain made it possible to obtain data on natural conditions and anthropogenic impact on landscapes. The soil horizon under the alluvium has a 14C date of 1770 ± B.P. (GIN-15382, humus; all dates is uncalibrated), the base of this layer is 2145 ± 20 B.P. (charcoal, IGAN 7466). The 14C dates are fully consistent with the ceramics of the Migration Period. Horizon 2 is dated by humus to 2790 ± 100 B.P. (GIN-15383) and 3020 ± 20 B.P. (bone, IGAN 7607). This horizon is rich in Bronze Age pottery. The lower horizon has a humus date of 4470 ± 110 B.P. (GIN-15384) and charcoal - 6999 ± 25(IGAN 7468). Its lower level contains rare flint artifacts. Its upper level contains ceramics similar to layer 2.

The report covers the results of geomorphological studies carried out using drilling, phytolith analysis data and palynological data. The synthesis of the results made it possible to trace the dynamics of changes in moisture conditions and determine the beginning of alluvial deposition in the floodplain (about 5000 B.P.). The increase in humidity in the floodplain in the 1st millennium AD confirmed the data on the relationship between the topography of the Migration Period settlements located in the highest areas above the river level and natural conditions.

11 **ANCIENT HYDROTECHNICAL STRUCTURES OF MSU ZVENIGOROD BIOLOGICAL STATION (MOSCOW REGION, RUSSIA): MULTI-PROXY STUDIES**

**Abstract author(s):** Ershova, Ekaterina (Moscow State University; Kazan Federal University) - Krivokorin, Ivan (Tallin University of Technology) - Krenke, Nikolay (Institute of Archaeology RAS)

**Abstract format:** Oral

Ancient hydrotechnical structures (ponds, ditches, wells, dams etc.), hillforts and mounds are visually distinguishable elements of the anthropogenic landscape. The latter receive constant attention from Russian archaeology and paleobotany. However, hydrotechnical structures are practically not investigated, despite the significant number of European publications on this subject. We applied pollen, moisture capacity, ash content, plant macrofossils, coprophilous fungi analysis and radiocarbon dating to investigate

two ancient ponds on different sides of the Volkov bog (Moscow region, Russia), to determine the date of their creation and economic purpose, and to evaluate their impact on the surrounding wetland vegetation. The results showed that the ponds were dug in the 11th-13th century for economic purposes related to agriculture and cattle breeding. There were three periods of human economic off-site activity near the bog: 1) forest burning and plowing on the banks of the bog during the Early Iron Age (about 2000 BP); 2) burning of the forest for agriculture / grazing and the creation of ponds (about 800 BP); 3) drainage of the bog with drainage trenches and peat mining (18/19 century). The creation of the first pond and the drainage trench facilitated the temporary drainage of the eastern edge of the bog. The creation of pond № 2 contributed to the flooding of the northern part of the bog. After the termination of their economic use, both ponds began to accumulate peat. Our research demonstrates the potential for applying multidisciplinary analysis in the study of ancient ponds is extensive.

12 **CHARCOAL IN THE CULTURAL LAYER OF EARLY IRON AGE AND MEDIEVAL HILLFORTS IN THE UPPER VOLGA BASIN (NW RUSSIA)**

**Abstract author(s):** Kupriyanov, Dmitriy - Smirnov, Alexei (Institute of Archaeology Russian Academy of Sciences) - Bobrovsky, Maxim (Institute of Physicochemical and Biological Problems of Soil Science, Russian Academy of Sciences)

**Abstract format:** Oral

This study is aimed at the reconstructing the anthropogenic impact on the environment in the Upper Volga basin (North-West Russia) in the Early Iron Age and the Middle Ages by examining the botanical composition of charcoal particles in the cultural layers of the 13 hillforts. Sampling was carried out using Eijkelkamp soil corer continuously every 15 cm from the surface to the underlying rocks. 1028 charcoal particles and 16 types of wood were identified.

Botanical analysis of charcoal particles revealed the predominance of coniferous species in the cultural layers of all hillforts. *Picea* and *Pinus* make up more than 60% of the total number of identified charcoal taxa. In the cultural layers of earlier hillforts (Dyakovo culture) predominate *Pinus* wood with a significant abundance of broad-leaved tree species (*Acer*, *Quercus*, *Ulmus*, *Corylus* and *Tilia*), which are currently practically not found in the study area. In the layers of later hillforts *Picea* charcoal predominate, broad-leaved species are much less common, but *Betula* and *Alnus* wood (less often *Populus*, *Salix* and *Corylus*) have a considerable abundance.

According to the pollen data, the decrease of broad-leaved species in the forests of the study area began synchronously with the start of the hillforts functioning. We assume that the active broad-leaved trees species reduction in the forests and charcoal accumulation in cultural layers caused by the active use of these tree species as fuel, since these species have a high combustion temperature and can potentially be used for metal smelting. Changes in the charcoal botanical composition are weakly associated with climatic changes in the past and implicitly indicates the anthropogenic causes of ecosystem changes in the area of the studied hillforts. In addition, the botanical composition of charcoal particles in the cultural layers may reflect the cultural characteristics of the use of different wood species.

13 **EARLY SLAVIC SUBSISTENCE IN THE PRIPYAT MARSHLANDS OF POLESIE (BELARUS)**

**Abstract author(s):** Kasiuk, Alena (Institute of History, National Academy of Sciences of Belarus, Minsk) - Schneeweiss, Jens (Cluster of Excellence ROOTS, Centre for Baltic and Scandinavian Archaeology - ZBSA, Stiftung Schleswig-Holsteinische Landesmuseen Schloß Gottorf, Schleswig) - Bartrow, Anna (Martin Luther University Halle-Wittenberg, Institute for the History of Arts and Archaeologies of Europe) - Shevchenko, Anna (Max Planck Institute of Molecular Cell Biology and Genetics, Dresden) - Kittel, Piotr (University of Lodz, Department of Geomorphology and Paleogeography) - Shumilovskikh, Lyudmila (Georg-August-University Göttingen, Albrecht-von-Haller-Institute for Plant Sciences) - Lyashkevich, Elona (Institute of History, National Academy of Sciences of Belarus, Minsk) - Gorobets, Leonid (National Museum of Natural History of the National Academy of Sciences of Ukraine, Kyiv)

**Abstract format:** Oral

The Pripyat marshlands in Polesie are characterised by a settlement continuity throughout the 1st millennium AD. An important example is the settlement cluster of Snjadzin (Belarus). Five settlements and one necropolis belong to this period. The pit house settlements were oriented towards the river. One objective of our interdisciplinary research on this settlement cluster is to find out more about diet and economy of the early Slavic settlers living here.

Archaeobiological and geoarchaeological investigations play an important role in this respect. While archaeozoological and archaeobotanical analyses belong to the standard methods, phytoliths are studied less frequently; palaeoproteomics on food crusts has hardly been used for archaeological questions so far. Geoarchaeology provides valuable additional data.

The first results prove a large diversity in the diet and indicate a complex economy of a sedentary population. Fish, waterfowl and wild game attest the intensive use of the water- and forest-rich natural environment, as do gathered fruits and berries. The main branch of the Pripyat as well as its distributaries and backwaters enabled the exploitation of at least 13 species of fish. Among domestic animals, the pig was the most important, followed by cattle. The surrounding mixed oak forests were well suited for wood pasture and pannage. Chickens were kept as poultry. Various cereals were cultivated, such as panic millet, barley, rye and spelt. Of interest is the abundance of bog iron ore, evidenced by metallurgical features and ore deposits within the settlements, but also by characteristic soil bacteria (*Koribacter*). Very likely are seasonally changing activities in the subsistence strategy (e. g. duck hunting in the winter half year).

14 The conservation conditions for organic matter are poor in the sandy, well-aerated soils with changing water levels. It is still open to what extent and where exactly the cultivation of crops (cereals) took place.

LAND USE SYSTEMS AND VEGETATION DYNAMICS IN THE DNIEPER FOREST-STEPPE IN THE LATE HOLOCENE (CASE STUDY KURILOVKA 2, RUSSIA)

**Abstract author(s):** Rodinkova, Vlasta (Institute of Archaeology, Russian Academy of Sciences) - Ponomarenko, Elena (University of Ottawa) - Salova, Julia (Kazan Federal University)

**Abstract format:** Oral  
The macrofossil analysis of soils and deposits was applied at the Kurilovka 2 settlement (Kursk region, Russia) to detect past land use systems, reconstruct vegetation dynamics in the site, and determine the chronology of site occupations.

The settlement is located in the northern part of the East European forest-steppe zone, on a remnant terrace in the floodplain at the confluence of the Sudzha and Psel Rivers (the Dnieper basin). The human presence can be traced here from the Neolithic on, with advanced development of the territory occurring in the 1st-2nd millennium AD.

According to our data, at the beginning of the Late Holocene the area was covered with a broad-leaved forest dominated by oak. The forest was burned apparently at the Early Slavonic period of site occupation (2nd – 8th centuries AD). The macrofossil composition of soil large fractions (the shape, size and coating of charcoal fragments, and a low proportion of charred bark) indicate that deforestation was associated with the slash-and-burn agriculture. Millet and wheat were cultivated crops, as evident from finds of charred grains. Perhaps there were several swidden cycles in the early Slavonic time.

The abandonment and reforestation of the territory after the 8th century AD was followed by a short-term episode of clearing for agriculture in the 12th – 13th centuries. Finally, total deforestation of the area, including watersheds, and a widespread establishment of permanent fields took place in the region in 17–19th centuries. It was accompanied by the significant increase in frequency and intensity of floods.

The land use was not limited to the crop cultivation. Particularly, bones and teeth of fossorial mammals, charred and re-burned shoots of prickly plants, charred grasses, and Chenopodium seeds evidence that the area was open for some time and was used as a grassland/pasture.

15 NEW PALEOENVIRONMENTAL RECORDS FROM SMALL VALLEYS IN THE MIDDLE VOLGA, RUSSIA IN THE LATE HOLOCENE: HIGH-RESOLUTION DATA FROM SEDIMENTARY ARCHIVES

**Abstract author(s):** Blinnikov, Mikhail (St Cloud State University; Kazan Federal University) - Leonid, Vyazov (Kazan Federal University) - Cordova, Carlos (Oklahoma State University) - Ponomarenko, Elena (University of Ottawa)

**Abstract format:** Oral  
Our team conducted investigations of natural-cultural connections of the Imenkovan people of the Middle Volga (ca. 4-7 centuries C.E.) using sedimentary archives (pollen, phytoliths, soil micromorphology and charcoal). One effort concerns precise 3D mapping of a hillfort and its vicinity (ca. 1 km radius) of a well-preserved 5th century C.E. Urnyak settelement and reconstruction of the extent of the agricultural and iron-smelting activity of its residents. This is a first attempt to produce a detailed map of the agricultural use near the hill-fort from the region. Another effort includes a study of an earlier and less prominent settlement in the Kiremet River valley (ca. 4th century C.E. and the likely predecessors) produced by a low-gradient meadow stream and exposed by channel incision, where evidence of five occupations exists in its stratigraphic sequence. The sequences of events interpreted from the sedimentation, soil formation, and evidence of fire reveal complicated relations between climatic changes and different forms of land use change by post-Neolithic peoples.

16 AGRICULTURE, MINING, AND SETTLEMENT PATTERN ON THE BANKS OF THE VOLGA RIVER DURING THE MIGRATION PERIOD

**Abstract author(s):** Vyazov, Leonid (Kazan Federal University) - Ponomarenko, Dmitri (Paleontological Institute, Russian Academy of Sciences) - Ponomarenko, Elena (University of Ottawa; Kazan Federal University) - Blinnikov, Mikhail (StCloud State University; Kazan Federal University) - Ershova, Ekaterina (Moscow State University; Kazan Federal University) - Salova, Julia (Kazan Federal University) - Petrova, Darya (Khalikov Institute of Archaeology, Tatarstan Academy of Sciences)

**Abstract format:** Oral  
The ensemble of archaeological sites in Komarovka, Ulyanovsk region, the Cis-Volga, Russia, appears to be the first in the Middle Volga region, which preservation and full-scale investigation enabled the reconstruction of spatial distribution and land-use pattern of the Eastern European forest farmers during the Migration period at the micro-regional level. The ensemble includes two hillforts, several unfortified settlements, a burial ground, and several mining sites, used for iron production.

We used drone surveys for detecting structures and occupation areas, soil sections for stratigraphical analysis and subsequent land-use reconstructions, as well as pollen, phytoliths and soil charcoal as proxies for understanding the vegetation dynamics. Our preliminary results revealed dramatic changes in the local landscape, associated with the human occupation of the area in the 6th-7th c. CE.

Agricultural development of the area included two stages, with the sedentary agriculture and permanent fields replaced by the slash-and-burn cultivation system at the later stage. Deforestation of the surroundings of the Komarovka agglomeration was reflected in both the charcoal pool of the occupation layers and in the fuel selection for cremation burials.  
But the most intensive environmental change appears to be related to iron smelting activities. We suggest that ore mining in sources of gullies was the main reason for the large-scale soil erosion, reflected in accumulation of thick alluvial deposits in the gullies.  
Our study allows considering one of the models of land development, which supported survival and even flourishing of the local societies of the deciduous forest zone of Eastern Europe during the Dark Age Cool Period. It was based on swidden agriculture on sandy soils in gully systems, complemented by hunting and mixed livestock farming. The geomorphological settings of the sites provided opportunities for intensive iron smelting of siderite ores.

17 MICRO SWAMP VERSUS POND: THE STUDY OF THE INTERACTION OF NATURE AND MAN IN MUSCOVITE RUSSIA OF THE XV CENTURY

**Abstract author(s):** Ershova, Ekaterina (Moscow State University; Kazan Federal University) - Chernov, Sergey (Institute of Archaeology RAS)

**Abstract format:** Oral  
Maslovskaya Lesnaya Dacha is a natural reserve located 17 km west of Moscow. This is a pine forest on fluvio glacial sands measuring 7 x 4 km, next to the valley of the Moscow River. Authentic traces of human activity of the XIV-XVI centuries are preserved on the territory of the forest. These are archaeological sites (7 settlements and two burial grounds), a network of roads with preserved ditches, and remnants of ancient meadows.

During this period, Maslovskaya Lesnaya estate was part of the fiefdoms of the Moscow metropolitans with its centers in the villages of Aksinino and Dmitrovskoye. Due to this fact, documents have survived, in which the boundaries of the estates are described and the names of all the settlements are listed. They also indicate the amounts of payments made and works performed for the benefit of the metropolitan and the Zvenigorod prince. In particular, there is an archeological record of the settlement of Lagirevo, which belonged to Kharya Lagir, a ministry of Prince Yuri of Zvenigorod (1389-1434) which passed into the service of the metropolitan. A transcript of the court session, which sheds light on the fate of this man who lived from about 1400 to 1460, has been preserved. A signet ring, with which he sealed documents, has been found. The pond found in the village of Lagirevo is a reference object of paleoecological studies. They reveal 3 stages of its functioning: 1) a natural bog in a micro hollow, 2) a bog turned into a pond; 3) a pond, left by man, turned into a natural bog again. Due to the pollen analysis of “swamp/pond” deposits, we were able to reconstruct in detail the local history of land use of the settlement.

18 EASTERN CASPIAN IN NEOLITHIC

**Abstract author(s):** Alisher Kyzy, Saltanat (Institute of Archaeology and Ethnography Siberian Branch of Russian Academy of Science) - Yanina, Tamara (Moscow State University) - Shnaider, Svetlana (Institute of Archaeology and Ethnography Siberian Branch of Russian Academy of Science; Novosibirsk State University)

**Abstract format:** Oral  
The Eastern Caspian Neolithic is represented by a few sheltered sites with stratified deposits (Kaylu, Jebel and Dam-Dam Cheshme1 and 2), and several open sites with surface deposits (Kuba-Sengir, Dhanurpa, Kyzyl-Lay et.al.). Recent reassessment of the materials from Eastern Caspian sites shows a complex pattern of cultural diversity in the Neolithic. Based on our techno-typological analysis of lithic materials from this period, we identify two different traditions of lithic production. The first one is associated with sheltered sites, and consists of a blade/lete industry. The tool types (end scrapers, notched tools, burin, symmetric points), and debitage found at these sites suggests they were used as hunting camps. The second tradition is represented by materials from open sites, which exhibit pressure microblade production (width of 3-7 mm), backed tools, scalene points, narrow triangles, microblades with ventral retouch, nail-scrapers and bifacial narrow points. The lack of absolute dates at this class of sites complicates their chronological attribution, which we attempt on the basis of paleogeographic reconstructions. During the Holocene, more comfortable climatic conditions emerged during the first phase of the Newcas pian transgression (7500-5600 BP). At this time, the climate became more humid, which may have increased plant biomass and opportunities for herbivore hunting. The location of these sites on the landscape appears related to sources of fresh water hunting opportunities. We hypothesizes that during the Neolithic in the Eastern Caspian, these two material assemblage types represent two different cultural or functional traditions.

A. HUMAN IMPACT AS A KEY FACTOR OF LANDSCAPE DYNAMICS OF THE UPPER DNIEPER BASIN (WESTERN RUSSIA): A CASE STUDY

**Abstract author(s):** Lavrenov, Nikita - Ershova, Ekaterina (Lomonosov Moscow State University; Kazan Federal University)  
**Abstract format:** Poster

Pollen analysis of bog sediments allows to reconstruct past dynamics of landscapes and qualitatively evaluate human and climatic impacts on them. We present the first results of the paleoecological study of the Akse ninskiy Moh peatbog that is the source of the Dnieper River. The peatbog is distanced from all known archeological sites for more than 20 km, though the region is rich in the archeological sites of various time periods.

The dynamics of vegetation and crucial shifts in the local hydrology imprinted in the peat bog sediment sequence were linked to human activities that started at least in the Iron Age (radiocarbon dates pending). Sudden changes in the tree pollen composition, along with the permanent presence of anthropochors pollen in the bog indicate that the surrounding ecosystems were utilized by people. The pollen spectra documented all types of traditional agricultural systems: the early agriculture was detected by the presence of pasture herbs pollen, the first arable agriculture by the appearance of cereals pollen, and the Medieval period was marked by the presence of the rye pollen. The bog itself was formed from a lake after a series of fires which were probably caused by the local human activities.

Our results suggest that there are unknown archeological sites around the bog, which can be instructional for further archaeological surveying. The study was funded by RFBR, project number 19-34-90172.

B. **DEVELOPMENT OF WATERSHED SPACES OF THE VOLGA- OKA RIGHT BANK IN 14TH-18TH CENTURIES AND DISASTROUS EFFECTS FOR FOREST LANDSCAPES**

**Abstract author(s):** Khokhlova, Olga (Institute of Physicochemical and Biological Problems of Soil Science, Russian Academy of Sciences) - Sycheva, Svetlana (Institute of Geography RAS) - Gribov, Nikolay (Institute of Archaeology, Russian Academy of Sciences) - Ukrainskiy, Pavel (Belgorod State National Research University)

**Abstract format:** Poster

The landscapes of the Volga-Oka right bank are currently changed by human activity considerably. Most of the forests have been cleared. The soils are largely eroded. The zone of deciduous forests has actually turned into a natural-agricultural area. A geoarchaeological study carried out jointly with archaeologists in the area of the Medieval Russian sites of Blizhnee Konstantinovo-1 and Podvyazye-3 made it possible to determine the beginning and maximum of anthropogenic impact on landscapes, which caused catastrophic changes in biota, soils, and landforms.

During the existence of the Medieval Russian settlements of the 13-14th centuries in the study area, mixed and broad-leaved tree species grew on Retisols. The houses were built from oak and spruce. At first, the development of landscapes by the ancient Russian population proceeded along the banks of small and large rivers. Starting from the 14th century and especially sharply since the 18th century, accelerated anthropogenic soil erosion manifested itself. On the watersheds and slopes, the upper part of the soil profile (up to the Bt2 horizon) was destroyed by erosion. As a result, watersheds and slopes decreased by no less than 40-60 cm. Coastal ravines and microdepressions were almost completely filled with colluvium. Mordvin's gully has turned into a flat-bottomed ravine. The sediment thickness in the bottom of the ravine reaches 4.5 m. The depth of dismemberment has decreased by 4-5 m. The relics of the Ah and AE horizons of Retisols have been preserved only in a buried state on the slopes and in the bottoms of depressions. The reasons for the described ecological catastrophe are associated with the deforestation and plowing of land on an unfavorable natural background - climate change towards humidification and cooling (wet phase preceding the Little Ice Age). This work was supported by RFBR, grant N19-29-05024 mk.

541 **PASTORALISM OF THE PAST: INSIGHTS INTO SOCIAL, CULTURAL AND ENVIRONMENTAL (IN) STABILITY**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Alaica, Aleksa (University of Toronto) - Windle, Morgan (University of Kiel)

**Format:** Regular session

Pastoralism and livestock management has been the basis for the economies, social capital and ideologies of societies throughout the past. Our contemporary world faces the reality of environmental transformations associated with large-scale agricultural practices and anthropogenically influenced ecological degradation. This session challenges participants to consider how pastoral practices have afforded and constrained past communities. How did the daily and annual rhythms of domestic species influence the short and long-term strategies of people? In what way did the activities associated with animal management change in the midst of environmental fluctuation? How did sociopolitical and palaeoecological change impact consumption and ritual use of herded animals? These questions may guide participants in widening their research horizons, and how they consider the ways pastoral strategies have adapted to change or resisted against it. We invite contributions focusing on pastoralism through the archaeological lens to illustrate the ways that mobile animal management mitigated, exacerbated or sustained various lifeways. We hope to expand the discussion on how mobile animal management can serve in mitigating the economic, environmental and social complexities of the contemporary world. Perspectives from Asia, the Americas, Africa and as well as Europe are encouraged so as to reflect the diversity in pastoral patterns around the world and the varied insights those contributions represent.

**ABSTRACTS:**

1 **NESS OF BRODGAR'S SEAWEEED-EATING SHEEP: ADAPTATIONS TO AN ISLAND ARCHIPELAGO ENVIRONMENT ON NEOLITHIC ORKNEY, SCOTLAND**

**Abstract author(s):** Blanz, Magdalena (University of Vienna; University of the Highlands and Islands) - Mainland, Ingrid (University of the Highlands and Islands) - Balasse, Marie (Muséum National d'Histoire Naturelle) - Card, Nick (University of the Highlands and Islands) - Ascough, Philippa (Scottish Universities Environmental Research Centre) - Fiorillo, Denis (Muséum National d'Histoire Naturelle) - Taggart, Mark (University of the Highlands and Islands) - Feldmann, Jörg (University of Graz)

**Abstract format:** Oral

Constrained by coastlines and resource limitations, small islands tend not to be ideal environments for mobile pastoralists. However, trade and travel exist beyond the confines of the land, and even small island archipelagos can serve as a backdrop for the movement of large amounts of animals. Islands may also serve as naturally constrained pastures in extensive herding strategies (i.e. using small amounts of labour per area), and their inherent resource limits can incentivize adaptations to the environment that increase the islands' carrying capacities. One such example is the seasonal consumption of seaweed by Neolithic sheep on the Orkney archipelago (Scotland), which took place from the moment of their first introduction to Orkney.

Recent excavations at the monumental complex Ness of Brodgar (ca. 3500–2300 cal BC, part of the 'Heart of Neolithic Orkney' UNESCO world heritage site) have revealed large numbers of cattle (likely over 400 tibiae) and sheep remains. Based on the number of remains and the sheep mortality profile, it seems unlikely that all these animals were raised close to the site, and so may have been imported from other islands of the Orkney archipelago.

At the Ness of Brodgar, stable isotope ratios ( $\delta^{13}C$ ,  $\delta^{18}O$ ) suggest the consumption of seaweed in winter/spring by only 3 of 17 analysed sheep, considerably less than the archipelago-wide average (around half of all Neolithic Orkney sheep). Could this be an indication that for the sheep brought to the affluent Ness of Brodgar, seaweed-consumption was not 'necessary'? Or could a decline in seaweed-consumption be a sign of wider societal changes, including a turning-away from the sea as a dietary source?

2 **WHERE DID THE SHEEP GO? COMBINING ZOOARCHAEOLOGICAL AND ISOTOPIC EVIDENCE TO ASSESS CAPRINE MOBILITY IN CLASSICAL-HELLENISTIC THESSALY, CENTRAL GREECE**

**Abstract author(s):** Filioglou, Dimitrios (University of Groningen) - Valenzuela, Silvia (Consejo Superior de Investigaciones Científicas-Institució Milà i Fontanals - CSIC-IMF)

**Abstract format:** Oral

Located between the Macedonian empire in the north, and the city-states in the south, Thessaly experienced a long period of political instability from the 4th-1st century BCE (Westlake, 1969). Short periods of peace and unity among the Thessalian cities alternated with conflicts caused by internal rivals and external intervention. In this context, common herders were practicing their activities and supplying the local markets with meat and other animal products.

In this paper, we examine the role of animals in the local economies and the evolution of human-animal relationship under changing historical conditions. Looking at the species composition, kill-off patterns and conducting isotopic analysis in zooarchaeological remains, we attempt to reconstruct the animal husbandry strategies and the degree of animal (and consequently human) mobility. Previous research in the region has attempted to examine whether ancient herders practiced seasonal movements (transhumance) for large-scale specialized production or small-scale agrofarming for subsistence. Prummel (2003) proposed the practice of short-distance transhumance of caprines for specialized milk and wool production, based on limited zooarchaeological data, while Bishop et al. (2020) suggested four different types of management in four caprines based on isotopic evidence. However, more integration of zooarchaeological and historical evidence is necessary. Although isotopic analysis is a powerful tool which allows us to get direct evidence for animal diet and mobility, the results are more effective when they are examined in their historical and archaeological context. For the first time, we bring together new zooarchaeological, isotopic and historical evidence from several neighbouring cities in southern Thessaly, Greece – Magoula Plataniotiki, New Halos and Pherae (4th-2nd century BCE) – to approach animal husbandry practices in a context of continuous political instability.

3 **PASTORALISM OF THE PAST: THE ROLE OF THE UPLANDS IN PREHISTORIC AND ANCIENT SICILY**

**Abstract author(s):** Forgia, Vincenza - Burgio, Aurelio - Canale, Alessandra (Dipartimento Culture e Società, Università di Palermo) - Martín, Patricia (Institut Català de Paleoeecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art; SERP, Departament d'Història i Arqueologia, Facultat de Geografia i Història, Universitat de Barcelona) - Messana, Chiara - Ollé, Andreu - Vergès, Josep Maria (Institut Català de Paleoeecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art)

**Abstract format:** Oral

In this paper we present the results of two ongoing research projects on the uplands of Sicily, in particular in the Madonie mountain range; here we are documenting the origin and early development of the pastoral economy on the island. Traces of pastoral practices are scattered on the mountainous territory since the middle Neolithic (end 6th millennium BCE) when mobile communities and their livestock begun to exploit (and transform) the natural environment. From that period onwards, the mobile animal management

system sustained (pre)historic lifeways, throuought the metal ages and until its acme, in coincidence with the Greek colonization. During this last phase the native communities were strongly involved in the pastoral economy, as it has been evidenced by the archaeological data and as we can also perceive from their settlement strategies and ancient viability system. The pastoral tradition then became iconic in Sicily, reaching the symbolic sphere and achieving a collective meaning with the (native?) myth of Δάφνις. We finally present a selection of the impressive ethnographic record that highlights the importance of the pastoral tradition, as one of the main activities sustaining the regional economy.

4 CAMELS AND CARNIVORES: EXPLORING THE TRILATERAL RELATIONSHIP BETWEEN PASTORALISTS, LIVESTOCK, AND LARGE PREDATORS THROUGH ROCK ART FROM NORTH-EASTERN JORDAN

**Abstract author(s):** Brusgaard, Nathalie (University of Groningen)  
**Abstract format:** Oral

In regions of the world where pastoralists and their livestock co-exist with large carnivores, the human-animal relationship is often fraught with tension and conflict. Large predators pose a threat to herd animals and thus human livelihood, while competition for resources and retaliatory killing endanger the survival of the carnivores. This is causing increasing challenges for the conservation of sustainable animal and human subsistence alike. Co-existence between pastoralists, their herds, and large predators has, however, been a state of being for millennia. The particular relationship and dynamics between these groups are not unique to our time and many of the challenges posed by co-existence are, therefore, not be new. There are, however, few deep-time perspectives on this issue.

This paper explores the trilateral relationship between pastoralists, their herd animals, and large carnivores in the so-called Black Desert of north-eastern Jordan in the late first millennium BC and early first millennium AD. In this period, the region was home to nomadic pastoralists, their herds of dromedary camels, and a range of wild fauna, including various large carnivore species such as lions, hyenas, and leopards. While osseous remains are scarce due to poor preservation, the desert is rich in iconographic and textual evidence. Rock art and inscriptions provide unique insights into the relationships the pastoralists had with, in particular, dromedary camels and lions. This paper presents results on the first in-depth study of these engravings. It aims to contribute to our understanding of the dynamics between herders and animals from a deep time perspective and, simultaneously, to demonstrate the potential of rock art for exploring human-animal relationships in the past.

5 PASTORALISM MAY CONTRIBUTE TO RESOURCE PREDICTABILITY IN THE LATER STONE AGE OF THE SOUTHERN AFRICAN CENTRAL INTERIOR

**Abstract author(s):** Cameron, Michelle (University of Toronto)  
**Abstract format:** Oral

The current climate emergency is associated with increased climate extremes and decreased predictability in weather conditions. In contemporary and past societies, pastoralist groups may be found in marginal regions with unpredictable environmental conditions and demonstrate resilience in these contexts. Archaeological sites located in the semiarid central interior of Southern Africa, particularly along the Riet River (approximately 1000–200 BP), highlight one response to the unpredictable environmental conditions prevalent in this region. Stable carbon and nitrogen isotope data from human skeletal remains and limited zooarchaeological evidence from these sites suggest high reliance on wild fauna. However, livestock was also kept in this area as indicated by large enclosures, faunal remains of domesticates, and historical reports of stock trading during the later occupation of these sites.

This paper discusses how bioarchaeological methods may clarify if pastoralism helped central interior groups resist local environmental unpredictability. Correlations were conducted between human skeletal measurements and previously analyzed bone collagen stable isotope data. In particular, intralimb proportions were investigated, as these proportions may reflect environmental stresses experienced during growth and development, including nutritional insufficiency. Here, this paper shows that the consumption of higher trophic level foods, such as products from domesticates, positively impacted growth and development and mitigated early life stresses in this unpredictable region. Wild resources predominated in the diet, however, the incorporation of pastoralism likely provided added stability for human groups living in this region. Pastoralism in this context may represent a strategy to mitigate unpredictability and maintain healthy growth and development in this semiarid environment.

6 PASTORAL POLITICS AND TRANSFORMING ANIMAL MANAGEMENT STRATEGIES: INSIGHTS ON CAMELID HUSBANDRY FROM THE ARID NORTH COAST OF PERU

**Abstract author(s):** Alaica, Aleksa (University of Toronto)  
**Abstract format:** Oral

Pastoralism in the Andes is the basis for small-scale subsistence strategies, interregional interaction, and the emergence of social inequalities. Camelid pastoralism provided an integral network for trade, a renewable source of fiber, and nourishing resources of protein. Sustaining the care for and exploitation of camelids and their primary and secondary products were impacted by shifting sociopolitical structures and climatic (in)stability. By mobilizing zooarchaeological data from the site of Huaca Colorada of northern Peru, this paper examines the way that camelids were used in daily activities and large-scale feasts to bolster political power among elites and foster interregional and local relationships during the Middle Horizon period (600-1000 CE). Despite the volatile Late Moche phase (650-900 CE), the sustained use of camelids as the principal part of daily diet emphasizes the intertwined lifeways of

pastoralists, agriculturalists, and fisherfolk on the northern coast. Sustainability in camelid management provided coastal societies with the means to disentangle themselves from the climatic, landscape, and marine fluctuations characterizing the end of Moche domination during the Middle Horizon and allowed for descendent communities to maintain aspects of their daily and ritual practices.

7 PASTORAL LANDSCAPES: A METHODOLOGICAL APPROACH TO THE STUDY OF PASTORALISM AND LANDSCAPE CHANGE

**Abstract author(s):** Domingo Ribas, Guillem - Carrer, Francesco (Newcastle University)  
**Abstract format:** Oral

Pastoralism plays a central role in landscape narratives and it is regarded as one of the main causes of landscape transformation in many areas. However, its consequences over landscape can sometimes be overlooked. Thus, it becomes paramount to discern what the real influence of pastoral practices on the landscape is. Our research intends to address this question by suggesting an inter-disciplinary methodological approach to the study of the long-term relationship between pastoralism and landscape. Starting from three case-studies (medieval Dartmoor, UK; 18th-20th century Aspromonte, Italy; today's Göksu river valley, Turkey) that comprise different pastoral strategies and ecological niches, and with a particular focus on pastoral mobility, we will define a methodological protocol using historical and archaeological literature, ethnographic observation, oral history, archaeological survey, archive sources (e.g., historic maps and documents) and GIS technologies.

The latter will be employed in conjunction with quantitative methods for the analysis of digital landscape datasets, as well as landscape mobility patterns, to provide a meaningful explanation of the spatio-temporal correlations between pastoral practices and the historic configuration of the territory. In this regard, ethnographic methods will be pivotal for coupling the recorded evidence to human activities and creating analogical models or narratives. Altogether, these approaches will enable us to address diachronically how pastoral groups in these areas have had an impact on the landscape, while analysing if other processes or driving forces of the territory (natural, socioeconomic, political, technological and cultural forces) have also influenced their practices. Additionally, this novel methodological approach allows to reinforce the need for interdisciplinarity in the historical reconstruction of pastoral landscapes.

A. SUBSISTENCE ECONOMY IN THE IRON AGE SETTLEMENT OF SAHARNA MARE (REPUBLIC OF MOLDAVIA). ARCHAEOZOOLOGICAL DATA

**Abstract author(s):** Malaxa, Daniel - Stanc, Simina (Alexandru Ioan Cuza University of Iasi) - Zancu, Aurel (Moldova State University of Chisinau, Republic of Moldova) - Mototolea, Aurel (National History and Archaeology Museum of Constanța, Romania) - Bejenaru, Luminița (Alexandru Ioan Cuza University of Iasi)  
**Abstract format:** Poster

Archaeological researches carried out during 2017-2018 in Saharna Mare-“Dealul Mănăstirii” site revealed finds, which are attributed to early Hallstattian (Cozia-Saharna) and Thracian-Getic habitation periods. The archaeological site is located to the west of the Saharna locality, Rezina Rayon, Republic of Moldova, being placed on a promontory of quasi-trapezoidal shape, with an area of about 15 ha and an altitude of about 130 m from the level of the Dniester river.

During the research, 3709 faunal remains were collected, coming from different archaeological contexts (layers, pits). The identified remains belong to molluscs, fish, birds and mammals (which are predominant). The archaeozoological study aimed to evaluate the animal resources and the exploitation strategies of the identified animals.

The collected faunal material was divided into four samples, two from each cultural context. The remains of domestic mammals have the highest proportion in each of the four samples is the (91-97%), indicating the importance of the animal husbandry in the economy of the settlement. The identified domestic species are: cattle, sheep, goat, pig, horse and dog. The livestock was dominated by cattle (48-58%), followed by sheep-goat (15% - 22%) and then by pig (7.2% - 10%). The management of livestock was guided according to whether the interest was focused, on primary or secondary products. Both, cattle and sheep-goat were exploited, first of all, to secure secondary products.

Wild mammals (red deer, wild boar, roe deer, hare and fox) have a low proportion, not exceeding 10% in the samples.

542 EUROPE’S MEDIEVAL PASTS: A MANIFESTO

**Theme:** 3. The new normality of heritage management and museums in post-Covid times  
**Organisers:** Driscoll, Stephen (University of Glasgow) - Citter, Carlo (University of Sienna) - Wouters, Barbora (Vrije Universiteit Brussel) - Seppänen, Liisa (University of Turku)  
**Format:** Round table

This roundtable session offers an opportunity to reflect on and critically evaluate the MERC Manifesto. These discussions will explore how we may deliver the aspirations it embodies. The Manifesto of the Medieval Europe Research Community seeks to awaken appreciation of the rich cultural resources embodied in our understanding of the medieval past. There is an urgent need to understand the foundations of contemporary Europe in order to help shape its future. Our vision promotes opportunities provided by archaeology to explore and to engage with the past, and to care for it and enjoy our shared European heritage. Perspectives grounded

in the material remains of the past allow us to embrace cultural diversity over national exceptionalism. Experiencing archaeology enables and encourages us to be in dialogue with the past and through this immediacy, its local stories of global resonance. This Manifesto addresses our political responsibility as European archaeologists as set out in the 2019 EAA Bern Statement: Archaeology and the Future of Democracy (<https://www.e-a-a.org/BernStatement>). Our manifesto asserts that engagement with medieval archaeology is a matter of European importance.

The Manifesto is intended to build consciousness and inspire action. If you are interested in using it, you are warmly welcome to participate in these discussions. It can be downloaded at: [www.mercmanifesto.org](http://www.mercmanifesto.org).

543

MATERIAL MINDS: EXPLORING THE INTERACTIONS BETWEEN CULTURAL ARTEFACTS, MATERIAL CUTLURE AND EMBODIED MIND

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Criado-Boado, Felipe (Institute of Heritage Sciences - Incipit, CSIC) - Müller, Johannes (University of Kiel, Institute of Prehistoric and Protohistoric Archaeology)

**Format:** Discussion session

This session proposes to a wider audience thinking and reporting in what ways the worlds we build and inhabit alter our own minds and the ways we process information. The research problem this session wishes to address is: Do the material structures of our cultural artefacts, buildings, and landscapes change fundamental patterns of thought and mind, so that understanding change in these 'material codes' becomes part and parcel of understanding the emergence of the modern mind?

To answer these questions, we propose participants from different audiences and backgrounds to bring their expertise and experience to explore the hypothesis of materiality-driven cognitive change to build further understanding of the cycles by which we humans make and transform the structured worlds that make and transform our minds. Case studies and contributions could be based on different sets of information, spanning the vast diversity of present day archaeological practice, including prehistoric, historic, ethnoarchaeological and contemporary archaeologies. Empirical accounts of the intended proposals will be important. But we also call for methodological, conjectural or even speculative approaches.

The session is related to a newly awarded ERC Synergy Grant project on Material Minds (acronym XSCAPE). Their proponents are part of the team of Principal Investigators of this project, being the others Andy Clark, of the University of Sussex, Department of Informatics and Department of Philosophy (UK), and Luis M. Martínez, of the Spanish National Research Council-CSIC, Institute of Neurosciences-IN (Spain).

ABSTRACTS:

1

PERCEIVING TOOLS: VISUAL ATTENTION DURING LOWER PALEOLITHIC STONE TOOL EXPLORATION

**Abstract author(s):** Silva Gago, María - Fedato, Annapaola (Centro Nacional de Investigación sobre la Evolución Humana - CENIEH) - Hodgson, Timothy (University of Lincoln) - Terradillos-Bernal, Marcos (Universidad Isabel I) - Alonso-Alcalde, Rodrigo (Universidad de Burgos) - Bruner, Emiliano (Centro Nacional de Investigación sobre la Evolución Humana - CENIEH)

**Abstract format:** Oral

Humans evolved specializations to integrate tools into their cultural, perceptive and cognitive systems. Tools extend cognitive functions beyond the brain and directly improve the range of our cognitive skills. A characteristic of human beings is their hand-eye coordination, associated with a specialized visuospatial system. In fact, parietal lobes, larger and more complex in modern humans, are involved in the management of the relationships between brain, body and environment. Tools activate brain motor regions even during passive viewing. When a tool is touched, it is integrated into the body scheme, expanding the peripersonal space. Recently, different disciplines have adopted an embodied cognition perspective arguing that physical tools should be considered as a functional part of the cognitive network. Vision is the dominant source of sensory information in primates, channelling action and body-environment relationships. We applied eye-tracking technology to investigate visual perception during human interaction with Lower Paleolithic stone tools. We quantified visual attention during a free exploration of stone tools in peripersonal space and during tool physical manipulation. Our results suggest that choppers are usually more explored at the upper region and cortex, while handaxes receive more attention at the base and edges. We can consider whether choppers, displaying a simpler morphology, may require less attention associated with the grasping strategy, while handaxes, with a more complex profile and more grasping and use possibilities, may need a finer exploration of its base. That differences during visual exploration are the same whether or not the tools are physically manipulated, suggesting haptic exploration simply serves visual perception, without influencing the visual exploration scheme. The analysis of visual behaviour associated with these affordances can supply information on the early steps of this brain-body-tool interaction, evidencing common factors as well as type-specific perceptual differences.

2

MATERIAL CULTURE, LANDSCAPE PERCEPTION AND “MODERN” MIND IN MIDDLE PLEISTOCENE. A NOVEL ARCHAEOLOGICAL WORKING HYPOTHESIS LINKING MATERIALITY AND COGNITION

**Abstract author(s):** Romagnoli, Francesca (UAM - Universidad Autónoma de Madrid)

**Abstract format:** Oral

The first problem when approaching the concept of modern mind in Prehistory is to define which evidences attest it. There is a general agreement in taking into account symbolic-mediated elements, i.e. coloured pigments, personal adornment, and 'art'. Technologies are usually bound in the sphere of the materiality and are analysed in terms of production sequences; productivity; time and energy costs of raw material supply, processing and transport; and efficiency of tool design. Thus, materiality is usually a negligible concern in the "modern behaviour" issue. The second problem is that the studies debating cognitive capacities in our species usually sustain the higher level of cognitive complexity in sapiens according to the lack of complexity in the pre-sapiens archaeological record. However, this inferiority is based on a traditional list approach, which is untrustworthy according to the novel data, and is biased by an Upper Palaeolithic European perspective and the lacking of an in-depth knowledge of pre-sapiens cultural evolution.

In this paper, I review the technological innovations that appeared in the archaeological record at approximately 400.000 years before present and are attested by the exploitation of previously unused resources. I discuss these innovations in the frame of the genetic, palaeoneurological, and behavioural changes that appeared in this period and through ethnoarchaeological evidences. I propose that these technological novelties expressed a ground-breaking cognitive complexity and possible new human relationships with things and the landscape. This novel working hypothesis looks at artefacts and raw materials as expressions of an indivisible union of functional and symbolic factors. It could open new perspectives in the search for the archaeological evidences of modern mind. Furthermore, it could allow overcoming the vicious circle that bias the modern behaviour issue in Prehistory and contribute to test the relevance in human evolution of shared communication and symbolic codes underlying material culture.

3

MATERIAL CULTURE AS MATERIALIZATION OF THOUGHTS

**Abstract author(s):** Gralak, Tomasz (University of Wrocław)

**Abstract format:** Oral

It was assumed that before any material object was created, there was always earlier an idea how to make it. This is what allows us to explore the way of thinking of its manufacturer. Analysis of Bronze Age material culture artefacts reveals a striking stylistic difference between ceramic and metal objects. This phenomenon is characteristic of almost all cultures from that period. Vessels were adorned mostly with rectangular and triangular ornaments, while various circular motifs were dominant among the decorations on bronze objects. It would seem that this division is a result of different sources of inspiration for each category of objects. As one might suspect, ceramic vessels imitated forms of those made of organic resources (see skeuomorphism), often manufactured by weaving or plaiting. This also applies to patterns or ornaments that decorated them. In case of metal objects, their most characteristic feature – shine, made them resemble (see metaphor) other shining phenomena. This would probably involve astronomic objects – stars, the Moon and above all else the Sun. This association might have been the reason behind various circular and spiral motifs. It seems plausible that it was a way of imitating shapes and movements of celestial bodies. Such a way of connecting different meanings seems to be similar to Vygotskian complex thinking. All this leads us to the question: to what extent did material objects reflect ideas, and to what extent they illustrated very simple beliefs about the workings of the world. Characteristically, the same beliefs pertained to very different fields (cosmos and bronze objects, weaving and ceramics). Therefore, it cannot be ruled out that these activities were a realization of cognitive schemas.

4

MATERIAL “BIG OTHER”: ON RELATIONS BETWEEN LANGUAGE AND MATERIAL CULTURE

**Abstract author(s):** Mlekuž Vrhovnik, Dimitrij (University of Ljubljana; Institute for the protection of the cultural heritage of Slovenia)

**Abstract format:** Oral

This is a highly speculative take on the relation between embodied mind and material culture, by juxtaposing the structuralist reading of Leroi-Gourhan's chaîne opératoire with Lacanian theory of language.

Leroi-Gourhan puts chaîne opératoire as the nexus of interaction between body, mind, social and material world. The gesture cannot be understood in isolation but rather as part of a chain of operations, a dynamic process that refers to the rules guiding the manufacturing process. These rules should be understood as a syntax, as rules about relationships that define the time-spatial organization of production.

In this way, it is isomorphic with language, which is defined by structural linguistics define as a structure composed of differential elements. Language is understood as "chain of signifiers", a stream of signifiers combined following the laws of grammar.

The gesture is at once individual and collective, concrete and abstract. Leroi-Gourhan emphasizes the collective knowledge that stands behind individual human action.

This is another similarity it shares with language. Lacan uses the term "discourse" is to emphasize the trans individual nature of language. This is the "big Other" where a system of determining relationships between signifiers is put into place. The big Other is the structure that symbolically institutes the subject's place in an established order with signifiers that pre-existed him.

Is there a material “big Other”? The individuals are born in a world transformed by a deep history of technological operations. Operational sequences are embodied in the material world, changed by previous gestures. Tools, artefacts, material culture, plays a role of technical big Other. The moment the subject begins to engage with the world enters into a relationship of dependency vis-à-vis this material big Other. This makes a relationship between technical and cognitive a recursive one, and structurally different from the language, with several interesting consequences.

544 **ARCHAEOLOGY TOURISM AND SUSTAINABILITY**

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Czonstke, Karolina (University of Gdansk; Archaeological Museum in Gdańsk) - McAtackney, Laura - Riis Andresen, Jens-Bjørn (Aarhus University) - Caretta, M. Nicolas (Bornholms Museum)

**Format:** Regular session

This session is organised by the ArchaeoBalt consortium, an association of museums and universities from the South Baltic Region. Our project is a cooperation between universities and museums across three countries (Poland, Sweden and Denmark) who use archaeological excavations to learn more about our common past and communicate these findings in the South Baltic region through tourism initiatives. We believe that archaeology can help us to locate and build up local and regional identities that can result in wider social bonds as well as pride in our transnational, common heritage. We recognize that archaeological heritage projects can support the local and regional community identities and economies by linking and promoting archaeology and culture heritage with sustainable tourism but currently they are not fully utilized. This focus on the “local” has become even more important, especially in the current pandemic situation in which people are restricted in their movements but want to be involved in cultural activities.

We invite colleagues from all over Europe who work with archaeology and cultural heritage management as tools of social integration and / or sustainable tourism to this panel. The intention is to share experiences and inspire each other through presenting methods and approaches to promoting cultural heritage and developing its economic and social potential. Papers can include case-studies or best practice that employ new and innovative trends as well as utilizing inspirational ways of building and developing archaeological potential, tourism audiences and transnational collaborative networks. Archaeology projects are broadly defined to include open excavations, collaborative projects, use of social media and / or social projects dedicated to particular groups or broad collaborations. We would like to discuss how we can cooperate even more effectively and how we can locate new archaeotouristic and cultural heritage stakeholders.

**ABSTRACTS:**

1 **MODERN PROBLEMS REQUIRE ANCIENT SOLUTIONS: A LONGITUDINAL STUDY OF ENVIRONMENTAL AND CULTURAL SUSTAINABILITY**

**Abstract author(s):** Maddox, Timmis (University of Wisconsin-Milwaukee) - Caretta, Nicolás (Bornholms Museum)

**Abstract format:** Oral

The following paper introduces a project co-designed by the Bornholms Museum and the University of Wisconsin-Milwaukee which explores the potential value of using studies of prehistoric urbanization—and the environmental issues encountered by ancient communities—to aid in the development of sustainable modern growth. The increasing urbanization of modern civilization is creating an expanding set of challenges for human society. As cities around the world rapidly grow, the destruction of the natural landscape is magnifying environmental hazards. Modern communities on the Danish island of Bornholm are also experiencing rapid development, with large growth taking place in both local agriculture and tourist industries as part of Bornholm’s “Green Island Initiative”. As a result, the local government is seeking ways to promote sustainable development. The prehistoric Sorte Muld settlement complex on Bornholm represents one of the first cities of southern Scandinavia, focusing a wide array of activities into a single spot and extending up to two hundred hectares. Using an interdisciplinary methodology, this project seeks to study the socio-environmental relationship between the occupants of Sorte Muld and the surrounding landscape and how it may have changed as the site developed. In doing so, it seeks to provide data which could be used towards the promotion of sustainable local growth and development—granting an exciting opportunity to determine how archaeology can directly influence modern social practice.

2 **WALKING TOURISM AND URBAN CONTEXTS: THE CHALLENGING ROLE OF ARCHAEOLOGICAL HERITAGE**

**Abstract author(s):** Salvarani, Renata (European University of Rome)

**Abstract format:** Oral

Walking is identified as a privileged way to restart tourism in the Covid-19 Age; cultural pathways provide chances to meet local communities and to share experiences in the field; the emerging concept of “walking society” unites people of different conditions (migrants, tourists, pilgrims, seekers of different ways of life), changes in deep self-perceptions and lays the foundations for a new social cohesion.

Archaeological Heritage has a central role, displaying open-air sites, offering meeting places of great emotional impact, and making evident elements of local memory and identity.

But what happens when Cultural-Historical Routes cross cities? What is a local community when we deal with a metropolis? How can tourism be re-designed to include peripheries, rural areas, and different social groups? Can archaeology supply effective chances to this process of cultural integration between tourism and new global urban communities?

Some problematic answers can come out analyzing the Via Francigena at her very heart: the intersection between the historical medieval roadways and the urban area of contemporary Rome.

The paper starts from data collected during the pandemic spread by the European Association of Vie Francigene (walking experiences, monitoring, accesses to heritage sites and services along the pathways, re-use of medieval buildings).

Further introduces results of researches carried out on the ground by CeSHet (Study Center for Heritage and Territory) of the European University of Rome on the critical overlapping between the historical route and nowadays multiethnic metropolis (projects on possible urban pathways; rural historical landscapes and peripheries; parks and protected areas; archaeological sites along via Appia, via Aurelia, and via Triumphalis; medieval xenodochia used to host walkers; devotional practices and liturgies both for pilgrims and for local communities).

Some experiences of social integration based on walking activities in and around archaeological heritage will be introduced as well (such as the “Ecomuseo Casilino”).

3 **HERE BE DRAGONS - CREATING OPPORTUNITIES FOR SUSTAINABLE EDUCATIONAL TOURISM IN NORTH WEST WALES**

**Abstract author(s):** Moeller, Katharina (Prifysgol Bangor University)

**Abstract format:** Oral

The Llŷn IVeragh Eco-museums (LIVE) project uses the community-based co-operative Ecomuseum model to enable coastal communities to promote their natural and cultural heritage, thus creating opportunities for sustainable tourism. To this end it aims to provide the tools for local residents to engage more deeply with their local environment and culture and supports them in developing a strong, distinct identity for the region that can be used to attract tourists. Part of the project focusses on the archaeology of the Llŷn peninsula, a popular tourist region in north west Wales with some interesting, yet sometimes hard to reach, archaeological sites. While the originally planned excavation with public participation and outreach elements had to be postponed due to the COVID-19 pandemic, LIVE has created digital and non-digital resources for eco and educational tourism. This paper looks at the different methods LIVE uses to make the archaeology of the Llŷn more accessible to the local community and the resources created to support sustainable tourism.

4 **CONTRACT ARCHAEOLOGY IN THE AGE OF CORONA - INNOVATING AND ADAPTING NEW WAYS FOR PUBLIC MEDIATION AND PARTICIPATION**

**Abstract author(s):** Nelson, Matthew (Linnaeus University)

**Abstract format:** Oral

Excavations in contract archaeology are often unique opportunities to experience archaeological heritage at a local site, a temporal window to the accumulated history and memories of a familiar or perhaps unrecognized place, open only to the public for a short time. The events and results of many excavations are often quite limited in their outreach, discarding the potential for sampling and forming knowledge and memories, shaping connectivity, identities and giving a sense of place associated with these sites.

Many times, results from excavations find themselves trapped in a report published mainly for a small group of experts and professionals. Finds may be displayed in museums long after the excavation took place, often losing some of its contextual relevance both in space and time. By acknowledging and finding solutions for the challenges in mediation and participation, there is great potential for contract archaeology to have enhanced cultural and sustainable effects on the heritage landscape in real time, transforming it to an archaeological landscape. A wider and more active public inclusion in the whole archaeological process can strengthen the cultural values and connectivity in society to the heritage landscape and enhance its democratic function.

The pandemic year of 2020 has caused several challenges for mediating and participating archaeological events, also having a huge impact on the tourism sector. However, finding solutions for achieving set cultural heritage goals for public inclusion in archaeological projects, has led to new ideas for outreach and accessibility. In my presentation I will show a few solutions used in excavation projects during this past year and share some experiences. I will also discuss how we may learn from these innovations and adaptations, leading to better ways of implementing and developing mediation and participation in archaeology for the future.

5 **ARCHAEOTOURISM IN THE SOUTH BALTIC REGION – THE ARCHAEOBALT PROJECT PERSPECTIVE**

**Abstract author(s):** Czonstke, Karolina (University of Gdańsk; Archaeological Museum in Gdańsk) - Świątkowski, Bartosz (University of Gdańsk)

**Abstract format:** Oral

What are the current needs of a modern tourist and what are their expectations? How can the new branch of tourism, known as archeotourism, answer them? Is it a chance to make better use of the often undervalued cultural heritage in the South Baltic region, such as archaeological sites and artefacts? Or does it pose a threat to the relics of the past?

The ArchaeoBalt project spans three Baltic countries - Poland, Denmark and Sweden - which are otherwise connected by a mutual history of numerous intercultural contacts. This shared past has so far been presented from the perspective of individual countries. The ArchaeoBalt project offers a starting point for creating a common story about the South Baltic region's past. Different experiences and traditions in the field of public archaeology activities are an advantage and, at the same time, a challenge to the project partners who are trying to create a coherent narrative. In order for these activities to be effective and achieve an appropriate response, it is necessary to include people, institutions and companies in the tourism, transport, and hotel industries, as well as regional and local government organizations. The current ongoing COVID-19 pandemic has presented a new and formidable challenge to this work. The new reality makes it impossible to carry out many originally planned activities and many other plans have changed as a result of the pandemic. At the same time, the pandemic forces ArchaeoBalt to search for new solutions and means of expression and prepare for a new, uncertain post-pandemic future. Is the current situation only an obstacle, or is it a unique opportunity for the development of archeotourism?

6 **HERITERRA – A TASTING CROSS-BORDER EXPERIENCE**

**Abstract author(s):** Vintar, Anja (Institute for the Protection of Cultural Heritage of Slovenia) - Črešnar, Matija (Department of Archaeology, Faculty of Arts, University of Ljubljana) - Kiszter, Sarah - Mele, Marko (Archäologie & Münzkabinett, Universalmuseum Joanneum)

**Abstract format:** Oral

Today's travelers and tourists are more and more seeking experiences and not just tourist attractions. Engagement of all five senses with interaction has almost become a must for any tourist destination. This is also true for archaeological museums, sites, and landscapes. An international partnership of institutions and communities from Austria and Slovenia has set itself the goal of strengthening the position of archaeological heritage in the tourism sector by engaging all five senses.

The PalaeoDiversiStyria project was implemented in the years 2016 to 2019 as part of the cross-border EU-program Interreg Slovenia-Austria. The focus was on researching and communicating archaeobotanical knowledge to the general public. The HERITERRA brand was created to make this topic interesting for a wide audience and at the same time support the local tourism infrastructure. The international brand connects local producers, such as farmers, bakers, butchers, inns, accommodations..., who offer products that draw their identity from the local archaeological heritage and are based on scientific results of archaeology and archaeobotany. The brand not only offers new tourist products of high quality but also serves to raise general awareness of the archaeological heritage and thus the protection of monuments. More about the project and the brand can be found here: <http://www.heriterra.eu/> and <http://www.interarch-steiermark.eu/>

The authors would like to present the process of establishing the Heriterra brand and at the same time point out the challenges and opportunities for the future of such projects.

545 **SOUTHEASTERN EUROPE IN 5TH AND 4TH CENTURY BC - INDIGENOUS COMMUNITIES IN CLASSICAL WORLD**

**Theme:** 6. Material culture studies and societies

**Organisers:** Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology; Center for Prehistoric Research) - Pravidur, Andrijana (National Museum of Bosnia and Herzegovina in Sarajevo)

**Format:** Regular session

This session aims to discuss different aspects of relation of indigenous communities of South-eastern Europe and powerful powers of the Classical world - primarily Greeks. The fifth and fourth centuries in Greek history represent the highest economic, political, and cultural flowering of the city-state. It is also period of the most important events that will define course of Greek and European history in general: from the Greco-Persian Wars, over the Peloponnesian and Corinthian War to final Macedonian domination. At the same time, north of Greece world was also changing. Powerful Early Iron Age cultural groups from Hallstatt Cultural Complex in Pannonia, over Donja Dolina and Glasinac cultural groups in Balkans to northern Macedonia were dissolving leaving place to new rising communities of the Late Iron Age that would enter the historical stage through their intensive contacts and interactions with Greeks. These are also the communities that we would later define in terms of indigenous ethnicities on larger and smaller scale (such as Illyrians, Thracians, Macedonians...), We would like to discuss:

- origins of these new communities especially in early stages of formation
- different ways in which indigenous communities demonstrated their specific identities and how these concepts

changed over time

- initial contacts between Greeks and indigenous communities and consequences of these contacts on development of these communities
- Greek colonisation in the area of south eastern Europe
- different models of interaction between Greeks and indigenous communities

We would welcome papers addressing one or more of these issues from different aspects of archaeological theory or material culture.

**ABSTRACTS:**

1 **CULTURAL MOSAICS: ARCHAEOLOGICAL VIEW ON THE CULTURAL INTERACTIONS ON THE WESTERN BLACK SEA COAST**

**Abstract author(s):** Nikolova, Veronika (Independent researcher)

**Abstract format:** Oral

One of the directions of the Greek colonization was towards the Western Black sea coast, where the colonists met the local indigenous tribes such as Thracians and Scythians. The historical development of the coastal territories in the region has an important role and impact on the settlement system before and during the Classical period. Both the relations of the colonies with the neighboring tribal unions and the interventions by the Achaemenid Persia, Athens and Macedonia play a role in this process.

These developments will be examined by diachronically tracing the establishment of new settlements with different functions in the outer territories. They were probably related to the needs of individual poleis, e.g. Apollonia Pontica, Histria etc. In addition to the settlements created by the colonists, new local settlements or settlements of mixed origin were established in the area. Their archaeological manifestation will be commented to help us understand the relations between Greeks and natives and how they were influenced by each other.

Particular attention will be paid to the changing settlement system on the western Black sea coast. The disappearance or emergence of new settlements show diverging paths in the social and economic life of the contact zone between local groups from and around the poleis. The initial dominantly peaceful cohabitation from the Archaic period is replaced by more complicated interactions during the Classical and Hellenistic periods. Apart from the settlements, the necropolises and sanctuaries in this area also show regional variations in the relations between different groups of the population and the introduction of one culture into the other and vice versa.

2 **GREEK EMPORION TO THRACIAN TOWN: DE-COLONISING PISTIROS AND RE-ASSESSING THRACIAN-GREEK RELATIONS AT ADZHIISKA VODENITSA NEAR VETREN, BULGARIA**

**Abstract author(s):** Dimova, Bela (British School at Athens)

**Abstract format:** Oral

Migration and encounters between different societies have been a defining feature of the Mediterranean world since deep prehistory. In the first millennium BC archaeological, literary, and epigraphic evidence make it clear that people moved long distances to explore, settle, and live overseas, voluntarily or by force. The scholarship on Greek colonisation has been revised in the past 30 years, so it is now clear that Greek settlement overseas took place in the context of wider mobility. The revisions also emphasise that 'Greek' cities were often inhabited by people from different places and their prosperity depended on a cooperative, mutually beneficial relationship with indigenous communities. Some of the critical post-colonial scholarship has specifically examined encounters between Greeks and indigenous groups in the north Aegean. Yet, Greek colonisation and Hellenisation remain the dominant models for imagining relations between Greeks and non-Greeks in the Balkans and these models have stifled analyses of inter-cultural relations in the region.

The city at Adzhiiska Vodenitsa near Vetren, Bulgaria, opens an excellent opportunity to challenge the existing views and move towards a new model for understanding Thracian-Greek relations. The site allows us to study a city with a mixed population, operating under the authority of a Thracian ruler. The dominant interpretation considers the site a Greek colonial establishment, the emporion Pistiros. However, a critical review of the archaeological evidence does not support this idea. Instead, the rich material culture of the site allows a nuanced account of production, consumption and exchange practices. It shows that Adzhiiska Vodenitsa was a multi-cultural town which brought together people with diverse backgrounds and their encounter and co-habitation produced a variety of technological, commercial, and commensal exchanges.

3 **MEMORY OR FORGETTING? – INDIGENOUS ELITES OF NORTHERN MACEDONIA AND THE THERMAIC GULF IN THE EARLY CLASSICAL PERIOD**

**Abstract author(s):** Heilmann, Daniela (LMU Munich)

**Abstract format:** Oral

During the Late Archaic period, a profound change in funerary practices is evident in Northern Macedonia and Northern Greece, which is still echoed into the Classical and Hellenistic times. The very beginning of these transformations seem to be marked by

ostentatious graves, occurring as early as the middle of the sixth century BCE at the Thermaic Gulf. The Sindos and Archontiko cemeteries are the most famous, especially for graves furnished with gold masks and sheets, golden and silver jewellery as well as Mediterranean imports. Typical for these ostentatious graves is a standardisation of the furnishing of the male individuals with a set of weapons and of the female individuals with jewellery.

On the basis of this uniform funerary practices it is assumed that a collective identity emerged. This concerns not only the groups of lavishly furnished individuals, but also the burial communities in the entire area of the Thermaic Gulf as well as Pella and Vergina. While ostentatious graves in Macedonia are mainly limited to the Late Archaic period, the standardized furnishing with weapons and jewellery continues to be evident at least into the Early Classical period.

By comparing the grave furnishings of the Late Archaic and Early Classical periods against the socio-historical background, a diachronic attempt will be made to shed light on the changes and adaptations which occurred over time and how these can be interpreted regarding the question of changing identity concepts.

4 IRON AGE SANCTUARY IN GORICA NEAR GRUDE (BOSNIA AND HERZEGOVINA)

**Abstract author(s):** Pravidur, Andrijana (National Museum of Bosnia and Herzegovina, Sarajevo)

**Abstract format:** Oral

The site of Gorica near Grude in Bosnia and Herzegovina was discovered in 1899 when Ćiro Truhelka excavated foundations of a drystone building with mixed remains of burned wood, human bones and abundance of iron and bronze objects roughly dated to Iron Age. The building apparently had two rooms with porch and central communication from the porch through the first room to the identical second room. He thought it was some kind of biritual cemetery object where both cremation and inhumation were practiced in the Early Iron Age. Today we know that skeletal human remains probably belong to medieval cemetery, which covered the whole field where remains of the building were located and that all metal finds were concentrated in a backroom of the building. The finds consist of defensive weapons (a bronze Greek-Illyrian helmet), over 40 pieces of iron offensive weapons (spearheads and short curved swords), and more than three hundred ornaments (mostly of bronze, but with some silver, amber and glass). The ground plan of the building, composition and location of finds (probably votive gifts) as well as their dates suggest that this could be some sort of sanctuary of local community, which perfectly fitted into general Mediterranean ideology and religious practice.

5 IRON AGE LANDSCAPES OF SOUTHERN ADRIATIC – NECROPOLIS OF ZAKOTORAC

**Abstract author(s):** Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

**Abstract format:** Oral

The discovery of already famous necropolis of Kopila with clusters of dry-stone constructions with hundreds of burials dating from the late 5th century BC to the Roman Age was thought to be example of unique development of burial customs specific for particular Iron Age community on the western part of the Island of Korčula. However, recent surveys and excavations on the peninsula of Pelješac suggest otherwise. In framework of the project Prehistoric Landscapes of Pelješac initial survey concentrated on the area of Nakovana with the Iron Age hillfort, famous cave sanctuary from Hellenistic period and dozens of stone mounds. Mapping of the mounds immediately showed two basic differences in construction: simple large mounds characteristic of the large area of Adriatic coast and inland in period between Eneolithic and Late Bronze Age, and more meticulously constructed mounds with several kinds of stone fill and carefully constructed concentric perimeter walls as well as rectangular drystone constructions inside the mound. The later were in terms of construction similar to mounds in Kopila. At the same time rescue excavation on the site of Zakotorac, also on Pelješac, revealed very interesting landscape with necropolis of over 25 mounds of the same type concentrated behind dominant hill and above important natural communication. The excavation in one of the mounds revealed large amount of Greek pottery (over 30 vessels), large amount of bronze and silver ornaments as well as over 500 glass and amber beads. Initial anthropological analysis suggest at least one male and one female adult and one child. Large amount of iron fragments probably belong to weapons but the most significant discovery was bronze Greek-Illyrian helmet of the type III A1. All finds belong to 4th century BC.

6 FOUND IN TRANSITION: THE COLAPIANS - THE IRON AGE PEOPLE IN BELA KRAJINA, SLOVENIA

**Abstract author(s):** Grahek, Lucija (Institute of Archaeology, ZRC SAZU)

**Abstract format:** Oral

The cultural image of the Iron Age societies in the hinterland of the northern Adriatic consists of various smaller territorial communities, such as the Dolenjska hallstat community in southeastern Slovenia. The southern part of this cultural area is Bela krajina, a geographically clearly delimited region along the upper reaches of the Kolpa River. Especially at the beginning of Iron Age this region was of great importance in communication with the Balkans and the Danube region, as well as with the Adriatic and the western Italian cultures. The first significant changes in the Iron Age settlement of Bela krajina can be observed in the Late Hallstatt period, in the 6th century BC, when its cultural development became distinguished and isolated from the central area of the Dolenjska Hallstatt community. Until recent discoveries, this was thought to be reflected in the absence of princely graves and the objects of Situla art. However, it is not yet clear whether the change in the development of Bela krajina was decisively influenced by the expansion of the lapodes, who began to spread northward and eastward from their original territory of Lika (Croatia) during this period. They probably reached the Kolpa River towards the end of the 5th century BC and had a significant influence on the emergence and development

of the Vinica cultural group in the Late Iron Age. The carriers of this culture are associated with the Kolapians, who are still very poorly studied. By presenting the results of new settlement excavations in Kučar and discovery of a large cemetery on Pezdirčeva njiva in Podzemelj, where burials began in the 5th century BC and then continued at least until the 2nd century BC, we will try to give an insight into the development and socio-political changes occurring in Bela krajina in the younger Hallstatt.

546 IDIOSYNCRATIC BURIALS: INTERPRETING THE POLITICS OF DEATH AND DEAD BODIES

**Theme:** 6. Material culture studies and societies

**Organisers:** Szeverenyi, Vajk (Déri Múzeum, Debrecen) - Polányi, Tamás (Independent scholar)

**Format:** Regular session

Recent decades in archaeological theory and practice witnessed increased attention on the complexities of mortuary practice. Breaking from characterizations of burial assemblages as normative and reflexive representations of social and biological facts, more emphasis has been given to idiosyncratic facets of the mortuary domain in an attempt to highlight human agency and the politics of death. In our perspective, idiosyncratic mortuary behaviour can materialize through a wide range of deposits from ‘mass graves’ to the minute, but significant, differences observed between the burial assemblages within a cemetery. However, such variability in mortuary practice often remains viewed through the lens of perceived cultural logic and grammar by merely introducing more nuanced, but still mostly non-negotiable biosocial categories—such as age-at-death, genetic variability, etc.—into the interpretative mix. Although it is undeniable that certain aspects of mortuary practice are governed by strict cultural rules and remain remarkably consistent over time and space, there are truly idiosyncratic, and contingent elements of funerary behaviour that can shed light on contemporary politics.

Moving beyond the basic comparative and statistical assessment of mortuary assemblages, understanding idiosyncratic, ‘deviant’ or unorthodox elements and instances of funerary practice require different approaches, such as microarchaeology and archaeo-thanatology. We invite papers to our session that investigate such ‘non-normative’ mortuary behaviour in any region and period and seek to make sense of such rituals and political acts through their analysis.

ABSTRACTS:

1 EVERYDAY LIFE OF DEATH: ACCESSING HISTORY ON A HUMAN SCALE

**Abstract author(s):** Polanyi, Tamas (Independent Scholar)

**Abstract format:** Oral

Understanding the role human agency and interaction play in the flows of history is a challenging task. Archaeology is well equipped to study history as sequences of transformative events linked together loosely by the thread of time, or as a continuous process of everyday life where time serves as a function of cultural persistence. On a macro-scale the sweeping reconfiguration of human-material relations marked by events and interpreted as cultural change have been at the center of archaeological practice since the first descriptions of ‘cultures’ as convenient analytical and spatio-temporal units of analysis. Within narratives of everyday life, the emphasis shifted to the mundane, to the multivocality and messiness of social existence. Corresponding to the decreasing scale of analysis and interpretive context, the struggle became to present the ways in which people’s repetitive day-to-day practices mattered and figured into broad-scale historical events. In this paper I attempt to redirect focus from easily discernible events to political discourse, to the processes that lead up to change and to the ways in which agency constitutes the texture history. Through the analysis of mortuary practice I will present a case study exploring the ways in which members of the Bronze Age Kajászó community engaged in political action surrounding change and persistence in the wake of some momentous transformations.

2 BEYOND THE GRAVE: INTERPRETING PROCESS AND PERFORMANCE IN THE MORTUARY ARCHAEOLOGY OF ROMAN BRITAIN

**Abstract author(s):** Phillips, Reanna (University of Chester)

**Abstract format:** Oral

Previous archaeological studies of Roman Britain have mainly categorized funerary evidence by paradigms of grave construction, body treatments (i.e. ‘cremation’ or ‘inhumation’), demographics of the deceased, or grave good typologies. However, these research conventions prioritize the excavated burial context as the ‘final’ and most emblematic ‘product’ of funerary practices. This structures the interpretation of burials as singular, static depositions rather than as extended and nuanced mortuary rituals of engagement between the living and the dead. These frameworks also reinforce dichotomies in archaeological data which may not reflect the understandings and motivations behind mortuary behaviors, ultimately failing to depict the complexities in individual burial treatments.

This paper analyses individual grave contexts from the major cemetery sites of Cirencester, Lankhills, York, and London in Roman Britain and identifies previously overlooked evidence of mourners’ actions and manipulations. The paper interprets this increasingly varied evidence to signify the enactment of commemorative performances and extended interactions between the living and the dead. In addition to developing a more dynamic understanding of individual burial contexts, this approach will demonstrate wider

variation within larger cemetery sites and contribute an enriched narrative to these key Romano-British burial assemblages. This interpretive framework will demonstrate the importance of challenging burial research paradigms, investigating mortuary practices as extended processes, and the need for theoretical interpretations of performances across the spectrum of Romano-British burial practices.

3 **MANAGING DEATH IN EAST CRETE DURING LM III PERIOD**

**Abstract author(s):** Psallida, Maria (Archaeologist; Ministry of Culture and Sports)

**Abstract format:** Oral

In LM II new burial types coming from the Mainland appeared in Crete associated with changes in the funerary performance. These changes were spread in the eastern part of Crete during LMIII. The cemeteries became the arenas where the social groups tried through the funerary performance to maintain their integrity. The funerary performance presupposes the participation of the living subjects in the mourning and the separation of the dead. The process is necessary for the healing of the trauma caused in the community by the loss of its member. The variabilities in the funerary cycle, visible mainly at the manipulation of the body and the grave offerings, are associated not only with the grief of the community for the loss but also with the social role and the status given by the livings to the dead.

Most of the tomb types which are used during LM III in East Crete are chambers and tholos tombs of medium or small size. However, among the usual architectural forms, there are some peculiar ones, which may indicate affiliation with specific social groups. Similar oddities can be seen in the body treatment and the accompanying burial offerings: “warrior tombs”, clay larnakes with elaborated decoration, special grave offerings with symbolic meaning, the ritual killing of the offerings. This paper aims to focus on the peculiarities that can be traced in the funerary realm at the eastern part of Crete. Therefore, the complexity in the funerary performance will be pointed out, which is related either to the ritual beliefs of the living or to the need of the community to maintain its social cohesion.

4 **PLAYING WITH FIRE: PARTIAL CREMATATIONS AND MORTUARY VARIABILITY IN THE EARLY MEDIEVAL BALKANS**

**Abstract author(s):** Parvanov, Petar (Department of Medieval Studies, Central European University)

**Abstract format:** Oral

Common sense in archaeology dictates that the so-called ‘deviant’ (or less controversially atypical and irregular) burials are a phenomenon exclusively recognizable in inhumation burials. The systematic collection of such discoveries from the eight-tenth century northern Balkans, however, provides an opportunity to challenge this generalization. Perhaps the easiest and most accurate description for the burials in question is partial cremation. The selection of six burials juxtaposing elements from the two principal modes of bodily deposition is scattered across the early medieval Adriatic littoral and the Lower Danube region.

As much within the context of their respective burial grounds, as within the wider variety of mortuary practices, these finds manifest a truly idiosyncratic funerary events. The seldom and often insufficiently recorded discoveries prove problematic to standardized analysis and traditional discourse. Further, their association with other forms of corporal manipulation such as decapitation and mutilation also deserves attention.

To the extent allowed by the available, mostly archival evidence, the particular combination of cremation and inhumation rites will be addressed through the lenses of funerary performance and local socio-political processes. Another line of thought that should be pursued in this respect is how these cases reveal and possibly advance the archaeological way of thinking about human remains.

5 **THE BURIAL GROUND MAKSIMOVKA I – THE MONUMENT TO THE ENEOLITHIC AGE IN THE FOREST-STEPPE VOLGA REGION**

**Abstract author(s):** Shalapinin, Anton - Korolev, Arkady (Samara State Social Pedagogical University)

**Abstract format:** Oral

The burial ground Maksimovka I is situated on the left bank of the Samara River – the tributary of the Volga River. The works at the monument started in 2017. 12 interments dated to Eneolithic Age were studied during this period. These interments are assigned to two stages of the Eneolithic Age, to the early one and to the late one. A single interment is dated from the early stage of the Eneolithic Age. It is oriented Nord-East-South-West. The deceased was lain extended prone in anatomical position, and was scattered with ochre. The inventory included pendants of marmot incisors, bone awl, bone rods, finial of horn in form of an elk head, polished adze, arrowhead, nucleus, flint plates. This burial place is similar to Mariupolskiy type monuments. The skeleton in semisitting position with its legs bent at the knee and with the head oriented to the East and North-East is typical of the Late Eneolithic interments. The skeletons with burned skulls were among these interments. The burial place consisted of 4 skulls and compact gathering of skeleton bones near them is rather a unique one. The inventory of interments included the pendants of marmot incisors, bone and stone pendants, pearl beading, arrowheads, flint plates, awl, scrapers, metal ring, probably a copper one. These burial places have radiocarbon dating indicating the period 4350-3710 calBC (68.2%) or 4360-3695 calBC (95.4%).

\*The study is done with the support of the Russian Science Foundation: (project No. 19-78-10001) “Ethno-cultural interaction of the Middle Volga populace in the Stone Age (Mesolithic - Eneolithic)”.

6 **A “MASS GRAVE” FROM THE MIDDLE BRONZE AGE SETTLEMENT OF TISZAFÜRED, EASTERN HUNGARY: THE PRELIMINARY RESULTS OF MULTIDISCIPLINARY ANALYSES**

**Abstract author(s):** Kiss, Viktória (Institute of Archaeology, HAS) - Mester, Edit (Pál Kiss Museum, Tiszafüred) - Dani, János (Déri Museum, Debrecen) - Gál, Erika (Institute of Archaeology, HAS) - Hajdu, Tamás (Institute of Biology, University Eötvös Loránd, Budapest; Hungarian Natural History Museum) - Kovács, Gabriella (Matrica Museum, Százhalombatta) - Kulcsár, Gabriella (Institute of Archaeology, HAS) - Szeniczey, Tamás (Institute of Biology, University Eötvös Loránd, Budapest) - Szeverényi, Vajk (Déri Museum, Debrecen) - Gémes, Anett (Institute of Biology, University Eötvös Loránd, Budapest)

**Abstract format:** Oral

In the autumn of 2020, during construction works, Middle Bronze Age features were disturbed in the outskirts of Tiszafüred, eastern Hungary, a few hundred metres south of the well-known Middle Bronze Age tell settlement of Tiszafüred-Ásotthalom and northeast of its cemetery, Tiszafüred-Majoroshalom. One, unique pit contained the comingled remains of at least 58 individuals in multiple layers, with complete, articulated skeletons lying mostly at the bottom. The study of this unique find is being carried out by a multidisciplinary team of archaeologists and scientist. The aim of our paper is to present the preliminary results of the multidisciplinary analyses carried out on the assemblage, including archaeological, biological anthropological, palaeopathological, zooarchaeological, malacological, soil micromorphological, stable isotope and biomolecular studies. Our questions include: Is there a difference between the population of the previously excavated cemetery and the new features in terms of lifestyle, health or origin? Why were some people interred in settlement pits instead of the usual, strict inhumation rite practices in this region and period? Why were most of the skeletal remains placed in the pit comingled, not in anatomical order? Did diseases or an epidemic cause this type of burial, or are we confronted with alternative or secondary burial rites and body manipulations?

This paper was supported by the Hungarian Scientific Research Fund (OTKA FK 128013) and the Momentum Mobility research project (Institute of Archaeology, Research Centre for the Humanities) granted by the Hungarian Academy of Sciences (Project Nr. LP 2015-3).

7 **DING DONG BELL, BODIES IN THE WELL. WHO PUT THEM IN...?**

**Abstract author(s):** Aulsebrook, Stephanie (University of Warsaw)

**Abstract format:** Oral

Mortuary practices in the Argolid region of the southern Greek Mainland during the Late Bronze Age were in general uniform and stable. At Mycenae, the foremost centre in this area, the majority of the population were buried in similar underground family tombs accompanied by a selection of grave goods apparently linked to specific aspects of their status (particularly gender and social position). Consistent application of set secondary rites facilitated the re-use of these tombs. Elite individuals were buried in more grandiose versions. More than two hundred such tombs cover the wider landscape around Mycenae, and were in use over a period of several centuries. Why then, in 1953, did excavators discover multiple skeletons of men, women and children in an abandoned well shaft under the foundations of a large house, thrown in along with ordinary household rubbish? Details of the exceptional find, including the lack of grave goods, the withholding of basic mortuary rites and the placing of three bodies at the mouth, alongside a large dog, further heighten the mystery. This paper discusses the applicability of the usual explanations given for mass graves and the possible relationship to a similar find at the neighbouring site of Argos. In particular, I argue that the treatment meted out to these individuals, so shockingly different from the norm, implies a fear or hatred that cannot be easily explained through causes such as a natural disaster or disease, which evidence suggests the community at Mycenae were able to cope with without the need for such an atypical solution.

8 **BETWEEN PATTERN AND IDIOSYNCRASY: HUMAN REMAINS FROM SETTLEMENTS IN THE BRONZE AGE CARPATHIAN BASIN**

**Abstract author(s):** Szeverenyi, Vajk (Déri Múzeum, Debrecen)

**Abstract format:** Oral

Human remains from prehistoric settlements in the Carpathian Basin are rare finds mostly referred to in the literature as “irregular burials”, and thought of as victims of unique events such as epidemic or warfare. During the past few years, such remains from Early and Middle Bronze Age (ca. 2600-1500 BC) settlements were collected in a database and analysed as part of a postdoctoral research project. The aim of this paper is to present some of the results of this research to reveal both possible patterns and unique depositions and provide interpretations of such depositions. These remains entered the archaeological record through a number of different processes and in many different forms, thus they represent a rather diverse group of evidence, which may reflect multiple social practices. Especially when studied in comparison with “normal” mortuary practices observed in cemeteries, this important but largely understudied group of remains provides important new information on (often alternative or secondary) burial rites, ancient views on the afterlife, and concepts and treatments of the (dead) body.

9

GLASS BURIAL SUITS AND GLASS PLAQUES IN HAN MORTUARY RITUALS

Abstract author(s): Lam, Eileen Hau-ling (Education University of Hong Kong)

Abstract format: Oral

Current researches on ancient Chinese glass mainly focused on the issues of origin and considered this medium as an evidence of China's contacts with outside civilisations. This paper, on the contrary, will discuss the objects of glass suits and glass plaques (most of the plaques are considered as parts of a burial suit), which undoubtedly were locally manufactured. To date, a considerable number of glass plaques have been excavated in different Han burials, and it appeared to be used in funerary context over a rather short period of time—from late Western Han through early Eastern Han. Because of the ostensive resemblance, some of the unearthed glass plaques have been confused with ceramic, stone, or even jade. In the meantime, due to the similarity of Chinese glass and jade, scholars generally perceive glass objects as less precious simulations of those of jade. However, by studying recent discoveries, the use of glass during the Han period, particularly in the mortuary context, did not necessarily follow that logic. This paper will explore the possible functions and political significations of adopting glass plaques in Han burial rituals, and also discuss the contemporaneous perceptions of immortality in relation to the materiality of glass.

10

THE BOOK OF THE DEAD BENEATH HEAD OF THE MUMMY ON THE COFFINS FROM THE CACHE-TOMB OF BAB EL-GASUS

Abstract author(s): Abdelfattah, Asmaa (Egyptian museum, Cairo; Cairo University) - Abdel Ghany, Khaled (Georg-August University, Göttingen) - Eissa, Ahmed (Cairo University)

Abstract format: Oral

"Bab el-Gasus" is the modern name given to the collective tomb of the priests and priestesses of Amun located in the Theban necropolis dating to the 21st Dynasty, discovered in 1891 beneath the temple of Hatshepsut at Deir el-Bahari. It yielded 153 burials consisting of coffins, papyri and many other artifacts.

Many Scholars focused in their studies on the vignettes of Book of the Dead that were depicted on the different sides of these coffins from a textual and iconographical point.

Therefore, it was necessary to study one of the complementary sides of those studies that had not been previously researched before, which is to deal with the funeral scenes that were depicted under head of the mummy on the anthropoid coffins of 21st Dynasty and analyze them to know not only type of these depictions, but also its magical and religious purpose.

By studying many of these coffins, The researcher was able to obtain various unpublished iconographic motifs. This composite iconography was inspired by the vignettes of Book of the Dead, shows evolved and intense details to identify these vignettes, despite not being fully illustrated in terms of artistic details and accompanying texts to fit the available surface of the coffins.

The deceased had carefully chosen the vignettes that express his desire to get out from the underworld, such as the motif of the solar cycle in the spell 16, as well as the scene of the horizon from the spell 17 of the resurrection of the sun god, in addition to the scene of the deceased taking the form of a swallow from the spell 86, in order to move freely in the Netherworld. Finally, these illustrations were the main characteristics of the decoration under head of the Mummy to express the new creation.

A.

PRONE BURIALS IN LITHUANIA DURING THE LATE MODERN PERIOD

Abstract author(s): Paskonyte, Jurate (Klaipėda University, Šiauliai)

Abstract format: Poster

Prone burials are among the most distinctive deviant burials during the medieval and early modern period. The 57 prone burials are found in the 27 different cemeteries of the 14-17th century. These burials do reflect the continuity of some certain pagan burial rituals and traditions. Prone burial traditions progressively disappeared because of the Christian post-existence concept and burials in churchyards and sanctified cemeteries. For this moment the only face-down burial of the late modern period was found in Ylakai Church's of Lord's Revelation to St. Mary environment. The men above 20 years old were buried face-down, with no coffin marks. The grave is from the second half of the 19th century. It was found in a mixed brown clay layer when the new brick church was built in Ylakai. During this event, it is possible, the cranial part of the grave was destroyed.

According to a small number of analogs from the Middle Ages in Western Europe, the face-down burial situation was very rare and could have been interpreted in several ways. First of all, the buried individual may have been highly respected (priest?). Such cases have been discovered in the 19th century period in Western Europe. Another implication is that the deceased was feared and thus unwilling to return to the world of the living for vengeance; Of course, this trend has been more prevalent in Western Europe during the Middle Ages, but it has persisted until Modern times. In this way, the buried did not pretend to resurrection promoted by the Christian world. Another negative aspect of this burial link between the living and the dead is that the individual had a serious illness, meaning he was a sinner. It was also expected that a serious illness would be stopped in the living world.

DOWN BY THE RIVER - EVIDENCE OF MATERIAL CULTURE FOR PREHISTORIC WATERBORNE COMMUNICATION ALONG EUROPEAN RIVERS, LAKES AND COASTAL WATERS

Theme: 6. Material culture studies and societies

Organisers: Luebke, Harald (ZBSA - Centre for Baltic and Scandinavian Archaeology) - Bockius, Ronald (RGZM - Leibniz-Forschungsinstitut für Archäologie) - Erič, Miran (ZVKDS - Institute for the protection of Cultural Heritage of Slovenia)

Format: Regular session

Mobility is a basic requirement for the exchange not only of material goods, but also of knowledge and ideas and thus of great importance for the socio-economic, cultural and socio-political systems already in prehistoric time. Cultural constraints, behavioral interactions and social norms might have regulated mobility and communication. Technology and ergology can express the identity of a group and provide insights into contacts and communication between different prehistoric societies.

It should be agreed that in the Early and Middle Holocene the communication and transport routes were largely based on the intra-European water network and coastlines. The humans' adaptive and innovative ability to respond to environmental changes with technical innovations has led to the development of well-organized mobility strategies and the invention of new boatbuilding technologies. However, it is still unclear in what form an exchange of goods, ideas and individuals took place and which vessels were available. In northern Europe, paddles have been proven as a means of propulsion for the Preboreal, but boats have only been found for the late Boreal. It is therefore still being discussed whether, instead of dugouts, boats made from soft material were already being used, whose archaeological evidence is much more difficult.

This session aims to deepen current knowledge within the framework of local, supra-regional, and diachronic development and application of waterborne transport and communication as well as other linked activities. In locations where direct evidence is insufficient, various kinds of indirect evidence are employed. Therefore, apart from the studies utilising archaeological sources, we would also like to encourage researchers contributing with studies applying analogous data, from the viewpoint of, e.g., ethnography, anthropology, and ethnohistory to help build the frames of reference and further our understanding about waterborne transport and communication as a phenomenon and its dynamics in the long term.

ABSTRACTS:

1

SHIP TECHNICAL CONSIDERATIONS ON MESOLITHIC AND NEOLITHIC BOAT BUILDING IN CENTRAL & NORTHERN EUROPE

Abstract author(s): Bockius, Ronald (Roemisch-Germanisches Zentralmuseum; Leibniz-Zentrum fuer Archaeologie)

Abstract format: Oral

It is largely accepted that beside logboats which were in use since the late Boreal, other types of watercraft existed in Holocene Europe and beyond. Archaeological remains of prehistoric bark and skin boats are hardly available, however such vessels might have been built already long before the inventions of dugouts. Since the late Pleistocene tools and technologies fulfilled to construct boats from natural sources by glewing and sewing.

More sophisticated boat building principals are archaeologically attested for the first time by British and Welsh finds of Early Bronze Age multipartite wooden boats which share morphological and structural features of contemporaneous dugout vessels.

This paper discusses data and methods to identify non-rigid boatbuilding in Early Holocene Northern Europe. It focusses also wood technical evidence from the Neolithic found in the Western Baltic and in Swiss lake-dwellings. Findings show the same type of timber joints well-known from Northwestern European Bronze Age "plank boats". From this results that techniques other than the concepts of lashing and sewing to construct multipartite wooden craft were at disposal to Neolithic communities on the continent as early as in the middle of the 4th millennium BC.

2

MYTH BUSTING: THE ANTLER FROM HUSUM (GERMANY) AND ITS INTERPRETATION AS EARLY EVIDENCE OF FRAME BOAT BUILDING IN LATEGLACIAL EUROPE

Abstract author(s): Wild, Markus (Cluster of Excellence ROOTS; University of Kiel; UMR 7041 ArScAn - Ethnologie préhistorique) - Jensen, Theis (Section for Evolutionary Genomics, Department of Biology, University of Copenhagen) - Hartz, Sönke (-) - Lübke, Harald (Centre for Baltic and Scandinavian Archaeology - ZBSA)

Abstract format: Oral

There is widespread agreement in archaeological research that the colonisation of northern Europe after the last Ice Age could not have taken place without suitable watercraft. However, so far vessels have only been found in late Boreal and younger periods. In this context it has always been debated whether frame boats were – instead of or in addition to dugouts – used in the earlier phases. Consequently, D. Ellmers interpreted a fragment of a reindeer antler beam from Husum (northern Germany) as a part of a boat frame in 1980. Many researchers accepted the find as a key to proof the existence of Lateglacial fur-covered frame boats. Therefore, this interpretation became part of the standard works on early boat-building technology. Although doubts were raised quickly and direct AMS dating since the 2000s questioned the age of the find, the interpretation of the antler fragment as part of a Lateglacial frame boat can still be found in recent literature.

As a result, the find was re-investigated in detail in the context of a technological analysis of Lateglacial antler artefact inventories from the southwestern Baltic region and the Paris Basin. In addition, ZooMS analysis finally made it possible to determine unambiguously the animal species. This paper will present the research history and the new results. Finally, it will explain why this find has to be excluded from the discussion on the existence of Lateglacial and Early Holocene frame boats, even though the authors principally still consider their existence possible.

3 **WATERBORNE EXCHANGE IN CIRCUM-ALPINE NETWORKS: INSIGHTS INTO A NEOLITHIC PILE DWELLING AT IMMENSEE/KÜSSNACHT, CANTON SCHWYZ**

**Abstract author(s):** Ries, Marie-Claire (Office for Urbanism, Underwater Archaeology and Laboratory for Dendrochronology Zurich)

**Abstract format:** Oral

Central Switzerland’s rich archaeological landscape houses several long-known prehistoric lake settlement sites. Previous archaeological research along the shorelines of Lake Zug focussed mainly on the northern lake area. It had already been assumed, however, that Neolithic activities also took place at Immensee on the south-western lake shore. Here, the historically significant land corridor “Hohle Gasse” connects Lake Lucerne to Lake Zug. If the waterways of the rivers Reuss, Lorze, Aare, Sihl, Limmat and Rhine are considered as well, this site appears as a node of transalpine networks between the inner alpine regions, Lake Lucerne, Lake Zug, Lake Zurich and eventually the pre-alpine foreland. This key site for prehistoric local to supra-regional limnic transport and communication routes has finally been discovered in 2020 during a construction project in Immensee. The Office for Urbanism, Underwater Archaeology and Laboratory for Dendrochronology Zurich, on behalf of the Cantonal Office for Culture in Schwyz, conducted an impromptu rescue excavation. We adopted a new, database-driven documentation system aiming for rapid analysis in 3D. Some 350 m2 were excavated and sampled in a detailed stratigraphic fashion.

First results provide evidence of multiple settlement phases. Artefact assemblages are associated typochronologically with Horgen and Corded Ware cultural groups from the late fourth millennium BC to the early third millennium BC. Plentiful lithic objects represent the full spectrum of the chaîne opératoire with a focus on serpentinite. The site has the potential to cast more light on the northern (pre-)alpine distribution network of an important raw material from the Gemsstock massive in the Gotthard region while also serving as evidence for the mobility of objects, technical innovations and knowledge traditions in past societies. Furthermore, numerous sediment samples of the waterlogged cultural deposits provide the opportunity to study the economical and socio-cultural functioning of a settlement in an edaphically suboptimal setting.

4 **THE PREHISTORIC PASTORALISTS OF RUSSIAN FOREST-STEPPE/STEPPE AND THE WATER TRANSPORT: HOW, WHEN AND FOR WHAT?**

**Abstract author(s):** Kashina, Ekaterina - Gak, Evgeniy (State Historical Museum, Department of Archaeology) - Okorokov, Aleksandr (Russian Heritage Institute) - Shutikhin, Aleksandr (Independent researcher)

**Abstract format:** Oral

The archaeological finds of the forest belt of East European Plain and Trans-Urals contain the indirect evidences of carcass boats, most probably the birch bark canoes, since the Mesolithic. The most ancient logboat in Eastern Europe, dated the Final Stone Age, comes from Lithuania. The most ancient logboat in Russia found in 1954 near the Schuchye village, Voronezh region, was believed to be the Neolithic, according to some paleopedological observations. Nevertheless, after the AMS-radiocarbon dating recently made in two different laboratories, it was firmly established that the Schuchye 1 logboat belongs to the Late Bronze Age, 18-17 cc. cal BC (research funded by the Russian Foundation of Basic Research (project no. 19-09-00301). According to the morphological characteristics it was a cargo vessel 7,5 m long, available for minimum 1000 kg load. Being made of oak, it was slightly unfinished and left at the shore or was accidentally rafted down the river, stuck and then drowned and deeply buried under the alluvial sediments.

The lifestyle of the Srubnaya (Timber-Grave) archaeological culture communities was based on the mobile cattle herding. The existence of a rich cluster of the Srubnaya settlements and burial mounds at the area of Shuchye, generally contemporaneous to the logboat, allows to reconstruct the active interconnections between both banks of the Don River, the constant ties between relatives, and the effective use of multiple local pastures. The logboat was supposed to be a multifunctional vessel, fitted to transport equally the cargo, the people and the cattle.

The use of boats for the livestock transportation between pastures is confirmed by the ethnographical sources describing the Kalmuck people of South Russian steppes. Thus, logboats were essential for the Prehistoric mobile pastoralists, no less than for the hunting or farming societies.

5 **WATERCRAFT AND WATERBORNE COMMUNICATION BETWEEN BRONZE AGE COMMUNITIES ON THE GREAT HUNGARIAN PLAIN. ARCHAEOLOGICAL AND ENVIRONMENTAL DATA**

**Abstract author(s):** Bodnár, Csaba (Eötvös Loránd University, Budapest; Museum of Fine Arts, Budapest)

**Abstract format:** Oral

The central part of the Carpathian Basin, the Great Hungarian Plain was a major crossroad for much of prehistory. Not only have raw materials and finished products moved over this landscape for thousands of years, but so have people, practices, and ideas.

During the Holocene this region had an extremely complex hydrological system: the landscape was networked by meandering rivers, streams and torrents, permanent or intermittent water-bearing areas, swamps and bogs. Until the great water regulation works of the 19th century, floods could cover hundreds of thousands of hectares of agricultural land for months, thereby they played a significant role in the daily life of people who lived along these watercourses. Paleo-hydrological data show that watercraft had to be indispensable means of trade and travel in this area from prehistoric times till the 19th century.

In this paper, I am going to present paleo-hydrological and archaeological evidence that directly or indirectly refer to the use of water transport and watercraft during the 2nd millennium B.C. on the Great Hungarian Plain. In the 1920s, a wooden, badly preserved object was discovered in the early layers of the Bronze Age tell site, Tószeg-Laposhalom, which the excavators identified as a logboat – so far it is the only known Bronze Age boat uncovered in Hungary. In addition to placing this find in a broader cultural and environmental context, I would like to give an overview of the different types of archaeological data that are available on Bronze Age water transport on the Plain. Furthermore, by presenting some archaeological case studies, I will argue that rivers in this region were important elements of the local and regional communication networks: they facilitated rather than hindered contacts between Early and Middle Bronze Age communities who lived on their two banks as several shared material practices suggest.

6 **DUGOUTS FOUND IN THE KUPA RIVER IN SISAK, CROATIA**

**Abstract author(s):** Škrkulja, Rosana (City Museum of Sisak)

**Abstract format:** Oral

The paper gives an overview of the dugouts found in the Kupa River in Sisak during the 1980s and ‘90s: their description, purpose, cultural context, and time-frame. The boats date from the 4th century BC to the 1st century AD (C14). In continental Croatia, it matches the period from the end of the late Iron Age to the consolidation of the Roman rule. During the late Iron Age, Segesta/Segestica settlement existed

on the left and right Kupa banks. The Romans destroyed Segesta in 35 BC and established a fort on the left Kupa bank. In an account of the Roman siege (Cass. Dio), the dugouts were mentioned. The passage stated that the Segestarni had fought in their boats against the Roman fleet. The neighboring communities had also tried to send the relief to Segesta via the Sava and the Kupa. The variety in morphological features and dimensions points to the different purposes, and possibly origin, of the vehicles. Some features of the vessels and the density of the finds point to a dock on the left bank of the Kupa. An underwater survey found a dozen more boats in the Kupa in Sisak, which attest to the importance of navigation in this area since prehistory. Future research will hopefully provide more information on this rather neglected class of objects and give a nuanced understanding of their use and connection to the local and regional economic systems.

7 **DUGOUT BOATS IN IRELAND - THE EVIDENCE AND RELEVANCE OF TECHNIQUES OF PROPULSION**

**Abstract author(s):** Gregory, Niall (Gregory Archaeology; IAI - Institute of Archaeologists of Ireland; EWA - Early Watercraft - A global perspective of invention and development)

**Abstract format:** Oral

Recent discoveries of dugout boats in Northern Ireland have evidenced new features integrated into the boats’ hulls. These features, which previously never entered the archaeological record, are new evidence for an expanding number of methods for propelling these boats.

With this extended diversity of methods of dugout boat propulsion across the island of Ireland, this paper examines these boats in the context of these features. It explores, the boats’ hull size and shape; dating; regional and environmental data in order to understand any correlations in boat use and propulsion techniques. Given the relatively small size of Ireland, the number of recorded discoveries of dugout boats significantly approaches 500. Consequently, this paper also postulates that within a small island, whether a pattern is emerging that some of these propulsion techniques are confined within a regional or environmental constraint.

The paper further queries the role and relevance of propulsion techniques in understanding and analysing emerging dugout boat typology.

8 **WHAT WERE IT USED FOR AND HOW DID IT GET THERE. TWO WRECKS FROM BAVARIA, GERMANY**

**Abstract author(s):** Weski, Timm (retired)

**Abstract format:** Oral

From rivers and lakes in Bavaria several logboats are known. Further rafts and landing places have been in the focus of research showing the importance of watertransport. In this paper a logboat dating to 900 BC from the Starnberger See will be presented. It was only partly preserved, but a 3-D survey made it possible to reconstruct the shape of the hull. Its stern is shaped in a complicated unusual form with a square balk protruding aft and several auger holes, which have not been observed at other wrecks. Possibly it was propelled by rowing facing forward, a means of propulsion which has not been recorded for this period yet. The quality of the oak trunk and its length of ca. 14 m indicates a use not as a fishing or transport boat, but as a ceremonial or warrior vessel. The other wreck is the remains of a plank boat discovered in the River Danube from the middle of the 18th century AD. The hull section with double chines is not known in that region at that time, but is common in the Rhine area. The analysis of the oak timbers revealed that

548 **TRACING THE PAST, CHARTING THE FUTURE: EXPLORING ARCHAEOLOGICAL RESEARCH COLLABORATION BETWEEN THE AMERICAS AND EUROPE**

**Theme:** 4. Globalisation and archaeology

**Organisers:** Saintenoy, Thibault (Université des Antilles) - Lazzari, Marisa (University of Exeter) - Hattori, Marcia (Incipit-CSiC) - Gomes Coelho, Rui (Durham university) - Geurds, Alexander (Leiden University)

**Format:** Discussion session

International collaboration between European and American teams for archaeological research has a long history of both practical and theoretical interactions. In addition to scientific achievements resulting from dialogues between schools of thought and exchanges of technical knowledge, this collaboration has also contributed to the creation of international institutions dedicated to Americanist research, such as museums, conferences, research centers, and university programs. Through a historiographic perspective, we would like to reflect on the future of such practices of international collaborations in the current global world where ubiquitous interconnections coexist with national borders, geopolitical interests, and the ongoing decolonial process.

This session welcomes testimonies and insights on diverse experiences of international collaboration for Americanist archaeological research based on the life stories of institutions, projects, and/or individuals. Contributions might refer to equity-related issues along the decolonial axis: what is happening on that end? In how far are there trends in Europe? What patterns do we see in local, regional, and national contexts in the Americas that shape such practices?

Our goal is to understand which purposes drove past international collaborations and which ones should motivate us to conduct new projects in the complex local/global frameworks of our time.

Organising team contains also Mariusz Ziółkowski (University of Warsaw) and John Carman (University of Birmingham).

**ABSTRACTS:**

1 **EL INSTITUTO FRANCES DE ESTUDIOS ANDINOS: A FRENCH RESEARCH PLATFORM ABROAD, AND/OR AN ANDEAN ACADEMIC PLACE?**

**Abstract author(s):** Saintenoy, Thibault (Université des Antilles) - Lara, Catherine (Instituto Frances de Estudios Andinos - UMI-FRE 17 MEAE/CNRS)

**Abstract format:** Oral

The Instituto Frances de Estudio Andinos (IFEA) is a well-known actor of archaeological research in the Andean countries. Since its creation in 1948, its editorial activity is responsible for the publication of dozens of books, as well as many papers in its scientific journal. Its library in Lima, which gathers thousands of books on the shelves of the archaeology section, has welcomed generations of Andean scholars, aside from the main Andean universities. As a place, the IFEA is also an Andean laboratory for French and local research projects, as well as a pan-Andean crossroads for many scientific events.

Through a historiographic perspective, illustrated by the most significant archaeological research projects the IFEA has collaborated with, I highlight the potential of such a particular research infrastructure, and discuss the past and present of the French concept of “scientific diplomacy”, in order to situate it in the history of the global international collaboration framework for Andean archaeology.

2 **FRENCH MISSIONS AND BRAZILIAN ARCHAEOLOGY**

**Abstract author(s):** Hattori, Márcia (Institute of Heritage Sciences - Incipit)

**Abstract format:** Oral

Since the first decades of the 20th century, different foreign research missions were developed in Brazil. Of this period, two are particularly noteworthy: the United States mission and the French mission. Their contribution in contemporary Brazilian archaeology is undeniable, especially in its professionalization by contributing in methodological approaches, the first generations of archaeologists in Brazil, and in the consolidation as an academic discipline.

The aim of this paper is to reflect on the contributions of these foreign missions, especially the French mission, to Brazilian archaeology. Departing from a decolonial perspective, this study is based on interviews with several researchers who worked in different periods, and those who inherited and/or continue to engage in investigations initiated by these missions, as in the states of Mato Grosso and Piauí. Thus, I aim to examine whether different practices, theoretical perspectives that implied forms of action and dialogue with local communities and Brazilian researchers have changed over time.

3 **STORIES FROM CALCHAQUÍ (NW ARGENTINA): CIRCULATION, ASYMMETRIES, AND ALTERNATIVE PATHWAYS**

**Abstract author(s):** Lazzari, Marisa (University of Exeter) - Scattolin, Maria (Instituto de las Culturas- Universidad de Buenos Aires & CONICET; Universidad Nacional de La Plata)

**Abstract format:** Oral

European-led archaeological exploration and research varied enormously across the Americas in the late 19th Century and early 20th Century. The lesser known history of these engagements in NW Argentina (NWA) points at root problems that continue to affect international cooperation today. Besides some remarkable records that are still in use today, the collective activities of early European practitioners have impacted enormously on both local researchers and descendant communities’ ability to both understand and engage with the region’s pre-Columbian past. This complex legacy, characterised by systematic and unsystematic excavations, field diaries and notes, as well as extensive artefact collection and exportation practices of various calibres, was predicated on the alienation of living indigenous communities from their past. This epistemic violence erased, through the will of the camera, the pen, and the spade, the desires and expectations of those who, as hired field labourers and guides, fearfully complied with orders to exhume ancient bodies and artefacts. This steady stream of practices and discourses concealed native peoples behind their objects and shaped Argentina’s early scientific archaeology, setting the bases for its development throughout subsequent decades.

From the perspective of the Calchaquí valleys region of NWA, we propose three themes to critically address this legacy: Early travellers; Object Lessons; and Roads and Habitats. The first theme examines the enduring impact of the words and actions of very different figures in the late 19th Century and early 20th Century. The second theme the strange relocation stories of two objects, exposing a system of hierarchical and asymmetric practices of heritage management and knowledge production, which continue to undermine contemporary collaboration. The third theme addresses cooperation and collaboration today, through the lens of our experience in the last 13 years, offering conceptual elements for more equitable, integrated, and sustainable international cooperation.

4 **ORIGINS AND EARLY EVOLUTION OF THE INTERNATIONAL CONGRESS OF AMERICANISTS**

**Abstract author(s):** Ziółkowski, Mariusz (Centre of Andean Studies, University of Warsaw)

**Abstract format:** Oral

The International Congress of Americanists is probably one of the most long-lasting scientific conferences in the world. The first one took place in 1875 in Nancy (France). At that time the first 16 points of its statute were formulated, of which the most important for the subject of the present symposium is the first one. It defined the areas of interest of the future meetings, namely: Contribution to the progress of the study of the ethnography, linguistics, and historic relations of the two Americas, especially during the pre-Columbian period.

But the Congress also had a strong political aspect at that time: all the major states sent their official delegates as far away as Japan and Turkey.

The first 10 congresses were held in Europe, but since the eleventh one in Mexico City it has been established that the meetings will be held alternately in Europe and in the Americas. During this initial period there was an interesting evolution of the themes of the presentations and discussions, which reoriented the direction of studies on the New World past.

549 **ANCIENT PASTORALIST ADAPTATIONS IN THE EURASIAN STEPPE: THE INTERSECTION OF BIOMOLECULAR AND LANDSCAPE ARCHAEOLOGY**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Wright, Joshua (University of Aberdeen) - Makarewicz, Cheryl (Institute for Prehistoric and Protohistoric Archaeology, Kiel University)

**Format:** Regular session

The Eurasian steppe is a vast, culturally connected region long inhabited by pastoralist societies that developed highly successful adaptations to its challenging landscapes. Extensive archaeological excavations and survey has uncovered a deep record of mortuary activity set within a rich monumental landscape that brought together spatially disparate communities and served as dynamic arenas of socio-political negotiation. Genomic research revealing major genetic turnovers associated with large-scale population movement and replacements has further distinguished the steppe as a busy geographic locale, a zone of interaction one flowing with people who carried with them their diverse technologies, modes of social organization, and styles. However, surprisingly little is known about the scales and modes of mobility that underscored the reshaping of steppe populations or how livestock husbandry – the backbone of pastoralist societies, emerged and evolved in the varied cultural and ecological contexts of the steppe. Similarly, the ways in which pastoralist diets were shaped by access to other animal and plant resources are generally not well-understood, and the articulation between political organization and economic dynamics has been theorized but not yet studied in detail.

This session seeks to bring together new insights into the subsistence, socio-political, and mobility dynamics of ancient pastoralist communities that inhabited diverse environmental and cultural contexts of the Eurasian steppe. This session welcomes new perspectives derived from excavations and survey, fauna and botanical remains, and the biomolecular and genomic records with

the overall aim of building holistic explanatory frameworks that better resolves why and how pastoralism spread across the diverse environments of the steppe and examine the ways in which pastoralist intensification, diversification, and longevity contributed to the formation of complex societies of the steppe.

ABSTRACTS:

COMPARATIVE LANDSCAPE ARCHAEOLOGY IN CENTRAL EURASIA: DEVELOPING THE ARCHAEOLOGY OF PASTORALISM IN LOWLAND AND HIGHLAND RESEARCH

**Abstract author(s):** Rouse, Lynne (Eurasia Dept, DAI)

**Abstract format:** Oral

The archaeological study of pastoralism in ancient central Eurasia is undergoing a sea change. Perceptions of pastoral economic, cultural, and political systems developed during the 20th century are bumping up against an increase in the number and types of sites recorded through excavation and survey data, new quantitative data streams from previously-uncollected or -uncollectable types of remains, and theoretical revisions to the concept of “nomadism” in neighboring areas of the Old World. Especially in light of the diverse forms pastoralism and its developments took across ancient central Eurasia, how might we attempt to reconcile our previous and emergent perceptions of pastoralism in the region? This presentation offers a brief overview of the intertwined development of scholarly views of pastoralism and landscape archaeology approaches in the region, illustrated through a comparison of research in lowland and highland zones. These examples help outline the importance of local socio-economic context and analytical scale in (re-)building our perceptions of ancient pastoralism, and ultimately, the ways pastoralist diversity may be incorporated into holistic regional frameworks describing the long-term development of Eurasian social complexity.
- 2

EURASIAN BRONZE AGE PASTORAL ECONOMY AND PEOPLES ‘MOVES

**Abstract author(s):** Shishlina, Natalia (State Historical museum)

**Abstract format:** Oral

Creation and development of a new economic model by steppe mobile pastoralists was accompanied by development of new principles of intra-site organization and landscape resource use. New methods and approaches facilitated discovery of a special type of settlements that appeared in the arid areas of the steppe belt of the Russian Plain, i.e. a seasonal campsite.

Analysis of characteristics of the occupation layer, archaeological, archaeozoological and archaeobotanical materials from the discovered campsites, seasonality, radiocarbon dating, isotope data on humans and animals provided an opportunity to discuss subsistence and seasonal migration systems as well as settlement patterns of pastoral groups, which inhabited the Sal-Manych steppes in 5200-2200 calBC. Isotopic markers of animals as well as of humans are also very helpful in reconstructing movements of the population and their herds across the exploited areas. Seasonal migrations of small mobile pastoral groups, whose aim was to search for and exploit rangelands beyond the nearby areas, were traced down.

MOBILITY IN THE GOBI-ALTAI MOUNTAINS (MONGOLIA): A DIACHRONIC ANALYTICAL APPROACH

**Abstract author(s):** Dal Zovo, Cecilia - Parceró-Oubiña, César - González-García, A. César (Incipit-CSIC) - Güimil-Fariña, Alejandro (DIMENSO Spatial Technologies)

**Abstract format:** Oral

The archaeological research increasingly investigates the mobility of nomadic and semi-nomadic communities in light of their potential role in the development of early trans-Eurasian interconnections. Spatial modelling based on the analysis of genetic, archaeobotanical, and zoo-archaeological information has recently opened stimulating research horizons on pastoral mobility in Central Eurasia. However, the chronological depth of modern paths and routes interconnecting steppe, high-mountain, and arid environments has been scarcely considered in this regard. In this paper, we illustrate our mapping of paths presently or until-recently used by the local herders in the Gobi-Altai Mountains (Bayankhongor Aimag, Mongolia). Moreover, we analyse paths’ relation to ancient archaeological features, particularly the (1181) Late Prehistoric mounds located in the same research area. The results of our spatial analysis indicate that there is a consistent pattern of spatial proximity between modern pastoral paths and ritual and funerary structures of the 2nd and 1st millennium BC. This (statistically) significant relationship is open to multiple interpretations that will hopefully contribute to the general discussion. The outcomes of our study namely suggest that the modern articulation of both long-distance and local paths could be rooted in the spatial choices of the Late Bronze and Iron Age people. This diachronic perspective can also help to elucidate the impact of pastoral mobility on the shaping of local and global dynamics in the Eurasian landscape over time.
- 4

DYNAMICS IN BURIAL CUSTOMS OF THE SINTASHTA CULTURE AND THE BEGINNING OF PASTORALISM IN THE SOUTHERN URALS

**Abstract author(s):** Schreiber, Finn (Independent researcher)

**Abstract format:** Oral

Sumptuous archaeological burials capture the imaginations of scholars and the public alike. This is also true for the Sintashta and related Middle Bronze Age cultures, which is famous for an elaborate burial ritual including even traces of some of the earliest chari-

ots in history. Interpretations for these “charioteers” range from warrior elites to religious authorities in a kin-based society. But the temporal dynamics of burial customs in the Sintashta culture have not yet been fully explored. Sintashta burials are rich in variation and extent, making interpretations challenging. In recent years, multivariate statistical approaches have revealed the dynamic adaptations of burial rites revealing long lasting developments. At the same time, first Bayesian modelling on radiocarbon dates, isotope analysis, and aDNA analyses have been conducted on Sintashta materials and Sintashta settlement archaeology has risen to a new level. This paper attempts to combine the results from burial studies with scientific information to identify how the unique Sintashta burial customs developed and changed over time and what it can tell us about the beginnings of pastoralism in the Southern Urals.

- 5

MULTI-ISOTOPE INVESTIGATION OF ANIMAL HUSBANDRY AT EARLY AENEOLITHIC MONJUKLI DEPE, SOUTHERN TURKMENISTAN

**Abstract author(s):** Eger, Jana (Eurasia Department, German Archaeological Institute) - Knipper, Corina (Curt Engelhorn Centre for Archaeometry) - Pollock, Susan - Bernbeck, Reinhard (Institute for Near Eastern Archaeology, Free University of Berlin)

**Abstract format:** Oral

Isotopic compositions of skeletal remains can provide substantial information on human-animal interactions and the organization of domestic animal herds in early village societies. The aim of the multi-isotopic (nitrogen, carbon, oxygen, and strontium) study conducted on material excavated from the late Neolithic and early Aeneolithic site of Monjukli Depe in southern Turkmenistan was to gain insights into animal husbandry practices primarily of sheep and goats. The approach presented here integrates analyses of bone collagen and sequentially sampled tooth enamel from caprine individuals in order to explore the life histories of animals herded at the site.  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values of bone collagen are examined to understand long-term dietary behavior.  $\delta^{13}\text{C}$ (carbonate) and  $\delta^{18}\text{O}$ (carbonate) values and  $^{87}\text{Sr}/^{86}\text{Sr}$ (apatite) ratios of animal tooth enamel are used to assess seasonal patterns related to grazing habits or foddering. Finally,  $\delta^{18}\text{O}$ (carbonate) values from second and third molars of sheep and goat provide insights into the annual timing/seasons of birth. The results support a scenario in which sheep and goats were kept in small flocks at ecologically different locations close to the settlement. Herding practices in the Monjukli case seemed to focus on landscape micro-variability rather than exploiting advantages of altitude differences.
- 6

EARLY EVIDENCE OF DOMESTIC SHEEP FROM CENTRAL ASIA

**Abstract author(s):** Shnaider, Svetlana (ArchaeoZOOlogy in Siberia and Central Asia - ZooSCAn, CNRS – IAET SB RAS International Research Laboratory, IRL 2013) - Taylor, William (University of Colorado Museum of Natural History) - Pruvost, Melanie (Bordeaux University) - Rendu, William (ArchaeoZOOlogy in Siberia and Central Asia - ZooSCAn, CNRS – IAET SB RAS International Research Laboratory, IRL 2013) - Posth, Cosimo (Archaeo- and Palaeogenetics group, Institute for Archaeological Sciences, University of Tübingen; Department of Archaeology, Max Planck Institute for the Science of Human History, Jena) - Abdykanova, Aida (American University in Central Asia) - Jeong, Choongwon (School of Biological Sciences, Seoul National University) - Hermes, Taylor - Douka, Katerina (Department of Archaeology, Max Planck Institute for the Science of Human History, Jena) - Warinner, Christina (Department of Anthropology, Harvard University; Department of Archaeology, Max Planck Institute for the Science of Human History, Jena)

**Abstract format:** Oral

In the last decade, the study of Early Holocene sites in the Central Asian highlands has been actively carried out by an international team, with the site of Obishir-5 (Fergana Valley, Kyrgyzstan) emerging as the best-studied locality from this region (Shnaider et al., 2017). The layers dated between 9-5 kaBP have yielded an assemblage rich in faunal and lithic remains attributed to the Early Neolithic. To cope with the high fragmentation of the bones ( $\text{NR}=90\%$ ), we performed collagen fingerprinting (ZooMS) to taxonomically identify indeterminate faunal remains. This analysis showed that most of the remains belong to the genus *Ovis* and *Capra*, with isolated finds belonging to *Canis*, *Cervidae*, *Lagomorph* and *Rodentia*. Cementum increment analyses suggest an exploitation of the ovicaprine during late autumn and early winter, consistent with pastoral management patterns. Finally, using DNA recovered from animal teeth at Obishir, we identified sheep mitochondrial DNA assigned to haplogroup A, which is common among domestic *Ovis aries*, and genome-wide diversity fell within the range of domesticated sheep breeds. These results suggest the presence of domestic animals and Neolithic economies deep into the heart of Central Asia already by the early Holocene.

RE-EVALUATING FISH PROCESSING IN THE SIBERIAN TAIGA: SPECIES IDENTIFICATION OF POTTERY PROTEIN RESIDUES FROM EXPERIMENTAL MIXTURES

**Abstract author(s):** Pal Chowdhury, Manasij - Buckley, Michael (Manchester Institute of Biotechnology, School of Natural Sciences, University of Manchester; Interdisciplinary Centre for Ancient Life, School of Natural Sciences, University of Manchester) - Makarewicz, Cheryl - Piezonka, Henny (Institute for Prehistoric and Protohistoric Archaeology, Kiel University)

**Abstract format:** Oral

Hunter-gatherers and pastoralists inhabiting the Siberian steppes and forests during the Neolithic Bronze Ages regularly exploited fish, but it is unknown to what extent these groups also used other resources, including waterfowl and forest birds. Here, we explore the utility of archaeological proteomics, now considered an indispensable part of the archaeologists’ toolkit, particularly for identifying exploitation of resources to their species level (i.e., as a species, and often tissue-specific biomarker), for species-specific identification of processed foods. Despite the increasing prevalence and importance of such studies, detailed methodological in-

8 vestigations remain rare. Bottom-up /shotgun proteomics whereby the proteins are digested prior to probability-based sequence matching, the approach commonly employed in archaeological investigations, can be ambiguous about identifying the specific origin of peptides, and as such is heavily reliant on the choice of a suitable database. Despite its pivotal importance in accurate identification of species, studies have not so far looked at how the choice of databases and other parameters can influence the species identification of proteins, and comparison between various extraction techniques also remain rare. In this work, we compare a novel protein extraction method to the standard GuHCl-based approaches, and also investigate how varying time, temperature and ultrasonication can influence the retrieval of proteins from ceramics. We also analyse a series of experimental ceramics in which bird and fish meat have been cooked to investigate how the choice of databases can affect the protein identification and tracing their source to a specific species. Our results show that despite the commonly accepted premise of proteins as species-specific biomarkers, considerable ambiguity can exist in identification of species, even with the use of highly specific databases. We further explore the utility of proteomic approaches to identifying food processing in archaeological cooking vessels through analyses of Neolithic and Bronze Age ceramics from the Eurasian steppe.

**FIRST DIRECT 14C DATING OF EQUINE PRODUCTS PRESERVED IN ARCHAEOLOGICAL POTTERY VESSELS AT BOTAI AND BESTAMAK, KAZAKHSTAN**  
**Abstract author(s):** Casanova, Emmanuelle (Organic Geochemistry Unit, School of chemistry, University of Bristol) - Knowles, Timothy (Bristol Radiocarbon Accelerator Mass Spectrometry, University of Bristol) - Roffet-Salque, Mélanie (Organic Geochemistry Unit, School of chemistry, University of Bristol) - Outram, Alan (Department of Archaeology, University of Exeter) - Evershed, Richard (Organic Geochemistry Unit, School of chemistry, University of Bristol)

**Abstract format:** Oral  
The Eurasian steppe is a key region for understanding the exploitation and domestication of horses. Identification of horse products in pottery vessels at several Kazakh sites emphasised the importance of horses in the economy of prehistoric pastoralists in the region, especially at Botai where the earliest evidence for mare’s milk exploitation was found. Direct radiocarbon dating of horse products would help resolve the antiquity of their exploitation. Direct dating of food residues preserved in ancient pottery vessels is now possible using a newly developed method that has demonstrated its ability to establish timeframes, in the absence of conventional materials, and to directly date specific food commodities (so far ruminant meat and milk). Using this method, we conducted for the first time, compound-specific 14C dating on horse products identified from two pottery assemblages in Kazakhstan. The direct dating of horse lipids extracted from Botai potsherds anchored them in the 4th millennium BC, which is compatible with the site chronology and demonstrates the reliability of the dating method on horse products. We then dated horse fats preserved in Bestamak pottery typologically ascribed to the Neolithic, but from a multi-period site lacking detailed absolute chronology. These case studies highlight the benefits and potential for establishing the chronology of horse product exploitation by prehistoric pastoralists in the Eurasian steppe through their direct 14C dating.

**PASTORALIST DIETARY DYNAMICS IN BRONZE AGE ALTAI**  
**Abstract author(s):** Makarewicz, Cheryl (Kiel University) - Roffet-Salque, Melanie - Casanova, Emmanuelle (University of Bristol) - Grushin, Sergey - Tishkin, Alexey (Altai State University) - Evershed, Richard (University of Bristol)

**Abstract format:** Oral  
The initial spread of domesticated animals into the Altai Mountains during the late fourth millennium brought a novel, readily replenishable food source to the region, sparking the development of new subsistence systems by indigenous Bronze Age communities that fused livestock keeping with local subsistence systems. However, the relative contribution of proteins and fats derived from livestock and those originating from fish, widely available in the lakes and rivers of the Altai Mountains, to the diets of early livestock herders remains poorly understood, due in part to isotopic equifinality in the human isotopic record. Similarly, the role of cultivars such as millet, documented in the isotopic record of pastoralist groups inhabiting the Minusinsk Basin by the mid-second millennium BC, in Altai subsistence systems is undefined. Here, we explore dietary dynamics across the Altai region during the late fourth – third millennium BC, when domesticated livestock were established first established and then proliferated, through multi-stable isotopic analyses of well-dated human and faunal skeletal material, as well as biomarker and isotopic analyses of organic residues in ceramics.

**10 DETECTING DAIRY IN THE ANCIENT EURASIAN STEPPE: METHODOLOGICAL DEVELOPMENTS IN PROTEOMIC ANALYSES OF HUMAN DENTAL CALCULUS**  
**Abstract author(s):** Palmer, Karren (School of Natural Sciences, Manchester Institute of Biotechnology, The University of Manchester) - Makarewicz, Cheryl (Institute for Prehistoric and Protohistoric Archaeology, Kiel University) - Tishkin, Alexey - Tur, Svetlana (Department of Archeology, Ethnography, and Museology, Altai State University) - Chunag, Amartuvshin (Mongolian Institute of Archaeology) - Diimajav, Erdenebaatar (Department of Archaeology and History, Ulaanbataar State University) - Jamsranjav, Bayarsaikhan (National Museum of Mongolia) - Buckley, Michael (School of Natural Sciences, Manchester Institute of Biotechnology, The University of Manchester)

**Abstract format:** Oral  
The role of dairy in the diets of ancient pastoralists that roamed the Eurasian steppe remains poorly defined, but direct detection of dairy proteins preserved in human dental calculus is revealing new insights into the presence of this comestible, thought to be crucial to pastoralist dietary regimes. Here, we discuss the pros and cons associated with the current sample preparation and analytical techniques available, and offer a new approach through analysis of the oral proteome recovered from the dental calculus of 150+ individuals interred in monumental mortuary complexes located in Russia and Mongolia dating from the late 4th to late first millennia BC. Specifically we compare current methodologies involving ultrafiltration and acetone precipitation with the newer paramagnetic bead approach SP3, and take into consideration the role of demineralisation acids, chaotropes and sample preparation techniques on proteome recovery, focusing in particular on the observed proteome complexity (i.e. peptide numbers in post-translational modification state) and sequence coverage (i.e. matched to significant proteins). We trace the relative ubiquity of dairy consumption by Bronze and Iron Age pastoralists in the Russian Altai and Mongolian steppe, and as part of our efforts, discuss how these methodological developments affect protein identification and taxonomic resolution and, consequently, impact our understanding of animal husbandry practices and human dietary intake in mobile pastoralist communities.

**11 ISOTOPIC PERSPECTIVES ON EARLY PASTORALISTS IN THE WEST SIBERIAN FOREST STEPPE**  
**Abstract author(s):** Reinhold, Sabine (German Archaeological Institue) - Marchenko, Zhanna (Institute of Archaeology and Ethnography Siberian Branch of the Russian Academy of Sciences - IAET SB RAS) - Eger, Jana (German Archaeological Institute) - Knipper, Corina (Curt Engelhorn Centre for Archaeometry - CEZA)

**Abstract format:** Oral  
How do people change their economy? One of the most important adaptations of societies at the northern frontier of the Eurasian steppe belt was the transition from a hunter-gatherer to a pastoral economy during the Bronze Age. Several hypothesis and timelines regarding the cultural and economic adaptation processes related to this transition have been outlined. We present here first results of a German-Russian research project with a multidisciplinary, bioarchaeological research agenda focusing on the analysis of stable isotopes to reconstruct changes in diets and mobility pattern. The study primarily focuses on the Vengerogo site cluster in the Baraba forest steppe in Western Siberia, where cemeteries such as Tartas 1 and Sopka 2 cover several millennia of cultural evolution. First results of stable isotope data ( $\delta^{13}C$ ,  $\delta^{15}N$ ) indicate considerable shifts in diets compared to the Early Bronze Age and earlier parts of the Middle Bronze Age. This concerns individuals associated with the Late Krotovo and even more those of the Andronovo complex. Both represent an epoch of significant transformations associated with migration processes from the steppe into the forest steppe. We notice a differentiation into diets, which resemble earlier patterns of a local hunter-gatherer-fisher economy on one hand, and a new form of dietary habits that indicates food obtained from animals fed on steppe like pastures on the other. Changing animal husbandry practices appear to enlarge the catchment areas for pasturing, eventually including more southern steppe biomes. These human individuals reflect a population with increased shares of pastoral economy or genuine pastoralists. For the first time in Siberia, we also apply a combination of strontium ( $^{87}Sr/^{86}Sr$ ) and oxygen isotope ( $\delta^{18}O$ ) composition of tooth enamel to assess mobility pattern as well as the Bayesian mixing model FRUITS to track these different dietary groups.

**12 THE SHIFT FROM HUNTING-GATHERING TO PASTORALISM IN THE MONGOLIAN STEPPE: COMPOUND-SPECIFIC AMINO ACID ISOTOPE EVIDENCE**  
**Abstract author(s):** Kendall, Iain (Organic Geochemistry Unit, School of Chemistry, University of Bristol) - Diimajav, Erdenebaatar (Department of Archaeology and History, Ulaanbataar State University) - Chunag, Amartuvshin (Mongolian Institute of Archaeology) - Jamsranjav, Bayarsaikhan (National Museum of Mongolia) - Tsaagan, Turbat - Altangerel, Enkhtur (Mongolian Institute of Archaeology) - Honeychurch, William (Department of Anthropology, Yale University) - Evershed, Richard (Organic Geochemistry Unit, School of Chemistry, University of Bristol) - Makarewicz, Cheryl (Institute of Prehistoric and Protohistoric Archaeology, Kiel University)

**Abstract format:** Oral  
The spread of mobile pastoralism across the Mongolian steppe during the Bronze Age (ca. 2800 – 1400 BCE) is thought to have initiated a major shift in steppe subsistence strategies that amplified the contribution of animal proteins and fats to human diets via dedicated exploitation of domesticated livestock. Meat and milk intensive diets, supported by intensive livestock herding, are considered a hallmark adaptation of mobile pastoralist communities to harsh steppe environments poorly suited for cultivation. High bulk  $\delta^{15}N$  values measured from the bone collagen of ancient pastoralist groups across the steppe are in general attributed to a strong trophic level shift associated with outstandingly high consumption of animal proteins ostensibly derived from domesti-

cated livestock herds. Here, we apply compound-specific nitrogen and carbon isotope analysis to bone collagen single amino acids isolated from Neolithic hunter-gatherers, Bronze Age mobile pastoralists, and Iron Age herders engaged in millet cultivation from the Mongolian steppe, all yielding high bulk collagen  $\delta^{15}\text{N}$  values, as well as domesticated livestock, in order to explore human dietary change over the transition from hunting-gathering to food production.

681 **MEDITERRANEAN ARCHAEOLOGY: FROM INTERCONNECTED PATCHWORKS TO OVERARCHING INTER- AND TRANSDISCIPLINARY FRAMEWORKS**

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Peters, Manuel J.H. (Department of Applied Science and Technology, Politecnico di Torino; HERCULES Laboratory, Universidade de Évora) - Fundurulic, Ana (Sapienza University of Rome, Italy; HERCULES Laboratory, Universidade de Évora) - Bhattacharya, Sriradha (Université Bordeaux Montaigne; HERCULES Laboratory, Universidade de Évora)

**Format:** Discussion session

The Mediterranean has historically been a patchwork of regions connected by trade networks and ancient civilisations.

Nowadays, there are significant variations in the archaeological research traditions in the area, influencing the methodological approaches and the potential future research. In the past decades, archaeological research has become an increasingly interdisciplinary field, applying and combining knowledge from several scientific disciplines. While the compatibility of the approaches brought forth by these disciplines is not always obvious, these multifaceted approaches enable to “think outside the box” and create innovative methodologies. Regardless of the numerous advantages of this approach, a well-defined goal is frequently lacking in interdisciplinary studies.

This session intends to continue the fruitful discussion brought forth during the EAA2020 session “How to promote inter- and transdisciplinarity in Mediterranean Archaeology?” by exploring previously identified issues and working towards the establishment of more inter- and transdisciplinarity in training and research.

Papers discussing projects and case studies related to Mediterranean Archaeology that involve the combination of various disciplines are encouraged. Contributors are invited to share their experiences, obstacles, and solutions. The session will aim to address questions along the following lines:

- What are the best practices employed to study materials and cultures in an inter- or transdisciplinary way?
- What are the questions we can and need to ask, depending on the material?
- How to advocate for a specific approach within the project, especially when budget and time are limited?
- Who formulates the main goal? (Different fields have different questions to ask and different approaches)
- What is the professional identity of the inter- or transdisciplinary researcher?

**ABSTRACTS:**

1 **INTER- AND TRANSDISCIPLINARY RESEARCH IN THE MEDITERRANEAN: RECOGNISING THE POTENTIAL AND THE OBSTACLES**

**Abstract author(s):** Peters, Manuel J.H. (Department of Applied Science and Technology, Politecnico di Torino; Department of History, Universidade de Évora; HERCULES Laboratory, Universidade de Évora)

**Abstract format:** Oral

The interconnectedness of the various fields related to archaeology has increased significantly over the past decade. International collaborations are a common sight, and there is specific funding to stimulate networking across institutions and countries. Within this framework, there appear to be two bottlenecks: first of all, each field has its own methodology, theoretical frameworks, and preferences for sample properties and analytical methods. Secondly, most regions have their own research traditions. This can make comparison and collaboration a complicated matter, although these issues are not always recognised by the parties involved. An overarching approach that achieves clear goals is sometimes lacking, since inter- and transdisciplinary work is not automatically successful and requires more than individual attempts at bridging the gap between ivory towers.

Unique questions can be answered by transcending disciplinary boundaries, although this sometimes only becomes visible once the lines fade and a new understanding evolves.

To move forward in a constructive manner, regional and disciplinary inconsistencies should be recognised, rather than ignored. When addressed explicitly, these different methodologies and frameworks can complement each other, instead of causing conflict. A more targeted approach to mediating these issues can be found, as is the case with survey archaeology, where efforts are underway to bridge the gap between the various methodologies across the Mediterranean, especially concerning legacy data. By addressing inconsistencies and merging datasets, new questions are being posed and answered.

Within archaeometry, research is often still conducted within disciplinary or institutional limitations. This lecture will highlight some of the advantages and complications of transdisciplinarity, using the investigation of degradation processes of metallic artefacts as a case study. A transdisciplinary approach can provide a more holistic view of the degradation process of these artefacts. By recognising the potential and the limitations of the individual fields, greater overall questions can be answered.

2 **MICROORGANISMS AND MOONMILK IN THE CAVES FROM THE VÈZÈRE VALLEY (DORDOGNE, FRANCE)**

**Abstract author(s):** Bhattacharya, Sriradha (IRAMAT-CRP2A ArchéoMATériaux Research, UMR 5060 CNRS - University of Bordeaux M; HERCULES Laboratório, Universidade de Évora) - Caldeira, Ana Teresa (HERCULES Laboratório, Universidade de Évora; Department of Chemistry, School of Science and Technology) - Chapoulie, Rémy (IRAMAT-CRP2A UMR 5060—CNRS-Université Bordeaux Montaigne, Maison de l’archéologie) - Ferrier, Catherine (PACEA UMR 5199—CNRS-Université de Bordeaux) - Mirao, José (HERCULES Laboratório, Universidade de Évora; Department of Geosciences, School of Science and Technology) - Lacanette, Delphine (I2M UMR 5295—Bordeaux INP) - Bassel, Léna (PACEA UMR 5199—CNRS-Université de Bordeaux) - Salvador, Catia (HERCULES Laboratório, Universidade de Évora)

**Abstract format:** Oral

Caves represent one of the best illustrations of hypogean environments. They may contain very diverse microbial communities. Moonmilk, a secondary speleothem, is a problem that plagues this art. Caves are considered as extreme environments due to little or complete absence of sunlight and limited interaction with the outside ecosystem. This context determines the growth of microorganisms that can easily adapt to these extreme conditions. Microorganisms play an important role in the development of biotransformations inside the caves, especially biomineralization and probably in the formation of moonmilk, thus leading to potential degradation of cave art. Moonmilk is identified by its distinctive crystalline fibres, referred to as Needle Fibre Calcite (NFC).

Moonmilk formation is not completely understood being attributed to abiotic processes and / or mediated by biotic processes. This study deals with the identification of the microorganisms sampled in three non-ornated caves (named Leye, Pilier and Racine) in the Vézère Valley (Dordogne, France) listed as a UNESCO World Heritage Site in October 1979.

In situ DinoLite Microscopy confirmed the existence of microorganisms and needles. In vitro culture showed the presence of bacteria, fungi and yeast. High Throughput Sequencing (HTS) was used to explore, compare and characterise the microbial communities present in the three caves. Scanning Electron Microscopy (SEM) helped us discriminating the different types of needles along with microbial deposits present in the caves. SEM micrographs showed in particular the presence of monocrystalline, polycrystalline and serrated needles, which occur due to biomineralisation. Bacterial communities are mainly composed by Proteobacteria, Actinobacteria and Firmicutes. Phylums like Nitrospirae, Tenericutes, Spirochaetes and Verrucomicrobia are also present in the caves.

Taking into account these data, the next step is to perform some simulation assays to better understand the microbial involvement in the formation of moonmilk.

3 **IMPORTANCE OF LOOKING IN THE SAME POT**

**Abstract author(s):** Fundurulic, Ana (Sapienza University of Rome)

**Abstract format:** Oral

Exploration of the past material culture has been in the center of archeological research resulting in diverse approaches and methodologies centered on object typology, dating, and utilization... The increase in studies focusing on use-wear and microscopic analysis, contents, and chemical and molecular markers brought to light plant-related remains and products that were often invisible in the archeological record or detectable only through indirect or contextual evidence. Attempts to bridge this gap in knowledge created a mosaic of diverse approaches in the study of plant materials from the past usually specializing on the type of organic remains like starch, phytoliths, pollen, residues etc. This causes discrepancies in terminologies used by researchers from different backgrounds, conflicting strategies of sampling, loss of information and destruction of potential plant remains, as well as a variation in the interpretations. A discussion is necessary to examine potentials and limitations of the utilized methods. On the basis of the theoretical study of contents of vessels in search of plant remains, the presentation looks into a possibility of a more inclusive workflow, exposes the pitfalls uncovered through research, reviews current terminology and encourages a path towards new lines of research and questioning.

4 **ORGANIC RESIDUE ANALYSIS AND THE ARCHAEOLOGICAL STUDY OF ROMAN AMPHORAE: EARLY ROMAN AFRICAN AMPHORAE AS A CASE STUDY**

**Abstract author(s):** Pecci, Alessandra (ERAAUB, Universitat de Barcelona) - Contino, Alessia (Ministero dei beni e attività culturali e del turismo del Lazio) - Mileto, Simona (ERAAUB, Universitat de Barcelona) - Capelli, Claudio (Università di Genova) - Toniolo, Luana (Parco Archeologico di Pompei) - Reynolds, Paul (ERAAUB, Universitat de Barcelona; ICREA)

**Abstract format:** Oral

Amphorae have always been crucial artifacts for the investigation of Roman networks, trade and economy. Traditionally, epigraphy and type forms have been used to assess the provenance and content of amphorae. In more recent years, petrographic analyses have provided a fundamental approach to better identify the provenance of these vessels. However, after the first attempts during the Seventies, it is only lately that systematic content analyses have given information on the goods actually transported in amphorae and their possible re-use. Here we present the results obtained through the organic residue analysis of different types of early Roman African amphorae found in Pompei and Ostia, which had been previously typologically and petrographically studied to characterize their provenance. The analyses were carried out by gas chromatography coupled to mass spectrometry. The paper is part of the activities of the RACAMed project (HAR2017-84242-P) founded by the MINECO Spanish Ministry, and the ERAAUB (SGR 2017-01173).

5

WHEN DIFFERENT DISCIPLINES USE THE SAME WORDS

**Abstract author(s):** Alliata, Victoria (CRC 1266: Scales of Transformation Kiel)

**Abstract format:** Oral

Communication in interdisciplinary work is definitely a challenge, since different disciplines walk their unique paths and are embedded in different traditions. Starting from diverse and sometimes subconscious presuppositions, terms are often used in different ways showing a different understanding of the underlying concepts and their application. A good example is the examination of the terminology and concepts used in describing transformation processes in Iron Age settlement development: Centralization and Urbanization, as well as the terms related to them, carry a baggage of traditions, pre-assumptions and images. This shows a significant potential for misunderstanding when it comes to a practical comparison of archaeological evidence. That is the case when we try to compare patterns of settlement transformation from the Mediterranean to the Baltic.

In order to enable an interdisciplinary comparison, there must be a mutual understanding. Finding the comparable components of terms and concepts across the disciplines is one first constructive step. A clear definition of common concepts to describe transformation and development processes is the key to an interdisciplinary discourse, which allows an actual comparability of different Iron Age contexts on a transregional level.

6

THE ANALYSIS OF ROMAN CENTURIATION AS A MEAN FOR THE INTERCONNECTION OF MEDITERRANEAN ARCHAEOLOGICAL RESEARCH THROUGH INTERDISCIPLINARY APPROACH

**Abstract author(s):** Ortega, Maria Jesús - Palet, Josep Maria - Orengo, Hèctor (Catalan Institute of Classical Archaeology)

**Abstract format:** Oral

Centuriation, the grid-based parcelling of landscapes for land distribution and field allotment, is a key evidential paradigm for tracing the Romans' transformation of the environments they colonised in order to fit their economic and productive needs. It reflected the rational thinking of the Classical world and was also linked to urban development, so that, as described in ancient land-surveying treatises, it represented for the Romans the ideal extension of the city to the territory. Advances in research have demonstrated that centuriation's apparent uniformity is in fact relative. Particularities within individual territories depended on chronology, cultural/social backgrounds, and geographical features of each territory. Also, written sources mention the existence of undivided areas within the centuriae, the integration of forests and grasslands, and the adaptation of these systems to mountain areas, natural relief and streams, fact that corresponds to modern planimetric reconstructions. The phenomenon of centuriation remains crucial for understanding the Roman idea of territory and the European historical landscapes, for that centuriation has influenced their evolution until the present day. Indeed, this system may be considered the basis of many European landscapes. From the 1980's a broad suite of approaches, techniques and methods have been used to identify and analyse many centuriations, showing them to have been a crucial element in the formation of cultural landscapes. But there is so far not a single case in which all the available approaches have been integrated holistically. This paper aims to bring out the need of a standardised methodology for the studies of centuriation by combining the different techniques and approaches used in several research projects focused on centuriated landscapes. To this end, we present a brief comparison of 4 case-studies in Mediterranean and Atlantic areas that would allow to analyze and compare how centuriation worked and evolved in different territories.

683

CONTESTED COLONIAL COLLECTING: REVITALIZATION, REPATRIATION AND REBURIAL

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Ojala, Carl-Gösta (Uppsala University) - Fossum, Birgitta (Saemien Sijte - South Sámi Museum)

**Format:** Discussion session

The aim of this session is to discuss contested museum collections from colonial/postcolonial, Indigenous and minority group contexts, with special focus on repatriation and reburial processes. Furthermore, the session aims to explore challenges and possibilities of decolonizing and revitalizing archaeology and museum collections and developing new practices of collaboration between archaeologists, museums and local and Indigenous communities.

We invite contributions dealing with colonial collecting, Indigenous cultural rights, repatriation and reburial claims, debates and processes, local and Indigenous decolonization and cultural revitalization movements, roles of museums in contemporary societies, the meaning and importance of collections for local and Indigenous communities, and visions for future heritage management. Contributions concerning relations and dynamics between archaeology, museums and Indigenous communities are especially relevant. We also encourage critical perspectives on histories of collecting and management of museum collections of sensitive material objects and human remains, as well as examination of ethical aspects and the roles and responsibilities of archaeologists and museum professionals.

At present, there is a great need for reflections and discussions in the archaeology and museum communities on the future of contested collections and ways of dealing with traumatic and highly sensitive colonial history and heritage. In this session, we wish to explore, evaluate and compare experiences from revitalization, repatriation and reburial cases and processes. In the session, we aim for an open discussion, reflecting different perspectives and experiences, and welcome presentations discussing more general issues as well as case studies from different geographical and historical contexts.

ABSTRACTS:

1

COLLECTIONS OF SÁMI HUMAN REMAINS AND INTERNATIONAL NETWORKS OF COLLECTORS IN THE 19TH AND EARLY 20TH CENTURIES

**Abstract author(s):** Ojala, Carl-Gösta (Uppsala University)

**Abstract format:** Oral

In this paper, I wish to discuss the collecting of Sámi human remains in the 19th and early 20th centuries, as part of larger international contexts of colonial collecting and physical anthropological and racial research. In particular, I will explore some aspects of the international networks of scholars and collectors interested in Sámi human remains, and trace some of the international exchange and trade with Sámi human remains that took place in the 19th and early 20th centuries.

In the paper, I argue that archaeologists and museum professionals need to critically examine the histories of their disciplines, including the darker sides of these histories, such as involvement in colonialism, racial science and grave plundering. I also argue that the contexts of collecting should be relevant for contemporary debates on repatriation and reburial, and for the ways in which we deal with these remains today. This paper stresses the need to examine the international contexts and the roles of networks of collectors and scholars in the collecting of human remains from Indigenous and other groups, as well as the importance of international collaboration today in order to better understand the histories behind the present collections of human remains.

2

THE REPATRIATION OF ARCHAEOLOGICAL ARTIFACTS TO ANGOLA

**Abstract author(s):** Barros, Beatriz (Indiana University Bloomington)

**Abstract format:** Oral

Angola was a Portuguese colony until 1975. During this period, particularly during the twentieth century, Portugal promoted many archaeological and anthropological expeditions to Angola, collecting thousands of archaeological artifacts in the process which were shipped back to Portugal in order to be studied. To this day, over 170000 of these artifacts remain in Portugal. What are these artifacts? What treatment has been given to and what knowledge has been produced about them in the meantime? What steps have been taken for the realization of their repatriation to Angola? What steps can be taken going forward? What does the repatriation of these artifacts mean for each of the countries involved? It is indisputable that repatriation has been associated with decolonizing practices and healing and empowering processes – is that also the case in this specific case study? How are these artifacts mediating the interaction between the two countries at this postcolonial moment?

This presentation will approach these questions and discuss how repatriation strategies are not one-size-fits-all and should be developed case by case, regardless of the importance and value of comparisons.

3

NORTH BY NORTHWEST: RUSSIA'S BALTIC GOVERNORATES – A CHALLENGE TO THE METROPOLE/ PERIPHERY MODEL OF IMPERIAL SCIENCE?

**Abstract author(s):** Howes, Hilary (The Australian National University)

**Abstract format:** Oral

Over the course of the 18th century, large parts of what are now the independent Baltic states of Estonia and Latvia were incorporated into the Russian Empire as the governorates of Estland, Livland and Courland. The highest local executive official and military authority in these governorates was the Baltic Governor-General, appointed by the Russian Emperor. In this regard the political situation of the Baltic governorates can be compared to that of present-day Australia, New Zealand and India under British colonial rule: the Baltic governorates were effectively the 'periphery' to the Russian 'metropolises' of St Petersburg and Moscow. However, the Baltic governorates punched well above their weight in terms of scientific achievement, providing much of the intellectual stimulus, personnel and literature for the professionalization of physical anthropology in Russia over the 18th and 19th centuries, as well as many of the connections to scientific centres in western Europe. This paper explores the extent to which Russia's Baltic governorates pose a challenge to the metropole/periphery model of imperial science, focusing specifically on the removal and study of Indigenous human remains during the long 19th century.

684

IMAGINATIONS AND IMAGINARIES OF THE PALAEOLITHIC AND MESOLITHIC – DISTORTED VIEWS, EMBELLISHMENT, AND WHAT WE MAKE OF IT [PAM]

**Theme:** 6. Material culture studies and societies

**Organisers:** Grimm, Sonja (ZBSA - Centre of Baltic and Scandinavian Archaeology) - Hussain, Shumon (Aarhus University)

**Format:** Discussion session

Archaeology, we often claim, studies past humans, their actions, and interrelations. Yet, actually we excavate and describe static material remains of these past humans and their actions – artefacts and features – that we interpret in comparison with other findings and ethnographic analogies as reflections of social norms, behaviours, and choices. Our underlying views and concepts of the past very much shape what we make of the available archaeological information. Because our imaginations of past life weight in so heavily on our interpretations and because the actual evidence is often sparse, poorly dated and highly fragmented, a reflexive

approach is important in these periods, yet the sensitivity of these underlying paradigms is better developed and more openly discussed in later prehistoric or historical periods.

In order to make our science more reflective, we aim to discuss in this session the following set of questions (open to expansion):

- How do we get from archaeological remains to people? Do we even get to people or rather to anonymous social formations?
- What concepts and theories are we using? How might received Palaeolithic/Mesolithic cultural taxonomies reflect recent political or other processes that have little to do with prehistoric reality? And do such received vocabularies structure our interpretations?
- Are we in need of more thorough and more critical history of science for the European Palaeolithic and Mesolithic archaeology?
- How to develop and install new concepts across different research practices?
- Is the borrowing of ideas and concepts from other disciplines and discursive contexts still useful and appropriate to answer big and long-standing question? What are the dangers of this practice and how self-determined needs Palaeolithic and Mesolithic research to be?
- Do we need to rethink our relationships to philosophy of science, STS and the emerging field of interdisciplinary science studies?

## ABSTRACTS:

### 1 BECAUSE THEY SAID SO! PITFALLS IN THE DATING OF ‘MESOLITHIC’ SITES IN ALPINE CONTEXTS – AN AUSTRIAN EXAMPLE

**Abstract author(s):** Posch, Caroline (Department of Archaeologies, University of Innsbruck)

**Abstract format:** Oral

In Western Austria, more than 200 sites can be found in montane, subalpine, and alpine contexts, which are mainly assignable to the Mesolithic period.

Or are they?

When looking more closely and asking for clearly datable artefacts or reliable radiocarbon dates, the number of Mesolithic sites shrinks rather drastically from over 200 to roughly 30. But then why are there in the scientific and popular literature as well as in various museums artefacts and sites denominated as ‘Mesolithic’, which do not support this attribution? If this question is put forward to the respective authors and persons in charge of the exhibitions in question, the answer predominantly is: Because the Mesolithic archaeologists said so.

Within this discussion contribution, I would like to explore how regional research history, perceptions of prehistoric lifeways and the uncritical adoption of scientific assumptions structure and bias our conception of ‘Mesolithic’ sites in alpine contexts within the archaeological landscape of Western Austria. Furthermore, I would like to discuss the possibilities of how to recognise and bypass these seemingly inevitable pitfalls.

### 2 WRITING THE IRISH MESOLITHIC

**Abstract author(s):** Warren, Graeme (University College Dublin)

**Abstract format:** Oral

This conference paper will be presented shortly after I have submitted a manuscript for a new book on the Mesolithic in Ireland (Hunter-Gatherer Ireland: Making Connections in an Island World, Oxbow - expected 2022). The book is intended for readers beyond archaeology as well as within the discipline. In particular, the book will be available at CHAGS13 (Conference on Hunting and Gathering Societies) to be held in Dublin in June 2022. The book aims to show the hunter-gatherer past in Ireland to the international audience of hunter-gatherer specialists who will be attending CHAGS. It is very much written with this audience in mind. The book is not a work of theory, but it is heavily informed by a variety of ‘post-human’ work across different disciplines and decolonising perspectives. In this short paper, I review the approach developed in the book and the role of creativity in constructing the Mesolithic past.

### 3 THE MESOLITHIC BURIAL OF BAD DÜRENBERG AND THE IMAGINATION OF SHAMANISM

**Abstract author(s):** Porr, Martin (University of Western Australia)

**Abstract format:** Oral

The notion of shamanism has undergone extensive criticism in anthropology and archaeology in recent decades. It is no longer regarded as a unified and monolithic category. Rather, together with notions such as ‘animism’, it is now rather seen as a product of universalising Western and colonial processes of knowledge creation. However, while this position is widely accepted within academic contexts and critically debated, shamanism continues to be an enduring motive in public and popular discourses. In the latter case, shamanism is widely regarded as humanity’s original religion and, therefore, placed close to the universal origin of human religiosity and spirituality. This understanding is not only reflective of a problematic progressive view of human history/evolution. It is also connected to the Western layered concept of each human being as a reflection of human history. As such, earlier stages are contained

in each human being and, therefore, everyone can connect or re-connect to his or her shamanic heritage. As an imaginary religious feature of humanity, shamanism not only acquires problematic esoteric dimensions. It also supports the interpretative appropriation of ethnographic practices, evidence, and material objects within a universalising framework of history and archaeological narratives. In this paper, these considerations are discussed with reference to the widely known Mesolithic shaman burial of Bad Dürrenberg and its representation in popular media.

### 4 PICTURES WITH A PAST – VISUAL REPRESENTATIONS OF PALEOLITHIC HUMANS AND THE THEORIES BEHIND THEM

**Abstract author(s):** Fries, Jana (Niedersächsisches Landesamt für Denkmalpflege)

**Abstract format:** Oral

Archaeological discourse is impossible without visual representation. We even might say, communication about the past is impossible without images. However, just like words, pictures express more than is intended and even more than we are aware of. And things get even more complicated if people are represented in the pictures.

Whenever an archaeologist (or a video game developer, an actor or an illustrator) depicts a person of the past, especially of the ancient past, there is a big chance that a lot more about this person is expressed than was intended – about it’s age, health, values, social standing, body concept, or gender just to name a few examples. Even more is said when several interacting humans are shown in a scene.

Pictures subtly transport our convictions, our view of the world, of ourselves and of other people.

In my presentation I will demonstrate how concepts of gender (and race) of the 19th century middle class were incorporated into fundamental theories about the Paleolithic and how they are influencing the visual representations of Paleolithic humans today. Their impact is mostly unconscious and even stronger beyond the archaeological community, in movies, advertisements, novels etc. I hope to discuss how we can become more aware of the underlying concepts of our pictures and get closer to more balanced representations of Paleolithic humans.

### 685 BETWEEN EAST AND WEST. MATERIAL STUDIES OF SOCIAL INTERACTIONS IN 3RD MILLENNIUM BC ON THE NORTHERN EUROPEAN PLAINS

**Theme:** 6. Material culture studies and societies

**Organisers:** Klecha, Aleksandra (University of Warsaw) - Tkachova, Mariya - Charniauski, Maksim (Institute of History, The National Academy of Sciences of Belarus)

**Format:** Regular session

In the 3rd millennium BC, the border between Western and Eastern European Plains was inhabited by paraneolithic communities with hunting, fishing and gathering strategies and incidentally visited by farming and pastoral groups. Despite the apparent proofs of this contacts as flint axes, amber or pottery imports, there are also other intermediate premises to indicate interactions such as style or technology. Analysing syncretic materials may provide more data on their occurrence, intensity and character.

This session aims to discuss materials and results of their studies, especially those that primarily show relics of contacts occurring between locals and newcomers.

We welcome papers focusing on:

- archaeological premises for interaction,
- studying materials of syncretic character,
- intercultural networks from the past,
- searching for interactions causes, proceeding and results,
- interpreting nature of social and cultural interactions,
- finding new interpretational possibilities for interactions.

We also invite all papers dealing with transmission of knowledge in the field of prehistoric production.

## ABSTRACTS:

### 1 FOREIGN GODS: EVIDENCE OF WORLDVIEW TRANSFORMATIONS IN THE MATERIAL CULTURE OF PEAT SETTLEMENTS OF THE BELARUSIAN LAKE LAND REGION

**Abstract author(s):** Charnianski, Maxim (Department of the prehistory archaeology, Institute of history, NAS of Belarus)

**Abstract format:** Oral

The Belarusian Lake land region on the border of the 4th/3rd millennia BC was a fairly homogeneous region inhabited by bearers of the Usviaty archaeological culture. The latter is a typical representative of the forest Neolithic tradition of North-Eastern Europe. Among the materials of this culture, there is a characteristic set of artefacts made of bone, horn and amber, which gives us an idea of the complex beliefs of the local population of that time. However, soon the region began to penetrate the carriers of completely

different cultural and economic traditions - first of the Globular Amphorae Culture, and then of the Circle of the Corded Ware Culture. Newcomers are associated with the appearance at the settlements of the Lake land region of artefacts, probably associated with the cult of the sun. These are key-shaped pendants, ring pendants, fragments of amber discs, as well as the appearance of notch-beam ornament on the surface of both new types of bone and antler amulets and previously known forms. These new beliefs, however, did not replace the existing ones. The material of the peat settlements of the Kryvina peat bog shows that these new elements have been added to already existed and participated in the creation of a more complicated worldview. This, in turn, may suggest that the physical composition of the population in the Belarusian Lake land region have not actually changed under the newcomer's pressure, but new cultural influences were strong enough to make significant changes in local's traditions and beliefs.

2 ON THE TIP: THE RESULTS OF THE TRACEOLOGICAL ANALYSIS OF BONE STEMS FROM KRIVINA PEAT BOG, BELARUS

**Abstract author(s):** Malyutina, Anna (The Institute for the History of Material Culture) - Charniauski, Maxim (Institute of History of the National Academy of Sciences of Belarus)

**Abstract format:** Oral

Archaeological sites of Krivina peat-bog (end of the 4th – middle of the 2nd mill. BC) are located on the (Biešankovičy district, Vitebsk region). Due to specific features of formation and bedding conditions in cultural layer of sites, artifacts made of organic material – bone, antler and teeth have remained and we were able to conduct a traceological analysis of the entire collection. According to the results of the study, a separate category of artifacts (26 examples) made of trade animals bones was identified in the material of the sites. These products are small (up to 3, 5 cm in length) sharpened stems (points) with a processed or not end. On most of the items, there are remnants of an adhesive substance for fixing the stems in the base (wooden or stone, the remains of which have not reached us). Analysis of micro-traces of wear on the surface of the points showed their functional difference. Thus, traces associated with plant and soft (wool) materials were recorded. Some of the items find analogies in bone artifacts related to fishing. To correctly interpretation the wear marks found on the points from the Krivina peat bog, the author of the study conducted a series of experiments on the manufacture and use of bone stems. The results of the experimental-traceological analysis indicate the presence of special composite tools (cards, combs) for processing plant fibers, wool, which was previously unknown for the material culture of hunter-gatherers of the forest zone of Eastern Europe.

3 CORDED WARE HORIZON ON THE ZEDMAR A SITE: CULTURAL ATTRIBUTION

**Abstract author(s):** Tkach, Evgenia - Malytina, Anna (Institute for the History of Material Culture Russian Academy of Sciences)

**Abstract format:** Oral

In report we present preliminary results of the research of the Corded Ware materials, which were excavated in 70-80s of the XX century on the Zedmar A site (Kaliningrad district, Russia, South-Eastern Baltic). This site is multilayer: above the Corded materials were fond ceramics of the Early Iron Age, below the Corded materials – layer of the Early Neolithic Zedmar culture. According to stratigraphy, Corded Ware horizon poorly identified. Main attention be devoted to ceramic materials, which represented by profiled flat-bottom ceramic, ornamented by corded imprints and notches. Also were found ceramic which could be attributed to the “Early A-horizon” of the Corded Ware culture distribution. Within bone and antler industry with the Corded materials we could correlate bone awl, which has direct analogies amongst Corded materials in Estonia. There are no typological or technological data to correlate flint materials with Corded Ware horizon due to multilayer character of the site.

These materials are an evidence of the distribution of the Corded Ware culture tradition to the South-East Baltic region and date to III mill. BC.

4 LATE NEOLITHIC POTTERY AS AN INDICATOR OF SOCIAL CHANGE IN NE POLAND

**Abstract author(s):** Klecha, Aleksandra (University of Warsaw) - Manasterski, Dariusz (Faculty of Archaeology at the University of Warsaw)

**Abstract format:** Oral

In the Late Neolithic the area of NE Poland was inhabited by communities of the Neman culture belonging to the last hunter-gatherers of continental Europe. During this period they were exposed to various cultural interactions with the environment of Central European agrarian, pastoral and chalcolithic groups, which in consequence led to a cultural differentiation of the indigenous folk. One of the manifestations of this is pottery identified as Linin type and Żąbie-Szestno type. The main characteristic of discovered pots is a distinct stylistic-morphological eclecticism. Materials of this type have been identified as a specific type of record with a toponymic character, a stylistic horizon with a chronological distinction, and more recently as a manifestation of a broader local production affiliated to the Neman cultural sphere. Syncretic forms, which were developed as a result of various cultural interactions, ultimately led to the formation of the early Bronze Age Trzciniec culture - the groups of which initiated a new type of social activity in the region. This paper presents a brief overview on a process that resulted in formation of a new unique unit that spread afterwards to wider territories of todays Poland, Belarus and Ukraine.

5 ON THE EASTERN PERIPHERY - BELL BEAKER MATERIALS FROM THE MASURIAN LAKE DISTRICT

**Abstract author(s):** Klecha, Aleksandra (University of Warsaw) - Manasterski, Dariusz - Januszek, Katarzyna (the Faculty of Archaeology at the University of Warsaw)

**Abstract format:** Oral

The research of the 20th and early 21st century on the Bell Beaker phenomenon in Poland established a conventional border zone of spreading of such records eastwards on the Vistula line. Although the presence of Bell Beakers’ artefacts was suggested in the areas reaching the Eastern European Lowland, these were only single finds discovered on the Belarusian territory. Recent discoveries from the area of northern Podlasie, however, unequivocally confirm the presence of new Late Neolithic materials of this unit in the area far beyond the Vistula line. Material analyses, especially focused on pottery, have not revealed any analogies with Central European variants of this cultural phenomenon. Instead, they have indicated numerous references to the materials of the transatlantic Bell Beakers’ package. With the exception of such distant analogies, numerous similarities, especially to pottery, were found on sites with syncretic materials of the Neman cultural sphere. Research carried out on selected fragments of pottery from this area, previously interpreted as influences from the neighbouring Iwno culture, revealed the presence of numerous Bell Beakers components of western and north-western European provenance. These conclusions became an inspiration to revise previous views and to extend the verification research with further archaeological records - pottery, but also flint artefacts from the best explored sites: X in Żąbie and II in Szestno from the Masurian Lake District. This paper presents the results of these analyses.

A. CHANGING PERSPECTIVES – THIN SECTION AND ICP-MA/ES ANALYSES OF NEOLITHIC POTTERY FROM THE ÅLAND ISLANDS, FINLAND

**Abstract author(s):** Brorsson, Torbjörn (Ceramic Studies) - Lucenius, Jenni (University of Turku) - Stenbäck, Niklas (Department of Education and Culture, Government of Åland Islands)

**Abstract format:** Poster

Ålands location in the Baltic Sea between Finland and Sweden during the Neolithic influenced its material culture and pottery traditions. Our study challenges the focus on typology by examining the technical composition of the ceramic ware and its provenance. The methods used are ICP-MA/ES analysis and analysis of thin sections of the clay used. The study includes early and late Comb ceramics, Jettböle I and II type of Swedish Pitted ware and Finnish Kiukais ceramics. Some sherds, interpreted as mixed with influences from both Comb- and Pitted ware, representing the succession between traditions, display a reinforcement of earlier ceramic traditions. The thin section analysis indicates a local technological continuity in the ceramic traditions visible in the preferred clay. A chronological difference in the choice and handling of the temper suggests different preferences within traditions. The ICP analyses indicate that some of the artefacts, as e.g. a clay figurine seems to be of non- Åland origin.

687 MEDIEVAL STONE MONUMENTS: THE MATERIALITY OF REMEMBRANCE

**Theme:** 6. Material culture studies and societies

**Organisers:** Caval, Saša (University of Reading; University of Primorska) - Busset, Anouk (University of Glasgow; Université de Lausanne)

**Format:** Regular session

Three major processes of human memory are encoding, storage, and retrieval. The medieval stone monuments encapsulate all of them, displaying various strategies of remembrance that are concerned with materiality and temporality. The chosen information was encoded and permanently recorded in stone, maintaining the information over periods, only to be recalled in future. Even if monuments were not initially created with the intention of memory recollection, they are subsequently perceived in terms of their ability to evoke the remembrance and imbue the mute stone with associations. They become mnemonic agents, which are read and interpreted differently throughout the past. This session calls for contributions detailing the research into the stone material culture of the medieval period. We invite colleagues to present their research into a wide variety of ways in which remembrance was materialised in stone in the period between 600 and 1600. We are interested not only in the European trends but also beyond, trying to gain a perspective on contemporary techniques, roles and meanings of stone material culture, whether architectural, funerary or other, across the globe.

ABSTRACTS:

1 THE SLEEPING BEAUTY OF KOPER THAT HYBERNATED THROUGH THE MIDDLE AGES BUT WOKE UP TO TELL THE STORY

**Abstract author(s):** Mileusnic, Zrinka - Pobežin, Gregor (University of Primorska)

**Abstract format:** Oral

We refer to the Sleeping beauty story as it best resembles the life story of a stone slab, (re)discovered in Koper during the recent restoration in the Assumption Cathedral and installation of the new organ in 2019. The modern Sleeping beauty is known for the say-

ing »If he loves me, he will let me sleep.«, but being a team of archaeologist and a classical philologist, we just could not let that happen. We had to research the story, actually many stories this monument had to tell. Moreover, , we do have some further questions.

The appealing part of this monument is that both sides were decorated, revealing stories about two periods of the history of Koper, 1000 years apart from each other. The marble slab was used twice. In the second half of the 6th century, it was used in a late antique church as part of an altar partition. The material and the methods of realization are confirmed by its sources coming from the Byzantine workshops. Its discovery represents evidence of late antique church testifying to the existence of the diocese, which also confirms the urban character of the settlement in the second half of the sixth century. The slab can tell us for sure that in the 16th century, it was not living its primary function anymore. At that time it was used again for another purpose. The little-known inscription until the latest (re)discovery, dedicated to Aurelio Vergerio, was engraved on the back of the slab. The inscription commemorates Aurelio Vergerio the oldest of the three Vergerii brothers, the youngest of whom was Pier Paolo Justinopolitan bishop and famous apostate. Because of his apostasy, he suffered the fate of damnatio memoriae shared by his older brother Giovanni Battista. The damnatio memoriae is a striking feature of the inscription.

## 2 FOR ALL TO SEE, AND YET FORGOTTEN: (RE)DISCOVERING THE MEDIEVAL CARVED STONE PANEL IN NEW MALTON, NORTH YORKSHIRE

**Abstract author(s):** Steinforth, Dirk (Independent researcher)

**Abstract format:** Oral

Mounted high up in the façade of the tower of St Leonard & St Mary RC church, New Malton, North Yorkshire, England, a weathered Romanesque carved stone panel displays an intriguing figural scene of a man with a crozier giving a benediction and standing on the necks of two dragons. In scholarly literature, this sculpture is hardly ever mentioned, let alone discussed and analysed. However, it certainly merits closer attention, as it represents one of the rare examples in the British Isles of the motif of 'Christ trampling the beasts'. This image has its origins in the eastern Mediterranean and features prominently in Christian art, such as in Carolingian book illumination, for example, as illustrations of the famous Psalm 91:13: 'Upon the viper and the cockatrice you shall tread, And you shall trample the lion and the dragon'. This paper is going to present and describe this neglected monument for the first time, analyse its iconography, and, comparing it to similar images, examine its place in medieval Christian art.

## 3 FAMILY TIES: THE GOVAN RECUMBENT CROSS-SLABS

**Abstract author(s):** Kasten, Megan (University of Glasgow)

**Abstract format:** Oral

Early medieval carved stones imbue the landscape with meaning specific to the contemporary people and connect them across Time and Space. The 'Govan School' refers to a group of art-historically similar carved stones in Western Scotland that attest to the prominence of the kingdom of Strathclyde. Digital imaging techniques, such as photogrammetry and Reflectance Transformation Imaging, have facilitated easier comparison between stone monuments and allowed for more direct comparison of their worn decorative elements (especially the form of crosses and their proportions). This approach has highlighted intriguing similarities in the design of the recumbent cross-slabs from the sites of Govan and Inchinnan, which likely covered the graves of an expanding elite class. Because the monuments lack inscriptions, I argue that the decorative elements are encoded with meaning and the identity of the deceased individual, and similarities in design embodied connections between members of kin groups across the region of Strathclyde.

## 4 MONUMENT, MOVEMENT AND MEANING: THE VARIED LIVES OF MEDIEVAL STONE MONUMENTS ON THE ISLE OF MAN

**Abstract author(s):** Johnson, Andrew (Manx National Heritage)

**Abstract format:** Oral

The Isle of Man is known internationally for its carved medieval stone cross-slabs. Over two hundred survive in either complete or fragmentary form, and are derived from over sixty locations - almost all of them funerary - throughout the island. Today they are mostly gathered at just twelve parish churches, despite the creation of these administrative units postdating the floruit of stone carving. The end of cross-carving is now thought more closely to coincide with the setting up of the parishes, suggesting that the latter may even have been the cause of the former.

The presence of substantial decorated and inscribed cross-slabs, which had only quite recently been erected, can now be seen as part of the process of 'place-making' which contributed towards the selection of these sites as the centres of these new parishes in the twelfth century, and also of others chosen as assembly sites, fairs and market-places, and as places for the administration and dispensing of justice and even execution. Other factors in place-making are the means of access, and its maintenance through time: this can be explored through map regression and the use of GIS.

Whilst some of these stones continued to serve a monumental function drawing people through and across the landscape - and perhaps even across the sea - others were broken up or reused, their carvings and inscriptions perhaps unintelligible and thus no longer relevant or even drawing suspicion, before being rediscovered and newly cherished around two hundred years ago.

The varied biographies of these monuments - and increasingly their modern replicas and proxies - can tell us much about the regard in which the Manx crosses have been held through time.

## 5 MIGRATION PERIOD PICTURE STONES FROM GOTLAND AS WITNESSES OF AN ORAL CULTURE

**Abstract author(s):** Strehlau, Hannah (Centre for Baltic and Scandinavian Archaeology - ZBSA)

**Abstract format:** Oral

The Gotlandic picture stones are a unique find group that is limited to the Swedish island of Gotland. The carved stone slabs occur in various sizes and forms between 400 and 1000 CE. The Swedish researcher Sune Lindqvist divided the monuments in five different groups, A to E. The oldest group is, thus, group A (400-600 CE) and is central to this PhD project.

The so-called A-stones appear in trapezoidal or axe-shaped form and show a rather abstract ornamentation of geometric motifs, in combination with anthropomorphic and zoomorphic figures and border decorations. The sudden appearance in perfectly elaborated form and without previous development phase gives reason to explore their parallels and possible predecessors in Scandinavia and the Roman provinces. A possible connection exists to remote Spain and Portugal where Roman Imperial tombstones contain similar decorations.

In an oral culture, carved stone monuments, which were erected visibly in the landscape, were an important medium of communication. It is not only the choice of motifs but their arrangement and composition that can give valuable insight to strategies of remembrance and thinking patterns. A comparison to other stone monuments can show different narrative structures and help clarify processes of idea transfer. The task of this PhD project is therefore, to collect material that is similar to the Gotlandic A-stones regarding style and motif to shed light on the long unanswered research question of the origins of these monumental stones.

## 6 OVERLAYING PREHISTORIC WITH MEDIEVAL REMEMBRANCE IN BOSNIA AND HERZEGOVINA

**Abstract author(s):** Caval, Saša (University of Reading; University of Primorska)

**Abstract format:** Oral

Medieval cemeteries with stećci in the western Balkans are frequently located on prehistoric burial mounds. A few such sites that have been studied demonstrate the reuse only of prehistoric sites and avoiding Roman-period burial sites. Acknowledging that the medieval reuse of prehistoric mounds is frequently encountered around Europe, it is nevertheless extraordinary that such practice appears in the western Balkans so much later - about 200-400 years later according to the current research - than the rest of comparable examples (Greece: Curta 2016; Hungary: Türk 2014; the western Europe: Van de Noort 1993; Bradley, Williams 2013). Can this be attributed to the geographical isolation of the medieval BiH, or it is a testimony to the (un)exploration of this important and information-rich cultural heritage?

Transhumance is another feature that voices the connection of medieval Bosnia and Herzegovina to prehistory. Transhumant pastoralism was a significant part of the local economy from prehistoric to recent historical periods. Placing cemeteries along these ancient herders' routes was a custom, highly praised among Balkan cattle-breeders, aimed to enable the deceased to oversee the herd (Antonijević 1982). In fact, the prehistoric princely tombs reflect a social structure and territorial organisation similar to the medieval transhumant communities (Palavestra 1995). Thus, if similar economic and social models were in use in the medieval Western Balkans, stećci cemeteries had to have a meaningful position within their micro-region and a specific role within a geographic network; the role to cultivate individual and collective identity recognition, to preserve social memory and to nurture the spiritual domain.

## 7 MEMORY AND MEMORIALISATION: CARVED STONES CONNECTING PEOPLE AND PLACES

**Abstract author(s):** Busset, Anouk (University of Glasgow; University of Lausanne)

**Abstract format:** Oral

Stone monuments are a link in the temporal fabric that connects the past, present and future. They are first and foremost erected as an act of commemoration(s), even though their context might determine their other functions. By reusing an ancient significant landscape, for instance, early medieval societies created a tangible connection to the past, or the past they perceived. Indeed, it is not rare to find early medieval carved monuments erected at or close to 'ancient places', such as burials, mounds, stone circles, or even larger structures, such as hillforts. Through associations, the stone monuments connect to the past, and relieve or reactivate it, by recreating a place. In that sense, carved stones participate in the formation of social memory. Exploring case studies from Scotland, Sweden and Norway, this presentation will engage with the multiple layers of commemorative practices encoded within early medieval carved stones, from their inscriptions or imagery to their landscape settings.

## 8 MEDIEVAL BRICKMAKERS' MARKS AND REMEMBRANCE IN THE MEDIEVAL DIOCESE OF TURKU, FINLAND

**Abstract author(s):** Aalto, Ilari (University of Turku; Aboa Vetus Ars Nova Museum)

**Abstract format:** Oral

In the medieval Diocese of Turku (Sw. Åbo), Finland, brickmakers' marks can be found in stone churches constructed between 1440 and 1500. These marks, similar to masons' marks studied elsewhere in Europe, consist of depictions of everyday objects, symbols,

letters, and merchants’ marks that were drawn on bricks before they were fired. Although the marks were probably initially used in controlling the production of bricks and paying wages, their placing in church masonry hints to other functions as well. The marks can be found in highly visible areas such as doorways and pillars, whereas they are only rarely found in areas hidden from view. For example, the marks visible in the outer wall of All Saints Chapel of Turku Cathedral are a tell-tale case of intentionality, as all visible marks are placed at elevations visible from the ground. This paper gives an overview of the brickmakers’ marks used in the stone churches of the Diocese of Turku and considers their possible functions as methods of remembrance, signature and devotion.

9 **INTERPRETATIO CHRISTIANA: THE POSSIBLE CHRISTIAN CONTENT OF THE RE-USED ROMAN STATUE OF ICARUS**

**Abstract author(s):** Smid, Katarina (University of Primorska)

**Abstract format:** Oral

In 1956 the Roman statue of Icarus, which was a part of the funerary monument, was discovered during the restoration of the Old Castle in Celje, next to the ruins of the chapel. The finding place, the fact, that no other Roman remnants have been found in the Old Castle so far and the small dent in the occiput suggest that it was secondarily used in the castle chapel instead of an angel.

In the Late Middle Ages, as it is recorded in several medieval testimonies (De Europa by Aeneas Silvius Piccolomini, Itineraries by Paolo Santonino), the physical remains of the Roman Celeia were ubiquitous in its medieval successor. Due to the fact that the Old Castle was the principal seat of the Counts of Celje (German Cilli), the statue was in all probability re-used at their command, as the ruling dynasty showed certain interest and affinity for the Roman heritage, what is best indicated by the female Roman statue (a goddess?), which was discovered built into the outer walls of the Princely Palace in the semi-circular niche that was carved especially for the statue.

688 **SOCIETY FACING CHANGES. REGIONS ON THE SOUTHWEST BALTIC BETWEEN 2500 - 1500 BC**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Czebreszuk, Janusz (Adam Mickiewicz University in Poznań) - Müller, Johannes (Christian-Albrecht-Universität zu Kiel) - Szmyt, Marzena (Adam Mickiewicz University in Poznań; Museum of Archaeology in Poznań)

**Format:** Regular session

The session will be devoted to the summary of the German-Polish project “Late Neolithic and Early Bronze Age in the South-West Baltic areas (2500 - 1500 BC). Why did political structures of the Bruszczewo-Łęki Małe type arise?” So far, the researched areas have been treated as peripheral (lying between) with respect to such centers as Southern Scandinavia, Mittelelbe-Saale-Gebiet or Silesia. As part of the project, for the first time, areas on the Southwest Baltic have concentrated a multi-year collective effort by an interdisciplinary team of researchers. It concerned socio-cultural changes that led to the emergence of communities with a complex structure and a clear internal hierarchy in the studied areas. The goal is achieved through an interdisciplinary approach with the use of new data and the re-analysis of archival information using modern analytical methods. A significant “added value” is an in-depth, multi-faceted analysis of data from the cemetery in Łęki Małe, the only necropolis of princely mounds in the Unetice culture. The papers will also cover environmental, settlement and economic changes, including metallurgy.

**ABSTRACTS:**

1 **LANDSCAPE TRANSFORMATIONS FROM THE NEOLITHIC TO THE BRONZE AGE IN GREATER POLAND INDICATION CHANGES IN SETTLEMENT PATTERNS**

**Abstract author(s):** Doerfler, Walter (Institut fuer Ur- und Fruehgeschichte Kiel) - -Radke, Iwona - Rzodkiewicz, Monika (Institute of Geoecology and Geoinformation, Adam Mickiewicz University)

**Abstract format:** Oral

What was the environmental background for the transition from the Young Neolithic (single grave time) to the Late Neolithic (dagger time) and the succession into the Early Bronze Age? In the time between 2500 and 1500 cal BC an up and down of anthropogenic pressure on the landscape is visible in pollen diagrams of Greater Poland that is accompanied by a general transformation in the tree composition: The spread of hornbeam characterises the change in the woodlands. Climatically the continental influence seems to prevail in the first half of this millennium with high values of pine and low for alder. From 2000 BC onwards higher Alnus values indicate a shift to a more oceanic climate regime with wetter and cooler summers and mild winters. High values of settlement indicators show a continuous land-use until ca. 1800 BC when a clear gap indicates a fast abandonment of arable fields for ca. 100 years in the surrounding of Lake Woniesc. A sequence of fast increase and reduction of land-use intensity characterises the 17th century BC before settlement indicators decrease again for a period of ca. 100 years after 1600 cal BC. The general picture shows stable conditions during nearly 700 years (2500 to 1800 BC) and a much more unstable pattern of land use during the following 300 years indicating either different land use practices or a less permanent settlement behaviour in this phase of the Early Bronze Age.

2 **THE BRUSZCZEWO MICROREGION REVISITED: GEOARCHAEOLOGICAL PROJECT OF BRUSZCZEWO LAKE. FIRST RESULTS AND THEIR IMPACT ON THE ARCHAEOLOGICAL STATE OF KNOWLEDGE**

**Abstract author(s):** Niebieszczanski, Jakub (Adam Mickiewicz University in Poznań)

**Abstract format:** Oral

The archaeological site in Bruszczewo (Central Greater Poland) is most famously known by its unique fortified settlement from the Early Bronze Age. Until now, several later occupation phases has been distinguished, including the Late Bronze/Early Iron Age, Roman Period and Early Medieval. The well-established archaeological narrative of the microregion was already supplemented by initial geoarchaeological activities in the early XX1st c., however little is still known about the palaeolake and marshes that dominated the landscape in prehistory and early historic times.

Since 2020, the new geoarchaeological project of Bruszczewo (“Living by the Lake”)\*, puts the landscape transformations of the area in a new perspective. Several cores obtained from the basin brought new data on the landscape changes in temporal, and most importantly, spatial aspects. Chronostratigraphy of vibra-core transect across the former lake and wetland revealed gradual diminishing of the lake as well as the fluctuation of environmental changes in different parts of the basin. One of the vibra-core was obtained from the direct proximity of the settlement in Bruszczewo. It’s stratigraphy tells about the former depth of the reservoir just nearby the site and supports the idea that the lake was an important element of the defensive system of Bruszczewo EBA settlement. The additional LIDAR and cartographic study, combined with the another set of verification drillings allowed to distinguish unknown to date morphological features which might force us to reexamine the microregion’s landscape appearance in the past.

\*The study “Living by the Lake(…)” is funded by the National Science Centre, Poland, grant no. 2019/33/B/HS3/00193.

3 **SPATIAL-COMPARATIVE ANALYSIS OF ARCHEOLOGICAL SITES FROM LATE NEOLITHIC AND EARLY BRONZE AGE IN NORTH-WESTERN POLAND**

**Abstract author(s):** Lawniczak, Marcin (Adam Mickiewicz University in Poznan)

**Abstract format:** Oral

The AZP (Archaeological Picture of Poland) program, conducted since ‘70s in the form of field prospection covered whole country and allowed to found of nearly half a million archaeological sites. Unfortunately, these data are still in analogue form and have not been digitized. As a part of the project „The Late Neolithic and Early Bronze Age in Southwestern Baltic area (2500-1500BC). Why did Bruszczewo-Łęki Małe type of power structures appear?” Late Neolithic and Early Bronze Age archaeological sites from north-western Poland have been digitized.

The total number of 15 000 archaeological sites were divided into chronological units such as Funnel Beaker Culture, Globular Amphora Culture, Corded Ware Culture and Interstage Neolithic and Bronze Age. In addition, separated areas were designated, to conduct spatial analysis (slope, aspect, elevation etc.) in relation to archaeological sites and chronological units.

The results of the analysis were presented as percentag. Comparative studies of individual regions and cultures allowed capturing some trends in the settlement bias that changed depending on the cultural and geographical course.

4 **THE NEOLITHIC TO THE BRONZE AGE TRANSITION IN THE SOUTHWEST BALTIC AREA IN THE LIGHT OF MATERIAL CULTURE STUDIES**

**Abstract author(s):** Teska, Sebastian (Adam Mickiewicz University)

**Abstract format:** Oral

The following presentation concern the development of societies in the transition period between the Neolithic and the Bronze Age in the particular area of Central Europe. Southwest Baltic Area, chosen for the study, extends from Schleswig-Holstein on west, eastward to the Vistula river. During examined time period (ca. 2300/2200-1800/1700 BC), it was inhabited by various societies, including those connected with Bell Beaker Culture, Corded Ware Culture, Únětice Culture and Trzciniec Culture. In my research I have focused on selected zones within Southwest Baltic Area: Lower Oder Region, Cuyavia, Southwest Greater Poland and terrain along the Noteć and Warta River. Collected data were studied in several steps. Fundamental one was the typochronological study of selected materials. It included typology of ceramic, metal and amber artefacts, flint and stone tools and basic features of burials. Its extension were results of geometric morphometric analysis of macromorphological differences in ceramic set. The result of conducted preliminary survey was a database containing number of variables reflecting features of studied archaeological material, combined in the further steps with radiocarbon data. The main aim of my research was tracking links between archaeological data, mostly from sepulchral context, throughout statistical methods and embedding them in a wider context.

5 **KEEPING UP WITH THE TIMES. TYPOLOGY OF YOUNG NEOLITHIC TO EARLY BRONZE AGE CERAMIC VESSELS IN THE SOUTHWEST BALTIC AREA**

**Abstract author(s):** Pfeiffer, Annalena - Raese, Hendrik (Institute of Pre- and Protohistoric Archaeology, Kiel University)

**Abstract format:** Oral

In the southwest Baltic region, socio-cultural changes led to the emergence of communities with a complex structure and clear internal hierarchy. In order to clarify the causes of the emergence of these power relations, as well as their origins and relationships

to the preceding socio-cultural phenomena of the Younger and Late Neolithic, intensive typochronological investigations were conducted. An important find category to answer these questions is the ceramic material, since vessel shapes as well as the prevalent ornamentations can be used as a tool for visualizing the continuity of distinct cultural phenomena. In this context, changes of material culture can be explained by chronological development or contemporary interaction with neighbouring regional groups or other cultures. Therefore, ceramic material from Corded Ware, Bell Beaker, Dagger Period, and Early Bronze Age inventories, especially from the north-eastern part of Germany was examined. Based on this data and the material from neighbouring regions, a detailed recording system regarding morphology and ornamentation of the vessels was developed by using but also discarding (e.g. cluster analyses) different approaches. In consequence, a typology was implemented through a synthesis of computational clustering, indices-based pre-selection and impressionistic comparisons. Due to the hierarchical structure of this system, it is possible to apply and adapt it for different aspects of our research questions. This will help us answering the question of socio-cultural changes and distinguish between the spheres of local groups as well as overarching cultural phenomena with the help of modern statistical methods in form of multivariate analyses.

6 **ANIMALS AS THE BASE OF SUBSISTENCE STRATEGIES OF ÚNĚTICE CULTURE IN THE CONTEXT OF ZOOARCHAEOLOGICAL DATA FROM CENTRAL EUROPE**

**Abstract author(s):** Makowiecki, Daniel - Krajcarz, Magdalena - Osipowicz, Grzegorz (Institute of Archaeology, Nicolaus Copernicus University in Toruń)

**Abstract format:** Oral

Animals as a component of subsistence strategies in the Early Bronze Age societies on the Polish Lowland are poorly understood. This is due to the low number of sites where animal remains were recovered. The excavations carried out in Bruszczewo (1995-2008), delivered an assemblage of animal bones. The remains were collected from various parts of the settlement, and dated to the Early Bronze Age. This paper focuses on comparative study of zooarchaeological data from the Bruszczewo settlement and other regions of Central Europe. The aim of the analyzes is an attempt to define the role of domestic and free-living animals in subsistence patterns of the Únětice culture societies. Which animal management practices were common among Early Bronze Age, and which ones were culture-specific? To what extent had the Early Bronze Age societies still practiced the late Neolithic animal subsistence practices? To what extent did the Early Bronze Age societies based on animal husbandry, and to what extent did they explore natural resources - game mammals, birds and fish? Additionally, preliminary paleoenvironmental and palaeoecological data will be reported based on stable isotope analysis of bone collagen. They will give an insight to human impact on the ecosystem, with a special focus on changes in ecology of wild mammals. The revisited analysis of blades made of mammal scapulae will provide an additional insight into the management over mammal resources. The revisited analysis of blades made of mammal scapula will provide an additional insight on new knowledge concerned their production and utilisation.

\*) The study is supported by the National Science Centre, Poland, projects: a) 'Late Neolithic/Early Bronze Age developments in the south-west Baltic area (2500-1500 BC) (grant No. 2014/15/G/HS3/04720); b) 'Isotopic paleoecology of mid-sized carnivores during Postglacial within the Polish territory (grant No. 2017/27/B/NZ8/00728).

7 **MACRO-LITHIC TOOLS IN METALLURGICAL WORK PROCESSES: THE CASE STUDY OF BRUSZCZEWÓ 5 (POLAND)**

**Abstract author(s):** Delgado-Raack, Selina (Universitat Autònoma de Barcelona) - Kneisel, Jutta (Christian-Albrechts-Universität Kiel) - Escanilla, Nicolau (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The settlement of Bruszczewo 5 is supposed to have been a leading site in centralizing mineral resources of distant provenance and redistributing metal objects, among other valuable goods. Part of the resulting production was very likely deposited in the princely graves of Łęki Małe, where they accompanied the death of the Únětice ruling class. Both the remarkable remains of different kind recovered in the old excavations of the tumuli of Łęki Małe, and the macrolithic tools found in the settlement of Bruszczewo during the last decades, together with the new techniques applied for their analysis, offer interesting empirical information to evaluate the possible link between Bruszczewo and Łęki Małe.

In this presentation, 36 macrolithic artefacts coming from the wet-soil area of Bruszczewo and used as tools in metallurgical tasks, according to use-wear traces, were measured under pXRF, searching for chemical evidence of metal adherences. Among them, a mold, anvils, sharpeners and pierres à cupule were included. This exploratory attempt seeks to define the materials that came into contact with the stone surface and to make a proposal of the manufacture and/or use process, in which macrolithic artefacts were involved. From a methodological perspective, this strategy allows checking previous results derived from functional analysis (i.e., production traces) and tracking metallurgical work processes from a different point of view, namely the tools implemented for manufacturing metal objects.

8 **POTTERY WITH TEXTILE PRINTS FROM THE EARLY BRONZE AGE DEFENSIVE SETTLEMENT IN BRUSZCZEWÓ IN THE LIGHT OF THE LATEST RESEARCH**

**Abstract author(s):** Czebreszuk, Janusz (Adama Mickiewicza University of Poznań) - Podkańska, Małgorzata (Independent Researcher) - Schaefer-Di Maida, Stefanie - Müller, Johannes - Kneisel, Jutta (Christian-Albrechts-Universität zu Kiel) - Szmyt, Marzena - Jaeger, Mateusz (Adama Mickiewicza University of Poznań)

**Abstract format:** Oral

Pottery with textile prints is found in many stages of European prehistory. The beginning of the Bronze Age (turn of the 3rd and 2nd millennium BC) undoubtedly belongs to the periods of its particularly intense use. Archaeologists initially treated this type of vessel surface finishing as a cultural distinguishing feature. Today, we already have a sufficient amount of information to recognize that ceramics with textile prints were known from various genetic contexts, and its importance should be located in other dimensions of the life of the studied communities. Thanks to these sources, we have a chance to get acquainted with one of the most important branches of prehistoric production, which was undoubtedly weaving. Moreover, having this information, we can undertake the task of reconstructing the social significance of this craft in the analyzed period.

In the above context, the settlement in Bruszczewo deserves special attention, where during the excavation works that lasted over a dozen years, a rich collection of ceramics with textile prints was discovered. It consists of a total of about 600 samples. They were analyzed using the same methodological questionnaire. Thanks to this, it was possible to determine such issues as: what types of textiles or sprang left their imprints on the surface of the dishes and what material they were made of. The subject of a significant technological complication of the investigated traces, revealing the extensive knowledge of the manufacturers, was also discussed. This knowledge also concerned the methods of preparing textiles before their use, which left imprints on the surfaces of the dishes. In Bruszczewo, a large variety of prints was observed and an attempt was made to typologize them. Finally, selected aspects of the social interpretation of textile production in the Early Bronze Age Bruszczewo are presented.

9 **CHRONOLOGY OF THE LATE NEOLITHIC AND THE EARLY BRONZE AGE IN THE LOWER ODER REGION**

**Abstract author(s):** Matuszewska, Agnieszka (University of Szczecin) - Krzysztof, Kowalski - Kozłowska, Dorota (National Museum of Szczecin)

**Abstract format:** Oral

Around 3500 BC in the region of the lower Oder intense development and crystallization of local features of the settlement of the Corded Ware culture (CWC) communities occurred. In the following centuries, the Lower Oder CWC group clearly had influence on neighbouring regions: Mecklenburg, southern Brandenburg, western Kuyavia and Greater Poland. At the same time, already in 2300 BC, the CWC communities from Pomerania got in contact with proto-Bronze cultures by adapting selected elements from their inventories and laying the foundations for introducing the discussed area into the early Bronze Age civilization circle. This initial stage, which lasted to around 2000 BC, is known as the Dagger Period, and it was definitely temporary. Assemblages of grave goods analysed indicate that new Early Bronze Age models of behaviour were put on traditional patterns. The actual/developed Early Bronze Age in Pomeranian zone did not start until intense influx of bronze object of Únětice type reached this region.

Until recently all findings on periodization of this period were based on conventional comparative methods and relative chronology. Now radiocarbon dates taken from three cemeteries located in the Lower Oder region: Czelin, Dębogóra and Szczecin Płonia were obtained. The analysis of the results is the subject of this presentation.

10 **ABSOLUTE CHRONOLOGY OF THE CEMETERY IN ŁĘKI MAŁE IN THE LIGHT OF NEW RADIOCARBON DATING**

**Abstract author(s):** Goslar, Tomasz (Poznańskie Laboratorium Radiowęglowe; Adam Mickiewicz University in Poznań) - Czebreszuk, Janusz (Adam Mickiewicz University in Poznań) - Müller, Johannes (Christian-Albrechts-Universität zu Kiel) - Szmyt, Marzena (Adam Mickiewicz University in Poznań; Archaeological Museum in Poznań)

**Abstract format:** Oral

The princely burial mound in Łęki Małe has a unique character in the entire Unetice culture (UC). Elsewhere, burial mounds with richly equipped burials, probably of people representing the elite of a given community, appear singly (for example, Leubingen or Helmsdorf). In Łęki Małe we are dealing with a cemetery encompassing at least 14 mounds, 5 of which were excavated many years ago. Detailed description of archaeological finds was then presented in monographs, however it suffered from the lack of specialist analyzes, because of very constrained capability of Polish archeology at the time. This drawback concerned also absolute dating, limited to a few 14C determinations made (Michigan, Groningen, Berlin). Nevertheless, it is worth emphasizing that some of them were among the earliest 14C analyses made on finds from Polish lands. Fortunately, the excavation research in Łęki Małe was very reliable, many samples were collected with a precisely described cultural and stratigraphic context, which were carefully stored for years at the Archaeological Museum in Poznań. These samples became the basis for redefining our knowledge about the chronology of the cemetery. These were relics of wood, charcoal, as well as human and animal bones. In total, over 100 determinations in AMS technology were obtained, the vast majority of which was related to the activity of the UC community. They came from four mounds: I, II, III and IV.

This paper analyzes these new radiocarbon data using innovative analytical techniques and confronts them with information on the stratigraphy and cultural context. The result of these procedures brings a new knowledge about the chronology of the entire cemetery and the dynamics of the use of individual mounds.

11 THE SOUTH-WEST BALTIC AREA BEETWEN 2500 1500 BC: WHY DID THE BRUSZCZEWO-ŁĘKI MAŁE TYPE OF POWER STRUCTURES APPEAR?

**Abstract author(s):** Czebreszuk, Janusz (University of Adama Mickiewicza in Poznań) - Müller, Johannes (Christian-Albrechts-Universität zu Kiel)

**Abstract format:** Oral

Studies on the new chronology of princely barrows will be presented: a key element of the package of cultural features indicating the formation of stable power centers in the UC. New data was provided by sources from the cemetery in Łęki Małe, based on the 14C method supported by dendrochronology.

We will propose an extended concept of the functioning of the northern borderland of the UC, showing the range, dynamics and nature of the presence of features of this culture in the areas from Schleswig-Holstein to Eastern Pomerania, with particular emphasis on the so-called the Kościan group of the UC in southern Wielkopolska. Information on aDNA (burials from Łęki Małe), the production of ceramics and metallurgy (from the settlement in Bruszczewo) and the features of the products of material culture (their genetic analysis) turned out to be useful in this respect.

We will present in-depth knowledge of manufacturing, especially prestigious products (made of gold, amber and bronze), as well as special-use tools ("knives" made of bones) and ceramics (a very large category of pottery with textile imprints in Bruszczewo). The general feature of the results of these studies is to show the extensive knowledge of manufacturers and the complications of socio-production processes related to the analyzed manufacturing.

The results of new studies on the cultural landscape of the Kościan group will be discussed, showing its complicated organization. On the other hand, research on the human-environment relationship has revealed the depth and radical nature of the phenomenon of anthropopresser with its local spatial dimension. This knowledge, in addition to the previously mentioned archaeological data, made it possible to build a model for the functioning of the community of the UC Kościan group.

690 GENERAL SESSION: NEW METHODS AND RESULTS

**Chair:** to be confirmed

**Format:** Regular session

ABSTRACTS:

1 HOW TO HARNESS A HORSE?

**Abstract author(s):** Bauer, Anna (Independent Researcher)

**Abstract format:** Oral

Whats the difference between a cattle and horse yoke? How can I know what I see? Interested? In my presentation I will explain the way they differ. Up from the neolithic till today and which problems you have to handle with a harnessed horse in contrast to a harnessed cattle. A short explanation: Cattle yokes either rest on the neck, on the forehead or in the front of the withers, for this reason cattle yokes have not big cavities. All types of twin-yokes have been known since the Neolithic and each design has its pros and cons. The only single cattle yoke known until now comes from Pforzheim and is a single yoke for the withers. Horses were also put to the twin yoke, recognizable by its big cavities for clasping the ribs of the horse. Single horse yokes occur in the shape of an iron bow, which rested on upper side of the neck. Its counter piece could have been a well padded semi-collar or a breast girth. The speed and carrying capacity of the animals are different and in some cases remarkable. The efficiency of animals always depends on their health condition. Remember the celtic warrior, he was driving into the battle, he was no rider.

2 POTENTIALS AND LIMITS OF PORTABLE X-RAY FLUORESCENCE ANALYSIS (P-XRFA) FOR POTTERY MATERIAL

**Abstract author(s):** Schauer, Michaela (ClfA Deutschland/LMU München)

**Abstract format:** Oral

X-ray analysis (XRFA) is know as a technique for archaeometry and geological research for quite a while know. I could almost be called a 'common' technique - if it would be widely applied and understood properly. The technique offers many possibilities for the study of clay objects: the elemental composition or fingerprint of a given sample can be identified through X-ray fluorescence and used to characterized material qualitatively and quantitatively. Portable XRF (p-XRF) additionally offers the option to get to the material that need to analysed which is extremely helpful for archaeologists working in countries where export of finds is impossible. p-XRF thereby offers the opportunity to identify different clay pastes and sources for pottery of a given settelement, region etc. and contributes greatly to our knowledge of past societys and their organisation. This paper will explore the potential of pXRF for pottery

3

COMPASSION IN ARCHAEOLOGY BY ARCHITECTURAL DESIGN METHODS

**Abstract author(s):** Lengyel, Dominik - Toulouse, Catherine (BTU Brandenburg University of Technology Cottbus-Senftenberg)

**Abstract format:** Oral

One very natural connection between materiality and emotion is haptics, and it is not for nothing that the metaphorical second clothing is architecture. Few spatial structures have as great an emotional impact as architecture. So what could be more obvious than to use the emotional impact of architecture for archaeological research? It is the passion of every architect to perceive architecture emotionally and to use its methods to make this experience also an experience of non-architects. The sophisticated mediation of archaeological hypotheses can be emotionally appealing as well as scientifically sound and even remain active. For this, however, it is necessary to translate archaeological hypotheses visually according to all the standards of architecture, including the expertise of design, i. e. the genuine shaping of artificial artefacts. This does not refer to so-called virtual reconstructions that disregard scientificity and rely solely on pure fiction. It is precisely the discipline of architecture that is able to make targeted and skilful use of abstraction and to create engaging visions out of abstract geometry, which are able to adequately express the uncertainty in the knowledge of archaeology, above all by the methods of architectural photography, which remain scientifically well-founded.

The presentation aims to demonstrate and illustrate this method by several projects developed by the authors in cooperation with archaeological research institutions:

- Cologne Cathedral and its Predecessors (by order of and exhibited in Cologne Cathedral),
- Bern Minster – its first century (by order of and published by Bern Minster Foundation)
- The Metropolis of Pergamon (within the German Research Fund Excellence Cluster TOPOI),
- The Palatine Palaces in Rome (by order of the German Archaeological Institute, both latter exhibited in the Pergamon Museum Berlin),
- The Ideal Church of Julius Echter (by order of the Martin von Wagner Museum in the Würzburg Residence).

4

ORIENTATION OF NEOLITHIC HOUSES IN THE POMORAVLJE REGION, SERBIA: A CHRONOLOGICAL PARAMETER OF THE DYNAMICS OF THE SETTLEMENT EXPANSION

**Abstract author(s):** Savic, Ružica (Institute of Archaeology, Belgrade)

**Abstract format:** Oral

The method of geophysical prospection enables the research of large settlements and their surroundings without the use of destructive excavation methods. This method has proved to be important for the study of Late Neolithic (Vinča culture) settlements, because the houses were burned, which resulted in the reading of strong anomalies on geomagnetic plans. Vinča houses have a rectangular form, with surface area from 20m2 to over 100m2. In addition to insight into the structure and organization of the settlement, geomagnetic plans, among other things, provide data on the orientation of buildings within the settlement.

This research is based on the assumption that the orientation of houses changes according to a certain rule, making it possible to roughly reconstruct their relative-chronological sequence. Determining the orientation of houses within a settlement could play a key role in deciphering the development of large settlements. In previous studies of orientation of houses on the geophysical settlement plan, a systematic deviation in the orientation of houses was observed, i.e., whenever houses were intended to be oriented in a certain direction and parallel to each other, there was an error in perception that caused a slight counterclockwise rotation, a phenomenon known as 'Pseudoneglect'. This paper will investigate the extent to which systematic errors in the orientation of houses can clarify the chronology, i.e. the simultaneity of buildings within a settlement, but also the dynamics of the expansion of Neolithic settlements in the Pomoravlje region (Serbia).

5

A SONG OF GIS AND FIRE. DETERMINATION OF FIRING TRAJECTORIES IN AN OFF-TELL ENEOLITHIC CONSTRUCTION AT SULTANA-MALU ROȘU (SOUTHEASTERN ROMANIA)

**Abstract author(s):** Covataru, Cristina - Opris, Ionela (Research Institute of the University of Bucharest, University of Bucharest) - Opris, Vasile - Ignat, Theodor (Bucharest Municipality Museum) - Panaiotu, Cristian - Dimofte, Daniela (Paleomagnetism Laboratory, University of Bucharest) - Lazar, Catalin (Research Institute of the University of Bucharest, University of Bucharest)

**Abstract format:** Oral

The 5th millennium BC witnessed a plethora of major changes in Southeastern Europe. The tell settlements became the main form of habitation, complemented by flat settlements, cemeteries, and temporary occupancies on the area nearby the tell site, also known as the off-tell habitation. In Romania, off-tell habitations were documented in several sites such as Sultana-Malu Roșu, Piet-rele-Gorgana, and Vătași-Măgura.

This paper aims at presenting the current information regarding the distribution of firing temperatures inside a burnt Eneolithic construction located in the off-tell area at Sultana-Malu Roșu. Since the discovery in 2014 of burnt daub in the necropolis area, new information contributed to changing our views relative to this unique site`s spatio-temporal evolution.

Our study implements an interdisciplinary approach integrating multiple analytical data (obtained using methods such as XRD, FTIR, magnetic susceptibility analysis) into a GIS application to perform a comparative spatial analysis of the temperature trajectories inside the construction.

The results of our multiple analytical approach provide insights concerning structure’s design as well as the potential operations that led to its burning and destruction.

This work was supported by a grant from the Romanian Ministry of Education and Research, CNCS - UEFISCDI, project number PN-III-P4-ID-PCE-2020-2369, within PNCDI III.

6

### THE USE OF DOT AND LINE PATTERNS ON THE BONE TOOLS FROM THE LATE NEOLITHIC AND CHALCOLITHIC EAST BALKANS

**Abstract author(s):** Azeri, Hazal (German Archaeological Institute, Eurasia Department) - Christidou, Rozalia (CNRS/UMR 5133-Archéorient) - Margarit, Monica (Valahia University Targoviste)

**Abstract format:** Oral

The study centres around patterns with dotlike depressions cut using mechanical drilling and with grooved lines, which are observed on bone tools from East Balkan sites of the late 6th and the 5th millennia BC. An ongoing survey of similar markings from the region shows that they were also made on bone figurines and personal ornaments. The types, raw materials and manufacturing quality of the artefacts marked, as well as their spatial and chronological distributions help analyse the use of the marks as a common practice or as unusual, still non-random, actions. In the latter case, patterns were mostly shaped on sleeves and edged instruments perforated for hafting and pegging, made from deer antler. These tools do not seem to have occurred at the same time in the entire region under study, and this could be the result of long-distance contacts and knowledge transfer. Objects that represent singular or rare finds in the areas where they were found, for example, a comb and a harpoon based on deer antler and a pig tusk, respectively, were also marked. Despite spatial and chronological variations, the tools of the Late Neolithic and Chalcolithic periods provide evidence for differential use of raw materials, skilled production as well as technological change including product innovation. Making patterns on specialised and new tool types could suggest a desire for sharing and promoting these technologies. It could vary or multiply connotations attached to them and support their dissemination and maintenance in the peoples’ social and economic activities.

7

### MINING AND MEMORY: BRONZE AGE COPPER MINING AT THE GREAT ORME MINE, UK

**Abstract author(s):** Wager, Emma (None)

**Abstract format:** Oral

It is now well-established that, during the second millennium BC, people mined for copper ore at various locations in Britain and Ireland. Research and interpretation have focused on identifying the chronology, content, scale and tempo of prehistoric ore extraction at these sites and how this was then linked into the organisation of contemporary bronze production and circulation. It is increasingly recognised, however, that to contribute more fully to wider discourses on the character and organisation of Bronze Age society, such studies also need to consider how a practical engagement with mining and mines by people in the prehistoric past was embedded in on-going processes of social reproduction.

This paper considers this issue from the perspective of the relationship between the creation and maintenance of memory; the active, lived experience of mining as a technological process; and the reactions provoked in prehistoric communities by encounters with the residues of this activity. The archaeological case study presented is mining for copper ore in the second millennium BC at one of Europe’s largest prehistoric mines, on the Great Orme, north Wales, UK. It uses material evidence from the mine, north Wales and elsewhere in Britain to assess the interaction between collective and individual memory and the practical, social configuration of routines of ore extraction at this remarkable site over more than 500 years. It argues that, for Bronze Age communities with a strong desire to maintain links to the past, copper mining on the Great Orme became a ‘technology of tradition’, with a significance that reverberated beyond the mine as a place and each physical instance of mining - and even beyond the mine’s productive prehistoric life.

8

### NEW PERSPECTIVES FOR THE SCIENTIFIC STUDY OF LEVANTINE ROCK ART: SURFACE CONSOLIDATION

**Abstract author(s):** Serrano Aranda, Claudia - Bea Martínez, Manuel (Universidad de Zaragoza) - Zalbidea Muñoz, M<sup>a</sup> Antonia (Universitat Politècnica de València)

**Abstract format:** Oral

Rock art of the Mediterranean Arc of the Iberian Peninsula constitutes a singular group of works in Europe, this led to it being declared a World Heritage Site by UNESCO (1998). In Spain, specifically in Aragon, there’s a group of rock art sites that stand out for their exceptional thematic, technical and stylistic features, as are the examples of Albarracín Mountain Range (Teruel).

This research focuses on the study and analysis of an intervention proposal for the shelter of Toros del Prado del Navazo (Albarracín, Teruel). The results of this study make it possible to extrapolate the study to other similar shelters thanks to the analyses carried out.

This work promotes the conservation and restoration of rock art from a scientific perspective, which complements the archaeological research initiated: multidisciplinary work to favour the preservation of the sites. In fact, thanks to the conservation proposals, it contributes to the stability of the groups, the improvement of visibility or even the possible appearance of new figures.

The analysis of the previous state of conservation and of the original materials by means of analytical techniques, like SEM-EDX, it’ve helped to define a correct working proposal.

Specifically, surface consolidation has been studied with the aim of halting or minimising the alteration mechanisms that accelerate the degradation of paints, allowing the particles to cohere and improve their mechanical properties. Within this study, consolidating products with nanoparticles and organosilicates have been evaluated. In addition, the interaction of the consolidation treatment with the stone material has been studied thanks to technological tests, SEM-EDX and spectrophotometry.

This work is a preliminary study that is planned to be further developed in future research but aims to initiate a conservation protocol for the assemblages adapted to their climatological situation and the physico-chemical nature of the original materials.

9

### MIGRANT INDICATORS: THE ARCHAEOLOGICAL IDENTIFICATION OF MIGRANTS IN THE PREHISTORIC MEDITERRANEAN

**Abstract author(s):** Giardino, Claudio (University of Salento) - Mieli, Gianfranco (Museum of the Emigrant, Introdacqua - L’Aquila) - Pisoni, Luca (Independent researcher) - Zappatore, Tiziana (University of Salento)

**Abstract format:** Oral

The growing presence of migrants in the European Union has pressured our societies to face a phenomenon that is new in many ways. Europe, that has been an immigrant continent for centuries, has now seen the migratory flows overturned, and it has become a host area.

It is possible to understand contamination between ancient cultures by comparison with modern migrations, studying what the migrants bring with them on their journey, even as intangible assets.

An ethno-archaeological research allowed us to understand values, skills and objects brought by the illegal immigrants from Africa and Asia. What do the migrants bring with them? What “identity” do they choose when they move to other countries? All objects reunite them with an intimate dimension made up of friends and relatives. Traditional clothes and foods participate with these objects in a representation of social identity (in the sense of agency).

It is possible to archaeologically identify ethnic, religious and social markers which help us recognize elements in prehistoric contexts connected to the presence of foreigners, to their material and immaterial cultures, to the effects between different contexts and to resilient practices.

Aspects of material culture - such as food, domestic ceramics, home furnishings, burials - have a very strong symbolic and identity value, not unlike personal effects. This identity value sometimes survives even for ensuing generations, even after assimilation, without necessarily conflict with the host society.

These identity indicators were observed in archaeological contexts of the protohistoric Mediterranean. Migrations have shaped European societies since ancient times. We present some case studies of migration indicators displayed in the material culture. E.g.: they are attested in some particular burials in southern Italy, or in the pottery produced by people coming from the central Mediterranean that were found in Bronze Age Crete and in the Mycenaean world.

10

### A TRACEOLOGICAL AND EXPERIMENTAL APPROACH TO SURFACE PROCESSING OF BRONZE AND IRON AGE CERAMICS IN SW POLAND

**Abstract author(s):** Gawron-Szymczyk, Aleksandra (Institute of Archaeology University of Wroclaw)

**Abstract format:** Oral

The biographic method – that is, tracing artefact’ ‘life’ from manufacture, through its use, and lastly to its deposition – is frequently applied in the analysis of flint, lithic and metal objects. Ceramic vessels are very common artifacts at many archaeological sites, but they are seldomly objects to such analysis. I focused on the short period of time during the “life” of a ceramic vessels when its surfaces were smoothed or/and burnished. Both are typical features of Bronze/early Iron Age pottery found in today’s Poland. I examined two components that affected the desired definitive result: the vessel drying time and the used tool(s). To complete this study, I combined the results of observations of 46 samples from three settlements and two cemeteries in southwestern Poland, as well as the interpretation of experimental reference samples. I indicated that the drying time was fundamental, while the tool kit was composed of rather simple, usually unprepared, matters such as pebble, pieces of antler and bone, pottery shred and wooden stick. During the smoothing process, I also noticed an association between surface selection (internal/external) and the intention to which the vessel was deposit (settlement/funerary).

11

THE PHOENICIAN SITE OF CASTILLO DE DOÑA BLANCA, GEOPHYSICS AND MODELLING CONTRIBUTIONS TO ITS ARCHAEOLOGICAL PLAN

**Abstract author(s):** Trapero Fernández, Pedro - Ruiz Gil, Jose Antonio - Lagóstena Barrios, Lázaro - Pérez Marrero, Jenny - Catalán González, Javier - Martín Mochales, Domingo (Cádiz University) - Parrilla Giráldez, Rubén (Seville University) - Rondán Sevilla, Isabel - Ruiz Barroso, Manuel (Cádiz University)

**Abstract format:** Oral

We propose in this communication a model for integrating new techniques in the study of archaeological sites, using the combination of non-invasive techniques like Ground Penetrating Radar, photogrammetric flight with RPA, and the archaeological plans generated by excavations, all of them incorporated into a Geographical Information System that allows us analysis and comparison. To exemplify this model, we use the case study of Doña Blanca’s castle, an important Phoenician settlement, in the Ancient Mediterranean Far West, located at the base of the Sierra de San Cristobal and at the old estuary of the Guadalete River. This archaeological settlement has an intricate stratigraphy of several meters, so has the difficulty of visualizing different overlying levels with geophysical techniques. Also is hard to distinguish possible levels of archaeological abandonment. All this with the problem of combining the non-invasive data with the planimetry of the city, which is already excavated and can give us an idea of its chronology and functionality.

12

ASSEMBLING POTTERY PRACTICES FOR THE STUDY OF EARLY VILLAGER HOUSEHOLDS IN THE SOUTHERN ANDES

**Abstract author(s):** Vazquez Fiorani, Agustina (Universidad Nacional de Cordoba) - Franco Salvi, Valeria (Instituto de Humanidades - IDH, Cordoba; Consejo Nacional de Investigaciones Cientificas y tecnicas - CONICET) - Salazar, Julian (Instituto de Estudios Historicos - IEH, Cordoba; Consejo Nacional de Investigaciones Cientificas y tecnicas - CONICET)

**Abstract format:** Oral

Pottery has been one of the key proxies in Archaeology to understand past societies. Most studies tended to characterize ceramics as closed packages often representing cultural groups, technological behaviors, and groups’ transmitted ‘ways of doing’. Recent contributions in social theory focus on the vibrant nature of materials. This has a crucial consequence for material studies, as it challenges its study as neatly closed boxes and instead, it highlights the hybrid temporal and spatial nature of human-things nets that are mutually dwelled. Among these contributions, an assemblage toolkit allows us to think about how things, in this case, pottery vessels and fragments, create and sustain past worlds, but also how they contribute to pulling them apart. It contributes to reconstructing how crafting practices bundled together several spaces and times, materials and beings, and also maintained communities over time.

In this way, our communication will focus on pottery practices of early villager households from La Cienega valley, in Northwest Argentina. Excavations carried out in a house compound showed a complex stratification formed by an acretional occupational floor, several pits carved below it, and post abandonment filling strata. The pottery samples coming from these different units were made from different raw materials, manufacturing techniques and were part of multiple-use scenarios and depositional events. We propose these activities can be thought of as multiscalar assemblages, applying procurement, morphological and technological analyses in pottery.

13

KEEP YOUR OBJECTS CLOSE, KEEP YOUR BONES CLOSER. HUMAN REMAINS AS HEIRLOOMS

**Abstract author(s):** de Roest, Karla (University of Groningen, Groningen Institute of Archaeology)

**Abstract format:** Oral

Re-used or ‘old’ artefacts found in graves spark the idea that these were heirlooms. From modern notions of heirlooms, it follows that these objects had significant meanings and an emotional laden biography. Whereby at some point, their role in the world of the living ended, and they now belonged with the dead. It is possible to imagine fitting stories to these archaeological finds.

However, the question raises whether the opposite is also true: How to approach graves that do not contain such older objects, or entirely lack material culture? Must we conclude that the concerning people did not use objects for mnemonic purposes during and after funerals? How does this effect our reconstructions of social bonds and identities?

To address these questions, I explore Late Iron and Early Roman Age graves in the Dutch region. Mortuary practices in this period were varied: next to cremations and inhumations, human remains were deposited outside formal cemeteries, and in settlement contexts. Probably, some death rites left no physical evidence at all. What the recovered graves have in common, is a lack of man-made objects and monumentality. This seems to be the result of a past society placing less emphasis on their deceased; as if they were to be forgotten. Yet, some of the bones show signs of being kept in circulation.

My PhD-research proposes that objects belonging to the now dead, or items that evoked their memory, were kept close to the living, and are thus not found in graves. Moreover, that the lack of visibility of graves is partly the result of human remains being used as tokens of remembrance; as direct physical evidence of prolonged bonds. Probably, the bones referred to the identity of a specific person and were handed down as heirlooms, to be transformed over time to communal ancestors.

14

OSTEOMETRIC ANALYSIS OF CATTLE IN THE ROMAN VILLA OF ALMENARA-PURAS (VALLADOLID, SPAIN)

**Abstract author(s):** Pazos García, Rocío (University of Salamanca)

**Abstract format:** Oral

This presentation will provide the necessary data to understand the changes in livestock practices in the Hispano-Roman villa of Almenara de Adaja-Puras (Valladolid, Spain).

Spanish zooarchaeology has frequently used the analysis of osteometric data. However, the limited publication of raw data makes it difficult to compare different corpuses of measurements, particularly when they are elaborated by different authors.

For this study, all the faunal remains from the so-called ‘garbage dump’ of the settlement were analyzed from the anatomical, taxonomic and osteometrical point of view. The fauna studied was found in 23 stratigraphic units. This collection was excavated during the 2002 campaign and is dated between the II and IV centuries AD. Thanks to these measurements, taken according to the abundance of elements, we will understand the changes in the livestock practices during this period, the way of cattle feeding, the distinction between sexes, the presence of different breeds, or the possible introduction of improved animals.

15

MEDIEVAL ARCHEOLOGY ON THE PERIPHERY. THE CASE OF THE MIDDLE CÔA (PORTUGAL)

**Abstract author(s):** Ramos, Tiago (Institute of Medieval Studies - Nova University of Lisbon)

**Abstract format:** Oral

This paper is the results of a Phd thesis in Medieval Archaeology. The objects of the study were the diachronic analysis of the medieval settlement in the Middle Côa, and the understanding of the genesis of the Côa river as frontier. To this end, the methodology was based primarily on an archaeological approach which was complemented with the contribution of historical data and GIS analysis.

The presence of rock cut graves and the correlations with material and structural traces demonstrate the effective presence of human occupation of the territory and its exploitation. However, there was a peripheral space during the High Middle Ages, with autarchic forms of territorial organization proliferating mainly based on a local scale.

This scale is also evident during the beginning of Late Middle Ages. However, a process of articulating the territory at a supralocal level is now evident. This process, carried out by external agents, will be based on the pre-existence of existing hierarchies of power in the territory, integrating or transforming them.

It was in this context that the genesis of the Côa River must also be understood as a border line between two kingdoms in the process of territorial expansion and consolidation. More than a line drawn in the territory, this is mainly a conceptual framework that can be appropriated both by supralocal agents and by local populations. However, and despite the dispute and alteration of the frontier at the end of the 13th century having given some relevance to the territory, its main characteristic - periphery - will tend not to change.

16

ENWHALED EUROPE. ON THE CONSUMPTION OF WHALE BLUBBER AND BONE DURING 16TH AND 17TH CENTURIES

**Abstract author(s):** Escribano-Ruiz, Sergio (University of the Basque Country - UPV/EHU)

**Abstract format:** Oral

Whale blubber and bone arriving from Newfoundland became highly sought-after products by European markets and went on to form part of the consumer revolution which an increasing number of authors are tracing back to the sixteenth century. As a consequence, large regions of North America underwent a severe ecological and social transformation. In turn, the increasing access to those products deriving from transatlantic fisheries may have offered European citizens a form of exoticism that they were able to enjoy in their homes and show off on their own bodies. In this presentation we aim to interpret the widespread consumption of whale products across Europe. By focusing on the beginning of the large-scale exploitation of whales in North American fisheries, we will be able to trace and understand the broad consequences of these American products on European daily life and lifestyle, especially both in clothing and lighting policies. Specifically, we will analyse the effects of whale blubber on the main European countries interested in its commercialisation and, besides, correlate this with the evolution of clothing deriving from whalebone.

17

BETWEEN INNOVATION AND TRADITION, OR HOW EARLY MEDIEVAL LOCAL COMMUNITIES BUILT THEIR GROUP IDENTITY (WESTERN POLAND)

**Abstract author(s):** Zamelska-Monczak, Kinga (Institute of Archaeology and Ethnology of the Polish Academy of Sciences, Center for Prehistoric and Medieval Studies, Poznań) - Kolenda, Justyna (Institute of Archaeology and Ethnology of the Polish Academy of Sciences, Department for Research on Late Antiquity and Early Medieval, Wrocław)

**Abstract format:** Oral

The subject of our research is ceramic from early medieval sites located in the peripheral zone of the area that was the centre of the formation of the first Piast state. The aim of the research is to verify the hypothesis according to which local communities operating in the Wielkopolska borderlands (on the borders of the emerging Piast state) in the existing new realities make self-determination of their cultural identity, and the result of these changes is the formation of a new landscape and the acceptance, or not, of new solutions in ceramics. This process concerns the 10th and 1st half of the 11th century. We refer to the definition of style as a so-

cio-cultural phenomenon that implies social relations and identifies a given community. Style is a way of visual communication and combines the decoration, form and technology of the vessel. However, at each stage of its formation, the limitation is the individual decision and creativity of the creator as well as the existing, unconscious cultural framework or tradition.

Ceramics, as one of the manifestations of changes taking place in local communities and the resulting need to manifest one's group identity (group identity is not identified with ethnicity by us), allows for capturing various models of expressing it. The analysis of selected ceramics from strongholds located in the peripheral zone in relation to the centre of the Piast state shows that such an effect may be: adapting new cultural patterns and adapting to a new situation, or rejecting all innovations and changes, or acquiring only selected details while maintaining traditional.

In the further research perspective, the method of combining landscape studies with archaeometric studies of ceramics will be used as basic data for formulating knowledge about the processes influencing the group identification of the local communities.

### INFRASTRUCTURES FOR CAPTURING, INTERPRETING AND VISUALISING TEXTS FOR ARCHAEOLOGICAL ANALYSIS: THE EXAMPLE OF THE RURAL-CY PROJECT

**Abstract author(s):** Paraskeva, Charalampos - Hadjittofi, Petroula - Rizopoulou-Egoumenidou, Euphrosyne - Vionis, Athanasios (Archaeological Research Unit, University of Cyprus)

**Abstract format:** Oral

Following the Ottoman conquest of 1571, the Christian Orthodox Church of Cyprus developed into one of the main political, economic and social actors on the island. In order to consolidate and expand its power, the Church undertook various agriculture-oriented income generating activities and became involved in wide economic networks spanning the island and beyond. Those activities are documented in a number of invaluable textual sources, including monastic property lists, which consist the focal point of the RURAL-CY (Rural Economy and Society in Early Modern Cyprus) project. Specifically, the project aims to explore the dynamics, strategies and patterns of rural-based economic activities by fully digitising, systematically recording and statistically-spatially analysing the Grand Manorial Codex, an unpublished document of 1188 pages dating to the late 18th century AD, which records in detail the movable and immovable property of 213 ecclesiastical institutions (churches and monasteries with glebes), located mainly in rural areas across Cyprus. In order to fulfil the above objectives, a novel archaeological information recording system has been developed with a view to capture textual data and their interpretations in a manner that renders them quantifiable and meaningful. The system consists of a fully normalised MySQL database and a custom-made graphical user interface developed in Microsoft Access 365 that allows data input, management, querying, filtering and output. As will be demonstrated the system allows the user to construct in-depth vocabularies associating specific words with abstract terms, enrich vocabularies with multimedia and bibliography, produce and record a logical tree-form topology of information, transcribe, translate, and automatically transliterate the source text; and break down the noetic structure of the Codex's contents, whilst retaining and constructing further logical relationships and assigning certainty values to each recorded data unit to allow statistical metanalysis using fuzzy statistics and spatial analysis using GIS software after data collection/consolidation.

### ARCHIVAL STUDIES AND ACTUALIZATION OF THE ARCHAEOLOGICAL HERITAGE OF THE TAMAN EXPEDITION (1929-1932)

**Abstract author(s):** Zastrozhnova, Evgenia (Archive of Russian Academy of Sciences) - Medvedeva, Maria (Institute of History of Material Culture of RAS)

**Abstract format:** Oral

1930s became a very difficult period in the history of Russian archaeological science. At that time, the whole country was under the pressure of political repression and ideology. The results of many archaeological investigations of these difficult years still remain unknown and unpublished, and their memory has been preserved only in museum and archival collections. Actualization of their scientific heritage is one of the most important tasks of modern science. The study of the Taman expedition heritage provides us with an example of when archival documents became almost the only source of information about the work of the largest archaeological expedition. It was organized by the State Academy for the History of Material Culture (Leningrad, Russia). Since 1929, the expedition members have carried out large-scale studies of archaeological sites of different chronological periods on the Taman Peninsula (southern Russia). They were engaged in the identification and fixation of archaeological objects in this region, made a map of them, conducted small excavations and monitoring the state of already known monuments. As a result, important and significant scientific material was accumulated from antiquity to the Middle Ages. During the organization and work of the expedition, there was a clash of interests of several scientists and scientific organizations. The Soviet power used these circumstances, the story ended with the arrest and death of the main initiators of the expedition and the scientific leader of the expedition. The results of the fieldwork were never fully published. However, the scientific heritage of the Taman expedition has been preserved in various archives and museums of St. Petersburg, Moscow and Taman. Thanks to the support of the Russian Foundation for Basic Research, it became possible to collect all the materials, systematize and publish them.

The study was conducted with the financial support of the RFBR grant 20-09-00180.

### QUANTIFIABLE TRENDS CORRESPONDING TO POST-MEDIEVAL OBJECTS FROM THE FOODCULT PROJECT, IRELAND

**Abstract author(s):** O Carroll, Ellen - McClatchie, Meriel (School of Archaeology, University College Dublin) - Flavin, Susan (Trinity College Dublin)

**Abstract format:** Oral

The ERC-funded FoodCult project (<http://www.foodcult.eu>) is an interdisciplinary research project that is seeking to understand the social, cultural and economic meanings of food in Ireland during the sixteenth and seventeenth centuries. This was a period of increasingly globalised trade when new foods and objects arrived into Ireland from the European, Asian and American continents. Over the past two decades, hundreds of archaeological excavations in Ireland have unearthed food-related materials dating to the sixteenth and seventeenth centuries, including archaeobotanical and zooarchaeological remains, and artefacts, such as cooking and eating utensils. Much of the data relating to these finds resides in individual technical reports, however, and is considered on an individual site basis only.

The FoodCult research project is addressing this issue through collation and analysis of archaeobotanical, zooarchaeological and object data from a wide variety of urban and rural excavations. New archaeological and scientific analyses are being integrated with evidence from historical sources, providing a ground-breaking new approach to understand food and identity in a complex society. This paper will focus on archaeological data, detailing initial results from quantitative analyses of several object types. Statistical analysis of relationships between objects across comparative social, occupational, ethnic and geographical contexts will shed light on food production, preparation and consumption, and the broader material culture of cooking and eating.

### DENTAL PHENOTYPIC SIMILARITIES IN THE CHALCOLITHIC-BRONZE AGE HUMAN POPULATIONS FROM NORTH-EASTERN ROMANIA: A STATISTICAL MODELLING OF THE SECOND MOLAR MORPHOLOGY

**Abstract author(s):** Popovici, Mariana - Groza, Vasilica-Monica (Romanian Academy – Iasi Branch, “O. Necrasov” Center of Anthropological Research) - Petraru, Ozana-Maria - Bejenaru, Luminița (Romanian Academy – Iasi Branch, “O. Necrasov” Center of Anthropological Research; Faculty of Biology, “Alexandru Ioan Cuza” University of Iași)

**Abstract format:** Poster

The dental morphology variations are often used to answer research questions related to archaeology and paleoanthropology. The teeth are generally well preserved in archaeological sites, even when the preservation of associated skeleton is poor. Furthermore, the tooth form is highly heritable and evolutionarily conservative, representing an excellent marker for testing various hypotheses on human history.

The dental morphology is approached in our study aiming to contribute at the understanding of the relationships between prehistoric human societies in north-eastern Romania. Upper and lower second molars (n=100) from several Chalcolithic and Bronze Age archaeological sites were used as phenotype marker. The study consists in the analysis of the size and shape of the second molar and of the covariation between them by techniques of geometric morphometrics. The quantitative data were collected using a set of landmarks located on the dental occlusal surface, at groove intersections, and a set of semilandmarks traced on the periphery of the same surface.

Results of this study reveal an important inter- and intragroup variability derived from dental morphology. The discriminant function of the upper second molar (M2) is mainly determined by the mesiodistal direction and the lingual cusps, while in the lower second molar (M2) the variability of the protoconid and the entoconid determines the characteristic phenotypes of the Chalcolithic and Bronze Age populations. Partial least squares (PLS) indicates that the upper and lower second molar are weakly covariate in both Chalcolithic and Bronze Age, according to the smaller RV coefficient (< 0.4).

This study provides evidence that may be used to infer interactions between different biological human groups correlated with historical events.

This work was supported by a research grant made with financial support from the Recurring Donor Fund, available to the Romanian Academy and managed by the “PATRIMONIU” Foundation GAR-UM-2019-II-2.1-16.

### RESEARCH OF PREHISTORIC POTTERY TRADITIONS - THE POTENTIAL AND PROBLEMS OF A HOLISTIC APPROACH

**Abstract author(s):** Kudelic, Andreja (Institute of Archaeology Zagreb)

**Abstract format:** Poster

The tradition of studying archaeological ceramics on the territory of Croatia is deeply rooted in the culture-historical approach, especially when it comes to prehistoric pottery, which represents most of the archaeological record on prehistoric societies. Furthermore, our knowledge about prehistoric, especially Bronze Age communities in the area has been stagnating for decades. However, the amount of excavated archaeological sites and pottery as well as publications are greater than ever before.

The paper will present the project and methodological concept according to which over the next five years it is planned to conduct extended research on Bronze Age (2400-800 BC) pottery traditions on the territory of Croatia. A large-scale and well-designed systematic archaeometry research programme will be combined with macroscopic physical forms of examination of already exca-

vated ceramic material. The study of pottery throughout its lifecycle from raw material selection, different stages of production, to distribution and use, and final discard, will provide valuable research contributions, but it also represents a huge data set. Therefore, the methodological challenges, as well as the challenges arising from the nature of the processed material, will be presented too. Accordingly, interdisciplinary (mis)understanding, the correlation of different data sets, quantification methods, and digitalization of such data currently present the biggest challenges. In that sense, awareness of the advantages but also limitations of analytical methods and a well-formed theoretical framework, research questions, and hypotheses are key parameters of an optimal methodological approach.

691 GENERAL SESSION: BURIALS, RITUALS AND MEMORIES

Chair: to be confirmed  
Format: Regular session

ABSTRACTS:

1 REVISITING STONE AGE SETTLEMENTS AND ROCK ART IN ALTA FJORD, NORTHERN NORWAY. A NEWFANGLED OVERVIEW

Abstract author(s): Gjerde, Jan Magne (NIKU - Norwegian Institute for Cultural Heritage Research)  
Abstract format: Oral

Alta displays the largest concentration of Stone Age rock art in northern Europe with more than 7000 figures. The rock art is inscribed on the UNESCO World Heritage List. Less known is the somewhat “forgotten” rich settlement record due to the unique and unparalleled rock art. Revisiting the previously known settlement record, supplemented by surveys and extensive fieldwork in the Altafjord region is part of the ongoing research project; Stone Age Demographics: multi-scale exploration of population variations and dynamics. The fieldwork resulted in the discovery of new settlements sites, new rock art sites and new quarries. The up-to-date settlement record displays an extensive settlement record with nodes or central places in the Stone Age seascape in the Altafjord region. Based on a hunter-fisher-gatherer coastal economy, the location of settlements displays a maritime orientation where boats would have been a prerequisite living in this seascape. The maritime focus is supported by boats and maritime activities depicted in the rock art. The settlements and rock art relates to the raised shorelines due to the land uplift. Subsequently the changing seascape shed light to the shore connection of settlements and rock art. This overview further investigates the spatio-temporal distribution of settlements and associations with rock art in the Altafjord region.

2 RITUALS AND REMEMBRANCE IN THE WARTBERG GALLERY GRAVE OF ALTENDORF

Abstract author(s): Rinne, Christoph (Kiel University) - Drummer, Clara (Orthodrone GmbH)  
Abstract format: Oral

The death of a loved one is a heavy loss for the bereaved. The process of coping with loss, of overcoming grief, is a multi-stage process. This process has been analysed in detail by psychology and at the same time reflects the process of recognising one’s own mortality and impending death (E. Kübler-Ross; V. Kast). We also know from antiquity the actions that are now called grief work. In the Iliad and the Odyssey death and the often ritualised act of burial are omnipresent. These ritualised acts result in a memory of the dead on the personal level and, through narrative, in a memory of the community (Assmann).

Neolithic collective graves, especially megalithic graves, are regularly understood as an expression of collective memory and monument. The archaeological evidence regularly cited is the long-term use of the graves, the effort involved in grave construction, conversions and extensions, or the deposition of vessels at the grave. The gallery grave of Altendorf is a typical grave for the Late Neolithic Wartberg Group in northern Hesse (Germany). On the basis of a meticulous analysis of the depositional processes and an extensive series of 14C-datings, a comparative presentation of rituals and remembrance is possible. On the one hand we can develop the archaeological model of changed burial rituals and on the other hand a well dated three-phase model of use. Here, the third phase reveals cyclical reburials of a few individuals over an entire millennium until the beginning of the Urnfield Culture. We thus grasp for the first time the collective memory of a burial community with intervals, as presented by Assmann.

3 CONTINUING THE RESEARCH ON THE CEMETERIES OF MARIUPOL TYPE: NEW PERSPECTIVES

Abstract author(s): Andriiovych, Marta (Institut für Archäologische Wissenschaften)  
Abstract format: Oral

During the XX century in the Middle and Low Dnieper was opened near 20 big Neolith cemeteries, united after the common name as Cemeteries of Mariupol type. These sites are unique among the Neolithic burial sites. It is a relatively big concentration of cemeteries alongside a Dnieper river and nearby in the region. All sites had a large number of graves and common burial rituals also were colored with red ochre.

The excavations in the XX century were usually a part of archaeological rescue operations caused by collapsed banks of the Dnieper river and water reservoir.

The biggest problem nowadays is that archaeological materials were only partly published and dated. Another question that appears the access to the original materials and documentation which during the last 50 years were partly relocated to the different institutions.

But even with published and accessible information together with new approaches, the new results would be found.

4 ALTO-ADRIATIC LEKANIDES FROM VALLE TREBBA NECROPOLIS OF SPINA: THE SHAPE IN THE FUNERAL PRACTICE OF PO DELTA

Abstract author(s): Serra, Anna (University of Salerno) - Trevisanello, Carlotta (University of Bologna)  
Abstract format: Oral

The Etruscan city of Spina, founded in the late 6th century BC in the Po Delta, represents a pivotal point in the Mediterranean trade routes. The settlement was part of a broader trade system in the Etruscan Po Valley based on the central city of Bologna/Felsina. Spina’s necropolises, consisting of more than 4000 tombs dated from the end of the 6th to the 3rd century BC, documented the harbor’s importance. The grave goods displayed items produced from all over the continent: from north Italy and Europe to Greece and the East Mediterranean. Over time, the evolution of trade routes led to different commercial partners, exemplifying the city’s dynamic role in the coastal community. In the late period (4th-3rd century BC), this scenario led to local ceramic productions that displayed foreign influences locally elaborated.

This paper will address the Alto-Adriatic ware, which developed in the northern part of the Adriatic Sea, as local figurative production. During the Valle Trebba Necropolis’s systematic study, which has been conducted by the University of Bologna, it was possible to enlighten the evolution of this ceramic class as a fundamental expression of the economic-social dynamism of the Spinetic community. The analysis will focus on a type of vessel (lekanides) recovered in the funeral kits of the period, representing an interesting case study to examine the production context, the class’s evolution, the iconographical and morphological references, and at least its role in the local funeral practice.

5 URNS, EMOTIONS AND MEMORY IN BRONZE AND IRON AGE ALBANIA: CLOSING THE CIRCLE OF LIFE

Abstract author(s): Trinder, Ermelinda (Staffordshire University)  
Abstract format: Oral

Cremation in burial mounds in Bronze and Iron Age Albania was a complex, versatile and long process, which involved communities coming together to prepare and organise these highly emotional events. The mourning cycle started with the preparation of the dead body and often concluded with urns either being buried in grave structures or placed on burial mounds.

Cremation as a healing mechanism for dealing with the trauma of loss and death has been explored both in archaeology and psychology. Building on this, through a series of archaeological case studies, I will explore how the act of burying in graves or placing urns on burial mounds impacted upon emotions, sensory experiences, bereavement and the healing process. I will also consider the importance of urns as material objects which helped create an emotional bridge between the deceased and bereaved societies. I suggest urns were far more than just containers of body and soul, they helped preserve memories of loved ones whilst creating new individual and communal memories for those left behind. Alongside remembering, I will explore the importance of deliberately forgetting and how the connection between forgetting and remembering could have played a pivotal role in the healing process.

6 “δῶρον δ’ ὅτι κέ μοι δοίης, κειμήλιον ἔστω” (HOM. OD. 4, 600). NOSTALGIC REFLECTIONS IN EARLY GREEK VOTIVE PRACTICE

Abstract author(s): Vlachou, Aphrodite (Postdoctoral Researcher; Amykles Research Project)  
Abstract format: Oral

According to Homer, keimelia were objects which because of their shape, design, or way of manufacture brought back memories of events and persons, from whom one had received them as a gift.

Material items of the Mycenaean period found in early Greek sanctuaries have been occasionally referred to as heirlooms, that were handed down from generation to generation because they were linked with reminiscences of the heroic age and symbols of kingly power. The survival of these artifacts may indicate that memories of older elements of the cult were also preserved in later periods, and may have been expressed in the local artistic production of the 8th century B.C. Male and female nude figures, riders seated side-saddle, miniature double-axes, pomegranate pendants, and representations of chariots and charioteers in bronze and clay, imply a reconnection with the mythical past, based on the memory of the sacredness of certain artistic trends.

That shift to the past must be considered in the context of specific social and political concerns shared by a community, most likely occurring in transitional periods or times of crisis. After the fall of the Mycenaean palaces, the early Greek societies went into a long process of self-definition, which influenced the ways in which the past was commemorated, as well as the parts of the past which were considered worth remembering. Memory and objects of memory were used to legitimize and control social and political power, or to allow different societies to participate in processes of shared identity formation.

Focusing on specific categories of votive objects and ritual communal acts, the paper aims to explore how images or memories of the past could be incorporated into, and possibly play a crucial role in shaping religious and social behavior in the early Greek world.

**THE CRAFT OF MEMORY. POTTERIES CURATED AS KEIMÊLIA IN THE IBERIAN SOCIETIES OF THE UPPER GUADALQUIVIR (VI-I C. B.C.), SPAIN**

**Abstract author(s):** Moreno Padilla, María Isabel (Grupo Patrimonio Arqueológico en Jaén - HUM 357; Departamento de Geografía, Historia y Humanidades. Universidad de Almería) - Ruiz Rodríguez, Arturo - Rueda Galán, Carmen (Instituto Universitario de Investigación en Arqueología Ibérica de la Universidad de Jaén)

**Abstract format:** Oral

The main objective of this proposal is to review certain contexts and material assemblages linked to the Iberian societies of the western Mediterranean during the Iron Age. Specifically, we analyze the symbolic life of those ceramics preserved over time as objects of memory and tradition, as attributes of identity. These items can be ascribed to the cultural category of Keimêlia, or objects with history (Reiterman, 2016). They are associated with family inheritances or linked to aristocratic distribution circuits (Ruiz y Molinos, 2018: 47-48). We focus on ceramic containers due to its importance in the discourses of power of the Iberian aristocracy, the social sector to which these types of manifestations are typically associated. This type of material normally have extended biographies of use and presents some distinctive characteristics: typological, chronological, iconographic, symbolic and cultural. These characteristics respond, ultimately, to the different mechanisms of production and reproduction of memory in Iberian times. These mechanisms differ according to the context, the territory, and the formulas used, although all of them have in common the desire to transmit a specific message of tradition, continuity, recognition and legitimacy. Also, the display of these items serves as communication hub with the community and with the divinity. Because of this, these keimelia contribute to the construction of mythologies of legitimation of power. That is, they contribute and participate in the genesis and transmission of some key stories of power.

In this session, several case studies related to Iberian necropolises (Baza, Tútugi, Castellones de Céal, Hornos de Peal or Piquía) will be presented. In addition, this study has incorporated, among others, the new theoretical and methodological approaches linked to the archeology of the senses (Skeates and Day, 2020), the Actor-Network Theory (Olsen et al., 2012) and ceramic sociology (Shanks, 1999; Gosden, 2005).

8

**THE TRUE STORY OF MERCURY. REMEMBERED OR LOST IN TIME?**

**Abstract author(s):** Szigli, Kinga (Ludwig-Maximilians-Universität München)

**Abstract format:** Oral

The correlation between pre-Roman and Roman religious systems shows a colourful and complex picture in terms of archaeology and geography. While certain provinces of the Roman Empire (e.g. Gaul, Germania, Britannia) indicate a clear continuity of indigenous cults, Illyrian and African regions seem to signal differences on the surface. Moreover, within the same province itself various categories of archaeological material provide a highly diverse information. Literary testimonies can serve, despite their fairly precarious value, as a basic reference system for stories and knowledge of sociocultural & religious life. Despite revealing a general continuity of indigenous beliefs, the sources merely give a general description of cults and essence (vis) of deities.

Epigraphic sources, on the other hand, provide a more coherent picture of deities (giving names & identity) merely in the Western and Northwestern provinces. In other provinces, inscriptions do not contain any additional information about them. Similarly, statuettes of gods seem to present pre-Roman iconography only in certain territories. Is this anomaly a matter of forgotten „stories“ or a switch in the reference frame of certain groups, reformulating the way of expressing unity and identity? Furthermore, how do various shared norms and emotions of these groups define the conceptualization and reception of diverse artefacts? Current work aims to answer such questions from the perspective of sociology, cognitive science and the Heidelberg concept, with the help of a case study about Mercury’s cult in Pannonia, in which statuettes are put in contrast to votive inscriptions and ancient texts (as an argumentative net) as well as to some significant epigraphic sources and statues from provinces with a different intensity of Romanisation, such as Gaul, Germania and Britannia. In particular, the study focuses on the reception of various artefacts; the collective & individual memory, symbols, identity and emotions of different groups of public.

9

**SACREDNESS IN THE NORTHEAST PHRYGIA: THE INHERITANCE OF PAST PERCEPTIONS IN THE EAST OF ESKIŞEHİR PROVINCE, TURKEY**

**Abstract author(s):** Güney, Hale (Aarhus Institute of Advanced Studies)

**Abstract format:** Oral

An epigraphic survey covering more than half the province of Eskişehir in central Turkey, which commenced in 2014, has provided evidence for Roman and Byzantine necropoleis and later churches that are still considered as a sacred land designated to Muslim tombs (or dervish lodge - tekke) by the locals. Also, modern inhabitants esteem the sanctuary of Zeus Sarnendenos and surroundings as a sacred grove. The aim of this paper therefore is to present preliminary results of the research (as a by-product of the survey project) about the sacred land and sacredness in the northeast Phrygia. The research focuses on ten case studies including sanctuary of Zeus Sarnendenos and its surroundings, Roman and Byzantine necropoleis and churches in the survey area located to the east of Eskişehir province. This continuous phenomenon (what I call ‘the inheritance of past perceptions’) frequently attested in Asia Minor will be examined with the help of the results of short interviews made with the locals. There are at least few reasons to observe such continuity: At first sight, the availability of stone (most of time marble and limestone and in good shape) at older

sites is one reason to make new burials for revered figures. When the first Turcoman families came to a region, they reused the same available material for their need. Beyond this practical reason, when we listen the inhabitants of the region, we hear the stories including their personal experience which reflect the inheritance of past perceptions, e.g. god’s anger, seeking god’s help for the fertility in one particular place and their hesitation to use such places for festivities. All evidence eventually indicates the role of strong oral tradition accumulated through the centuries in one particular region and reflects the ‘unchanged’ nature and the need of the inhabitants settled in the countryside.

10

**TIBURTINI CALICES OR GEMMATA POTORIA IN THIN WALLED WARE: A LUXURY ROMAN PRODUCTION OF THE FIRST IMPERIAL AGE**

**Abstract author(s):** Puppo, Paola (Miur - Ministero Istruzione Università e Ricerca)

**Abstract format:** Oral

Gemmata potoria in thin walled ware is a particular production of the ager Romanus, represented by drinking vessels (beakers, mugs and small cups) decorated with vegetable motifs and embellished with gems of colored glass paste (pasta vitrea). This type of pottery, dating from the Augustan period to the imperial period until the Flavian age, was found in funerary contexts (for example in the child’s grave of the necropolis Settecimini) and religious contexts (many specimens have been found at the Ara Maxima in the Foro Boario and in the sanctuary of Tivoli, both dedicated to the worship of Hercules Victor). The precious decoration à la barbotine is made with points, stems and drops arranged to form phytomorphic elements and embellished with inserts of glass paste of blue gradation encapsulated in clay. These drinking vessels are used closely in Rome and surrounding areas. The specimens found in the urban contexts (as the luxury villa in Privernum or the residential quarters in Ostia) provide significant elements to identify the sources and the cultural traditions that this particular class of ware reflects. This pottery hasn’t been produced only for the libations in the funeraries and sacred contexts, but it may have been used on request by clients of a certain level as proved by Seneca in Epistulae to his friend Lucilius. The production seems to lie in Tivoli, whose figulinae workshops were already fully actives in the production of fine ware such as the Hellenistic reliefware (the so-called Italo-megarian bowls) and the thin walled ware.

11

**GODS, HUMANS AND THE MATERIALITY OF MEMORY AT THE ACROPOLIS OF ELEUTHERNA\***

**Abstract author(s):** Spanou, Nikolia - Kalpaxis, Athanasios (University of Crete) - Bitis, Ioannis (Aristotle University of Thessaloniki) - Tsigonaki, Christina (University of Crete)

**Abstract format:** Oral

The systematic excavations of the University of Crete have focused,

for the past thirty years, on the Central Plateau of the Pyrgi hill, the acropolis of ancient Eleutherna (Central Crete). The archaeological investigations demonstrated the public nature of the Central Plateau, directly connected to the political and religious functions of the city down the centuries. An Archaic temple and an imposing Christian church were brought to light during the excavations. These buildings seem to have been the landmarks of Eleutherna’s acropolis during different phases of its history. Their architectural remains, along with other vestiges, such as ritual depositions of feasting residues and votives, inscriptions and building materials constitute the “memory record” of the place. Through their study, we will try to explore its dynamics and transformation and how they were affected by the intention of maintaining or obliterating the community’s existing collective memory in each successive phase of the acropolis.

\*This research is co-financed by Greece and the European Union (European Social Fund- ESF) through the Operational Programme «Human Resources Development, Education and Lifelong Learning 2014- 2020» in the context of the project “From the Ancient Temple to the Christian Church: the transformation of the “sacred topography” (MIS 5049038).

12

**MEMORY MANIPULATION, MOVEMENT, AND CHRISTIANISATION ASSEMBLAGES ON A CROSSROADS IN EPHESUS**

**Abstract author(s):** Selsvold, Irene (Department of Historical Studies, University of Gothenburg)

**Abstract format:** Oral

Memory is fluid. It is continuously shaped and reshaped through repeated encounters between people and their material environments. In this talk, I demonstrate how religious memory was reshaped in an urban environment during the Christianisation of the Roman Empire. The Triodos intersection is at first glance inconspicuous in the narrative of the material Christianisation of Ephesus; The destruction of the great temple of Artemis and the construction of the monumental basilicas of St. John and Mary have played the lead roles. The Triodos intersection was a street environment without monumental temples or churches, and have been overlooked as a locus for the Christianisation effort. Yet, the devil is in the details, so to speak. I combine social memory and materiality theory in the concept ‘memory manipulation’ to demonstrate how the material assemblage that together constitute the Triodos crossroads was altered through an array of small transformative efforts. I draw on ideas of lived religion and spatial archaeology to argue that ritual and everyday movement in Roman streets are key to better understand how lived experience and the mutually affective relationships between people and material environments shaped the religious transformation in Roman Late Antiquity.

THE LONG TRANSITION FROM THE REIHENGRÄBERFELD TO THE CHURCHYARD

**Abstract author(s):** Müller, Kathrin (University of Freiburg)

**Abstract format:** Oral

The paper provides an overview of the central issues of my PhD project on the development of burial grounds in Early to High Middle Ages in southern Germany. From the 7th century onwards, the archaeological remains reveal significant changes in the structure of burial grounds. The Reihengräberfeld, which has been used almost exclusively since the 5th century, is used less frequently and a number of new forms are emerging. On the one hand we can observe cemeteries which are defined by their spatial “separation” from the Reihengräberfeld. On the other hand, we can also observe an increasing shift of burials into the settlement, either in/at churches or without any relation to a church. The currently still used model of the process until the churchyard emerges as the only place of burial, assumes a short transition phase of about 50 to 100 years. This is due to the circumstance that from the 8th century onwards, fewer and fewer furnishings were placed inside the graves. Thus, the graves without furnishing were not dated and the end of the burial ground was set parallel with the end of the practice to bury with goods. More recent results point to a much longer duration of the different forms of burial grounds until at least the 9th/10th century. This is mainly due to the increasing number of radiocarbon dating. The aim of my project is to establish a more accurate model of the development of burial grounds up to the general establishment of the churchyard in the High Middle Ages.

WONDERS FROM BEYOND: LUXURIOUS AND EXOTIC GOODS IN THE GRAVES OF VIKING AGE RITUAL SPECIALISTS

**Abstract author(s):** Gardela, Leszek (The National Museum of Denmark)

**Abstract format:** Oral

Over the last twenty years, interdisciplinary research combining archaeology, textual studies and folklore has led to the identification of more than forty graves of presumed Viking Age ritual specialists. Although each grave is unique, they share a number of common traits and often include iron staffs (probably used in the practice of magic and/or serving as emblems of religious authority and power) and small-size objects which likely played the role of amulets. Another characteristic feature of these presumed ritual specialists’ graves is the occurrence of luxurious portable goods such as metal vessels, jewellery, and small utensils that stem from geographically and culturally distant locations, including the British Isles, Eastern Europe and Asia. The present paper will try to trace more precisely the origins of some of these items and will investigate the dynamic and complex networks of influences they were part of. How were these ‘wonders from beyond’ understood by their new Northern European owners? Did they serve merely as exotic curiosa or did they have significant roles to play in shaping and manifesting secular and sacral power?

SPEAK, MEMORY: THE ROLE OF SOCIAL MEMORY, IDENTITY, AND STORYTELLING IN THE REUSE OF MAYA MONUMENTAL ARCHITECTURE

**Abstract author(s):** Ruf, Kim (University of Cambridge)

**Abstract format:** Oral

Research on the relationships and interdependence between human beings and the built environment mostly seems to have labeled monumental architecture as plain vehicles for sociopolitical messages. These structures, however, convey meanings beyond the political sphere. Due to their monumentality, they outlive subsequent generations and their reuse can be considered another form of storytelling: one in which collective memories, ideas, and ideologies are materialised, and aspects of the past are consciously being carried over into the present.

Drawing from archaeological evidence, ethnographic and indigenous sources, and archival materials, this research investigated the reuse of Maya monumental architecture in pre- and post-colonial times, focusing on social memory and collective identity both in ancient Maya and modern indigenous communities in Yucatán. Two main questions lay at the heart of it: Firstly, how is the present constructed by reusing past material elements, specifically monumental architecture? And secondly, what is the role of social memory in constructing narratives of identity and community, both in past and present communities?

This paper concluded that social memory powered the reuse of monumental architecture as a means to encapsulate the past in the present. It was also used to establish new settler communities and build collective and individual identities on the interpretation of ancient structures – often through constructed memories of the distant past and invented lineage connections. Moreover, social memory and narratives of identity as practised in the reuse of ancient Maya structures serve to strengthen and anchor present-day indigenous communities through shared memories and traditions, and even allowed people to survive and overcome traumatic events. Investigating this interrelationship between the reuse of ancient material culture, social memory, and identity will allow us to comprehend how people perceive the past which is woven into monumental architecture and put on display so prominently, both in ancient and modern times.

SUBSTITUTE BIOGRAPHIES: SOCIAL MEMORY AND HEIRLOOMS WITHIN EARLY MEDIEVAL SUB-ADULT BURIALS

**Abstract author(s):** Costello, Brian (University of Chester)

**Abstract format:** Oral

From the 5th-7th centuries AD, Anglo-Saxon inhumations were furnished with grave-goods to either display or idealise the identity of the deceased. While grave contexts demonstrate rigid adherence to social protocols in aspects of grave furnishings and body positioning, the inequality of the number and type of objects created individuality within a socially competitive environment. For example, though generally found with few or no grave goods, a small number of sub-adult burials were lavishly furnished with objects of exceptional quality, some of which have been identified as likely heirlooms. These heirlooms consist of socially significant brooches which displayed noticeable abrasion patterns providing evidence of their extended use, frequent adornment, and thus recognisability within the community.

Previous discussions have demonstrated that grave goods placed in the burial acted as mnemonic devices and enhanced the collective remembrance of the mourners attending the funeral. The visual presence of an heirloom, with an extended and known biography, would create a focal point to amplify the social remembrance of the mourners participating in the funeral. The inclusion of such biographical objects within the graves of sub-adults may have been intended to reinforce or bolster the shortened biography of a child. Using examples from 5th-7th century AD Kentish cemeteries, this paper interprets the rare cases of sub-adult graves containing curated objects and their effects on social remembrance.

FELDLUFTPARK PORI: LANDSCAPE OF WAR AND MEMORY

**Abstract author(s):** Väisänen, Teemu (University of Turku; Satakunta Museum)

**Abstract format:** Oral

World War II is a period often associated with destruction, but it’s also a period of extensive construction efforts. This can especially be observed through airfields, many of which were heavily modernized and expanded due to their strategic importance.

For example, the Pori Airfield in Finland grew from a small airfield into a massive aviation equipment depot containing hundreds of construction. After the war, many of the buildings were given a new life, as the airfield remained in military use until eventually becoming an important hub for civilian and commercial aviation. While some of the constructions were abandoned into the woods, they were never truly forgotten, as aircraft shelters and ruins became places for children to play at.

Thus, the memories tied to the constructions eventually outlived their original wartime purposes. But how can we connect materiality, emotion and memory, especially as the collective memories tied to the constructions have changed with new generations. During Feldluftpark Pori research project, oral recollections regarding wartime constructions and their modern use have been tied to space and time. Through GIS, these memories can be combined into a projection, which demonstrates the landscape of war as well as changes in collective memory.

GENERAL SESSION: ENVIRONMENTAL IMPACTS ON HISTORY

**Chair:** to be confirmed

**Format:** Regular session

ABSTRACTS:

NEVER MIND WET OR DRY, PERIODICITY AND CYCLICITY IS A COMMON PHENOMENON

**Abstract author(s):** Dreslerova, Dagmar - Demján, Peter (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic)

**Abstract format:** Oral

Because we want to demonstrate the principles of cyclicity and periodicity in ‘dry’ habitats, our contribution should be somewhat provocative regarding the main subject of the meeting.

If dry and waterlogged areas exhibit the same material culture and similar livelihood strategies, then similar laws should apply to the cyclicity and recurring nature of both types of sites. Of course, this only applies if the displacements in humid localities do not depend only on the movement of lake levels but also other factors behind them.

Our model of long-term development of the structure of the settlement landscape (based on the economic needs of prehistoric societies) allows us to analyse settlement patterns in terms of continuity and stability. Although we do not have data with such a high temporal resolution as from wetlands, thanks to spatio-temporal modelling we are able to observe the frequent relocation of dry settlements/inhabited areas to several hundred meters away after 20-40 years. In addition, the models show a shift in prehistoric habitation areas within the same settlement area at a frequency of around 50-150 years. We propose a possible explanation of these movements based on the sustainable management of environmental resources and the regular maintenance of soil produc-

2

tivity. Using a sufficient amount of radiocarbon data, we could refine the chronometric models of phase lengths for dry sites, which would allow for a better comparison between the two types of archaeological sources.

2

## UNDERSTANDING THE EARLY COASTAL CONTACTS THROUGH NEWLY DISCOVERED ONSHORE ARCHAEOLOGICAL SITES IN COASTAL WEST BENGAL, INDIA

**Abstract author(s):** Ghosh, Ahana (Archaeological Sciences at Indian Institute of Technology-Gandhinagar)  
**Abstract format:** Oral

An exploration was carried out in a so-far unexplored region along the shoreline of Bay of Bengal, located in East Medinipur district, West Bengal. The survey resulted in the discovery of three intertidal archaeological sites named Shankarpur, Tajpur and Chandpur represented by scattered mudflats and large ceramic assemblages just near the shoreline. The ceramic assemblage found within the site is diverse in nature. The ceramic assemblage consists of Red Ware, Black and Red Ware and Black Ware, Buff Ware and Black Slipped Ware. Interestingly, the shards found within the shore surface showed some kind of roundness questioning the actual context of the site. The discovery of these sites in the region for the first time has thrown light on the early settlement near the shoreline which was previously considered to be of marginal significance and the detailed analysis of ceramic assemblage also has shown some traces of possible coastal contact with Southeast Asian countries. Moreover, it has opened a new arena for understanding the early coastal communities settled just near the shoreline. This discovery has opened new possibilities for more geoarchaeological and marine archaeological research in this part of the coastal region in future.

3

## HOLOCENE COASTAL ENVIRONMENTAL DYNAMICS AND THE ROLE OF SEA-LEVEL, CLIMATE AND HUMAN IMPACT IN MARANHÃO STATE, NORTHEASTERN BRAZIL

**Abstract author(s):** de Moraes, Caio (Georg-August-Universität Göttingen) - Lima da Costa, Marcondes (Federal University of Pará, Institute of Geosciences, Faculty of Geology) - Guida Navarro, Alexandre (Federal University of Maranhão, Laboratory of Archeology) - Nunes da Silva Meneses, Maria (Federal University of Tocantins, Laboratory of Soils) - Boiadeiro Ayres Negrão, Leonardo (Martin Luther University Halle-Wittenberg, Research Group Mineralogy, Institute of Geosciences and Geography) - Behling, Hermann (University of Goettingen, Department of Palynology and Climate Dynamics)

**Abstract format:** Oral

Little is known about the history of the coastal environment in northeastern Brazil and the role of sea-level and climate change as well as the human impact during the past. In order to shed more light on coastal ecosystem dynamics and its influencing factors, a 300 cm long sediment core has been taken from Lagoa do Formoso archaeological site located around 150 km from the coast in Maranhão State. The core has been radiocarbon dated and analyzed by pollen, spores, charcoal, X-Ray Fluorescence (XRF), X-ray Powder Diffraction (XRPD), and sedimentary characteristics. During the period from 7560 to 5070 cal yr BP occurred a dominance of mangrove vegetation and a high relative sea-level (RSL), indicating that the coast of the Atlantic Ocean was close to the study area. In the following period from 5070 to 2590 cal yr BP, the predominant sandy sediments have a chemical and mineralogical composition typical from continental sources. The vegetation is represented mainly by herbaceous and arboreal vegetation, while the mangrove is absent, indicating an RSL decrease. The period between 2590 and 1320 cal yr BP, is marked by the lower water table and the stronger presence of rainforest and increasing presence of palms trees, indicating probably the beginning of the human establishment. The last period after 1320 cal yr BP, is marked by an even stronger anthropogenic influence in the study area as it is also evidenced by the records of the stilt-house settlements. These records together with others from the same region are the only evidence of stilts-houses from the pre-colonial period in South America.

4

## ENVIRONMENTAL, FIRE AND HUMAN HISTORY OF THE EAST EUROPEAN FOREST-STEPPE FROM LATE GLACIAL TO PRESENT – STUDY SITE ZAMOSTYE

**Abstract author(s):** Lukanina, Ekaterina - Shumilovskikh, Lyudmila (Georg-August-Universität Göttingen)  
**Abstract format:** Oral

East European forest-steppe is one of the most important crop districts of humanity. It is known for the most fertile soils in the world – the chernozems. An active agricultural use and modern climate change strongly affect the natural vegetation endangering ecosystems and plant species. Archaeological data show the presence of humans in the region since the early or mid-Palaeolithic. In order to study the human and climate impact on the East European forest-steppe in the past, we investigated the study site Zamostye located in the center of the forest-steppe zone. The sediment core was taken from a silted oxbow lake and studied for pollen, non-pollen palynomorphs, macroremains and charcoal to reconstruct environmental, fire and human interactions. The core covers the time period from 14 655 cal y BP to present providing unique data on the Late Glacial period for the area. The data revealed the major changes in the vegetation had occurred during the glacial-interglacial transitions. During Holocene the area was covered with mixed-broadleaf forest and did not experience considerable changes. In the last 1000 years, the processes of active deforestation and agricultural use increased, turning the area into a forest-steppe.

5

## LANDSCAPES, CLIMATE AND CULTURAL SITUATIONS ON THE VOLGA-BALTIC WATERSHED IN THE EARLY MIDDLE AGES

**Abstract author(s):** Islanova, Inna (Institute of Archaeology Russian Academy of Sciences)  
**Abstract format:** Oral

The analyzed territory is a 22×34 km section. The relief and soils were formed during the retreat of the last Valdai glacier 11-12 thousand years ago. This territory is occupied by the Vyshnevolotskaya lowland with separate hills of glacial origin and numerous lakes. The soil picture is variegated.

Detailed archaeological research was carried out here. The settlements and burials belong to the population of two different cultural groups: this is the culture of the Pskov long barrows and the assemblages predating the culture of the sopki (high burial mounds). The population of the two groups lived here “in parallel” in the 6-8th centuries, but occupied specific micro-regions with different landscape and soil conditions. The distance between microregions is sometimes 4-5km.

The choice of the locality was associated with the economic type of antiquities. Settlements of the culture of the long barrows were found in microregions with infertile sandy soils along the shores of ancient lakes, which are now swamps. The population was engaged in slash farming. This culture was left by the locals who spoke the language of the Baltic-Finnish group.

The settlements of another group are located on the main river of the region - Msta and on a large lake Mstino. There are soils favorable for arable farming. Settlements appear in the 6th century as a result of the arrival of a new population, presumably from the territory of modern Belarus.

Approximately 8th–9th centuries the local population leaves the micro-regions located on small lakes. This could have happened due to climate change, which led to the impossibility of farming here. Further settlement of these microregions occurs only in the middle of the second millennium AD.

Settlements on the banks of the Msta River and Lake Mstino continue to exist in the 8th–9th centuries and in subsequent periods.

6

## THE FUR TRADE, MARKET INTEGRATION, AND HUMAN-ENVIRONMENT INTERACTIONS IN NORTHERN ALASKA: DATA FROM THE WALAKPA SITE

**Abstract author(s):** Jones, Emily Lena - Judkins, Abigail (University of New Mexico)  
**Abstract format:** Oral

In northern Alaska, sporadic interaction with fur traders starting in the 18th century and subsequent integration into a global market system changed how human populations exploited the animal species present in this region. The fur trade increased the focus on certain taxa, such as caribou (*Rangifer tarandus*), that had previously been a primary food source, but impacts on animals less of interest to fur traders are less well-understood. Did the increased focus on fur-bearing animals for trade lead to changes in the other species exploited for food? In this paper, we use results from our analysis of the pre-contact Thule and historic zooarchaeological assemblages from the Walakpa site in northern Alaska to examine the effect of the fur trade on animal populations and human subsistence. We then consider the significance of these changes for understanding the impact of increasing market integration on human-environmental interactions in this region in the twentieth and twenty-first centuries.

7

## THE IMPACT ON THE ENVIRONMENT OF THE NEOLITHIC PERIOD GÖBEKLİ TEPE EXCAVATION AND THE FIGURINE DIALECTIC IN ANATOLIA

**Abstract author(s):** Sozer Kolemenoglu, Selma (Universidad Empresarial De Costa Rica)  
**Abstract format:** Oral

In the culture of the Neolithic period in Anatolia, communities came together symmetrically, with a horizontal and vertical approach and it can be seen from the ontological messages they have left that, for instance, they warned of the symbol figurines exceeding the dual ambivalence of typological humans. Metaphoric, rhetorical and religious deliriums and to open up space for themselves with universal dialectic quests. According to the Theological and Monotheic point of view, they also identify the cult of the pharaohs, which they wish to sustain with the envoys of the cruel demons living on Anatolian lands, with the cult of Göbekli Tepe. The very large number of phalluses found during the excavation can be explained as an image of a cult centre pointing towards the satisfaction of the Flesh, with a perception of a sect which is in pursuit of the mysterious Red Apple. The historic perverse force of energy reflected by the figurines idols, also carry a message of complaint by the figurines.

What stands out in today's Turkey is the desire of the demon culture to establish a political agenda with the liberated mythological bull culture which wishes to dominate by propounding the excavation of Göbekli Tepe, with unethical human typologies which want to ensconce the ancient Egyptian cultural structure in the political social arena. The boundless oppressive tyranny has eroded the social perspective and the denominational cult struggle of the understanding of Monotheism in the system of faith and is the important political dialectic which is the peripheral problem of today.

A. **LIFE IN THE SHADES OF DYRIS: NATURAL ENVIRONMENT AND HUMAN IMPACT ON THE ATLAS AND RIF MOUNTAIN AREAS IN ANTIQUITY**

**Abstract author(s):** Havlíková, Hana (Institute of Classical Archaeology, Charles University)

**Abstract format:** Poster

Taking a wider look from individual archaeological contexts, buildings, or sites, to the level of regions, allows us to investigate the broad and complex image of interrelated natural and cultural features. These features establish the essential determinant of the local environment, defining the background of the studied society. As it is generally well-known, the mountain areas of the Atlas and Rif mountains (in nowadays Morocco), were attractive as a source of metalliferous ores and home of the rebellious Berber tribes, but also a refuge of rich wildlife during the whole antiquity.

The aim of this poster is to present a preliminary results of the initial stage of research on the historical landscape of the area, with a special attention to the human impact on the environment. To test the generally accepted hypothesis of the inconsiderable exploitation of the natural resources in antiquity, in this phase, the currently known archaeological data referring to the nature of the human activities (e.g., settlements, mines, and sites of subsequent metal manufacture, petroglyphs). The archaeological evidence is supplemented with the testimony of ancient literary sources – above all Pliny the Elder and Strabo, providing observations on the local natural conditions as well as the practices of its exploitation.

Based on the available data, the natural environment suffered from the human action as seen primarily on the specific fauna species (hunting and the use of animals in warfare, spectacle events, material for luxurious items, mining etc.) and contributed to their extinction to a large extent. However, the subsequent paleo-environmental study referring to the local flora, as well as to a possible impact of the climate conditions, must follow in order to complete the picture of the area in its complexity.

693 **GENERAL SESSION: ARCHAEOLOGY AND THE PUBLIC**

**Chair:** to be confirmed

**Format:** Regular session

**ABSTRACTS:**

1 **ROLE OF SOCIAL MEDIA AS AN INFLUENCER IN HERITAGE CONSERVATION INITIATIVES IN INDIA**

**Abstract author(s):** Ghosh, Ahana (Archaeological Sciences -Indian Institute of Technology-Gandhinagar) - Konar, Snigdha (Department of Archaeology, University of Calcutta)

**Abstract format:** Oral

This research had thrown light on the influence of social media platforms in generating awareness among general masses on heritage conservation in India. Social media is an important platform for developing any kind of connections these days. It will also look into the implementation and impact of the concept of citizen science in heritage conservation process and the participatory aspect within the whole process. Specially during the Covid-19 pandemic where everything got transformed from offline to online and online platforms became pertinent one. So, in this scenario the individual efforts of conservation or organizational efforts started enlightening awareness among people with enormous social media implications. Previously, a lot of surveys have been conducted centering around the topic of heritage conservation but not much work has been done on understanding the social media implications of these heritage conservation units (individual and organizational). A questionnaire based verbal or non-verbal interviews have been conducted on the resource persons related to these social media platforms. This method was followed by a qualitative and quantitative analysis of the yielded data. Individual efforts were also given much importance during the research as sometimes individual efforts tend to have more influence than organizational or collective efforts. It has been noticed that social media pages are also acting as a voice for protest sometimes. So, this research is presenting the current state of social media influence and citizen science management in heritage conservation in India with proper statistics and also throwing light on its future endeavors.

2 **TRUST AND TRIBULATIONS; HOW CITIZEN SCIENTISTS IN ONTARIO, CANADA CAN HELP ARCHAEOLOGISTS WITHIN PLOUGHZONE CONTEXTS**

**Abstract author(s):** Beaulieu, Kiara (University of Birmingham)

**Abstract format:** Oral

In Ontario, Canada very few collaborative efforts are finding strong roots in the citizen scientist/metal detecting communities. As such, limited pilot projects or collaborative efforts have been established and only due to the perseverance of a few dedicated individuals. Many detectorists enjoy posting on forums, Facebook groups and websites geared specifically to like-minded persons, yet are hesitant to work with archaeologists or submit their find locations or artifacts to help further cultural heritage knowledge. The relationship and trust doesn't exist to instill confidence that hobbyists will be treated fairly and with respect-causing some hesitation for collaboration. Currently no project exists within the province that allows detectorists/citizen scientists to engage in a meaningful way with the archaeological data they do collect. A proposed pilot project considers the feasibility of a citizen scientist lead initiative that is geared to recording finds unearthed in cultivated contexts/ploughzones. This paper explores such a venture

and considers what is needed in order for such a project to be viable within the Ontario heritage landscape, what challenges exist, what ethical concerns present from participants and observers, how would the partnership function, and finally who would maintain control of the data.

3 **EXPERIENCES AND EMOTIONS IN THE NOTEBOOK PAGES OF THE FINNISH POWS FROM THE ISLE OF MAN**

**Abstract author(s):** Ylimaunu, Timo (University of Oulu) - Mytum, Harold (University of Liverpool)

**Abstract format:** Oral

We will discuss in our paper experiences, memories, and emotions which the Finnish Prisoners-of-War shared with each other when they were held in the Isle of Man at the 1941–1944. The notebook was found hidden in a former boarding house which had been requisitioned as part of the Mooragh internment camp. British and other Allied authorities took several hundred Finnish sailors as prisoner of war during the World War II, and more than 400 Finnish sailors were placed in the internment camps on the Isle of Man. They were released from captivity at the fall 1944. The notebook consists of 36 pages, mainly song lyrics and drawings, which were written and drawn, probably, by five or six different people. This is a rare example of material culture from the Mooragh camp, in contrast to other camps on the Island which produced craftwork and newspapers. We will discuss how image and text reveals what the Finnish internees experienced, and what kind of emotions these lyrics and drawings transmit. These shared experiences and emotions that can be compared with those revealed by newspapers from other camps that housed other nationalities.

4 **THE TROUBLESOME CASE OF A HUMAN SKELETON, POSSIBLY OF A CALIFORNIA INDIAN, IN A SWEDISH MUSEUM COLLECTION**

**Abstract author(s):** Wärmländer, Sebastian (Stockholm University)

**Abstract format:** Oral

Museum collections involving human remains have become an ethic dilemma during the last decades. The earliest collections of human skeletons were derived from scavenged Indigenous graves, or from anatomical dissection of the executed and the very poor. The more recent skeletal collections are almost always the result of cemetery removals, or consist of unclaimed bodies from hectic city morgues. In neither case have the individuals in question, or their families, consented to having a museum box as a final resting place. But should this really be required, and if so, should all old collections be disassembled and the skeletons repatriated and reburied? What is the benefit of keeping these museum collections, and if the old ones are discarded, should new ones be created? Here, we present the case of an unidentified human skeleton – possibly of a California Indian - in a Swedish museum collection. The case is used to illustrate some of the ethical concerns that European museums currently are facing, especially with regard to human skeletal identification, repatriation, and display.

5 **EMOTIONAL ARCHEOLOGY FOR THE HERITAGE MANAGEMENT OF A WIDE TERRITORY. THE MASAV PROJECT (ÁVILA, SPAIN)**

**Abstract author(s):** López García, Juan Pablo (MASAV)

**Abstract format:** Oral

In 2017, the Terra Levis project, Archeology in Community, was launched at the proposal of the AC Abulaga, based in the mountain town of San Juan del Olmo -Ávila, Spain-. Work processes based on rural heritage and participation, led with the creation in 2018 of the MASAV - Open Museum of the Sierras de Ávila and Valle Amblés-. This communication reflects on emotions in archeology beyond their possible reflection in material culture. The work strategies based on a continuous communication flow between all the agents involved, the horizontal management of the project, the transformation of the sites through art as well as the scope of our concept of community are guaranteeing the continuity of a regional project that he perceive cultural heritage as one of the last remaining opportunities for a territory haunted by the specter of depopulation. Emotion has become a fundamental pattern for the connection of communities with the landscape, materiality and with the project itself.

6 **WIKITOPIA ARCHIVES: INVOLVE EVERYBODY ABOUT ARCHAEOLOGY HISTORY**

**Abstract author(s):** Gransard-Desmond, Jean-Olivier (ArkéoTopia, une autre voie pour l'archéologie)

**Abstract format:** Oral

WikiTopia Archives is a program for digitization of archaeological sources run by the association ArkéoTopia, an alternative approach to archaeology. Launched in March 2018 with a first corpus of letters from the 19th century, the program is aimed at individuals interested in archaeology and at archaeologists, both students and researchers as well as enthusiasts. Its objective is to encourage them to digitize and then publish their historical sources on Wikimedia via the Open Source tools. In this way, the various documents will be accessible to the greatest number of people all over the world and research on them will be encouraged.

With this first experience, we hope to encourage private individuals to enhance their personal collections, archaeology students to contribute to the work of referencing, and researchers to take note of the information on display and to study them. The goal is to complete the current project on Anatole de Barthélémy's archives and to initiate others, all archaeological periods combined.

7

COMMERCIAL ARCHAEOLOGY IN PORTUGAL 2008-2020: THE PANDORA BOX, THE GLOBAL CRISIS AND BRIEF PROFESSIONAL CHARACTERIZATION

**Abstract author(s):** Luciano, Vanda Bela (UAL)

**Abstract format:** Oral

Commercial archaeology in Portugal began to take their first steps, after projets of public development as Foz Côa. After our ratification of the Malta Convention in 1997, and consequent legislation aimed at safeguarding cultural heritage. That concern extends to monitorization of archaeological, prospecting or surveys, when public or private works took place. The boom in commercial archaeology would have disastrous consequences a few years later, in 2008 when the crisis hits us. Companies needed to reinvent themselves and archaeologists needed to diverse their range of skills in order to adapt to this new demand. Recently we invert the tendency of a sector in crisis, commercial archaeology rise up again, with tourism and development of the real estate. A united and more capable professional class is required, also the universities need to adaptated their role to that quest. For that matter we have to establish new forms to approach these two sides, that are still apart.
