## ORGANISERS

## HOW TO READ THE ABSTRACT BOOK

The Abstract Book is ordered by session numbers which were allocated during the session submission (i.e., the number sequence is discontinuous).

Author's affiliation is stated in brackets following the author's name; where authors share the same affiliation, it is only stated once.

Index of Authors includes all session organisers and only the main authors of contributions.

Please note that names, titles and affiliations are reproduced as submitted by the session organisers and/or authors. Language and wording of titles and abstracts are not revised.

# Contents...

5	Understanding Prehistoric Demography .....	9
16	“Economic Archaeology” and Quantitative Approaches – Measuring the Variations in Production and Consumption from Archaeological Data.....	16
21	Domesticating Time: Temporal Changes in Animals and Plants during the Holocene .....	20
22	A United Europe of Things 2. Large Scale and Local Networks of Differences and Similarities in Medieval Material Culture .....	23
34	Scales of Interaction in the Bronze and Iron Age Central Mediterranean .....	28
35	Human Mobility and Archaeological Thought: Moving forward .....	32
46	Advancing Skyscape and Landscape Archaeologies: Relations with the Sky. Interactions between Disciplines.....	37
48	Ebb & Flow: Exploring Rivers from Prehistory to the Present Day .....	43
49	Luxury in Life and Death in the European Iron Age. Identity - Elite Networks - Economy - Arts and Crafts.....	49
57	A Martial World or a Diverse Community? Gender, Social Stratification and Minorities on Castles .....	54
85	Islamic Archaeology in Europe and Beyond: Widening Horizons, Blurring Boundaries. Part 1 .....	57
86	Islamic Archaeology in Europe and Beyond: Widening Horizons, Blurring Boundaries. Part 2 .....	62
87	The Material Culture of Attachment: Social Bonds, Childhood and Emotionally Important Objects .....	66
94	Decision-making in Archaeological Heritage Management: Moving forward .....	68
95	Arts in Work: About the Interaction of Soundscapes and Tasksapes in Antiquity .....	71
97	Redrawing Lines in the Sand: New Archaeological Approaches to Addressing Climate Impacts [CCH].....	75
100	To Gender or not to Gender? Exploring Gender Variations through Time and Space [AGE].....	79
101	On the Shoulders of Prometheus: International Collaboration and the Archaeology of the South Caucasus .....	84
111	Preserving Transformative ‘Palimpsests’: The Role of Digital Heritage and Participative Approaches in Current Urban Archaeology.....	87
114	1200 BC from the Atlantic to Asia: Social Collapse and Resilience in Regional Perspective. Part 1 .....	88
115	1200 BC from the Atlantic to Asia: Social Collapse and Resilience in Regional Perspective. Part 2 .....	93
116	The Archaeology of Magyar Raids in Western and Eastern Europe.....	97
119	On Class, Elitism, and Poverty: Archaeology and Social Class .....	102
120	What Is “Social” in Social Archaeology? Re-evaluating Social Theory and Its Impact in European Prehistory .....	104
130	BIG-BIO: Opportunities and Challenges of BIG Data with a Focus on BIO-Archaeology.....	107
131	The Place of Queer Theory in Current Archaeological Debates: All T, No Shade? [AGE].....	112
140	Compensation in Architecture and Archaeology - On Compensation as a Concept, Method, and Professional Practice .....	115
141	Between Bones and Beliefs: Human-Bird Relations in Central and Northern Europe in the 1st Millennium AD.....	119
143	Dendroarchaeology: Wood Science for the Reconstruction of Past Landscapes and Human-Environment Interactions Based on Archaeological and Historical Studies of Wood Remains .....	123
144	The Ever Changing Coast: Interactions of People, Landscapes and Environment along Europe’s Seas in High-Resolution .....	128
149	Bioarchaeology of Health, Lifestyle and Social Change in the Later Middle Ages .....	137
152	Ancient West Asia and Egyptian Soundscapes in Contact .....	147
153	Archaeology in the Digitocene Age: Discussing Critical Approaches, Onto-Ethics, and Policies of Digital Practices .....	151
156	Users of Heritage: Critical Appraisal of the Adoption of Citizen Science in Digital Processes of Archaeological Knowledge Production.....	155
164	Constructive Conservation: Making Monuments Useful .....	157
165	People Power? Past, Present and Future for Public Participation in Archaeological Fieldwork .....	161
167	Dirty Heritage: Towards an Archaeology of Consumption, Waste and Environmental Change .....	164
169	Periodicity and Cyclicity in Prehistoric Practice as Seen in Waterlogged Contexts .....	166
171	The Emergence of Social Inequality in Europe and Southwest Asia: From the Later Upper Palaeolithic to the Early Bronze Age .....	169
172	Sacrifice & Value: Seeking an Anthropological Archaeology of Sacrifice .....	175

178	Between Autochthonism, Marxism and Turboslavism: Concepts of Slavs and Slavic Origins Through Space and Time .....	178
179	The Geoarchaeology and Sustainability of Cultivation Terraces and Lynchets in Europe.....	183
180	Protecting Archaeological Heritage in the Globalisation Era: Trends, Challenges, Solutions [Illicit Trade] .....	191
188	Beast and Human: Northern Europe, from the Bronze Age to Modern Times.....	194
192	Landscapes and the Augustan Revolution: Exploring the Transformation of the Western Provinces between the Republic and the Early Empire .....	197
202	Ancient Cultural Routes: Past Transportation as a Two-Way Interaction between Society and Environment.....	201
204	Are We Really Strategic? Devising and Implementing Archaeological Strategies .....	206
205	Lithic Raw Materials in Prehistory: Methods, Practice and Theory. Part 1 .....	208
206	Lithic Raw Materials in Prehistory: Methods, Practice and Theory. Part 2.....	214

5 UNDERSTANDING PREHISTORIC DEMOGRAPHY

**Theme:** 5. Assembling archaeological theory and the archaeological sciences  
**Organisers:** Armit, Ian (University of York) - Damm, Charlotte (University of Tromso) - Črešnar, Matija (University of Ljubljana)  
**Format:** Regular session

In recent years, archaeologists have become increasingly interested in questions related to the demography of prehistoric communities. Indeed, the study of population dynamics is critical to many of the questions we now want to ask about the prehistoric past, whether our concern is population size, structure or mobility. Demographic analysis can operate at multiple scales, each posing its own challenges and necessitating the development of innovative theoretical and methodological approaches. Studies using aDNA analysis have identified significant population movements across large swathes of Europe, dramatically affecting the genetic composition of prehistoric communities. Isotope analyses have similarly made great strides in detecting prehistoric mobility, permitting finer-grained understandings of the mobility of specific individuals and groups. Summed Probability Distribution analyses of radiocarbon dates have been used as proxies for population fluctuations over time, while ethnoarchaeological and cross-cultural approaches to population reconstruction remain important in understanding local and sub-regional population dynamics.

This session brings together researchers working across the broad field of prehistoric demography, including papers from Stone Age Demographics, and COMMIOS (Communities and Connectivities: Iron Age Britons and their Neighbours), two large-scale projects studying prehistoric Norway and Britain respectively. Instead of focussing on one method, the aim of the session is to explore how different methodologies, spatio-temporal scales and theoretical perspectives may complement each other within and between projects and case studies to provide a more nuanced understanding of prehistoric demographies. We invite papers at any spatio-temporal scale, from the size and composition of individual households and intra-settlement organisation, to regional and supra-regional settlement patterning and population structure. Papers may focus on the development of specific methods, theoretical frameworks for demographic reconstruction, or case studies.

ABSTRACTS:

1 THE COLOGNE PROTOCOL: ESTIMATING PAST POPULATION DENSITIES

**Abstract author(s):** Schmidt, Isabell (University of Cologne) - Hilpert, Johanna (Kiel University - CAU) - Kretschmer, Inga (Landesamt für Denkmalpflege Stuttgart) - Peters, Robin (Landschaftsverband Rheinland) - Broich, Manuel - Schiesberg, Sara - Vogels, Oliver - Wendt, Karl Peter - Zimmermann, Andreas - Maier, Andreas (University of Cologne)  
**Abstract format:** Oral

During the last decade, the Cologne Protocol has been established in prehistoric research for estimating past population size and density through a geo-statistical, site density based upscaling approach. The estimated data are available at different spatial scales, ranging from regional areas of social units up to continents. The relevant proxies are selected based on their validity for the relevant socio-economic setting, which currently comprises mobile hunter-gatherers and sedentary farmers, while the overall methodological framework is kept consistent. The application of the protocol to a long diachronic series of European prehistoric periods provides a consistently derived and scalable set of spatially explicit data on past population dynamics. The work takes place within the framework of the Rhine-Lucifs Project and the CRC806 at the University of Cologne.

In this presentation we will discuss the methodology and results from our research with regard to scaling issues in Late Pleistocene forager contexts. Perspectives will be provided for the application of the Cologne Protocol to new contexts. Recently published manuals for modelling Core Areas in MAPINFO, ARCGIS, QGIS/SAGA, and R, are briefly introduced.

2 DWELLINGS, SETTLEMENT ORGANISATION AND POPULATION FLUCTUATIONS: A MULTI-SCALAR CASE STUDY FROM ARCTIC NORWAY

**Abstract author(s):** Damm, Charlotte (Arctic University of Norway)  
**Abstract format:** Oral

Methods employed by archaeologists to address prehistoric demography not only use different types of data, but also target demography at different spatio-temporal scales: from site based, event and individual oriented cases through landscape and culture-historically delimited group scale studies to interregional and diachronic population analyses. Each of these scales have their merits and make important contributions to the knowledge of demographic variation and developments. However, in order to discuss the dynamics of prehistoric demography, it is important to acknowledge the inherent relationship between different scales.

The presentation will illustrate this through preliminary results from a project in Arctic Norway, Stone Age Demographics, investigating northern maritime foragers ca 6000-0 BCE. Based on radiocarbon dates and Bayesian chronologies the projects investigates re-use and contemporaneity of house-pits dwellings; extensive surveys and redocumentation of sites assist in evaluation of settlement organisation in one coastal region; and radiocarbon dates are used in SPD modelling of population fluctuations across millennia and in comparison with climatic change.

Combining the information from all three scales of analysis together results in a more substantial and nuanced insight to the demographic patterns of these northern foragers.

3

### EXPLORING LOCAL GEOGRAPHICAL CONDITIONS UNDERPINNING REGIONAL DEMOGRAPHIC CHANGE AMONG HUNTER-FISHER-GATHERERS IN SOUTHWEST COASTAL NORWAY (11,500-4300 CAL BP)

**Abstract author(s):** Lundström, Victor - Bergsvik, Knut (University Museum, University of Bergen)

**Abstract format:** Oral

Once communities started to explore and settle along the Norwegian coast after the last ice-age, population numbers started to grow at an exponential rate (Solheim, 2020; Jøregensen, 2020). This is often attributed to notions of the coast as providing highly productive and stable ecozones that help suppress any severe setbacks to a population’s trajectory of long-term growth. However, long-term changes in a population’s growth are ultimately underscored by the fitness of specific life-history strategies that are more or less determined by the fact that resources do not rank equally in their calorific return, nor are they evenly distributed across space (Tremayne and Winterhalder, 2017). It is our impression that previous work on the Norwegian Stone Age has dealt with these concerns inadequately, and we wish to remedy this with a case study from the west coast of Norway. In this paper, we wish to explore how evenly or unevenly Stone Age population-levels were distributed across space by posing the following research question: Were some areas along the west coast settled at greater population levels, densities and intensities over time than others, and if so, where was this and why? Informed by the paradigm of human behavioral ecology (HBE) we predict that settlement and subsistence practices were organized across the landscape in ways that would have -other things being equal- maximized their fitness. To test these predictions, we bring to the fore ethnographically upscaled population counts (Lundström et al., 2021) and juxtapose them against local estimates on growth rates using spatially explicit analyses on radiocarbon dates (e.g. Crema et al., 2017) and stray finds.

### TERRITORIES, STRATEGIES AND TWO GENERATIONS

**Abstract author(s):** Odgaard, Ulla (Independent researcher)

**Abstract format:** Oral

This paper presents a model of non-sedentary territorial management based on archaeological surveys in combination with ethno-historical and anthropological studies in Greenland. It is further suggested that the model can also have relevance for studies of other prehistoric societies.

The archaeological surveys revealed a landscape of many settlements, with varying numbers of house-structures. Attempts of 14c datings did not answer questions about demography in the area: Were they many hunters at one time or just a few? Which strategies for exploitation of the landscape were applied?

The Thule culture hunters were direct ancestors of modern Inuit, and in several cases, it has been possible to interpret archaeological structures with the help of the existing ethnographic and ethno-historic sources.

Today there is no ownership of land in Greenland, and everybody can in principle go hunting everywhere. However former concepts of user’s rights to territories and camp sites can still be met among hunters. Interviews with contemporary hunters and observations in their hunting camp made it possible to create a model, which applied on the ancient camps make sense. On this basis it has been possible to interpret population dynamics and change of strategies through time.

5

### POPULATION DYNAMICS AND THE EXPANSION OF AGRICULTURE. ASSESSING THE RADIOCARBON GAPS DURING THE NEOLITHIZATION PROCESS IN THE WESTERN MEDITERRANEAN

**Abstract author(s):** Cortell-Nicolau, Alfredo (Departament de Prehistòria, Arqueologia i Història Antiga. Universitat de València) - Crema, Enrico (Department of Archaeology. University of Cambridge) - Shennan, Stephen (Institute of Archaeology. University College London) - Rivas, Javier (Department of Economics. University of Bath) - García-Puchol, Oreto (Departament de Prehistòria, Arqueologia i Història Antiga. Universitat de València)

**Abstract format:** Oral

The increase in the radiocarbon record during the past years has helped acquiring a better understanding of the Neolithization process in the Western Mediterranean. Different theoretical (not necessarily contradictory) models, such as the classic wave of advance, the Dual Model or arrhythmic models have been proposed in the light of the new information obtained through the increasing 14C dating programmes.

However, this greater volume of information has not solved one of the problems characterising the Neolithization process. From the Alps to the Iberian Mediterranean, it is common to find radiocarbon voids between the last groups of hunter-gatherers and the first groups of farmers. These ‘gaps’ can last from 200 to 500 years, and despite some efforts, have still not received a satisfactory explanation from the archaeological community.

In this proposal we approach the problem from the perspective of population dynamics, and develop a theoretical model, which could account for those gaps in the radiocarbon record emphasizing the relationships between the last Mesolithic populations and the first Neolithic groups. Our framework is now limited to the Iberian Mediterranean, but its results could be explored for different geo-chronological frames.

6

### GENOME-WIDE INVESTIGATION OF THE REGIONAL DIVERSITY OF POPULATION DYNAMICS DURING WEST EUROPEAN MESOLITHIC-NEOLITHIC TRANSITION

**Abstract author(s):** Rivollat, Maïté (University of Bordeaux, PACEA, France; Max Planck Institute for the Science of Human History, Department of Archaeogenetics, Jena, Germany)

**Abstract format:** Oral

The Neolithic transition from foraging to farming is one of the most important events in human history. Starting from 12,000 years ago in the Middle East, the new lifestyle spread towards Europe via separate continental and Mediterranean routes. Both streams eventually overlapped in Western Europe. Here, a complex period of contact, interaction and exchange with autochthonous hunter-gatherers from the Mesolithic to the Late Neolithic resulted in a mosaic pattern of the material culture that is well-known in archaeology.

Investigated in greater detail using genomic data, incoming farmer groups have been shown to have a clear Near Eastern/Anatolian cultural and genetic background with only limited genetic contribution from hunter-gatherers for at least two millennia from the south-east to Western Europe, despite considerable evidence of mutual material exchange. However, thus far no genomic data was available from modern-day France, the key region where both routes converged.

Here, in the framework of the collaborative project INTERACT (ANR/DFG), we present new genome-wide data from 101 individuals from 12 sites covering today’s France and Germany from the Mesolithic to the Neolithic (7000-3000 BCE). Utilising the genetic substructure observed in hunter-gatherer groups across Europe, we are able to trace characteristic patterns of admixture between incoming farmers and indigenous hunter-gatherers in different regions, which are consistent with both routes of the Neolithic expansion. In particular, Western European early farmers show a higher proportion of specific Western Hunter-Gatherer ancestry compared to those linked to Southeastern or Central Europe. Our data shed a new light on the complexity of biological interactions between human groups during the Neolithic expansion and establishment in Western Europe, echoing the archaeological knowledge and confirming major regional variations. This increasing resolution paves the way for a finer, multi-scale approach to better document the processes implied in the mobility and evolution of prehistoric groups.

7

### SOCIAL GENOMICS OF THE LBK, INSIGHTS FROM THREE DIFFERENTIATED SITE TYPOLOGIES

**Abstract author(s):** Gelabert, Pere (Department of Evolutionary Anthropology, University of Vienna) - Olalde, Iñigo (Institute of Evolutionary Biology - CSIC-UPF) - Ringbauer, Harald (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Genetics, Harvard Medical School, Boston, Massachusetts) - Teschler-Nicola, Maria (Department of Anthropology, Natural History Museum, Vienna) - Anders, Alexandra (Institute of Archaeological Sciences, Eötvös Loránd University) - Bickle, Penny (Department of Archaeology, University of York) - Hofmann, Daniela (Department of Archaeology, History, Cultural Studies and Religion, University of Bergen) - Pavuk, Juraj (Archäologisches Institut der SAW, Nitra) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna) - Reich, David (Department of Genetics, Harvard Medical School, Boston, Massachusetts; Broad Institute of Harvard and MIT, Cambridge, Massachusetts; Howard Hughes Medical Institute, Harvard Medical School, Boston)

**Abstract format:** Oral

The Linear Pottery Culture (LBK, ALP in Eastern Europe), represents one of the major cultural groups of the Early Neolithic in Central Europe, and was associated with the dispersal of farming over a vast region of previously uncultivated Europe. The LBK cultural complex flourished for around 500 years, from around 5,500 BCE to its disappearance around 5000 BCE. Genetic studies have already characterized the ancestry of these peoples, however until today, genetics have not decisively provided insight into LBK social organization. Here we analyse three different LBK sites: The cemetery of Nitra, the graves from Polgár-Ferenci-hát and the Massacre of Asparn-Schletz, spanning the duration of the cultural complex. Our strategy allows us to deeply characterize the familial connections of these sites, the demographic patterns and inter-sites connections. We have revealed the presence of large family clusters in the cemeteries of Nitra and Polgár-Ferenci-hát, as well as high degrees of unrelatedness between parents (indicated in the aDNA of children) in the culture, indicating large population sizes at the onset of the LBK. From the site of the Schletz massacre, we have produced genomic data from the entire assemblage of individuals, providing a snapshot of a “living” LBK population.

8

### USING ANCIENT DNA, ISOTOPIC ANALYSIS, RADIOCARBON DATES AND ARCHAEOLOGICAL EVIDENCE FOR (RE)CONSTRUCTING DEMOGRAPHY AND SOCIAL STRUCTURES

**Abstract author(s):** Massy, Ken (LMU Munich)

**Abstract format:** Oral

Reconstructing past life, with all its varying perspectives, has been one of the main focal points in archaeology ever since. Scientific methods, developed in different fields of research, were integrated into archaeology bit by bit, with some having turned out to be essential for future analyses for us to understand human life and its remnants we still encounter today. One of the major breakthroughs was the extensive use of calibrated radiocarbon dating in order to put cultural changes into a timeline. It was used to determine the principal chronological framing of “cultures” in the first place (e. g. beginning of the Neolithic), but has evolved to a multi-purpose tool for all kinds of applications, inter alia, demography.

9 In some way, ancient DNA, a much younger field of research, has shown a similar evolution from geographical large-scale population genomics based on small sample sizes (e. g. biological provenance of Neolithic people in Central Europe) to detailed questions about pathogens, kinships, ancient proteomics etc. However, this development took place way faster as seen with radiocarbon dating.

With a huge number of skeletal remains of humans analysed in the micro-region of Augsburg, Bavaria, including all available scientific methods, a new time in archaeology has begun. Ancient DNA analyses generated data about kinships among the inhabitants of this small-scale area, showing core families accompanied by non-related foreign women and wealth-inheritance. The information of the pedigrees reconstructed via aDNA are then used to refine radiocarbon dating by Bayesian modelling and estimate the timeframe of cemetery occupancy. All these methods combined with “hard” archaeological evidence led to a new understanding of mobility and settlement development as well as demography within this micro-region.

9 **DEMOGRAPHY AT THE MESO-SCALE: AN INTEGRATION OF LOCALIZED DEMOGRAPHY AND SETTLEMENT PATTERNS IN PREHISTORIC JAPAN**

**Abstract author(s):** Simmons, Charles - Gjesfjeld, Erik (University of Cambridge) - Kaner, Simon (University of East Anglia; Sainsbury Institute for the Study of Japanese Arts and Cultures; University of Cambridge) - Crema, Enrico (University of Cambridge)

**Abstract format:** Oral

The Jomon Period of Japan was a pre-agricultural complex society that existed on the main islands of the Japanese Archipelago from as early as about 15,500 cal BP until the introduction of agriculture from the Korean Peninsula around 2800 cal BP. Over the course of this long and diverse period, a series of increases and decreases in population levels were experienced, with the most significant being a “boom and bust” that occurred during the Middle Jomon (ca. 5500-4,600 cal BP). Regional-scale analyses first uncovered this demographic event using total regional counts of archaeological sites and the pit house dwellings characteristic of the period. Analyses at these scales demonstrated that different regions of Japan experienced the event to varying degrees and with different temporal offsets for the initiation of the event, and some regions, particularly those in Western Japan, were relatively unaffected by the event. This paper contributes to the understanding of these demographic events by using Bayesian computational analyses on a meso-scale dataset of nearly 2000 pit houses from over 50 sites within a 13 sq. km area that was surveyed or excavated nearly in its entirety in Kanagawa Prefecture in the Kanto region of Japan. These analyses employ a Monte-Carlo simulation to account for the uncertainty associated with periodized chronologies and provide localized demographic estimates. These estimates are then compared to patterns of continuity and discontinuity in settlement occupation to help connect observations across regional and site-level scales.

10 **REGIONAL DEMOGRAPHIC RESPONSES TO THE SPREAD OF RICE FARMING IN JAPAN: NEW INSIGHTS FROM BAYESIAN ANALYSIS OF THE RADIOCARBON RECORD**

**Abstract author(s):** Crema, Enrico (University of Cambridge) - Shoda, Shinya (University of York; Nara National Research Institute for Cultural Properties)

**Abstract format:** Oral

The 1st millennium BC saw a pivotal episode of demic and cultural diffusion that led, in the subsequent centuries, to long-lasting social, cultural, economic, and genetic changes in the Japanese islands. This period marks the end of the so-called Jomon period, characterised by a subsistence economy predominantly centred on hunting and gathering, and the start of the Yayoi period, when a package of cultural traits brought-in by migrant groups from the Korean peninsula spread across the Japanese archipelago. A core element of the Yayoi package was rice and millet farming, and its broad-scale demographic impact can be observed by a population boom and by a shift in the regions with highest population density from north-east to southwest Japan. The Jomon-Yayoi transition was, however, far from a homogeneous process, and archaeological evidence indicates a wide range of responses, from the immediate adoption of the full Yayoi package to instances of partial adoptions, hybridisation, rejection, and even cases of short-term adoption followed by a reversion to previous subsistence economies. This paper examines the demographic consequences of these regional responses to the Yayoi package by synthesising and analysing the rich settlement and radiocarbon data offered by Japanese archaeology. It will employ a new Bayesian framework for analysing large collections of radiocarbon data to detect the presence of major shifts in population growth rate and examine their timing in relation to evidence from subsistence and climate data.

11 **HOUSES OR HOUSEHOLDS? A SOCIO-ECONOMIC ANALYSIS OF THE CHALCOLITHIC SETTLEMENT FROM HĂBĂȘEȘTI (IASI COUNTY, ROMANIA)**

**Abstract author(s):** Balaur, Radu (Alexandru Ioan Cuza University of Iasi, Interdisciplinary Research Institute - Science Department, Arheoinvest Center)

**Abstract format:** Oral

Problems of a social nature are less discussed with regards to the Cucuteni communities. The dwelling represents the spatial delimitation of the social group within the settlement. The spheres of social structures in a community, represented by the management of the common space, the position of the individual and the family within the group, and the degree of solidarity of the group, seem to be influenced by the quantity and quality of the raw materials, also by the available labour force, the experience of the builders, individual’s desire to allocate a different amount of resources in the construction of housing, etc. In this case, we discussed the settlement of Hăbășești, one of the few Cucutenian settlements fully investigated. I followed first the individual analysis of the

houses in order to identify their functions. Included among the analysis criteria were the way of constructing, the orientation and the size of the houses, the presence of the artefacts discovered inside as the identification of the activity areas in each structure. The next step considered the distribution of structures at the settlement level in order to identify possible relationships between dwellings. Most activities identified inside the houses were related to activities that ensured the survival of individuals, and also a possible collaboration between the households.

12 **DEMOGRAPHIC NUANCES OF RADIOCARBON DATING AND DEATH RATES OF THE BRONZE AGE EASTERN CARPATHIAN BASIN**

**Abstract author(s):** Daróczy, Tibor (Aarhus University, Department of Archaeology & Heritage Studies)

**Abstract format:** Oral

Demography, as the science of social statistics, is an important means of better understanding past realities and to lay the foundations of emic perspectives. Undoubtedly, graves are an important, if not the most significant, means of evaluating dynamics of past populations. They do provide a straight-up quantitative and qualitative approach to assess amounts of deaths, but in order to view these numbers as death rates the depth and, especially, span of time of each burial ground and their micro- and macro-regional temporal relation must be established and refined. Furthermore, intervals of time of architectural layers of multistratified sites provide aid to enhance these chronologies. Both aspects would suggest not just cherry-picked radiocarbon dating of prestigious burials or architectural finds, but the systematic AMS dating of both burial grounds and multistratified series within a site. A rigorous sampling strategy for both, selected individuals and such sites, would need to be implemented in order to even consider the weighted estimate based on the unearthed graves of Bronze Age death rates. New research and implementation of such sampling strategies for radiocarbon dating sheds new light on the intensity of death from one century of the 3rd and 2nd millennium BCE to the other. Results of both the evaluation of a synoptic radiocarbon database containing dates of the deceased individuals of the Bronze Age Eastern Carpathian Basin and implemented sampling research of multistratified sites, also from the same period and region, shifts our views to a more refined distribution of death through these two millennia. The improvement of absolute chronologies of various micro-regions has the potential to echo into other fields of demography, significantly challenging previously held beliefs of directionalities of movement of people, disease and social practises.

13 **PAST POPULATIONS IN SILICO: ADVANCES IN MODELLING ARCHAEOLOGICAL POPULATIONS**

**Abstract author(s):** Verhagen, Philip (Vrije Universiteit Amsterdam) - Séguy, Isabelle (INED Paris; CEPAM Université de Nice-Côte d’Azur) - Düring, Andreas (IföSA, Munich) - Bertoncello, Frédérique (CEPAM Université de Nice-Côte d’Azur) - Vlach, Marek (Institute of Archaeology, Czech Academy of Sciences) - Angourakis, Andreas (University of Cambridge) - Lane, Justin (Prospectus Research, Kristiansand) - Degioanni, Anna (Université Aix-Marseille) - Pennec, Sophie - Courgeau, Daniel (INED Paris)

**Abstract format:** Oral

Simulation modelling is increasingly applied to reconstruct, interpret and understand the demographic behaviour of past populations. Many factors are known to influence the dynamics of human populations, including demographic patterns, social practices, political coercion, technological know-how, warfare, cultural beliefs, and a myriad of both biotic and abiotic environmental factors. Accounting for all such processes is challenging and requires a great deal of interdisciplinary collaboration. In this paper, we want to set out the major advances, alternative approaches, and challenges in modelling ancient populations while presenting an agenda for future research in this field. In particular, we address the following issues:

- Intrinsic dynamics of human populations (natural growth under stable conditions)
- Integration of social and environmental factors in population models
- Spatial and temporal scales of population movement, from generation-wise individual displacements to continental mass migration
- Spatio-temporal effects of high-impact events, such as epidemics and climatic episodes
- Model designs and validation methodologies able to link population models to archaeological data, particularly the osteoarchaeological record of cemeteries.

14 **HOW MANY MYCENAEANS DOES IT TAKE TO CHANGE A LIGHT BULB? AGRICULTURAL POTENTIAL AS A METHOD FOR ESTIMATING POPULATION SIZES**

**Abstract author(s):** Timonen, Riia (Leiden University)

**Abstract format:** Oral

The Late Bronze Age (ca. 1600 – 1200 BCE) in the Aegean is renowned for considerable advancements, such as the development of palatial administrative systems, agricultural intensification, and organized long-distance trade. All of these efforts were presumably enabled by a considerable population increase. However, very few population estimates exist for this time period. This absence is largely due to the lack of data on contemporary burials, and the sizes of households and settlements. In the absence of such traditional demographic data, the concept of agricultural potential can be used to provide population estimates. The agricultural potential uses information about the landscape (e.g. soils, contour, vegetation) and subsistence strategies (cultivation, herding) to calculate the maximum number of individuals who could be sustained by the food produced on a particular land area. This talk presents the results of a recent study, which aimed at determining the size of the Late Bronze Age (LBA) Argive Plain population

15

through its agricultural potential, as well as testing the usefulness of such an approach in comparison to other demographic methods. The Argive Plain in the southern mainland Greece is known for its large citadels such as Mycenae and Tiryns. These are also one of the few settlements with previously published LBA estimates of population sizes. A comparison of these estimate to the regional agricultural potential resulted in a discrepancy in which the number of individuals dwelling the citadels was high compared to the agricultural potential. This presentation discusses how underlying assumptions included in different demographic methods may result in mismatches in population estimates, and shows why the comparison of methodologies is important. This way, the case study also presents an innovative way to overcome issues related to the poor availability of demographic data.

**MIGRATION, MOBILITY AND SOCIAL INTERACTION IN BRONZE AND IRON AGE BRITAIN: INITIAL RESULTS OF THE COMMIOS PROJECT**

**Abstract author(s):** Armit, Ian - Bleasdale, Madeleine - Büster, Lindsey - Fischer, Claire-Elise (University of York) - Booth, Tom (The Francis Crick Institute) - Patterson, Nick - Isakov, Michael (Harvard University) - Evans, Jane (British Geological Survey) - Hamilton, Derek (SUERC) - Reich, David (Harvard University)

**Abstract format:** Oral

Recent advances in aDNA and isotope analysis have revealed unparalleled insights into issues of mobility and population change in European prehistory. Until recently, however, the main impact of this work has been in the Neolithic and Early Bronze Age periods, where major demographic transformations are attested. The COMMIOS Project (Communities and Connectivities: Iron Age Britons and their Continental Neighbours) sets out to examine the population dynamics of Bronze and Iron Age communities through a combination of scientific and humanities approaches, focussing on Britain and neighbouring regions of mainland Europe, c. 1500 BC – AD 100.

Combining aDNA and multi-isotope analysis with osteoarchaeology and the contextual analysis of mortuary practices, COMMIOS examines later prehistoric population dynamics at several scales. At the broad scale, aDNA analysis can reveal the genetic diversity of Bronze and Iron Age populations in Britain (including genetic relationships with communities in continental Europe) and, alongside multi-isotope analysis, can provide insights into mobility patterns and inter-regional contacts. At a more local scale, the integration of these techniques with osteoarchaeology and funerary archaeology allows us to examine questions concerning kinship, gender and inequality within and between later prehistoric communities. Finally, the integration of these methods can expand our understanding of the individual life course and help us explore the different experiences and treatments of Bronze and Iron Age people. This paper examines the background to the project and explores its initial results.

The COMMIOS Project is led by the University of York, partnered with the University of Glasgow, UKRI (British Geological Survey) and Harvard Medical School. The project has received funding from the European Research Council (ERC) under the European Union’s Horizon 2020 research and grant innovation programme under grant agreement No 834087.

16

**TRACING POPULATION DYNAMICS IN LATE PREHISTORIC SLOVENIA: HOW TO COMBINE TRADITIONAL AND MODERN SCIENTIFIC DATA AND APPROACHES**

**Abstract author(s):** Cresnar, Matija (University of Ljubljana) - Armit, Ian (University of York) - Mason, Philip (Institute for the Protection of Cultural Heritage of Slovenia) - Koon, Hannah - Nicholls, Rebecca (University of Bradford) - Leskovar, Tamara (University of Ljubljana) - Snoeck, Christophe (Vrije Universiteit Brussel) - Potočnik, Doris - Ogrinc, Nives (Institute Jožef Stefan)

**Abstract format:** Oral

The history of intensive archaeological research, especially of the rich remains from the Bronze and Iron Ages in Slovenia extends far back into the 19th Century. In the 20th century, antiquarian approaches were slowly replaced by more question-driven investigations, while in the recent decades development-led interventions dominated and still dominate research.

Typological studies (of artefacts) were, and often still remain the most common research approach, which has nevertheless provided solid foundations for further investigations. However, it is also important that the more recent development-led investigations include scientific analysis as part of the post-excavation analysis. The amount of archaeological material and data available is therefore very substantial and provides a firm base for further scientific research, which can now address demography and population dynamics in unprecedented ways.

Important new techniques and methods have been introduced and are increasingly being integrated into archaeological research. However, these data often remain alienated from traditional archaeological studies, so that interpretations often do not produce the results desired by the archaeologist as a humanist. However, in fact, for the first time, we have acquired tools, to help us approach to individual biographies, the demography of small communities, as well as regional and transregional population dynamics.

The recent case studies from Slovenia are diverse and do not answer all the questions we may ask about late prehistoric demography; however, they already outline new pathways that further investigations could use in thorough interdisciplinary research to better understand the different levels of population dynamics.

17

**IDENTITY OF THE MEDITERRANEAN CELTS: LIMITS AND POSSIBILITIES TO STUDY PARTICULAR RITUAL PRACTICES**

**Abstract author(s):** Pruvost, Melanie (PACEA UMR5199) - Ciesielski, Elsa - Roure, Rejane (UMR 5140 ASM, CNRS, Université Paul Valéry Montpellier 3)

**Abstract format:** Oral

Over the last decade, views of the Celts have changed significantly. Archaeologists have demonstrated the great complexity of ancient populations and have shown how earlier perspectives regarding Celtic populations in the Iron Age have to be reviewed. Furthermore, recent innovative approaches to archaeological data allow us to explore new questions concerning the diet, health and demography of past populations. Through the study of remains from one specific ritual practice: the exhibition of weapons and severed heads at Le Cailar (France, 3rd century BCE), we will investigate the potentialities and the limits of multidisciplinary approaches to characterize the Mediterranean population of Iron Age. Isotopic analyses, palaeogenomic approaches and taphonomic studies will be combined with archaeological and historical data to understand better the identity of the Celtic people of the South of France. We will suggest a link between biological identity, i.e. the past genetic events (mixture, isolation, migration), which leads to one population /individual to their cultural identity.

18

**BUILDING A BIGGER PICTURE: POTENTIAL OF DATA FROM THE MARCOMANNIC SETTLEMENT ZONE OF THE MIDDLE DANUBE REGION IN DEMOGRAPHICAL RESEARCH**

**Abstract author(s):** Vlach, Marek - Komoróczy, Balázs - Zelíková, Michaela - Sofka, Stanislav (Institute of Archaeology of the Czech Academy of Sciences, Brno) - Smrčka, Václav (Institute for History of Medicine and Foreign Languages. First Faculty of Medicine, Prague)

**Abstract format:** Oral

The Middle Danube region during the Roman Period exhibit one of the specific geopolitical contexts representing a direct coexistence and multifaceted interactions of the barbarian and Roman provincial world. During the period the low-lying regions to the north of the Middle Daube Limes were inhabited by the Germanic tribes of Marcomanni and Quadi. Within the long-term archaeological research, anchored mostly in culture historical paradigm, usually limited attention was paid to demographical aspects of the Germanic populations. It is also caused by the limits of anthropological research due to almost exclusively applied cremation burial practices. The presently ongoing research project (Grant Agency of the Czech Republic) aims - amongst other issues - also to fill in this gap in research of demographical aspects. So far, the archaeological research has assembled large quantity of information, however, scattered throughout countless publications and has differentiated information characteristics. In order to open its potential for demographical research, the large-scale collection and formalization of the available data is essential and presently ongoing. Using various methods and tools (e.g. spatial analyses, multivariate statistics) it is the aim to evaluate their interpretative potential and to expectably provide ground for establishment of meaningful spatiotemporal proxies for derivation of various demographic estimates (population size, density etc.) on regional, subregional (well surveyed spatial units) or community level (residential areas, dwellings). It will be also complemented with modelling and simulation of complexity and dynamics (agent-based modelling) of the selected phenomena on various scales (e.g. development of the settlement structure, formation processes of burial grounds).

A.

**WHEN THE WORLD CHANGED. POPULATION, SETTLEMENT CHANGE AND MAJOR EVENTS**

**Abstract author(s):** Torfing, Tobias (Sydvestjysker Museer)

**Abstract format:** Poster

The paper will examine the relation between intra-site development in settlement size and possible driving outside factors. The scope of the paper is settlements in a small area in southwest Jutland in Denmark and the time frame is roughly 200 BC to 600 AD. The paper will combine the use of radiocarbon dating and specific analysis of large-scale archaeological excavation as evidence of changes in population size and compare these changes with possible driving factors.

The analyses show a period which encompasses several major changes in how people lived, and how settlements was organized. From a shift from a very loose structure of single farmsteads to settlement organized in small hamlets and larger villages. In some periods both the house-size and the size of the fenced areas of each farmstead grows, while in others the size declines drastically. There are also periods in which almost no settlement activity has been found or dated.

These shifts will be compared to major “world” changes. Both social factors, such as the rise and fall of the roman empire and related migrations, and natural occurrences, such as sea-level changes, volcanic activity, and pandemics, will be considered. Especially two drastic drops can be observed, one between 50 AD-200 AD and one in around 450 ad 550 AD. The last possibly related to either climate disaster related to volcanic activities in the 530, or the Justinian plague slightly later, but migration to the British Islands is also considered.

“ECONOMIC ARCHAEOLOGY” AND QUANTITATIVE APPROACHES – MEASURING THE VARIATIONS IN PRODUCTION AND CONSUMPTION FROM ARCHAEOLOGICAL DATA

**Theme:** 4. Globalisation and archaeology  
**Organisers:** Pasquini, Béline (Université Paris 1 Panthéon-Sorbonne) - Millot-Richard, Clara (Université Paris 1 Panthéon-Sorbonne; CNRS - UMR 8215 Trajectoires) - Keil, Jessica (Leopold-Franzens-Universität Innsbruck)

**Format:** Regular session  
Economic approaches are crucial to enhance our understanding of prosperity in ancient societies. By assessing variations of production, exchange and consumption, it is possible to describe and interpret fluctuations of wealth and standard of living in human communities. Quantitative measures of production and consumption are vital for archaeologists and historians interested in economic growth and standards of living.

Many archaeological studies of past economies based on quantitative approaches have been published in the past. Most of them are based on multiple variables such as storage capacities of granaries, the type and size of workshops, or the circulation of goods. However, despite what has already been achieved, many archaeologists working on production and consumption still disregard quantitative approaches and limit their focus on technical processes without integrating these into a broader economic scheme. Measurements of economic fluctuations can indeed be challenging. Economic sciences themselves have been created in and for modern times. They often offer limited resources and tools for ancient times. Moreover, archaeological materials differ significantly from written sources used by historians working on contemporary and early modern economies.

We believe it is crucial to develop economic and quantitative approaches for pre-modern economic systems. The improvement of data management systems and the growing practice of rescue archaeology in many European countries since the 1990s provide archaeologists with a considerable amount of data. Thanks to these developments, it is now possible to contemplate quantitative approaches of variations of production and consumption. The aim of this session is, therefore, to present innovative methods to measure variations in production and consumption on short and long-term timelines, on small and large scales. Contributions dealing with the implementation of concepts or methods coming from modern economics are also welcome. We accept papers ranging from prehistorical sedentary societies to mediaeval times, without geographical restrictions.

ABSTRACTS:

1 AN ECONOMIC HISTORY OF EXCHANGES FROM GRAVE GOODS : SOME QUANTIFICATION ISSUES IN ARCHAIC CAMPANIA (8TH-6TH BC)

**Abstract author(s):** Maudet, Ségolène (Université de Lorraine - Hiscant)  
**Abstract format:** Oral

My research aims at studying economic exchanges from archaeological sources, especially from grave goods, in Campania between the 8th and the 6th centuries BC. I have developed a method of analysis combining the use of GIS with a cautious quantification, mostly in order to contextualize some of the phenomenons I observed regarding the consumption of allogeous goods (Greek, Etruscan and Phoenician vases, Egyptian and Phoenician ornaments and scarabs, etc.). In my paper for this session, I would offer a critical review on some methods of quantification, in two complementary perspectives: first, the quantification of funerary contexts, and secondly, some issues about allogeous ceramic’s quantification in archaic Campania.  
A Social Network Analysis has recently been made on grave goods from a Greek site in Campania, Pithekoussai. Grave goods were isolated, counted, and assumptions were made about the links they allowed to observe between Pithekoussai and some other Mediterranean sites.

I propose in this paper to examine how such a quantitative and formal approach tends to neglect some fundamental properties of grave goods, and to propose other forms of quantification, more respectful of the complexity of the funerary context.  
Another aspect of my communication would concern ceramics’ quantification, especially when the goal is to compare different types of context (graves, sanctuary, settlement) or even different sites. Depending on the vases fragmentation and on the classifications homogeneity, many issues arise when trying to quantify those sherds. I will use some empirical examples from my ongoing study of unpublished graves from Pontecagnano and Calatia.

2 TRACKING MICROREGIONAL ECONOMIC TRENDS THROUGH ARCHAEOBOTANY: LESSONS FROM THE LATE ANTIQUE NEGEV HIGHLANDS

**Abstract author(s):** Fuks, Daniel (McDonald Institute for Archaeological Research, University of Cambridge)  
**Abstract format:** Oral

A recent study of quantitative archaeobotanical and ceramic data from trash middens provided the first empirical proof for export wine production in the Late Antique Negev Highlands, tracing its rise and fall within a period of approximately two centuries (mid-4th–mid-6th c. CE). This study advanced an original approach to tracking trends in ancient production, using quantitative changes in grape pip proportions as an index for the intensity of grape cultivation, and those of Gaza amphorae as an index for involvement in Mediterranean trade. For the sake of future applicability and adaptability of this approach to economic archaeology, this presenta-

tion surveys its strengths and limitations, with reference to the comparability of archaeological contexts, dataset size, and temporal/regional resolution. In addition, reasons why an alternative approach – based upon calculating production capacity of known winepresses – yielded different conclusions regarding Byzantine Negev viticulture, will be discussed, including how to reconcile the discrepancy. Furthermore, additional archaeobotanical findings from the Byzantine Negev Highlands demonstrate how different scales of temporal analysis yield different narratives of the microregional agricultural economy. This not only contributes to more holistic, multi-scalar economic reconstruction but offers potentially profound opportunities for integrated models. For instance, seasonal effects can potentially be incorporated in archaeological-economic reconstructions, as is done in modern gross domestic product (GDP) growth models. Findings from the Late Antique Negev Highlands demonstrate how archaeobotany can contribute to economic reconstruction on millennial, decadal-centennial, and seasonal levels, while emphasizing the importance of temporal scale in economic archaeology.

3 REFLECTIONS ON THE QUANTIFICATION OF LATE ROMAN BRICK PRODUCTION: THE “AULA PALATINA” IN THE IMPERIAL RESIDENCE OF TRIER

**Abstract author(s):** Schmidts, Thomas - Herdick, Michael (Römisch-Germanisches Zentralmuseum)  
**Abstract format:** Oral

When Trier became the imperial residence in the 4th century AD, a large-scale building program began that permanently changed the appearance of the city. Among the most striking large-scale buildings were the imperial palace, the largest thermal complex north of the Alps and one of the largest churches of late antiquity. The supply of building materials was an enormous logistical challenge: about 2 million bricks were needed for the construction of the “Aula Palatina” alone. The demand for bricks was met by newly founded brickworks, though these production sites have not yet been located. Four large producers that met the demand in the 1st half of the 4th century are known by their stamps on the bricks. In the second half of the 4th century, additional producers can be identified and military bricks were also delivered from the more distant border regions at high transport costs. This may have been an indication that the demand could no longer be met in a suitable manner by private suppliers.  
Based on current findings using experimental archaeology and process chain analysis, the effort in labor and time, as well as material resources for a brick kiln firing are quantified. The results will be contrasted with current research on brick production in the Trier region. The goal is to develop a quantification model for the procurement of ceramic building materials for the construction of the “Aula Palatina” and to identify future research needs.

4 FORMATION OF ANCIENT INDUSTRIAL DISTRICTS – THE CASE STUDY OF THE EASTERN EIFEL

**Abstract author(s):** Hunold, Angelika (RGZM - Römisch-Germanisches Zentralmuseum, Leibniz-Forschungsinstitut für Archäo) - Schaaff, Holger (RGZM)  
**Abstract format:** Oral

The quarrying and mining district of the Eastern Eifel, situated nearby the confluence of the Rhine and Moselle rivers and characterised by mineral raw materials, very early became an economic player of supra-regional importance. From the Roman era, the products – primarily basalt lava mills, tuff stone building material, and pottery – were traded throughout much of Europe. Even today the raw materials are a significant economic factor.  
The initial triggers in this development were two technology and knowledge transfers from the Mediterranean: the introduction of the rotary mill and the introduction of stone construction on the territory north of the Alps. As a result, the quarries and mines became part of the Roman expansion and urbanisation policy. But which were the additional key factors and how can an ancient industrial district be defined? The case study of the Eastern Eifel provides evidence about this. The contribution focuses on the formation, development and social impact of the district in Roman times.

5 ON THE OTHER SIDE OF THE MIRROR: HOW EUROPEAN LATE PREHISTORY PEOPLE MEASURED AND QUANTIFIED THEIR OWN WORLD?

**Abstract author(s):** Poigt, Thibaud (UMR 5607 Ausonius - Univ. Bordeaux Montaigne; UMR 5608 TRACES - Univ. Toulouse Jean Jaurès)  
**Abstract format:** Oral

The quantitative approaches of archaeological data allow to transcript in our modern analysis grid what remains of ancient economic activities. In this paper, I propose to reverse the question focusing on the way Bronze and Iron Age people developed practices and tools to organise, count and measure their own world, from natural resources to possible surpluses. I will present a brief overview of the main archaeological remains allowing to characterise the use of measuring instruments, practices, institutions during Late Prehistory. The study will investigate several features of measuring during European Late Prehistory: weighing metrologies, metal calibrations and capacities of ceramic containers. The data analysis will rely on a set of analytical tools dedicated to metrological studies and developed in the scope of various interpretative approaches.  
In addition to the formal presentation of the data and their analysis, this paper will question the degree of awareness and knowledge of the Late Prehistory people concerning the quantification in an economic perspective. One of the main points will be to determine

what position occupy the quantification in the development of daily production, exchanges or storage practices, their impact on the construction of economic – formal or informal – institutions and their materialisation in the archaeological record.

## 6 ENERGY EXPENDITURE CALCULATIONS ON COPPER UND BRONZE METALLURGY AS A QUANTITATIVE TOOL FOR UNDERSTANDING BRONZE AGE ECONOMY?

**Abstract author(s):** Brinkmann, Johanna (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

Energy expenditure calculations have been used in archaeology mainly to describe construction processes (e. g. of megalithic tombs and grave mounds, see Müller 1990, Schulze-Forster/Vorlauf 1990). However, energy expenditure calculations prove to be a valid tool to approach questions of production and consumption in Bronze Age societies. This offers the possibility to study the production of copper and bronze artefacts in a quantitative way. Archaeological finds and features indicate a series of changes in metal processing technology at the end of the Early and the beginning of the Middle Bronze Age (around 1600 BC) in Central Europe. The oxidizing smelting process is replaced by a smelting technique that runs under reducing conditions. The reducing process allows the production of larger amounts of metal and a greater standardisation, but presupposes a more complex furnace construction, which is indicated by furnace features from the Eastern Alps. In the later phase of the Early Bronze Age a change in alloying from arsenical copper and copper with a low tin content to tin copper with approximately ten percent of tin occurs. An examination of the archaeological material and the systematic evaluation of experimental results show that these changes in metalworking technology are accompanied by an increase in energy expenditure required for the production of copper and bronze artefacts and an increased demand for wood resources. The calculation of the energy expenditure – including all production steps – gives a comparative value (in person hours) for every copper or bronze artefact measured by their weight. These person hours do not, however, reflect the economic or intrinsic value of the object, as the concept of energy expenditure calculations was created in and for modern times. Nevertheless, the presented method represents a new quantitative approach that allows for comparison between different (types of) copper and bronze artefacts.

## 7 IRON AGE ECONOMICS IN PERSPECTIVE OF DATA QUANTIFICATION FROM ARCHAEOLOGICAL ANALYSES OF – HOW FAR CAN WE GO?

**Abstract author(s):** Bursak, Daniel - Danielisová, Alžběta (Institution of Archaeology of the CAS, Prague)

**Abstract format:** Oral

Character of production is a key indicator of the overall development level of any studied past society. Importance of our understanding of economic activities is even more accentuated in periods with unbalanced archaeological source base like in case of the La Tène period in Central Europe (5th – 1st century BC) when we literally miss graves from the 2nd century onwards. Common hypotheses are typically built on interpretation of specialisation of crafts, their spatial distribution, intensity, and the network of resources, producers and consumers. From this viewpoint, we are establishing the hierarchy of settlements, their involvement in long-distance trade etc. Quantitative aspect has so far been used in terms of representation of various production activities, in the bioarchaeological research or as an alternative approach to artefactual studies and material analyses.

We would like to introduce a new perspective which emerged during our work focused on geochemical analyses of artifacts made predominantly of copper alloys. With a large amount of data covering a timespan of more than four centuries, we can distinguish a long-term trend of narrowing the geochemical pool of possible resources. Simultaneously we detect a wider spectrum of produced alloys. These results correlate well with hypotheses on the development of specialized crafts and tendency towards centralized supply in the younger part of the given period. Based mainly on the evidence of influx of exogenous material, we discuss the market-oriented production versus its control by the elites, which has been postulated by earlier works but still lacks more exact verification. The dialogue between archaeometric data and hypotheses on the La Tène organisation of the production will be illustrated on a broader spectrum of evidence, including glass, gold, salt and iron.

## 8 SALT AND IRON IN FRANCE AND GERMANY: COULD THESE RAW MATERIALS BRING AN EARLY MARKET ECONOMY TO LIGHT?

**Abstract author(s):** Millot-Richard, Clara (Paris 1 Panthéon Sorbonne)

**Abstract format:** Oral

Market economy can be defined as a set of mechanisms through which human societies secure and regulate their material reproduction. This is done mainly via the supply of, and the demand for, rare products that meet tangible or social needs. Thus, the concepts derived from economics have been regarded as inappropriate to study ancient societies and indeed, they can hardly apply as such because archaeological data are incomplete. However, the data available on raw materials, especially salt and iron, can certainly be analysed from an economic point of view.

The aim of this presentation is to show how the market economies of the Iron Ages can be apprehended and understood when applying the methods of economic science. Salt and iron are resources that can be described as strategic. Iron is highly valued for its physical properties. Consequently, both resources are very likely to be contingent on market trends that are inherent to the normal course of supply and demand. The concepts of specialisation, trade, industrialisation, which are often regarded as the pillars of a market economy, are also perfectly applicable to salt and iron. In order to highlight some of the economic phenomena that affected

Iron Age societies, our presentation will be based on the data on salt and iron that we have collected in the East of France and the West of Germany.

To study them, we used spatial analysis, but also to understand the interplay between production factors and consumption factors. Moreover, the statistics clearly show correlations, on a given period, between consumption contexts and the various categories of objects. Thanks to this dual approach, the variations in demand and the dynamics of the raw materials market become noticeable. This kind of approach enables to detect demand, therefore to highlight from the archaeological data available the market dynamics.

## 9 A WEALTH FROM CRUCIBLE AND ANVIL – IRON AGE SPATIAL SOCIO-ECONOMY AS SEEN THROUGH MULTIMETAL CRAFTSMANSHIP AND METAL USE

**Abstract author(s):** Svensson, Andreas (Dept. of Archaeology and Ancient history, Lund University)

**Abstract format:** Oral

The project ‘From the Crucible and at the Anvil’ was started in 2015 with the goal of examining the socio-economic implications of metalworking in Iron Age Scandinavia, focused on the spatiality, economic remits and technological repertoires of metal use. The connection between economy and metal use is central to the project. Within one case study, metalworking sites have been analysed from a macro-level landscape perspective covering the wider south-east Scandinavian region throughout the Iron Age (500BCE-1100CE).

In this paper, results from the case study are presented and evaluated. The macro-spatial patterns of metal craftsmanship are used to infer the role of metal use in the overarching economic climate.. Employing a data-set from both contract-archaeology and inventory projects in southern Sweden, quantitative approaches and spatial statistics have been both necessary and fruitful. Using a macro-level approach, the site-information analysed was reduced, with spatial location, primary metal use and coarse chronology forming key attributes.

This method differs significantly from the more high-resolution qualitative approaches normally favoured when countering questions concerning the societal implications of metal use. What are the benefits and limitations of these approaches? And how can these methods be integrated in economic analyses of the Iron Age?

A qualitative landscape analysis of a sub-region of the study area forms the basis of another case study within the project. The focus here has been to elucidate the spatiality of commodity-chains of metal use, and contrast those patterns to the general Iron Age landscape. Comparing the two case studies provides the opportunity to gauge the use of both sets of approaches, highlighting pros and cons. Arguments for utilizing an inclusive toolbox with regards to method and theory when interpreting the economic landscapes of the past will in this way be advanced in the paper.

## 10 WRITING ECONOMIC HISTORY WITHOUT CONCRETE FIGURES? BRONZE AGE NORTH TYROL AND THE QUESTION OF THE ECONOMIC SIGNIFICANCE OF METAL PRODUCTION

**Abstract author(s):** Keil, Jessica (University of Innsbruck - Department of Archaeologies)

**Abstract format:** Oral

Based on metal analyses, the so-called “classical Ösenring (ingot torque) copper” is closely associated with copper mining in the Tyrolean Lower Inn Valley (fahlore mining district Schwaz – Brixlegg) in Western Austria. In the Early Bronze Age, it was distributed in considerable quantities over large parts of Europe up to Scandinavia. Thus, it can be assumed that during this epoch an intense mining activity took place in North Tyrol – which was abandoned in the Middle Bronze Age and resumed in the Late Bronze Age –, and yet it is hardly possible to make quantitative statements on this matter. This is mainly due to the fact that corresponding mining traces and processing facilities are missing or have not been preserved.

Under such circumstances, what possibilities remain for writing an economic history of the region and assessing the importance of metallurgy within this framework? Since the archaeological sources on the Early Bronze Age in the area are quite limited overall (burials of this period, for example, are almost unknown), the incorporation of archaeometric data seems absolutely necessary. Archaeozoological, geochemical, and palynological analyses are of particular importance here. The purpose of this paper is to present some preliminary conclusions from an ongoing research project in this regard: on the one hand, such sources are consulted in a case study based on the Buchberg near Wiesing, a smelting site in the Tyrolean Lower Inn Valley. On the other hand, valuable insights can be derived from a more far-reaching comparison of archaeometric data from Bronze Age sites in the Eastern Alps.

In this way, even if no direct calculations on the (Early) Bronze Age metal production in North Tyrol are feasible, we can nevertheless obtain concrete figures and information on the economic system and the importance of metallurgy therein.

21 DOMESTICATING TIME: TEMPORAL CHANGES IN ANIMALS AND PLANTS DURING THE HOLOCENE

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Rosenstock, Eva (Freie Universität Berlin, Einstein Center Chronoi) - Orton, David (University of York, Department of Archaeology, BioArCh) - Antolin, Ferran (Universität Basel, Integrative Prehistory and Archaeological Science - IPAS)

**Format:** Regular session

Investigation of the effects of domestication in the Southwestern Asian to European trajectory of Neolithization and subsequent periods so far has focused on morphological aspects. Besides coat colour and texture or body size and shape in animals as well as rachis structure or grain size and shape in plants, however, there have also been changes in biological rhythms. Such temporal changes with domestication have so far received only spotlight research. Did animal birthing seasons and birth spacing change with domestication? Did spread into different climates affect animal life cycles? How were ruminant and equid lactation periods manipulated? How did domestic birds lose migration? Can we see changes in growth and wear rates? How did germination and harvest seasons change with latitude? Can we trace the origins of winter/summer crops? How did irrigation affect plant life cycles? Can we say anything about the temporality of wild and domestic microbes? The session aims to bring together researchers working on data and theories to unravel temporal changes in domesticates sensu lato during the entire Holocene more systematically.

ABSTRACTS:

1 A TIME TO SOW, A TIME TO REAP: CHANGING BIOLOGICAL AND ECONOMIC RHYTHMS IN SOUTHWEST ASIAN PLANT AND ANIMAL DOMESTICATION

**Abstract author(s):** Marom, Nimrod (University of Haifa, Department of Maritime Civilizations & the Leon Recanati Institute for Maritime Studies) - Fuks, Daniel (McDonald Institute for Archaeological Research, University of Cambridge)

**Abstract format:** Oral

This paper explores aspects of temporal variation in southwest Asian plant and animal domestication which have contributed to the economic success of the 'Neolithic package'. More specifically, we relate biological aspects of seasonality with economic developments in the evolution and diffusion of agriculture. We discuss how: (1) flowering/lambing times affect geographic diffusion of domesticates; (2) ripening/slaughtering times affect risk management strategies; and (3) harvesting/sowing times, as well as seasonal grazing regimes, affect both human labor and perceptions on time. For instance, spontaneous hybridization of tetraploid domesticated emmer with the wild grass, *Aegilops tauschii*, conferred genetic adaptability to non-Mediterranean climates in the resultant hexaploidy wheat. As a result, wheat today is grown in a variety of climates and latitudes worldwide, is the most important source of food grain for humans today and the largest primary commodity. Genetic mutations affecting photoperiod enabled evolution of spring wheat from winter wheat, while in southwest Asia more subtle differences of harvesting season between wheat and barley were key to managing weather-related risks. Finally, loss of seed dormancy and ripening uniformity were part of an increasing process of economic routinization under domestication. It emerges that changes in biological temporality of domesticates over the Holocene are related to increasing geographic diffusion, increasing production intensity, and decreasing diversity in herds and fields – processes inherent in contemporary globalization. Thus, while biologists since Darwin considered domestication a model for the study of evolution, we suggest that domestication may also offer a model for the study of globalization.

2 AGRICULTURAL PRACTICES OF THE NEOLITHIC COMMUNITIES IN THE CENTRAL BALKANS: WHAT CAN THE WEED SEEDS TELL US?

**Abstract author(s):** Sabanov, Amalia (Laboratory for Bioarchaeology, University of Belgrade) - Obradović, Đurđa (Institute of Archaeology, Belgrade) - Filipović, Dragana (Institute for Pre- and Protohistory, Christian Albrecht University, Kiel) - Antolín, Ferran (Integrative Prehistory and Archaeological Science - IPAS, University of Basel; German Archaeological Institute, Berlin)

**Abstract format:** Oral

The Neolithic farming communities and the agricultural practices in the Central Balkans are still poorly understood, even though this geographical region played an important role in the spread of the Neolithic way of life. Archaeobotanical analyses contribute greatly to the investigation of this topic, especially if they are conducted systematically at multiple archaeological sites. The analysis of remains of crops can determine the crop choice, but does not provide enough knowledge on other aspects of plant cultivation. Nevertheless, the examination of remains of arable weed species can supply important data concerning strategies of field preparation, sowing season, management and harvest of the cultivated crops. Despite the numerous excavated Neolithic sites in this region, the paucity of systematically collected archaeobotanical data, paired with differences in the strategies employed for retrieving plant remains, raises challenges for the assessment of agricultural practices and direct comparisons between the sites. Our study has, therefore, focused on several Neolithic sites in modern day Serbia and North Macedonia where a more systematic approach for the recovery of plant remains was adopted and which could provide relevant information concerning weed species. The collected data allow us to observe intra- and inter- regional patterns and differences in the farming practices. Further, we explore whether agricultural choices show a dependency on environmental constraints and opportunities or cultural preferences and learned traditions. Apart from offering hypotheses on the nature of agricultural practices which will serve as a good starting point for future studies, we

also stress the need for systematic sampling for archaeobotanical remains at Neolithic sites in the Central Balkans, as more robust archaeobotanical datasets are needed for a more profound understanding of early farming in the region.

3 IDENTIFYING SHEEP AND GOAT TEETH AND MANDIBLES USING GEOMETRIC MORPHOMETRICS FOR STUDYING THEIR DIACHRONIC EVOLUTION

**Abstract author(s):** Jeanjean, Marine - Evin, Allowen (Institut des sciences de l'évolution)

**Abstract format:** Oral

Sheep and goat are often herded together and show great morphometrics resemblance of their skeleton. While discrete criteria are now available to identify a large number of bones and teeth, quantitative approaches are still scarce especially for mandibles and isolated teeth. The aim of this study is therefore to propose new 2D geometric morphometric (GMM) protocols for distinguishing sheep and goat applied to lower third molar and mandible based on landmark and sliding semi-landmarks approaches. Once identified, teeth and mandibles size and shape can be quantitatively studied through time and space, leading to a better understanding of the bio-cultural drivers of sheep and goat diversity. Our analyses combine modern specimens of known breed, sexe and estimated age with archaeological specimens dating from the Neolithic to the middle-age and originating from the North-Western Mediterranean basin. The GMM results will be contextualised in the framework of ERC-DEMETER project aiming at studying « Eight millennia of changes in domestic plants and animals: understanding local adaptation under socio-economic and climatic fluctuations ».

4 SEASONAL REPRODUCTIVE RHYTHMS OF EARLY INTRODUCED SHEEP IN THE IBERIAN PENINSULA: DECIPHERING NEOLITHIC PATHWAYS

**Abstract author(s):** Tornero, Carlos (IPHES-CERCA, Institut Català de Paleoecologia Humana i Evolució Social; Area de Prehistòria, Universitat Rovira i Virgili - URV) - Balasse, Marie (Archéozoologie, archéobotanique: sociétés, Pratiques Et Environnements - AASPE, Muséum National D'histoire Naturelle, CNRS) - Navarrete, Vanessa (Laboratori d'Arqueozoologia, Departament de Prehistòria, Edifici B Facultat Filosofia i Lletres. Universitat Autònoma de Barcelona) - Martín, Patricia - Messana, Chiara (IPHES-CERCA, Institut Català de Paleoecologia Humana i Evolució Social; Area de Prehistòria, Universitat Rovira i Virgili - URV) - Sierra, Alejandro (Laboratori d'Arqueozoologia, Departament de Prehistòria, Edifici B Facultat Filosofia i Lletres. Universitat Autònoma de Barcelona) - Fiorillo, Denis (Archéozoologie, archéobotanique: sociétés, Pratiques Et Environnements - AASPE, Muséum National D'histoire Naturelle, CNRS) - Saña, Maria (Laboratori d'Arqueozoologia, Departament de Prehistòria, Edifici B Facultat Filosofia i Lletres. Universitat Autònoma de Barcelona)

**Abstract format:** Oral

Spanish Sheep livestock is today one of the largest in the European Union. In this area, the significance of sheep farming arises from its threefold production uses (milk, meat and wool), and the frugality, endurance and adaptability of sheep. Given their exceptional rusticity, Iberian sheep is capable to live in difficult environments, with harsh climates, little rain, low temperatures in winter and high ones in summer, taking advantage of poor pastures and agricultural by-products. To this is added a capability to de-seasoning, a distinctive marker of many sheep livestock systems with autumnal lambing as the main lambing season. Autumnal lambing is prized because it brings benefits in terms of out-of-season availability of sheep products, and here sheep flocks have this ability without artificial or pharmacological treatments.

In this contribution we check the ability to de-season sheep breeds in the Iberian Peninsula during the Early to Late stages of the Neolithic. Birth season and lambing period are investigated using intra-tooth sequential oxygen isotope values from archaeological sheep specimens found in some of the most relevant sites together with a new reference data set from modern sheep specimens covering a more detailed dates of birth. Autumn lambing and prolonged lambing periods are both present in some of the tested sites while others show spring births as a general rule. Our findings are discussed in the frame of the Iberian Peninsula considering two axis: i) the location of sites within the different agroecological environments of the Iberian Peninsula; and ii) the timing and geographical distribution of sites along the neolithisation processes.

5 UNRAVELLING MODES OF LIVESTOCK MANAGEMENT IN THE CENTRAL PYRENEES DURING THE EARLY NEOLITHIC

**Abstract author(s):** Sierra, Alejandro (Laboratori d'Arqueozoologia, Departament de Prehistòria, Edifici B Facultat Filosofia i Lletres, Autonomous University of Barcelona; Primeros Pobladores y Patrimonio Arqueológico del Valle del Ebro, Universidad de Zaragoza) - Balasse, Marie (AASPE « Archéozoologie, archéobotanique: sociétés, pratiques, environnements » UMR 7209 CNRS MNHN) - Rivals, Florent (ICREA; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art) - Bréhard, Stéphanie (AASPE « Archéozoologie, archéobotanique: sociétés, pratiques, environnements » UMR 7209 CNRS MNHN) - Montes, Lourdes - Utrilla, Pilar (Primeros Pobladores y Patrimonio Arqueológico del Valle del Ebro, Universidad de Zaragoza) - Fiorillo, Denis (AASPE « Archéozoologie, archéobotanique: sociétés, pratiques, environnements » UMR 7209 CNRS MNHN) - Saña, Maria (Laboratori d'Arqueozoologia, Departament de Prehistòria, Edifici B Facultat Filosofia i Lletres, Autonomous University of Barcelona)

**Abstract format:** Oral

The adoption of animal husbandry in the different areas that make up the Iberian Peninsula was fast, with all domestic species (sheep, goat, cattle, pig) being documented in all regions between 5600 and 5400 cal BC. The speed of this process must have been

DIVERSTIY OF CATTLE DURING THE LATE NEOLITHIC CARPATHIAN BASIN

**Abstract author(s):** Csippán, Péter (Eötvös Loránd University of Sciences, Institute of Archaeology)

**Abstract format:** Oral

During the Late Neolithic of the Carpathian Basin, the consumption of wild game increased generally. This trend appears in all known sites from the period, with the ratio of the bone finds of wild game near 50% or higher. However, based on the quantity of the bones of domestic mammals, their stocks were also significant. What are the possible explanations for this phenomenon? Was that a special cultural attitude or can we interpret it as a sign of degradation of the stocks of domestic species? Some researchers explain these processes with a second wild fauna inflow of Holocene to the Carpathian Basin and they hypothesize, that the meat of wild game was available easily, so their consumption was more common.

The question is whether these environmental and/or cultural processes had an impact on the breeding ways of the main domestic species like cattle? Was there a homogenous phenotype around the Carpathian Basin during the Late Neolithic or can we reckon with local breeds?

In this study, the author compares cattle bone finds from different Late Neolithic sites of the Carpathian Basin, moreover, with conventional osteometric methods and geometric morphometrics, tries to find as much as possible answers to these questions above.

CATTLE-BASED AGRICULTURE IN THE EARLY AND MIDDLE NEOLITHIC IN THE POLISH LOWLANDS: INVESTIGATING TEMPORAL AND REGIONAL CHANGES IN CATTLE POPULATIONS

**Abstract author(s):** Gembicki, Maciej (Department of Archaeology, Adam Mickiewicz University in Poznan) - Lisowski, Mik (Bio-Arch, University of York) - Winkler-Galicki, Jakub - Derebecka, Natalia - Wesoły, Joanna (Department of Biology, Adam Mickiewicz University in Poznan) - Marciniak, Arkadiusz (Department of Archaeology, Adam Mickiewicz University in Poznan)

**Abstract format:** Oral

The gradual decline in body size of cattle is a post-domestication phenotypic adaptation well documented across Europe in the Neolithic. Whilst these continental trends are clear, more local patterns of variation in body size and shape may be overlooked. In our presentation we focus on gradual changes in morphology of cattle over time happening in several regions of the Polish Lowlands after the Early Neolithic. Data coming from traditional osteometry as well as three-dimensional geometric morphometrics suggest that initially, in the Early Neolithic, the size and shape of cattle bones did not vary significantly between the regions. However, with time, the populations of different regions started exhibiting different patterns of change in their morphology. The reasons for these variations are not fully apparent. It is not clear whether these changes can be attributed to an introduction of genetically distinct morphotypes of cattle, or rather the variations in cattle exploitation caused by the local economy or ecology.

SEASONAL CALVING IN EUROPEAN PREHISTORIC CATTLE

**Abstract author(s):** Balasse, Marie (AASPE, CNRS MNHN, Paris) - Gillis, Rosalind (ICArEHB, Universidade do Algarve) - Živaljević, Ivana (BioSense Institute, University of Novi Sad) - Berthon, Rémi (AASPE, CNRS MNHN, Paris) - Kovačiková, Lenka (Laboratory of Archaeobotany and Palaeoecology, University of South Bohemia) - Bălăşescu, Adrian (“Vasile Pârvan” Institute of Archaeology, Romanian Academy) - Bréhard, Stéphanie (AASPE, MNHN, Paris) - Dimitrijević, Vesna (Laboratory for Bioarchaeology, Department of Archaeology, University of Belgrade) - Stefanović, Sofija (BioSense Institute, University of Novi Sad; Laboratory for Bioarchaeology, Department of Archaeology, University of Belgrade) - Ivanova, Maria (Vienna Institute for Archaeological Science - VIAS, University of Vienna; Institut für Ur- und Frühgeschichte und Vorderasiatische Archäologie, Universität Heidelberg)

**Abstract format:** Oral

Present-day domestic cattle are reproductively active throughout the year, which is a major asset for dairy production. Large wild ungulates, in contrast, are seasonal breeders, as were the last historic representatives of the aurochs, the wild ancestors of cattle. Aseasonal reproduction in cattle is a consequence of domestication and herding, but exactly when this capacity developed in domestic cattle is still unknown and the extent to which early farming communities controlled reproduction seasonality is debated.

A UNITED EUROPE OF THINGS 2. LARGE SCALE AND LOCAL NETWORKS OF DIFFERENCES AND SIMILARITIES IN MEDIEVAL MATERIAL CULTURE

**Theme:** 6. Material culture studies and societies

**Organisers:** Sawicki, Jakub (Institute of Archaeology, Czech Academy of Sciences in Prague) - Lewis, Michael (British Museum; Portable Antiquities Scheme) - Vargha, Mária (Universität Wien, Institut für Geschichte, Digital Humanities)

**Format:** Regular session

The idea of ‘unity of culture’ of Medieval Latin Europe is well known in historical literature, especially when it concerns the so called ‘Europe North of Alps’. Scholars had often inclined that due to long distance trade, universal knowledge of Latin and shared religious ideas we can observe cultural similarities all over Late Medieval Europe. Our question is whether a similar trend is visible in portable material culture? To be more precise what are the similarities and differences in portable material culture, ‘in and between’ regions, during the period AD 1000 to AD 1550.

The first session on this theme was held at the EAA 2019 in Bern and enjoyed great interest and a large audience. Then most papers were focused mostly on North-West Europe, raising a need for a broader European perspective. We hope that more interregional focus will allow us to observe networks of material culture in different social and economic contexts across time. Broadening the chronology also opens discussion on the appearance and disappearance of small finds in burials in some parts of Europe, and thus, allows us to have an insight on the impact of material culture through changes in religious belief.

We will accept papers concerning full and late medieval (1000-1550) material culture focusing on:

- finds that are typical in regions as well as their comparison with other regions
- possible borders and peripheries of a common material culture
- interactions between local material culture and imported objects
- production, consumption and interregional exchange
- grave finds and their presence in burials (impoverishment of cemeteries).

ABSTRACTS:

LOŠTICE GOBLETS IN MEDIEVAL SLAVONIA AS A SYMBOL OF HIGH SOCIAL STATUS

**Abstract author(s):** Tkalcec, Tatjana (Institute of Archaeology, Zagreb) - Procházka, Milan (Department of Archaeology Faculty of Philosophy and Arts, University of West Bohemia in Pilsen)

**Abstract format:** Oral

Loštice goblets are specific types of tableware that was produced in the area of the town of Loštice since the end of the 14th or at the beginning of the 15th century and ceased to be manufactured till mid16th century. With its shape, specific raw material and fabrication technology that has resulted in the characteristic appearance of their surface covered with the small bumps, craters and nodules, this drinking ware represent easily identifiable goods of North Moravian workshops. Loštice goblets represent popular items that the elite wanted to have, and thus express their higher status. They have often been used as vessels for drinking beverages in castles and noble houses across the Central Europe. However, their distribution in the area of medieval Slavonia has not been considered so far.

The prevalence of Loštice goblets in the castles of Medieval Slavonia corroborates their value as a trading commodity and as luxury items that were reserved exclusively for the privileged class of society. One single specimen found in a rural settlement raises the question of the reason for its occurrence in an atypical context. Several Slavonian specimens of goblets imitating the Loštice type by their form and manner of decoration are also taken into the consideration in the context of achievement of the Loštice goblets in the Central European market as an inspiration for potters to design similar vessels.

2 **IMPORT OR IMITATION? – LATE MEDIEVAL GRAPHITE WARE AND ITS INFLUENCE IN TRANSDANUBIA (HUNGARY)**

**Abstract author(s):** Kovács, Bianka (Institute of Archaeology, Research Centre for the Humanities; Eötvös Loránd University, Institute of Archaeological Sciences) - Jáky-Bárdi, Bogáta (Eötvös Loránd University, Institute of Archaeological Sciences)

**Abstract format:** Oral

The graphite ware was a typical pottery product in the western areas of the Danube region in the Middle Ages, so it has great importance for research in Hungary too. Some graphitic ceramics already appeared in the tenth-twelfth-century Hungarian Kingdom, however from the second half of the 13th century more and more occurred in the country based on finds from excavations. Vessels of similar forms fired in reducing atmosphere, but without graphite were also found. The number of the latter was much higher in the 13-14th century than of the graphitic exemplars, but their proportion is reversed in the 15-16th century. Researchers in the 20th century usually considered it clear that both graphitic ceramics and reduced products were imported from Austrian provinces. However, the large amount of these ceramics suggest to recent studies the local production - at least partially - as a possibility. But there is no doubt that these types of imported objects had a strong influence on the local pottery. In our presentation, we would like to examine the incurred questions about this group – including the possible social aspects – with the help of already published and new finds.

3 **MEDIEVAL WHITE MINIATURE VESSELS FROM THE CZECH LANDS AND CENTRAL EUROPE AND THEIR ENTANGLEMENT IN THE SOCIAL-ECONOMIC NETWORKS**

**Abstract author(s):** Capek, Ladislav (Department of Archaeology, University of West Bohemia)

**Abstract format:** Oral

In the High and Late Middle Ages we encounter with miniature vessels (small cups, mugs, jugs, bottles, bowls, or bells) made of white fine sorted kaolinic clay, often decorated with red pain or lead glaze that appear next to ordinary pottery (earthenware). These vessels appeared in Central Europe in the territory of Germany (Saxony) in the early as the 12th century and were previously described as Pfeifenton or an imitation of Pingsdorf-type ware. Only few production sites have been discovered so far, despite the abundance of their findings. The later miniature vessels entered the Czech lands as imports during the 13th century, before the spread of late medieval “colonization pottery”. They were found in urban, rural, secular, or ecclesial milieu and their distribution may indicate a well-developed market exchange in the 13th century. The miniature vessels from the 14th century could also be produced in Czech lands as an imitation of older examples. They were traditionally interpreted as containers for spices, salt, ointments, or fragrant essences; contemporary research considers them to be children’s toys because of their often findings in assemblages together with clay figures. These miniature vessels are one of the unusual but not rare types of medieval goods, which can point to contacts between producers and their consumers entanglement in social and economic networks, as well as the “medieval world of childhood and games”.

4 **RAM, BULL AND RABBIT – POTTERY AQUAMANILIA FROM UPPER MARIBOR CASTLE**

**Abstract author(s):** Jancar, Mojca - Ravnik, Mateja (Independent researcher)

**Abstract format:** Oral

A very popular object, which was an essential component of religious and secular rituals in medieval society, was an aquamanile. In the liturgy of the medieval church hand washing played an important role as at each Mass the priest washes his hands twice. However, the ritual hand washing was not limited only to the liturgy. It was also an important aspect of medieval courtly etiquette. In monastic refectories and in households of the nobility and those imitating their customs, meals began and ended with hand washing.

Aquamanilia are animal- or human-shaped vessels used for ceremonial, hand cleaning purposes as well as table decorations at banquet feasts, and were produced in large numbers all over Europe from twelfth through the fifteenth century in large variety of forms. They are usually cast in copper alloy or made from ceramic. Pottery aquamanilia are mostly found in fragments and were supposedly made for a more humble clientele. They are presumably made more locally, while copper alloy aquamanilia can be sometimes attributed to different production centres.

During excavations on the Upper Maribor Castle, Slovenia, fragments of at least five different pottery aquamanilia – five spouts representing different animals and one belly with handle and tail - were found. In this contribution, the authors will try to show the similarities and differences of these widespread and popular vessels regardless of material or region, but will focus on vessel’s form and depicted animal.

5 **MATERIAL CULTURES AND SOCIAL PRACTICES IN THE ARCHAEOLOGICAL ASSEMBLAGES OF UPPSALA 1100-1550 AD**

**Abstract author(s):** Kjellberg, Joakim (Department of Archaeology and Ancient History)

**Abstract format:** Oral

This presentation will address issues of identities and social practices within the Swedish medieval towns from a perspective of material culture and artefact assemblages. In my soon to be finalized PhD project at Uppsala university I have been studying changes in the archaeological assemblages from 14 archaeological excavations in the town of Uppsala in relation to the overall structural

development of the urban environment. Within the material there are discernable traces of shifting social and ethnic identities as well as different gender and agegroups. The differences in status of the households is also possible to track over time giving new insights to the dynamic of the town. By taking such a multi-object and comparative approach to select materials from more than 70 000 medieval objects, ranging from personal belongings to mass-materials, a new and hitherto unexplored potential to capture and discuss the experience of urban everyday life, the effects of urbanization as well as household dynamics in the region have been made possible.

6 **DIFFERENCES AND SIMILARITIES OF MATERIAL CULTURE IN EAST BALTIC AND OSTRIV CEMETERY ARTEFACTS FROM MEDIEVAL PERIOD USING ELECTRON MICROSCOPY**

**Abstract author(s):** Saleem, Khurram - Schürmann, Ulrich (Institute of Materials Science and Engineering, CAU, Kiel; ROOTS-Cluster of Excellence, Kiel) - Shiroukhov, Roman (Zentrum für Baltische und Skandinavische Archäologie, Schleswig) - Ivakin, Vsevolod - Baranov, Vyacheslav (Institute of Archaeology of the National Academy of Science of Ukraine - IS NASU) - Bornheim, Claus von Carnap (Zentrum für Baltische und Skandinavische Archäologie, Schleswig; ROOTS-Cluster of Excellence, Kiel) - Kienle, Lorenz (Institute of Materials Science and Engineering, CAU, Kiel; ROOTS-Cluster of Excellence, Kiel)

**Abstract format:** Oral

Material science approaches are powerful tools to investigate material artefacts. In archaeology, observing networks of material culture to study the Interregional connections is at centre stage of studies since decades. The interdisciplinary approaches of material science analysis and archaeology can unearth quantifiable comparisons between artefacts of different regions to trace the networks. In this research, analytical tools have been utilised to investigate the microstructure and composition of artefacts to draw similarities and differences between them. The artefacts are grave goods found at Ostriv cemetery, located 100 km South of Kiev in Ukraine and belong to the 10-11th century. These artefacts definitely belong to the East Baltic tribes and are not comparable with the local material culture of Kieven Rus’. This is the first time that artefacts from the Baltics have been found in an archaeological context so far east. Therefore, it is hypothesized that the population buried at Ostriv cemetery are immigrants from East Baltic regions. Hence pointing towards extension of Baltic networks into east European regions. Our question is whether a trend is visible in portable material culture of the two regions. To investigate this, material composition and structural similarities and differences between typologically similar artefacts are made. For the investigation of the materials, Transmission Electron microscopy (TEM) and Scanning Electron Microscopy (SEM) have been utilised. Focussed Ion beam (FIB) has been used to extract a nano-sized lamella out of the original artefact to keep the process quasi non-destructive. The study demonstrated the comparison of chemical compositions between the Medieval brass artefacts from East Baltic and Ostriv. Additionally, differences in chemical compositions between the outer surface and internal parts of the artefacts were noticed, owing to the significantly modified outer surface, mainly at the interface with the environment.

7 **“TRIEWE AS STIEL”: KNIFE MANUFACTURING TECHNOLOGY IN NORTHERN EUROPE, 10TH-12TH CENTURIES**

**Abstract author(s):** Hall, Mark E. (Black Rock Field Office, Bureau of Land Management)

**Abstract format:** Oral

Iron knives are one of the most ubiquitous artifacts found on Early Medieval and Medieval sites in Northern Europe. This paper is a Bayesian meta-analysis of a sample of knives from several locations in Northern Europe dating from the 10th through the 12th centuries. In addition to metallographic and typological data from the author’s research on the knives from Dublin and Waterford, Ireland and Deer Park Farms, North Ireland, previously published materials from York and Winchester, England, Kivivare and Rouge, Estonia, and Novgorod, Russia are included. The shape/form typology proposed by Ottoway (1992), which focuses on the shape of the back of the blade and handle, and the manufacturing typology proposed by McDonnell (1989), which classifies the blade on how steel is used in the blade, are utilized in this study.

The Bayesian meta-analysis shows that there is only a weak correspondence between the typological shape and manufacturing typology, potentially implying that the shape of a knife has little to do with its physical properties such as hardness, toughness and ductility. While manufacturing types 3 (pile-welded) and 4 (carburized edges) are not common at the above-listed sites, the meta-analysis does indicate that there is a correlation between the manufacturing typology and the site. Across the sites, hardness values are fairly similar for each manufacturing type, though there are some individual outliers. These results will be discussed in regards to technological styles.

8 **DISTANT INFLUENCES AND NEAR EXCHANGES: NEW PUBLIC FINDS EVIDENCE FOR FINNISH LATE IRON AGE AND EARLY MEDIEVAL MATERIAL CULTURES**

**Abstract author(s):** Oksanen, Eljas (University of Helsinki) - Wessman, Anna (University of Bergen)

**Abstract format:** Oral

Late Iron Age and early medieval material culture in Finland (c. 600 - c. 1200) combines peripherality with liminality, arising as it does from relatively sparsely populated regions of northern Europe and at the same time closely connected to the east-west trade routes that joined the Baltic Sea with the great eastern European river networks. This paper considers new metal-work archaeological evidence in Finland that has emerged over the last five years through public (mostly metal-detected) small finds. Until recently, most of the knowledge on the material culture from this period was based on published inhumation cemeteries, despite this not being the dominant burial form during this time.

In this paper we will analyse public small finds in order to discuss evidence for international and interregional influences and contacts emerging from the data. There is, for example, a substantial rise in the number of recovered objects of the so-called Permian (by the upper Kama River in Russia) type, as well as other eastern and overseas Baltic styles. These distributions have not been examined before on a national scale, and they open a window into examining population structures, settlement patterns, and the flow of material culture influences within the region of modern Finland and beyond. Novel evidence for regional differences between eastern and western, maritime and inland, and sparsely and densely settled areas is apparent. Further, this new material may indicate fundamental biases in the processes by which archaeological data, its dating and subsequent analyses has been carried out, calling for a more substantive reassessment of the Finnish archaeological chronologies.

9 **LOCAL OR REGIONAL? ELEMENTS OF MEDIEVAL URBAN MATERIAL CULTURE FROM BAIJA MARE (NAGYBÁNYA) AND SATU MARE (SZATMÁRNÉMETI)**

**Abstract author(s):** Szocs, Peter Levente (County Museum Satu Mare)

**Abstract format:** Oral

The two towns were part of medieval Satu Mare County of the Hungarian kingdom (today North-western Romania). The distance between them was only cca. 60 km, and in many aspects the two towns enjoyed similar historic evolution, but there are several significant differences, too, due primarily to the natural resources available at local level. The town of Baia Mare was one of the important centres of silver and gold-mining, and coin-minting of the kingdom, while the economy of Satu Mare was based on the farming and husbandry, in addition to the commerce of salt and to its role played as the county's administrative see. During the last decades, several rescue excavations revealed a considerable amount of finds from medieval urban households of the two towns. The majority of the finds belongs the usual categories of ceramic vessels: table ware, cooking and storage pots and various fine ware. Furthermore a significant amount of stove tiles were recovered, while the number of other items made of other materials (bone, metals or glass) remain low, but not negligible. The paper will focus on several selected samples of the finds from the two sites and will compare their composition and specificities. This type of analysis might offer the opportunity to identify goods produced locally and their regional distributions, in contrast or in parallel to the items of the long distance trade.

10 **WHAT DID A LOST AND FORGOTTEN MEDIEVAL SETTLEMENT IN THE MIDDLE OF THE POMERANIAN FOREST HAVE IN COMMON WITH LONDON?**

**Abstract author(s):** Sikora, Jerzy (Institute of Archaeology University of Lodz)

**Abstract format:** Oral

The medieval settlement complex in Ostrowite existed between the middle of the eleventh century and the beginning of the fourteenth century. It was located on the shore of and on an island on Lake Ostrowite (described as Waldsee – Forest Lake in Late Medieval sources), about 10 km south-east of Chojnice. It was situated in East Pomerania, in the northern part of the Kraina Lakeland, close to the Tuchola Forest Plain, in what could be called a medieval border area between the Kingdom of Poland and Pomeranian Principalities. During over twenty years of research, remains of settlement features on the island and on the shore were found, as well as two inhumation cemeteries, relics of two subsequent timber bridges leading to the island, and poorly preserved remains of timber fortifications connected with the first bridge. Field walking/surface surveys, metal detector surveys, and excavations yielded tens of thousands of small finds. Most of them are characteristic of the medieval Slavic culture in Pomerania, however, a number of them seem to expose a wide network of trade connections reaching far east to Central Asia and west to London. They clearly illustrate that a peripheral settlement of relatively low importance was not only part of the local cultural and trade exchange, constituting the material culture of North-West Slavs, but that it also had links with long-distance trade and a wider North European cultural zone.

11 **SMALL BUT OR PERIPHERAL? MATERIAL CULTURE OF MINOR TOWNS OF POMERELIA IN THE PERIOD OF HANSE DOMINATION**

**Abstract author(s):** Starski, Michal (Faculty of Archaeology University of Warsaw)

**Abstract format:** Oral

The paper will be devoted to the characteristic of specific features of the material culture of Pomerelian minor towns in the late Middle Ages. These urban centres, such as Chojnice, Człuchów, Debrzno, Lębork, Puck, Skarszewy, were located off the main trade

routes and at the outskirts of the Hanseatic or Baltic world, however archaeological excavations conducted there revealed numerous finds related to the Hanseatic lifestyle or elements of it. Through an analysis of such categories of finds as pottery, stove-tiles, glassware and metalware a picture is drawn of Baltic towns' participation in the urban culture. It enabled inferring the nuanced status of the smaller towns in relation to the main trade centres of the Baltic Sea. The cases discussed in the paper are aimed at broadening the ongoing discussion by introducing smaller towns that complemented the urban network in the Baltic region along with the peculiarity of its commercial exchange.

12 **THERE'S SOMETHING ABOUT MARY: THE ROLE OF THE VIRGIN MARY IN THE MATERIAL CULTURE OF MEDIEVAL HUNGARY**

**Abstract author(s):** Stark, Karen (Central European University)

**Abstract format:** Oral

In the study of medieval religious beliefs and practices, material culture can often be overlooked in favor of textual sources. However, material culture provides a literal and figurative physical connection to the past that is invaluable and provides insights into often overlooked fragments of society. Such is the case of the Virgin Mary in medieval Hungary. The Virgin can be found in numerous—often mundane—material forms in Hungary:

on coins traded daily in markets to pilgrimage badges acquired from faraway lands. From these we can explore cultural networks and exchange, and the growth and particularities of aspects of the Marian cult within Hungary. We can, for instance, identify variants of Marian iconographic representation (e.g., the Annunciation and Maria in sole) on stove tiles and evidence of the cult of the Rosary through the discovery of rosary beads in medieval graves.

By considering material culture within the larger picture of the cult of the Virgin Mary in medieval Hungary and East-Central Europe, we can form a more nuanced and complete view of the role of this incredibly important figure in medieval religious life.

13 **UNITED WE PLAY, UNITED WE PRAY? LOOKING FOR CONNECTED NETWORKS OF MEDIEVAL PLAY AND SUPERNATURAL ENGAGEMENT**

**Abstract author(s):** Hall, Mark (Perth Museum, Scotland)

**Abstract format:** Oral

This paper is offered as a case study around the commonality/distinctiveness of portable material culture across medieval Europe. It will focus on material culture manifestations of play and belief/supernatural engagements, namely board games and pilgrimage souvenirs. The paper will adopt an entangled narrative of supernatural engagement, board games and cultural interaction. Its long durée trajectory commences in the mid-first millennium AD (with a link back to the earlier first millennium and Roman/European contacts) and closes in the sixteenth century. Over this time frame it will seek to highlight differences and similarities in play practices as suggested by board and dice games kit; with the nature and spread of chess a particular focus and its social and metaphorical understanding. Regarding Christianity as a broad cultural practice, wider than a set of theologically controlled faith precepts, it will also seek to understand pilgrimage as a unifying practice linking movement, supernatural engagement and gaming/play practices.

14 **A UNITED EUROPE OF INSCRIPTIONS (ON MEDIEVAL DRESS ACCESSORIES)?**

**Abstract author(s):** Lewis, Michael (British Museum)

**Abstract format:** Oral

Medieval 'dress accessories' are interesting object types for many reasons, not least because they can have inscriptions - many (but not all) religious in nature. These tend to be abbreviated (for example many consist of just of a few letters or words), rather than full-sentences or longer. As such they must have been well-known verses, derived from biblical texts and such like. This relationship between 'dress accessories' and 'religion' forms the basis of a thesis (presented here) that connects 'a United Europe of Things' through the over-arching presence of the catholic church.

This study will examine, in particular, inscriptions on medieval brooches, strap-ends and buckle-plates, but with reference to other types of medieval culture. Drawing primarily on the data held within the Portable Antiquities Scheme (PAS) database, but also on the information in other datasets and museum collections in Europe, it will highlight similarities and divergence in inscriptions on medieval finds.

15 **MATERIAL CULTURE MADE ACCESSIBLE: 'MEDIEVAL METAL' FROM URBAN EXCAVATIONS IN FLANDERS (BELGIUM)**

**Abstract author(s):** Deckers, Pieterjan (Vrije Universiteit Brussel, Maritime Cultures Research Institute - MARI)

**Abstract format:** Oral

A non-negligible hurdle in the collective analysis of medieval artefacts at large spatio-temporal scales is the accessibility and alignment of data. In many countries, development-led archaeology has yielded substantial amounts of new information in the past decades. These valuable results, however, are often fragmented and difficult to access, impeding the further valorization of archaeological fieldwork. This may be all the more true for assemblages of small finds such as metalwork, which, in contrast to bulk categories

such as pottery or glass, are typically limited in number and very diverse. Hence, they often lack coherent regional frameworks for classification, making finds processing and reporting labour-intensive and expensive.

In response to this challenge, the 'Medieval Metal' project was established in order to collate metalwork finds from medieval towns in Flanders (Belgium), one of the most economically successful and strongly urbanized regions within medieval Europe. The project is a collaboration with a range of partners, including several town archaeological services, and is funded by Flanders Heritage Agency.

'Medieval Metal' aims to revise the chronotypology of medieval metalwork for the region, aligning it with the 'Reference Typology' established by the finds recording scheme Portable Antiquities Netherlands. In addition to this expanded and updated classification, a semantic web portal is being built to expose artefact data, and a quantitative analysis of the dataset will be performed to identify important trends in the production, use and deposition of metalwork items in urban contexts in Flanders. These outcomes will be important resources for archaeologists and other scholars, but will also serve to engage lay audiences. This presentation will report on the background, goals and preliminary findings of the ongoing project.

16

WHAT TO (NOT) EXPECT OF MEDIEVAL DRESS ACCESSORIES. COMPARISON OF ASSEMBLAGES FROM WROCLAW AND PRAGUE

**Abstract author(s):** Sawicki, Jakub (Institute of Archaeology, Czech Academy of Sciences in Prague)

**Abstract format:** Oral

Medieval dress accessories (buckles, clasps, mounts, strap ends, hook and eyes, etc.) are most often the only archaeologically preserved evidence of dress. Dress, which, in addition to purely practical functions can also communicate identity and status of the wearers, their belonging to a specific class, ethnicity, social condition or a specific lifestyle.

This group of finds, used to be somewhat neglected in archaeology of Central Europe. This is due to several reasons, but the biggest issue seems to be that there were not enough accessible (and well published) finds which could constitute a significant assemblage for further analyses and drawing specific conclusions. To counter this problem, I have prepared a study based on over 1100 dress accessories from different urban excavations in Wrocław and Prague. Urban centres, slightly different in size, but still deriving from the same or very similar political, cultural and economic environment.

In this presentation, I would like to discuss the differences and similarities of those two archaeological assemblages as well as problems which arise during such research. These problems concern, among others, difficulties in comparing large collections from distant sites, or the specificity of dress accessories finds from a non-urban context, or even an accurate identification of specific items. All these factors contribute to the attempt to determine the social aspect of dress accessories, and their alleged belonging to people of different classes of the medieval world.

34

SCALES OF INTERACTION IN THE BRONZE AND IRON AGE CENTRAL MEDITERRANEAN

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Holt, Emily (Cardiff University) - Schirru, Davide (Università degli Studi di Roma “La Sapienza”)

**Format:** Regular session

The cultures of the Central Mediterranean played a crucial role in the pan-Mediterranean interactions of the Bronze and Iron Ages. At large scales, these cultures facilitated trade across the Mediterranean Sea and beyond, reaching eastward to Cyprus, Crete, and the Near East, northward into mainland Europe, and westward to Iberia. These long-distance exchanges thrived despite the marked differences in social organization between the cultures of the Central Mediterranean and many of the cultures they contacted. Such exchanges carried people, ideas, and goods into new markets and new communities. At regional and local scales, the internal dynamics of Central Mediterranean communities created opportunities for both physical and social imports to become embedded in existing cultural structures, changing them and being changed by them. These dynamics are often investigated through artifact distributions, settlement patterns, and site hierarchies, but can also be addressed through materials analysis, isotope studies, and aDNA. This session will bring together research on the many scales of interaction operating in the Central Mediterranean during the Bronze and Iron Ages, with the goal of untangling the interwoven threads of cultural connection.

ABSTRACTS:

1

FROM THE ATLANTIC TO THE MEDITERRANEAN AND BACK: SARDINIA, IBERIA AND THE TRANSFER OF KNOWLEDGE IN BRONZE AGE NETWORKS

**Abstract author(s):** Araque, Ralph (University of Freiburg)

**Abstract format:** Oral

Sardinia was a hub of sea-routes connecting the Aegean and the Levant with Iberia at its latitudinal extremes in the Final Bronze Age (FBA), c. 1200-800 BC. At the West End of this network Portugal, Extremadura and Andalusia were the pivotal nodes between the Atlantic and Mediterranean worlds. Sardinia and West Iberia, although situated some 1200 nautical miles apart, shared unequivocally related bronze working techniques and typological preferences during this period. The shapes of swords and tools were almost identical and high quality binary tin bronzes prevailed.

2

MULTI-PARAMETER ANALYSIS OF NURAGIC BRONZETTI: ON THE TRAIL OF METAL-DRIVEN TRADING NETWORKS IN THE FINAL BRONZE AND EARLY IRON AGE

**Abstract author(s):** Berger, Daniel (Curt-Engelhorn-Zentrum Archäometrie Mannheim) - Matta, Valentina (Graduate School of Arts, Aarhus University) - Nørgaard, Heide (Moesgaard Museum) - Salis, Gianfranca (Soprintendenza Archeologia, belle arti e paesaggio per la città metropolitana di Cagliari e le province di Oristano e Sud Sardegna) - Vandkilde, Helle (School of Culture and Society, Aarhus University)

**Abstract format:** Oral

Lead isotope and trace element analysis has over the last decades proved a significant tool for provenancing metals and hence to begin charting the variety and complexity of connections between Bronze Age societies. In metal-rich Sardinia, several archaeometallurgical studies were carried out in the early 2000s and helped fuelling the debate on long-distance metal trade. Besides, numerous oxhide ingots reached Sardinia in the Bronze Age hence testifying to the island's involvement with the Mediterranean metal-trade circuit. However, sourcing the copper and tin used for local Sardinian metalwork production has so far had limited success.

This paper reports on new multivariate analyses of Sardinian bronzetti (bronze statuettes) whose physical form embeds both local and global meanings within the Late Bronze Age/Early Iron Age world. We used a novel multi-parameter approach to analyse 48 samples of bronzetti from three Nuragic sanctuaries: Santa Vittoria-Serri, Abini-Teti, Su Monte-Sorradile. The approach combined lead, tin and copper isotopes as well as chemical analysis with metallographical and archaeological information in order to extract knowledge of the provenance and the processing of the metals.

The results reveal that most statuettes were cast and slightly worked over by cold-hammering. Specifically, local copper and/or lead sources were most likely used for their production. However, the tin in the bronzetti was imported since local tin mineralisation can be excluded by means of tin isotopes. Rather, Iberian deposits could have supplied the tin, additionally supported by preliminary results of Sardinian Late Bronze Age tin objects. A strong Sardinian – Iberian connection is manifest in the large number of Iberian artefacts discovered in Nuragic contexts, and vice versa. Finally, we can show mixing/recycling of the metal, which connects most of the bronzetti. Overall, Sardinian metalwork production relied not only on internal supply networks but was also connected to supra-regional trading partners.

3

SARDINIA AND ITS ROLE IN THE GLOBALIZED INTERNATIONALIZATION OF MEDITERRANEAN CULTURES

**Abstract author(s):** Pisanu, Laura - Hitchcock, Louise (University of Melbourne)

**Abstract format:** Oral

Since the 16th century BC, Nuragic communities, distributed through strategic nodes in the Sinis and lower Montiferru regions in western Sardinia created a network of settlements along coasts and rivers that promoted external and internal security of this territory while protecting its local resources. Maritime interaction between this region and similar networks in Mycenaean Greece and Cyprus contributed to a secure maritime environment that enabled globalized flows of artifacts such as pottery and bronze objects, raw materials such as copper and tin, technologies, and individuals to move through this and neighboring regions. The value of these networks are demonstrated by the appearance of new and internationalized civil and ritual monuments in Sardinia, Greece, and in Cyprus. We propose to investigate these entangled and internationalized styles of portable objects, technologies, and monuments through examining the similarities and differences in their uses in these regions, and through examining the degree of internationalism incorporated into architectural styles. In doing so, we shall distinguish between the foreign and local function of a selected group of objects. For example, we will examine the purpose of Cypriot bronze stands and Aegean ceramics in Sardinia, Greece, and Cyprus, as well as the incorporation of Nuragic building techniques in Greece, and the appropriation of some Aegean architectural styles in several monumental administrative structures in Cyprus.

4

**APPROACHING INTERACTION IN IRON AGE SARDINIA: MULTI-SCALAR SURVEY EVIDENCE FROM THE SINIS ARCHAEOLOGICAL PROJECT**

**Abstract author(s):** Gosner, Linda (Texas Tech University) - Nowlin, Jessica (University of Texas at San Antonio)

**Abstract format:** Oral

The island of Sardinia lay in a crucial location for trade and interaction in Iron Age maritime networks of the Mediterranean. Over the course of the 1st millennium BCE, Phoenicians, Carthaginians, and Romans, among others, came to trade and settle on the island, interacting with the local Nuragic culture. Despite this, the island has long been thought of as isolated. Travel writer D.H. Lawrence called it an unsubdued landscape “outside the circulate of civilization.” Recent DNA studies have underscored these perceptions, emphasizing the long-term genetic continuity of the island’s population. Archaeological research on interaction has traditionally focused on the excavation of major coastal settlements, leaving questions of interaction in the varied landscapes of the island’s interior understudied.

This paper draws from the results of the Sinis Archaeological Project (SAP) that complicate this view of interaction in Iron Age Sardinia. SAP is a regional survey in west-central Sardinia, a landscape with diverse ecologies and resources: agricultural plains, coastal, marshy, and mountainous territory. The project aims to understand the social, economic, and environmental factors that impacted resource extraction, settlement patterns, and interaction in these varied landscapes. We present our multi-scalar methodology, which integrates targeted excavation, pedestrian survey, and remote sensing. We discuss our initial results and then lay out our plans for future work in the region, on the island, and in the wider Mediterranean as part of our collaboration with the Migration and the Making of the Ancient Greek World Project. Ultimately, we suggest that multi-scalar methodology allows us to consider interaction and its impacts beyond coastal landscapes and to integrate our view of local and regional dynamics with wider Mediterranean phenomena. Work in Sardinia further illuminates the agency of Nuragic people in these dynamics in their local context, complementing scholarship on the role of Nuragic sailors in larger Mediterranean networks.

5

**DYNAMIC SOCIAL NETWORKS ACROSS THE LANDSCAPE. A PETROGRAPHIC STUDY OF BRONZE AGE CERAMICS IN THE MARMILLA REGION, SOUTH-CENTRAL SARDINIA, ITALY**

**Abstract author(s):** Gradoli, Maria Giuseppina (COMET S.a.s. Cagliari, Sardinia)

**Abstract format:** Oral

Focusing on the relationship between ceramic technology and social organization, this research studied 392 ceramics from eight Bronze Age settlements (1700-950 BC) in the Marmilla region (south-central Sardinia). The multidisciplinary methodology adopted, permitted to analyze the complex pattern of mobility, exchange, cultural and technological networks at a regional scale.

The selected ceramic thin sections were characterized using petrography, identifying the raw materials used, their provenance and highlighting specific technological and social choices. Considering fabric heterogeneity through time, it was demonstrated how the Bronze Age potters had a widespread appreciation of similar raw materials in the region, which indicates not only shared manufacturing traditions but also wider community interactions.

The number of samples studied and the chronological interval covered (750 years) makes this study the broadest Bronze Age petrographic dataset produced up to now for Sardinia.

Nuragic plain domestic pottery, like its imported counterparts from the Aegean, circulated among nuragic settlements as exchanged items, at an inter-site and inter-regional level, throughout the Bronze Age as demonstrated on petrographic basis.

This research also showed that pottery production throughout the Bronze Age and especially during the transitional and crisis periods of the nuragic society was not affected by any reorganization phase or social change. Potters continued their day-to day living, producing the same vessels types, using the same raw materials and even manufacturing new richly decorated vessels during the Early Iron Age, the full crisis period of the nuragic culture.

Moreover, by ceramics petrography, the author was able to demonstrate that the fabrics of two of the five Late Bronze Age burnished bowls found recently at Hala Sultan Tekke (Cyprus) came from some of the well-known production centers found in the Marmilla region (Gradoli et al. 2020).

6

**CHANGING INTERSECTIONS AND INTERACTIONS IN NURAGIC SOCIETY: A NEW ASSESSMENT OF THE DYNAMICS IN SÀRRALA, EASTERN SARDINIA**

**Abstract author(s):** Lai, Luca (University of North Carolina at Charlotte)

**Abstract format:** Oral

The issue of scales of interaction and connectivity in the Nuragic society of Bronze-Iron Age Sardinia is inextricably tied to the parallel understanding of the nature and extent of social complexity, and to the interpretation of the changing role and intensity of external contacts. The insular nature of the Nuragic culture coupled with Sardinia’s large landmass magnifies the impact of outside people, ideas and items while skewing it with the specific diffraction lens of local social norms and belief systems.

The specific case study examined is the coastal area of Sàrrala, in Eastern Sardinia: geographic features and buffer zones allow to the likely identification of a Nuragic territory. The evolution of the meaning of such territory and its different and changing scales of interactions are traced through settlement and building analysis, and interpreted in light of the record from elsewhere on the

island including stable isotopes and aDNA, and of Mediterranean-wide climatic patterns. While a picture of progressive demographic growth and infilling of the landscape and subsequent concentration of population and labor follows a sequence widely detected on Sardinia, specific identifiable aspects include:

- comparatively higher fragmentation/competition (ratio of complex vs. simple nuraghi; ratio of tombs vs. nuraghi);
- possible clues pointing to descent as an ordering principle;
- a fairly consistent pattern in the distribution of non-local building materials in a late phase perhaps coinciding with the advanced Final Bronze Age and the Early Iron Age.

These elements appear compatible with an organized exploitation of the available territory, and with patrilocality and closeness to emerging lineages and/or locations as a long-lasting ordering force. Questions that remain open concern the role played by internal dynamics relative to constraining factors as climate change and long-distance trade connections.

7

**LOCAL AND REGIONAL MOBILITY IN AN EARLY NURAGIC COMMUNITY: STRONTIUM MAPPING CENTRAL SARDINIA**

**Abstract author(s):** Holt, Emily (Cardiff University) - Schirru, Davide (Università degli Studi di Roma “La Sapienza”) - Madgwick, Richard (Cardiff University)

**Abstract format:** Oral

Understanding human and animal mobility in small-scale societies can help elucidate networks at local, regional, and inter-regional scales. In turn, these networks can shed light on inter-community cooperation and competition, differential access to goods and the development of inequality and hierarchies. Strontium isotope analysis is a powerful tool for understanding mobility and reconstructing networks. This approach is long-established, but in the cycle of methodological refinement the importance of high resolution biosphere maps on which to base interpretation has come into sharper focus in recent years. The Marie Curie project ZANBA – ZooArchaeology of the Nuragic Bronze Age – is creating a strontium isoscape of central Sardinia for use in provenancing faunal remains from excavated sites. This will allow researchers to reconstruct local interaction networks even in the absence of easily identifiable exchanged artifacts like pottery. ZANBA is domain mapping strontium isotope ratios using homogenized sampling of deep-rooted modern plants from 137 points across central Sardinia. The research area was divided into 22 separate lithologies, 19 of which were large enough to warrant sampling. This presentation reports the first results of ZANBA and discusses future directions, including using the isoscape to interpret faunal remains from the early Nuragic site of Sa Conca sa Cresia near the town of Siddi in south-central Sardinia.

8

**CENTRAL MEDITERRANEAN INTERACTIONS IN THE LATE BRONZE AGE SEEN FROM CANNATELLO HUT 2 (SICILY)**

**Abstract author(s):** Vanzetti, Alessandro (University of Rome “La Sapienza”) - Levi, Sara (Hunter College, NY) - Castagna, Maria Antonietta (Independent Researcher) - Day, Peter (Sheffield University) - Di Renzoni, Andrea (CNR - ISPC, Rome) - Cannavò, Valentina (University of Modena & Reggio Emilia) - Porta, Francesca (Independent Researcher) - Talotta, Natalia (University of Rome “La Sapienza”) - Gulli, Domenica (Soprintendenza BBCCAA, Agrigento)

**Abstract format:** Oral

Cannatello is a well-known site in coastal Southern Sicily, whose finds span from a vast number of locations, within the Late Bronze Age Mediterranean. The new research on the site since 2017, conducted jointly by the Soprintendenza BB.CC.AA. of Agrigento, the University of Rome “La Sapienza” and the Hunter College of New York (USA), brought to the proper definition of some relevant contexts. Among them, the completion of the excavation of hut nr.2 and the comprehensive study of its finds resulted in details about its structure, use and abandonment.

Hut 2 is the biggest hut found, in terms of size, with a particularly massive structure; its construction is placed in stratigraphic phase 2 of the site’s sequence, currently correlated with the Italian early Recent Bronze Age. In particular, its construction influenced the topographic structure of the site during phase 2. Fire was involved in its collapse, sealing the abandonment layers under the walls’ burnt remains.

The abandonment layers, although rather poor in finds, presented a high concentration of artifacts of Nuragic typology. This is well framed in the discussion of the growing insertion of the central Mediterranean, and of Sardinia in particular, in the transmarine routes, as attested at Kommòs in Crete, or Hala Sultan Tekkè and Pyla-Kokkinòkremos in Cyprus. Furthermore, the context is significant for the characterization of Nuragic-style pottery, as either imported from Sardinia or locally produced - it is well known that this situation is so far exclusive to Cannatello.

The paper intends to contribute to the ongoing debates on the scales of interaction inside the central Mediterranean (and beyond), during the boom-and-crisis phases of connectivity dating to the Mediterranean Late Bronze Age.

WHAT THE DEAD SEE: EXAMINING THE SOCIAL IMPLICATIONS OF FUNERARY AND SETTLEMENT POSITIONS IN BRONZE AND IRON AGE WESTERN SICILY

**Abstract author(s):** Ferrer-Martín, Meritxell (Universitat Pompeu Fabra) - Sevara, Christopher (University of Newcastle)

**Abstract format:** Oral

Between the later Bronze Age and the Iron Age, western Sicily experienced deep processes of social, political, economic and environmental transformation. The effects of these processes are seen in changes in settlement patterns, in the organization of the domestic realm, in the use and the construction of the landscape as well as in the funerary sphere. In this paper, we want to focus on the changing relationship between the living and the dead through an analysis of the placement and positioning of funerary features in relationship to other elements of their contemporary landscapes, such as settlement areas, agricultural land, paths and trade routes. What did the dead ‘see’ through their specific placement? How did the dead and the living interact through the landscape? How might these interactions have changed in relationship to the social and environmental changes occurring in western Sicily during this time? These questions are examined through a study of the spatial position of funerary elements in the local settlement landscapes of two well-known hilltop settlements in the region, the Bronze Age settlements of Mokarta and nearby Iron Age Monte Polizzo. To do this, we combine geospatial analyses, archaeological data and social theory to look at the changes in the associative positioning of funerary elements in relationship to other landscape elements. We then discuss the impact of this on the visual configuration and social understanding of each settlement and their surroundings, and compare these results to suggest the potential merits of expanding this analysis to further locations in future studies.

PAST INSULARITIES: INTERREGIONAL INTERACTIONS IN BRONZE- AND IRON-AGE PANTELLERIA

**Abstract author(s):** Schön, Frerich - Cespa, Stefano (University of Tuebingen) - Magri, Alessandra (Università di Bologna)

**Abstract format:** Oral

Situated halfway between Tunisia and Sicily, the island of Pantelleria (Italy) is a focal point to study interregional dynamics in the Strait of Sicily during the 2nd and 1st Millennium BCE. The results of two excavation projects on Pantelleria Island will be presented: the Mursia-Excavation Project (Bologna University) and the Acropolis-Excavation Project (Tuebingen University).

The Bronze Age settlement of Mursia, protected by an imposing fortification wall, was uninterruptedly occupied for three centuries, from 1750 to 1450 BCE.

The pottery assemblage of the site shows close parallels in Northern and Western Sicily and in the surrounding islands, while the presence of exotic artefacts and imported raw materials provide the evidence of interregional and long-distance interactions. Furthermore, the finding of metal objects and casting moulds points to the inclusion of Mursia within the broader socio-cultural network of the Mediterranean Bronze Age.

After the abandonment of the village of Mursia, there is no clear evidence for occupation on the island for at least 6 centuries. In the context of Phoenician expansion into the Western Mediterranean, the island was re-populated during the 8th century BCE by western Phoenician settlers. The material culture of this period shows close connections to Carthage. Pantelleria became part of the Carthaginian sphere of influence and was involved into the conflicts of the Roman-Punic Wars. At the End of the 3rd century BCE the island became part of the first Roman Province Sicilia.

This paper focuses on changing interregional dynamics like mobility, exchange, trade, warfare, colonization and abandonment and the related local responses in the Strait of Sicily from the Bronze to the Iron Age. These different dynamics and stages of occupation in Pantelleria can be considered as ‘laboratories of social and cultural experiences’, where issues of connectivity and relative isolation can be explored comparatively and in a diachronic way.

HUMAN MOBILITY AND ARCHAEOLOGICAL THOUGHT: MOVING FORWARD

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Nikita, Efthymia (The Cyprus Institute) - Radini, Anita (University of York) - Mutri, Giuseppina (The Cyprus Institute)

**Format:** Regular session

Human mobility has held a central and often contentious place in archaeology. Early archaeological theory, culture-historical archaeology, viewed large-scale human mobility, migration, as the driving force of any change in the material record. The advent of processual archaeology witnessed a denial of the importance of past human mobility as a cultural change agent, and an emphasis on indigenous processes and internal dynamics. More recently, post-processual archaeology stressed the role of human agency and revived the interest in the study of human mobility, acknowledging the complexity of this phenomenon. Indeed, it is nowadays appreciated that human mobility has taken several forms and was motivated by diverse incentives. To disentangle the dynamic movement of people, ideas, technologies, and objects, contemporary research encompasses a broad range of approaches from the archaeological sciences. Isotopic, ancient DNA, biodistance studies, provenance analysis and network analysis have all been adopted in different contexts. Now that the complexity of past human mobility is self-evident and the methodological tools to explore it are ever-developing, the conditions have matured to reassess the interplay between archaeological theory and human mobility. This session seeks contributions that discuss past human mobility in the context of network theory, identity studies, nationalism and postcolonial archaeology, as well as contributions that explore the social role of archaeology in understanding contemporary large-

and small-scale human relocations. We are also interested in contributions that amalgamate archaeological science approaches in the study of human mobility with broader archaeological evidence as well as evidence from other fields, such as epigraphy, historiography, and environmental studies. Finally, we encourage submissions focussed not only on the factors that instigated mobility and the nature of the mobility events but also on the implications of the relocation of past humans at a socio-economic and biological level.

FARAWAY, SO CLOSE! THE DIALECTICS OF ARCHAEOLOGICAL THEORY AND SCIENCE IN PALAEOMOBILITY STUDIES

**Abstract author(s):** Karligkioti, Anna (The Cyprus Institute) - Kozatsas, Jannis (Aristotle University of Thessaloniki) - Nikita, Efthymia (The Cyprus Institute)

**Abstract format:** Oral

The recent EAA meeting in Maastricht selected as a general theme the “Third Scientific Revolution” in archaeology. As stated by Kristian Kristiansen in 2014, this revolution embraces new developments in archaeological sciences (genetic and stable isotopes analysis) and new methodological trends in relation to statistical quantification and modelling. Past mobility studies have been among the domains of archaeological scientific enquiry that have benefitted the most from relevant advances in ancient DNA, isotopes and agent-based modelling approaches. These scientific advances accompany a theoretical acknowledgement of the complexity of past human movement; an acknowledgement that reflects the culmination of decades of archaeological thought around the subject of human mobility. Early in the advent of western science, archaeologists employed ‘migration’ as an axiomatic explanatory approach to cultural change rather than a dynamic social process. This trend was followed by an appreciation that empirical results coming from the natural sciences would be employed as self-evident proof for the interpretation of social phenomena, such as human mobility, drawing upon positivist approaches, which were subsequently criticized as oversimplifying complex social dynamics. The aim of this contribution is to map the diverse approaches implemented by archaeological theory and archaeological sciences and explore how these get entangled in order to explore the complex and dynamic nature of past human mobility. Emphasis will be placed on identifying where relevant interdisciplinary research currently stands and what its future directions may be.

2

ON THE RUN: EARLY MEDIEVAL SETTLERS AT KOKSIJDE CAME FROM BEYOND THE CHANNEL

**Abstract author(s):** Spros, Rachèl - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel) - Pellegrini, Maura (Thermo Fisher Scientific Italy) - Claeys, Philippe (Research Unit: Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel)

**Abstract format:** Oral

The early medieval coastal communities of the North-Sea area are known to have kept close contact during the seventh and eighth centuries. Though, evidence of connections with areas from beyond the Channel are less extensive, especially indications of mobility between the North-Sea area and the Southern European Atlantic coast around modern day Spain, Portugal and southern France are vague. Still, these southern areas in Europe knew tumultuous times during the late seventh and eighth centuries and direct evidence of migrants and refugees moving towards Northern Europe was yet to be discovered. This changed with the finding of an early medieval coastal settlement at the Belgian coast. Twenty-three individuals buried at Koksijde were analysed for provenance and dietary reconstructions through carbon, nitrogen, oxygen, and strontium isotope analysis of various tissues (bone collagen, bone apatite, and tooth enamel). The results suggest that, even though most of the artefacts were of local origin, the individuals themselves were most likely not. This presentation will provide new insights into lives of this group of Southern European Atlantic coastal migrants.

3

ON THE NORTHERN BORDERS OF HERODOTUS’ SCYTHIA: INDIVIDUAL MOBILITY AND FOOD PREFERENCES OF THE NOMADS OF THE MIDDLE DON

**Abstract author(s):** Dobrovolskaya, Maria - Volodin, Saimon (Institute of Archaeology Russian Academy of Sciences)

**Abstract format:** Oral

Studies of the migratory activity of the Early Iron Age nomads by applying to data on the isotopic composition of strontium are still few in number. Descriptions of Scythian migrations are mainly based on the study of archaeological and paleogenetic materials. However, today the question of the individual mobility of the Scythians throughout their life is relevant. The northern borders of Scythia, described by Herodotus, run through the forest-steppe territories of the Middle Don. It is in these places that kurgan graves materials, dating back to the 5th - 4th centuries BC, were discovered. There were examined individuals from two collective burials. We use data on the strontium isotopic composition of tooth enamel and bone tissue to evaluate the mobility. In addition, we apply to information on the carbon and nitrogen isotopic composition of bone collagen to reconstruct food models that reflect both cultural traditions and environmental characteristics. The 87/86 Sr values in the bone and enamel of the teeth are considered as indicators of the presence of an individual at different ages in a territory similar or different in its geochemical parameters from the regional Middle Don. We have identified a significant variety of individual mobility. Information on the isotopic composition of nitrogen and

carbon in bone tissue collagen is analyzed by means of the comparative data of the steppe Eurasian population of the early Iron Age. In most cases, in the study of individuals, the isotopic composition of carbon was determined, which means that this individual ate C4 plants (millet). However, there is a group of individuals with indicators of eating only C3 plants. As a hypothesis, this feature is proposed to be considered as evidence of contacts between people from the Middle Don burials with the territories and traditions of antique farmers.

4      **NON-METRIC DENTAL TRAIT VARIATION AMONG WESTERN SIBERIAN FOREST-STEPPE POPULATIONS IN THE GREAT MIGRATION PERIOD**

**Abstract author(s):** Sleptsova, Anastasiia (Tyumen Scientific Centre SB RAS)  
**Abstract format:** Oral

In the transition period from the Early Iron Age to the Middle Ages, the disintegration of the centralized early state Sargat community and the formation of new cultures are observed on the territory of Western Siberia. The main goal of this study was to find a possible links between Early Medieval and Early Iron Age populations of Western Siberia forest-steppe zone using dental non-metric traits. The frequencies of thirty traits were observed using ASUDAS (and A.A. Zubov’s program). The study was based on the dental remains of 49 individuals from four Great Migration period burial grounds (Ustyug-1, Kozlov Mis, Revda-5, Ipkul) located in Tobol river region of Western Siberia. For comparison we observed 424 individuals of Sargat culture from the burial sites located in the area between the Tobol, Irtysh, and Ishim rivers including the Baraba forest-steppe zone of Western Siberia. Trigonometrically transformed dental trait frequencies were subjected to the principal component analysis and cluster analysis based on Euclidean distances. Besides Sargat culture samples, 32 Early Iron Age dental samples from different region of Eurasia were used for statistical comparison. As a result, it was established the Sargat population (especially from Baraba forest-steppe zone) became a basis for the formation of the Early Medieval tribes. Eastern dental traits were almost absent there except for the shoveling of upper medial incisors and the deflecting wrinkle on the lower first molars. Also we cannot make a conclusion about the migration of the population in the III–VI centuries AD from Western Siberia to the Urals, although this assumption has been repeatedly described in archaeological literature. Migration of the groups from the taiga zone to the south in the III–VI centuries AD is not excluded.

The research was funded by RFBR and Tyumen Region, project number 20-49-720010.

5      **GENESIS OF THE UPPER OB REGION POPULATION OF THE EARLY IRON AGE**  
**Abstract author(s):** Kishkurno, Maria (Institute of Archaeology and Ethnography SB RAS)  
**Abstract format:** Oral

The Upper Ob region is a vast territory in West Siberia. It’s landscape can be characterized as forest-steppe. The main waterway that crosses the entire region is the river Ob.

In the Early Iron Age, the region was inhabited by tribes united by Scythian-Siberian cultural and historical traditions. According to archeological data, in the second half of the 1st millennium BC they began to experience migration impact of the southwestern Saka tribes. Also, contacts are actively developing with neighboring groups of Sargat, Kulai and other tribes. Thus, the specificity of the population of the Upper Ob region could be formed under the influence of several different factors. As a result of these processes, not only cultural traditions changed, but also an anthropological composition transformation could be observed. To study the influence of all these factors on the population of the Upper Ob region of the Early Iron Age, a detailed dental morphology study was carried out. It was based on the standard method of accounting for dental phenes, and also archaic dental signs were taken.

The provided results have shown a rather interesting picture. South and southwestern migration waves did not have a significant impact on the anthropological composition of the Upper Ob region population. Also, peaceful contacts with neighboring tribes did not affect the biological component of the studied population. Another ancient component became predominant here, dating back to the Upper Paleolithic South Siberian populations. In the Bronze Age samples this component could be found in the composition of the Okunev culture population of the Khakass-Minusinsk basin. Apparently, the contacts with neighboring and migrational tribes, recorded according to archeological data, most prominently had a cultural (trade and exchange) character, without any kind of biological connections.

The research was funded by RFBR and Tyumen Region, project number 20-49-720010.

6      **TRAVELLERS AND CONSUMERS: ASSESSING POTENTIAL AND LIMITATIONS OF MICRO DEBRIS IN CALCULUS TO THE TOPIC OF ANCIENT HUMAN MOBILITY**  
**Abstract author(s):** Radini, Anita (BioArCH and York JEOL Nanocentre, University of York)  
**Abstract format:** Oral

Dental calculus is a deposit on teeth resulting from the mineralisation of dental plaque. It can adhere to tooth enamel for millennia. A great variety of particles, from diet to environment, have been found to survive in this deposit, across times and cultures. Recent work suggest it is a potential sources of information of imported food items as well as art material, providing new insights into long distant trades. In most cases the remains of exotic materials found in dental calculus has been seen as the results of ‘imports’, while the topic of the mobility of people rather than the goodies has not received much attention. This paper reviews the evidence of exotics materials in calculus in light of people mobility and addresses the importance of wide reference collections to ensure

stronger identifications of the remains. It discusses potential and limitations of dental calculus in the topic of people mobility and provides possible ways forward.

7      **TRANS-CONTINENTAL AND TRANS-CULTURAL MOBILITY: CRUCIBLE STEEL BETWEEN INDIA, PERSIA AND EUROPE**

**Abstract author(s):** Rehren, Thilo (The Cyprus Institute) - Alipour, Rahil (University College London) - Desai, Meghna (The Cyprus Institute)  
**Abstract format:** Oral

Ever since the emergence of modern metallurgy has crucible steel attracted the fascination of scientists and travelers alike. As a fabled material in the West, and since the crusades colloquially linked to the city of Damascus, its true nature and origin remained a mystery until the 19th century when European travelers brought back the first specimens of unworked crucible steel ingots from southern India. The triad of Indian, Persian and European actors manifested itself when in the 1820s a British geologist recorded crucible steel making in the wider Hyderabad region, where he met a Persian trader who regularly bought the local crucible steel to be sent to Isfahan. This, of course, is ironic, given that ancient Persia was the heartland of crucible steel production, with ample industrial-scale production documented in several sites in Central Asia from the 10th c CE onward, and multiple recipes recorded in Persian manuscripts.

This paper will explore the interplay of forced migration of artisans from Central Asia to southern Iran as a result of the Mongol invasion, the movement of people and goods as part of the long-distance trade of the ingots, the diachronic movement of historical recipes and reports through copying and compiling manuscripts, and the spread of the obsession with the material among both early and contemporary metallurgists. Combining historical sources, tangible remains and intangible heritage with science-based analyses we attempt to draw a mind map of past craftsmen and their perception of the properties of matter, and its interaction with human mobility through time and space.

8      **WANDERING IDENTITIES: LA TÈNE EVIDENCE IN ABRUZZI BETWEEN 5TH AND 3RD CENTURY BC**  
**Abstract author(s):** Scarsella, Elena (University of Cambridge) - Di Giovanni, Andrea (Università di Roma, La Sapienza) - D’Ercole, Vincenzo (Università Gabriele D’Annunzio, Chieti-Pescara)  
**Abstract format:** Oral

La Tène material culture is not uncommon in Central-Italy, and it is widely recognised by now that its movement must have included some migration of sort. The historically known Senones occupied indeed most of the modern Marche, including Senigallia, Ancona, and possibly the southern part of the region, until modern Ascoli Piceno. Abruzzo has usually been considered out of the reach of this movement of Central-European influence, but recent excavations may induce to re-think some of the established paradigms. In fact, Campovalano on the coastal side of the region, Bazzano, Fossa, Capestrano and other minor cemeteries of the hinterland brought to light new materials that suggest a wider distribution not only of the La Tène material culture, but also of its people. Moreover, if Campovalano shows a more pervasive distribution of La Tène material culture, including male, female and child burials, in Bazzano and in the rest of the hinterland the evidence is more scattered and made of single or out of context objects. This new and compelling framework raises new theoretical questions about the interaction of identities in Central-Italy in the final centuries of the 1st millennium BC. La Tène people moved and migrated within the complex frame of dynamic Italic identities, in the crucial years of their formation and of their interaction with the growing power of Rome, sometimes imposing, sometimes negotiating their identity. Using as a case-study the cemetery of Campovalano and comparing it to the necropoleis of internal Abruzzo, we will address the La Tène presence in Abruzzo and their impact on local identity(es).

9      **COLONIZATION AND VETERAN SETTLEMENT IN THE ROMAN PROVINCE OF MOESIA INFERIOR**  
**Abstract author(s):** Dumitrache, Iulia (University Alexandru Ioan Cuza Iasi, Romania)  
**Abstract format:** Oral

The impact of the Roman army on the limes areas is an important issue of the present historiographical debate. It stimulated drastic shifts in demography, settlement patterns, and the economics of the conquered areas. Demographic changes consisted of both emptying areas along the limes and population transfers. Although the evidence concerning the reasons for the veterans’ mobility is unfortunately parsimonious, it appears that some chose to return to their home regions, although many decided to remain in the areas in which they had served. Primarily, they were attracted by the economic opportunities offered by larger, developing towns or enjoyed social ties with people near the army camps, encouraging them to stay there after discharge, a more likely situation for the German limes, for example, while in Moesia the veterans seem more eager to join the local administrative apparatus. The main objective of the presentation is to identify the individuals in the civil milieu of Moesia Inferior that have a military background and can be included in the mobility study circumscribed to the subject. Three specific research courses should become relevant: the clustering of veterans settled in the place of discharge, the tracing of circular mobility and the mapping of veteran cases that have chosen neither their place of origin, nor their place of discharge as their residence. The results are obtained through several methods: the epigraphic investigation, focused both on military diplomas, and on stone inscriptions, providing not only information on the moment of recruitment or the military stage, but also on the life of the veterans; the prosopographic investigation, implying the use

DO THE DORIANS HAVE DNA? ADDRESSING INDIVIDUAL AND COLLECTIVE IDENTITY IN GREEK MIGRATION TRADITIONS

**Abstract author(s):** Judson, Catharine (Université Libre de Bruxelles)

**Abstract format:** Oral

The Dorian Invasion of the Aegean is a classic example of the culture-history migration story: the Dorians, attested in later historical sources, were held responsible for major shifts in material culture in the Early Iron Age (1200-700 BCE), including the introduction of cremation burial and new pottery types. Despite archaeology demonstrating a lack of cohesive evidence for such a migration, it has remained entrenched in scholarship as an explanation for cultural and ethnic changes in the Greek world. Various attempts have been made to disentangle the ancient use of the migration tradition in reinforcing contemporary collective ethnic identities of the seventh century BCE onward from modern impositions of it onto the archaeological record and the study of ancient mobility in prehistory.

This paper focuses on the lack of ethnic specificity caused by the top-down application of a Dorian identity onto the archaeological record of the Early Iron Age. The debate is approached here through a long-standing methodological problem of identifying Dorian individuals in the archaeological record, as opposed to the Dorian collective of historical tradition. Their association with the practice of cremation, however contested, has contributed to a shared assumption that there are no Dorian bodies to study as a genetic population. This was already a difficulty for early craniometric studies of the racial makeup of the post-Bronze Age Aegean, but it has also contributed to a continued lack of aDNA or isotope studies of Early Iron Age populations aimed at addressing questions of migration and mobility during this period. This paper therefore aims to address the poorly drawn boundaries between historical traditions, archaeological cultures, and genetic populations in discussions of mobility during the Early Iron Age in Greece, and to propose a new framework for approaching local identities and ethnicity in the archaeological record.

UNEASY BEDFELLOWS? (BIO)ARCHAEOLOGY, ANCIENT HISTORY, EPIGRAPHY AND THE STUDY OF MOBILITY IN THE ANCIENT WORLD

**Abstract author(s):** Voutsaki, Sofia (University of Groningen)

**Abstract format:** Oral

The growth of bioarchaeological, and especially isotopic and DNA analyses (and of course the recent refugee crisis and the heated debates surrounding the causes and consequences of migration) have brought new impetus to the study of mobility in the past. While methodological advances and the proliferation and constant refinement of scientific techniques open up exciting new research possibilities, they also bring in some problems which require more attention. These include over-specialisation, lack of communication between specialists, entrenched positions and the ensuing fragmentation of the field. In the worst case, they bring scientism, i.e. the overreliance on scientific data and the omission of the archaeological, historical and cultural context.

In this paper I would like to argue that the bioarchaeological analyses of human remains have an enormous potential in enriching our understanding of mobility and connectivity in the past. However, this potential can only be fully realised if we seriously address the problem of integration. In addition, if we are dealing with the ancient Mediterranean, integration involves bringing together not only archaeology and archaeological science, but also the neighbouring disciplines of ancient history and epigraphy. As a result, integration (or consilience) requires more than combining several methods or playing data sets against each other. It requires close collaboration at every stage – from the formulation of the research design and the sampling strategy to the final interpretation. But more than that: It necessitates reflecting on research questions which arise from separate academic traditions, employ dissimilar methodologies, use distinct procedures of verification, but also rely on different funding structures and publication cultures. I would like to offer such a reflection, using examples from the highly mobile and interconnected societies of the ancient Mediterranean.

TEMPORAL OR DEVELOPMENTAL? INVESTIGATING SOURCES OF CRANIAL SHAPE VARIATION BETWEEN A HISTORIC ICELANDIC POPULATION AND A MODERN AMERICAN ‘WHITE’ POPULATION

**Abstract author(s):** McCrane, Samantha - Meloro, Raphaela (University of Florida, Anthropology Department)

**Abstract format:** Poster

In this study, cranial variation is explored between and within two populations: a modern, likely admixed population of American individuals who identified as “White” from the William W. Bass Donated Skeletal Collection (n= 50), and a genetically conserved historic population of Icelandic individuals derived from a broader temporal span from the Harvard Peabody Collection (n=41). A geometric morphometric approach revealed significant shape differences between Icelandic and U.S. White crania for overall cranial shape (F1,89= 18.298; p=0.001), shape variation associated with size (F1,89=518.15; p=0.001), and within the individual regions of the viscerocranium (F1,89=19.449; p=0.001), neurocranium (F1,89=10.958; p=0.001), and basicranium (F1,89=15.647; p=0.001). Icelandic individuals were found to have relatively smaller crania than American White individuals, with narrower faces, shorter and wider neurocrania, and longer, more posteriorly projecting basicrania. The overall larger size of American White crania compared to Icelandic crania is consistent with documented increases in cranial measurements over time. However, the direction of cranial shape variation is contrary to previously identified Northwest to Southeast clinal trends for European populations. Environmental plasticity

during development and neutral evolutionary processes resulting from migration and admixture are considered as likely candidates for producing the observed patterns of cranial variation. Measures of fluctuating asymmetry are utilized to distinguish developmental effects. These results suggest that craniofacial shape changes can be utilized as a non-destructive means for understanding how mobility and migration has shaped morphological variation in admixed populations, and that with larger, more varied samples different European populations may be able to be distinguished geomorphometrically.

ADVANCING SKYSCAPE AND LANDSCAPE ARCHAEOLOGIES: RELATIONS WITH THE SKY. INTERACTIONS BETWEEN DISCIPLINES

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Balbi, Jose (Sec Cultura y Educacion BA Argentina; SEAC - SIAC - CAG) - Iwaniszewski, Stanislaw (State Museum of Archaeology, Warsaw) - Martz de la Vega, Hans (Escuela Nacional de Antropología e Historia)

**Format:** Regular session

One of the aspects of the relationship between archeology and cultural astronomy has been the interconnection between heavenly bodies and humans. By studying the stars and their relationship with ancient constructions, we can learn about the relationships that past human societies had with the celestial bodies and the phenomena. Understanding the sky in this way is just one way to relate human experience to the celestial landscape. Astronomically aligned constructions or topographic features provided the places where the connections between humans and the landscape were created and recreated. The sky, clouds, rain, wind, earth, and the people themselves, form a web of connections that shape their actions in the world. From our point of view, places with celestial connections have generated new assemblages (the term borrowed from Gilles Deleuze and Feliz Guattari) of objects, human and non-human, revealing various aspects of ancient cultures. Our proposal is to study landscapes from different perspectives and to give them a cultural meaning.

Adding our conclusions in each of these study areas, we will attempt an ontological understanding of the proposed archaeological context. Therefore, some of the issues that the papers in this session should address with the above criteria are: Is it possible to understand how people lived in their environment by observing and studying the landscape with astronomy or any other aspect of an archaeological site? How does technology and new techniques allow us to understand the known data? What is the ontological relationship between people and their environment?

The object of the session is to achieve a presentation of the archaeological study with multidisciplinary contributions. In which archaeological research is complemented with the contribution of other sciences and study methods in the aforementioned areas.

ABSTRACTS:

CROMLECH OF MEZORA: AN ARCHAEO-ASTRONOMICAL IN NORTH MOROCCO UPDATING IN THE SEARCH TO IDENTIFY A SOLAR CULT

**Abstract author(s):** Balbi, Jose (Colchester Archaeological Group; Dirección de Cultura y Educacion BA Argentina) - Leone, Isabel-la (SIA - Società Italiana de Archaeo Astronomia)

**Abstract format:** Oral

The Mezora cromlech, has been object of our studies for the last three years. It concerns an excavated site studied for almost two centuries in the traditional Archaeology manner in a series of expeditions which took place since 1829. It was excavated several times, sometimes in the midst of complicated war-political events, and almost always without the appropriate archaeological elements or the idea of landscape/cultural archaeology or Archaeoastronomy.

Throughout our work and studies, we have come researched by means of abundant bibliography in this regard, and our studies and opinions coincide with the ideas of one of the most prolific writers about Mezora, Enrique Gonzalbes Gravioto. Gravioto believes that in recent years there have been no new studies, and that there are no complete studies based on history, sociology and geomorphology.

Our intention is to carry out a multidisciplinary study of the megalithic group, in all aspects that made it functional throughout its history. Not only we will carry out a thorough study of the existing bibliography but our work will expose the first result of our campaign to the North of Morocco, in order to place Mezora geographically, sociologically and historically in the set of Mediterranean megalithic monuments.

We studied various Archaeo-Astronomy aspects. Our current work will try to make sense of the succession of functions with which the people of the area used it: Burial site, temple for solar worship, and the possibilities of its use in the form of other sacred aspects, meeting point, mark of political boundaries and part of the prehistoric social mobility and commerce system in North Africa.

We will conclude with a field research of the site surroundings and old known routes in order to understand and discover new architectural and functional relationships, in this exciting archaeological and cult site of North Africa.

2 **HUMAN LIFEWORLDS, LANDSCAPES AND WORLDVIEWS: ECOSYSTEMS, ANTHROPOLOGY, ARCHAEOLOGY, AND THE APPROACH OF CULTURAL COSMOLOGY**

**Abstract author(s):** Rappenglück, Michael (SEAC; Adult Education Center and Observatory Gilching)

**Abstract format:** Oral

Human life of the individual and within communities takes place under spatial, temporal, material, energetic, biological, and communicative living conditions. They are differentiated in ecosystems. The natural conditions of life are extended by the specific anthropological characteristics and the cultural frameworks during the unfolding of human evolution. Lifeworld includes the subjective view and construction of the ‘world’ based on living conditions. Different lifeworlds to a certain extent correspond to a plurality of ontologies, representing perspectives of human communities/societies on the respective ecosystem. Cultures living close to their ecosystem regardless of the epoch, perceive the environment as co-environment differently than cultures that define themselves more at a distance from nature and see co-environment as environment. Archaic cosmologies contain essential elements significant for archaeology. The phenomena of the respective ecosystem are perceived with all available senses and their processing can be qualitatively different from today’s scientific-technical cultures. Events, places, rhythms, corporeality, mobility, and sedentariness, tuning, sense of place and time, orientation essentially shape the conception of spatio-temporal phenomena (‘the landscape’, including ‘seascape’, ‘skyscape’ ‘forestscape’ etc). The 3D perception (sky and air, mountains, caves, depth of the sea) leads to other spaces of cosmic experience. The lifeworld is understood as a cosmic living being, a network and interplay of polar forces and events. Ancestors and archetypal entities influence from other spheres (‘spiritscapes’). Cosmologies enabled ideas about orientation, modes of existence, socio-political order, the why and wherefore, assessments, and spirituality shared by social groups co-evolving with changing ecospheres, tangible in archaeological relics. Examples from different cultures provide an overview of the approach of Cultural Cosmology. The transdisciplinary methodology combines phenomenology, hermeneutics, semiotics, systems theory, and assemblage theory methodologies with content of comparative mythology, four-field anthropology, religious studies, ecology, and astronomy.

3 **OM HAIL! SOME STORIES ABOUT THE BASIC PROBLEM OF ARCHAEOLOGICAL WORK IN ASIA: CYCLICAL TIME VS. LINEAR NOTIONS OF TIME**

**Abstract author(s):** Lange, Perry (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

What is a memorial, how authenticity is perceived and what meanings the concepts of linear and cyclical time perception have in this context, is of great importance for the understanding of cultural heritage in Europe and Asia. Both time concepts have a direct impact on the perception of monument protection and cultural heritage. The perception of time is shaped by two phenomena. First there is the very personal experience of a linear, continuous and consciously perceptible development, such as the changes in aging, growing up with their “breaks” and “new beginnings”. But time has always been perceived as a cyclical phenomenon in which changes are repeated with great constancy. Both phenomena, the linear time and the cyclical time, have accompanied mankind from their beginnings and are, in their complexity, decisive cultural catalysts for religious and philosophical questions - until today.

The practical work in Nepal has repeatedly and directly led to irritations in the communication between European and Nepalese experts, employees and institutions when it comes to the question of the value of historical material culture. One reason for these problems is the, in part, significantly different levels of meaning that are assigned to the concept of authenticity.

Why is something “old” valuable when it can - with perfect craftsmanship copied - shine in new splendor? And why should an object, space or artifact become more valuable if it is frozen and preserved exactly in its current state? The historical background for the different understanding of monuments in Asian and European consciousness could be explained in the previous chapter on the importance of the cultural influences of linear and cyclical time perception. The lecture deals with the experiences from over five years of work at one of the oldest temple sites in Nepal, the Anantaliṅgeśvara Mahādeva in the Kathmandu valley.

4 **SKYSCAPES OF FBC MEGALITHIC LONG BARROWS IN SOUTHERN KUYAVIA**

**Abstract author(s):** Iwaniszewski, Stanislaw (Arqueologia Escuela Nacional de Antropologia e Historia - Instituto)

**Abstract format:** Oral

On the south-eastern edge of the Kujawy Upland, within the area of the gentle undulating morainic uplands cut by numerous glacial tunnel valleys and kettle holes, there are several sites with Funnel Beaker Culture unchambered long barrows.

Monumental structures in the form of elongated earthen mounds flanked by stone rows and sometimes with added wooden ritual structures were set in drier and higher locations overlooking the immediate surroundings, which in conditions of development of more or less permanently deforested areas could have contributed to the establishment of new concepts of social space. It can be presumed that when the forest cover disappeared, the long barrows would have become visible from the surrounding landscape, and simultaneously, the sites with monuments would have offered wide-ranging views in several directions. On the other hand, the tendency to place tombs in specially selected locations might have produced an opportunity to deliberately orient them towards the four cardinal directions and the phenomena observed in the sky.

The paper explores the skylscapes of FBC long barrows at the Izbica Kujawska microregion, involving Obalki, Wietrzychowice, Gaj and Lubomin Poduchowny. It suggests that those who erected the structures embedded within them directions that linked to celestial horizon events.

5 **LA MUCULUFA RECONSIDERED: LANDSCAPE AND HORIZON ASTRONOMY AT A CASTELLUCCIAN SANCTUARY ON SICILY**

**Abstract author(s):** Orlando, Andrea (Istituto di Archeoastronomia Siciliana) - Riorden, Elizabeth (University of Cincinnati)

**Abstract format:** Oral

During the 1980s Prof. R. Ross Holloway of Brown University (USA) and his team excavated an Early Bronze Age site situated in a dramatic rocky cleft at a place known as Muculufa (territory of Caltanissetta). Holloway found a terrace and depositional trench filled with the remains of ritual feasting, including masses of painted pottery of exceptional quality. Many disturbed Castelluccian rock-cut tombs lined the southeast-facing escarpment running west of the terrace “sanctuary.” Holloway also identified a settlement on the slopes southwest of the sanctuary; during the 1990s his disciple Prof. Brian E. McConnell expanded excavation at the terrace and focused on the settlement, where he found more distinctive pottery of the same type. Although Holloway did not hesitate to call the feasting terrace in the cleft a “sanctuary” of regional importance, he never posited an additional skyscape rationale for its location. McConnell remained agnostic on the ritual nature of the terrace area.

Given recent studies on the cognitive agency of landscape features and sky interactions during prehistory, the authors proposed an investigation of the phenomena visible from the terrace, with a reassessment of the possible meaning conveyed by the painted pottery and other artifacts found at Muculufa. Preliminary results are encouraging: at the summer solstice 2020 the sun was documented rising between distant Etna and another peak, in alignment with the cleft. The pottery contains icons of the sun rising between two mountains and the face of the “owl” type goddess figure so widely spread during the 4th to 2nd millennia BCE. Many questions remain including 1) was Muculufa, easily accessible from the south coast of Sicily, a super-regional cult place? (mysterious bone amulets of Castelluccian origin have been found as far away as the Argolid and Troy); and 2) what was the connection between solstice, tombs, terrace and settlement?

6 **SKYSCAPE ARCHAEOLOGY: ARCHAEOASTRONOMY TURNED ONTOLOGICAL**

**Abstract author(s):** Silva, Fabio (Bournemouth University)

**Abstract format:** Oral

Though as old as archaeology, archaeoastronomy still lacks frameworks underpinning its data collection, descriptions and interpretations. Without a cohesive body of theory, archaeoastronomical studies can look like a theoretical potpourri. Its quantitative methods and overemphasis on explanation align it with processualism; whereas its aspiration to tap into societies’ cosmologies and worldviews is more allied to post-processualism. However, any attempt to realign the archaeoastronomical endeavour with any of these labels would now be not only outdated and anachronistic, but backwards-looking.

Anthropology has been turning to alternate ontologies which have led to new theoretical approaches and explorations. One such approach is the Ontological Turn, which involves asking ontological questions, rather than taking ontology as the answer (Holbraad and Pedersen 2017). It gives primacy of place to the world(s) experienced by the societies being studied, but the onus is on the scholar to change their conceptual toolbox in order to conceive those other world(s) in the same way those societies did (Henare et al 2007). The skyscape, as the element of a society’s world(s) that includes the clouds, the atmosphere, the sky and the celestial objects (Silva and Campion 2015), can also be explored ontologically.

This talk will introduce the Ontological Turn as a method that can not only be adopted for archaeoastronomical studies but, as will be argued, should become a cornerstone of skyscape archaeology. It will discuss the three pillars of the ontological turn – reflexivity, conceptualisation and experimentation – and, using examples from prehistoric Europe, explain some of the ways they can be deployed to overcome the western biases and anachronisms that still plague archaeoastronomical studies.

7 **EXPLORING SKYSCAPE AT KARANOVO, BULGARIA**

**Abstract author(s):** Iwaniszewski, Stanislaw (Arqueologia Escuela Nacional de Antropologia e Historia - Instituto) - Maglova, Penka (Bulgarian Academy of Sciences, Space Research and Technology Institute, Stara Zagora Department) - Stoev, Alexey (Yuri Gagarin Public Astronomical Observatory, Stara Zagora)

**Abstract format:** Oral

Karanovo is an impressive tell type settlement located at the foothills of the Sărnena Sredna Gora Mountains, in the fertile valley of the Azmak River, a tributary of the Maritsa river, Bulgaria. This impressive tell has accumulated 12.4 meters of cultural stratigraphic layers, each with various occupation levels from the early Neolithic Karanovo I to the Bronze Age Ezerovo-Karanovo VII phase. Like other tells, Karanovo exhibits an ordered and repetitive pattern of the houses’ continued rebuilding in the same place with the same specific grid street orientation. Though there were minor deviations from its unique street layout in later phases, the separate houses that were continuously built one on top of the other at different times generally shared their master orientation.

Using the skyscape archaeology approach, we examine Karanovo street grid orientation and its relationship with the site’s surroundings. We acknowledge that buildings’ orientation might be governed by specific environmental concerns such as the direction

of prevailing winds, solar radiation, heat absorption, and light penetration. We conclude that equally important were astronomical alignments linking structures with the outside world elements such as celestial objects or specific points on the landscape.

8 REACHING OUT FOR (NEW) OLD HORIZONS ALONG THE ATLANTIC FAÇADE

**Abstract author(s):** Mom, Vincent (Digital Preservation Project Foundation) - Higginbottom, Gail (El Instituto de Ciencias del Patrimonio - Incipit, CSIC)

**Abstract format:** Oral

In this paper we are comparing our research results on megalithic monuments from Neolithic Iberia and Bronze Age Britain. In particular, we are investigating the choices of monument location and the connections between monuments and astronomical phenomena. This comparison is done not so much as proof of concept relating to the migration of cultural ideas (due to the chronological differences), but at least to fathom something of the possible underlying philosophical similarities between these two sets of monuments from these differing regions: specifically, the considerations taken by builders in the creation of these monuments. Last year at EAA-SEAC, we revealed that the islands of Islay and Jura appeared to focus on particular lunar events that were different to those found in other areas nearby in western Scotland. It seems that similar lunar targets exist for the dolmens of Iberia. This presentation will review these similarities and also demonstrate how observing and studying the landscape in relation to the associated astronomy has revealed possible life-style activities and preferences as well as belief systems related to these and their environment.

9 THE ONTOLOGY OF THE ANCIENT MAYA THROUGH THEIR DEAD. THE ORIENTATIONS OF THE BURIALS OF TIKAL, GUATEMALA

**Abstract author(s):** Martz de la Vega, Hans - Grecco Pacheco, Daniel (Escuela Nacional de Antropología e Historia, México) - Mejuto González, Javier (Universidad Nacional Autónoma de Honduras) - González Morales, Cecilia (Universidad Tecnológica de México)

**Abstract format:** Oral

The Maya of the Classic Period (250-900 AD) devoted significant effort to the spatial arrangement of their cities. The principles focused on fundamental and symbolic classification systems, on landscape physiognomic properties, and on cyclical and regular movements of celestial bodies. The latter were the ones that indicated the coherence of the universe. Thus, it was for this reason that astronomical phenomena formed a common reference plane for processes and events. In this way, the definitive directions of space; that is, the north, south, east and west were decisive for his life. But also for their death because they guided, under the same principles, their dead's remains. On this occasion we will present a sample of the burials of Tikal, from the Guatemalan Petén. Tikal was one of the most powerful Mayan cities of antiquity, being therefore, the target of a large archaeological project (1956-1970), the Tikal Project of the University of Pennsylvania. The archaeological record of this project provides the data of a considerable amount of burials allowing a statistical study of the orientation preferences of some archaeological contexts and their possible spatial interpretation.

10 ASTROMORPHS IN THE HONDURAN ROCK ART: A PRELIMINARY STUDY

**Abstract author(s):** Mejuto, Javier - Rodas-Quito, Eduardo (Universidad Nacional Autonoma de Honduras)

**Abstract format:** Oral

This paper presents the preliminary analysis of two archaeological sites of rock art in Honduras, in particular the study focuses on the existence of astromorphic motifs, that is, a figure of rock art whose shape or appearance reminds of a celestial body, a set of them or an astronomical event. The works were carried out in two important rock shelters in Honduras. The first one is Ayasta, one of the most profuse both in petroglyphs and in a variety of patterns in clear danger of destruction and the rock shelter of Santa Elena, which contains one of the few examples of feathered serpents in the entire country. Despite the fact that these places have been the object of archaeological studies, there has been no bibliography or attempts to analyze the motifs that appear in this work. Therefore, after an analysis of the local horizon together with possible recordable astronomical events according to dating, we can infer the plausibility that these astromorphs are records of celestial events.

11 K’ATUNSCAPE: A LANDSCAPE MODEL BASED ON THE K’ATUN AND K’ALTUUN IN TIKAL, PETÉN

**Abstract author(s):** Martz de la Vega, Hans - Grecco Pacheco, Daniel (Escuela Nacional de Antropología e Historia, México) - Mejuto González, Javier (Universidad Nacional Autónoma de Honduras)

**Abstract format:** Oral

The Classic Period Maya (250-900 AD) had a political organization rooted in worldview and time cycles. Time was cosmic order and its registry gave coherence to the universe. This record of time was made through a complex meshwork of calendrical cycles and regular celebrations. It is known as the Long Count and it started from a fundamental unit that was the day (k'in), which was a living being, deeply linked to a variety of myths. Thus, the cycles and their entities governed all existing things. The fourth cycle was perhaps the most important of the long cycles, the k'atun or 7200 days, since after its ending, carved stelae of the rulers in turn were raised in the places of greatest power. The cycles were related to a complex geopolitical organization, which in Tikal, one of the most powerful cities, had its maximum expression. In this case, in addition to raising the mentioned k'atun ending stela, they built a

representative stage of the katunic world. Thereby, we based on Tim Ingold's ideas of meshwork and the life of lines, Felipe Criado's xscapes and Fabio Silva's skyscape, to propose that the contexts of the k'atuns, that we will describe as a "k'atunscape". The other ritual component related to the end of k'atun was the k'altuun ("covered stones, or wrapped"); consisted in covering and wrapping stelae and monuments, leaving a kind of bundle that left a part of the context hidden from view. We will discuss the meaning of the time wrapping for the mayans and, finally, the intrinsic relationship between the rulers or ajaw and the elements and beings of the cosmos through time as a fundamental tool for the exercise of political power it is also proposed.

12 INDIGENOUS ASTRONOMICAL FOOTPRINTS IN THE ROMAN TEMPLE OF PIEDRAS LABRADAS IN JARILLA (CÁCERES, SPAIN)

**Abstract author(s):** Rodríguez Antón, Andrea - González-García, Antonio César (Incipit - Institute of Heritage Sciences)

**Abstract format:** Oral

In this work we present the results of an archaeoastronomical study of the little known Temple of Piedras Labradas in Jarilla (Cáceres, Spain). More than 1000 m above the sea level, this temple was built by the Vetons and/or Lusitans (indigenous peoples of Celtic cultural substratum). On that point, they may have venerated astral gods or deities linked to natural forces, as argued by some authors. The temple and the sacred area was later appropriated by the Romans and assimilated in the new-founded nearby town of Capera.

The study of the archaeological material remains together with the orientation and location of this monument point towards the use of the Celtic start-of season feasts in the construction of the local landscape, and its latter assimilation by the Romans. Similar patterns have been previously found in several Iron Age and Roman settlements in Western Europe and the Iberian Peninsula. The present results contribute to elucidate the origin and nature of the cults in this place and the gods worshiped in it, still under discussion. Finally, these results aim at a better understanding of the pre-Roman religious traditions in this area of the Central Mountain Range in western Spain.

13 THE SKY ON EARTH: FIRST ARCHAEOASTRONOMICAL APPROACH TO THE PRE-HISPANIC MOUNDS OF THE URUGUAYAN LOWLANDS (ROCHA, URUGUAY)

**Abstract author(s):** González-García, Antonio César (Institute of Heritage Sciences, Incipit-CSIC) - Gianotti, Camila - Gazzán, Nicolás - Cancela, Cristina - Sotelo, Moira (Universidad de la República)

**Abstract format:** Oral

The development of different mound architectures in South America appears in distant ecological regions and with clear ethnic differences. We could highlight the Amazonia, the Moxos lowlands, the Paraná delta, the Uruguay and southern Brazil wetlands and the southern Atlantic coast and sierras. It is generally understood that this phenomenon materialized the establishment of communal ways of organization, the emergence of social complexity and the increase of population. These changes have been interpreted as a part of the domestication process of their environment that rendered singular archaeological landscapes.

Different social, productive and economic hypothesis have been put forward to explain the complex location, distribution and orientation patterns that these architecture displays. Recently, the recurrent and consistent spatial orientation found at the groups of mounds in Uruguay paved the way to new hypothesis that recognize other knowledge related to their ecologic environment, location and distribution.

The present study shows the result of an archaeoastronomical investigation on the orientation and location of the mounds in five sites at the Rocha department (Uruguay). We discuss the coherent orientation of these groups of mounds in relation with certain asterisms such as the Southern Cross or the Milky Way and celestial bodies such as the full moon after winter solstice. The results allow discussing how the perception and knowledge of celestial phenomena c. 3000 BP could have played a key role in the organization of space and time among these pre-Hispanic societies. Besides, some results gain particular relevance when contrasted with ethnographic, ethno-historic and archaeological information for other groups in the Southern Hemisphere. This preliminary approach prompt us to conclude that the skylore and the particular perception of time and Nature's cycles linked with flood and drought periods were part of a holistic technology that allowed these peoples to live in these wet ecosystems.

14 RESCUE ARCHAEOASTRONOMY. AN ARCHAEOASTRONOMICAL STUDY OF THE EMERGING MEGALITHS IN GUADALPERAL (EL GORDO, SPAIN)

**Abstract author(s):** Rodríguez-Antón, Andrea (Incipit - Institute of Heritage Sciences)

**Abstract format:** Oral

In the summer of 2019 an extraordinary drought rescued for a few weeks the dolmen of Guadalperal (El Gordo, Extremadura, Spain), an impressive megalithic monument which was submerged for nearly six decades under the waters of the Valdecañas reservoir, built in 1963 under fascist Franco's regime. Discovered and excavated by Hugo Obermaier between 1925 and 1927, the dolmen has been called the Spanish Stonehenge by the international press, from China to USA, although Guadalperal is a different construction to the iconic English monument. It belongs to a small sample of isolated, bigger and more complex megaliths in the Tagus basin, (compared to the smaller tombs grouped in necropolises in Extremadura and Portugal) which are in general little known because some of them are also in the flooding area of reservoirs. Since the first publication of Georg and Vera Leisner in 1960, little research has been done in Guadalperal due to the short and exceptional periods of visibility. In this work I present the results of the first archaeoastronomical

THE SKY ABOVE MACHU PICCHU OR: ON REAL AND IMAGINED INCA OBSERVATORIES

**Abstract author(s):** Ziółkowski, Mariusz (Centre of Precolumbian Studies, University of Warsaw) - Kościuk, Jacek (Faculty of Architecture, Arts and Technology, Wrocław University of Science and Technology)

**Abstract format:** Oral

In the paper we will analyse the possible astronomical function of some structures and architectural ensembles of the Llaqta of Machu Picchu and some of its satellite sites. We will devote particular attention to the so called “Mortar room” and to the structures of Intimachay and Inkaraqay.

The Mortar room (Sala de los Morteros) is one of the buildings at Machu Pichu to which an astronomical-calendar function has been attributed. The most elaborate hypothesis was that of Eulogio Cabada , who based it on a series of photos and measurements taken in 2006-2007.

However, the precise reconstruction of the whole complex of buildings, based on 3D measurements and digital modelling as well as other series of photos, showed that in Inca times the Sala de los Morteros could not have fulfilled the postulated astronomical function.

One of the main challenges was the presence of ceilings, which made it impossible to illuminate one of the mortars and limited the illumination possibilities of the other. The same reasons made it impossible to use the mortars as mirrors for reflective astronomical observations as well as for zenithal observations of celestial bodies. On the other hand, our recent analyses of Intimachay and Inkaraqay show not only their function as astronomical instruments as such (which we have already discussed in our previous publications) but also some interesting traces of re-adaptations, probably due to the need to correct some construction errors that limited their practical use.

EVALUATION OF LIGHT AND SHADOW INTERACTION OF AN INCA SANCTUARY IN STELLARIUM

**Abstract author(s):** Zotti, Georg (Ludwig Boltzmann Inst. f. Archaeological Prospection and Virtual Archaeology) - Malville, Kim (Department of Astrophysical and Planetary Sciences, University of Colorado) - Gullberg, Steven (University of Oklahoma)

**Abstract format:** Oral

In the mid-15th century, the 9th Inca ruler, Pachacuti, established several royal estates, among them Ollantaytambo in the Urubamba valley. The water temple of the Incamisana is probably the most explicit expression of the Inca interpretation of the world which was animated from the combination of stone, water, and sunlight. Its western wall was illuminated by the rising sun, watered by many fountains and channels cut into the rock, and extensively sculptured to become a huge huaca, interconnected by flowing water.

A special place is the Inticcahuarina, where the shadow of a cylindrically carved-out protruding stone acting as horizontal gnomon has been reported to move into a V-shaped notch in the carved stone ledge below around December solstice. Another such gnomon’s shadow appears to do the same, but the right half of the corresponding notch seems to have been destroyed.

It is well known that the Inca have worshipped the sun, and they have left a multitude of carved rocks which deserve analysis also by observation of light and shadow effects during the seasons, however extended stays required for observations depending on seasonal changes are often not possible. The open-source desktop planetarium program Stellarium has been extended in particular to analyse virtual 3D models with respect to astronomical orientation and light and shadow interaction, so that analysis of these seasonal changes can be done mostly with computers off-site.

During a short touristic visit one of us (GZ) has taken a series of photographs from which a 3D model could be produced which was however neither scaled nor oriented without proper survey. The only hint at orientation were the shadows of the cliff and gnomons recorded in the timestamped photographs. This presentation will provide some insights into the modelling and analysis process.

LANDSCAPE AND SKYSCAPE AT LARK HILL, NEAR STONEHENGE, IN THE LATER NEOLITHIC

**Abstract author(s):** Chadburn, Amanda (Historic England) - Ruggles, Clive (University of Leicester) - Leivers, Matt (Wessex Archaeology; Cultural Heritage Institute, Royal Agricultural University)

**Abstract format:** Oral

Although the Stonehenge World Heritage Site (WHS) is one of the most archaeologically-studied landscapes in the UK, it still has the power to surprise. Recent years have seen the discovery of Neolithic houses, West Amesbury Henge and an Avenue leading to the Durrington Walls Southern Circle. More recently in 2016, an unexpected Early Neolithic causewayed enclosure was discovered just to the north of the WHS boundary, on the chalky ridge known as Lark Hill which gave its name to the nearby garrison town of Larkhill. Archaeologists found the north-eastern circuit of a causewayed enclosure, along with lines of prehistoric posts, and enormous natural sink holes which were visible in prehistory.

About a millennium after the construction of the Lark Hill Enclosure, a line of at least six timber posts was erected over the old ditch – and the last three posts in the line faced out precisely and directly towards the position of June solstice sunrise in 2500 BC. There are several reasons for believing this solstitial alignment was intentional and meaningful, and it may even have represented

the “monumentalisation” of a broadly solstitial alignment of natural features, as has been suggested at Stonehenge itself, and may also have been the case at Durrington Walls.

This paper explores the relationship between the natural and built landscapes and the sky at this recently discovered site, with reference to other monuments in the wider area and how we interpret the landscape/skyscape as a whole in the Neolithic and Early Bronze Age.

EBB & FLOW: EXPLORING RIVERS FROM PREHISTORY TO THE PRESENT DAY

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Nimura, Courtney (University of Oxford) - Evans, Christopher (Cambridge Archaeological Unit/University of Cambridge) - Skoglund, Peter (Linnaeus University) - Schulting, Rick (University of Oxford) - Cooper, Anwen (Cambridge Archaeological Unit/University of Cambridge)

**Format:** Regular session

From prehistory to the present day, evidence for the practical, political, economic, and cosmological significance of rivers abounds. Rivers flow, so can move people and objects. They are niches, providing food and water for humans, plants, and animals alike. To say that rivers have always been essential to life is an understatement. As both potential corridors and territorial divides, they are entangled with the communities living around them. This session aims to think about the many different roles that rivers have played throughout time and think holistically about rivers as active agents with the capacity to shape human behaviour. With this aim in mind, this session has no chronological or geographical parameters, in order to facilitate an inclusive discussion.

We welcome case studies that investigate any number of topics, including rivers as borders that divide regions; routeways that connect people and promote human and object mobility; and places to conduct specific types of cultural activity. Rivers are particularly diagnostic of and sensitive to physical and anthropogenic forces, so they are ideal archaeological records and can be studied using a variety of methods. We therefore welcome case studies that highlight different proxies that can be used to evaluate human-river interaction and the scientific/archaeological/geological analysis techniques we can employ to inform our understandings. Central to this session is the goal to explore the theory of interpreting the archaeology we find in, on, and around rivers; to move past interpreting human and river interaction as a set of cause-and-effect behaviours and instead consider it as a complex and entangled relationship.

ABSTRACTS:

DOWN BY THE RIVER IN LATER PREHISTORIC BRITAIN

**Abstract author(s):** Nimura, Courtney - Schulting, Rick (University of Oxford) - Sturt, Fraser (University of Southampton) - Snoeck, Christophe (Vrije Universiteit Brussel) - Green, Chris (University of Oxford) - Cooper, Anwen (University of Cambridge)

**Abstract format:** Oral

Rivers have long captivated human imagination. The source of food and water, the sites of religious and ritual activities, and the inspiration for novels and myths – rivers have always been part of human experience. The later prehistory of Europe (c. 2500–400 BC) was a period of unprecedented pan-European mobility in which water travel increased and people and objects, and the ideas that they held, were circulating widely. Here we encounter a changing world, one in which the centrality of rivers comes to the fore. This is the focus of the Leverhulme-funded project ‘Ebb & Flow: Exploring rivers in later prehistoric Britain’. In this paper, we present ongoing work from this two-year project (2020–2022) revolving around three themes that lead us into many areas of later prehistoric life: rivers have entangled physical and cultural histories, rivers are magnets for people and things, and rivers move people and things. We will discuss a range of evidence currently being analysed by the project, from strontium isotopes along the Hampshire Avon to the distribution of material culture around the Ribble, Great Ouse, and Nene to the new mapping of palaeochannels across our case study catchments.

HOSTY. THE NODAL POINT OF THE EARLY BRONZE AGE ROUTE ON THE RIVER VLTAVA IN BOHEMIA

**Abstract author(s):** Hlášek, Daniel (Institute of Archaeology of the Czech Academy of Sciences, Prague) - Břicháček, Pavel (West Bohemian Museum in Pilsen) - Eigner, Jan (National Museum in Prague) - Ernée, Michal (Institute of Archaeology of the Czech Academy of Sciences, Prague)

**Abstract format:** Oral

In prehistoric Europe, water routes played a crucial role in the distribution of artefacts, ideas, and people themselves. Undoubtedly, large watercourses affected many aspects of the lives of the communities of that time, from purely practical ones (such as the source of water, livelihood and raw materials, the possibility to be used for economic transport) to symbolic ones (difficult to be documented archeologically, but known from comparative mythology). One of the numerous examples may be the significance of the river Vltava in the Early Bronze Age. The Vltava was an important part of the long- distance route connecting the area of the Únětice culture, which dominated the Central European area, with the Southern areas, with important exploited sources of copper, among other things, in the Eastern Alps. The importance of the Vltava is evident from the close connection of Early Bronze Age settlements

3 to its watercourse. The superregional nature of the route can also be well illustrated by the settlement of Hosty at the confluence of the river Vltava and the river Lužnice, which can be seen through its landscape context, with a concentration of many hillforts, flat settlements, burial mounds and hoards. It is considered an important nodal point of the Central European trade network of the Early Bronze Age. The history of research at this site was also influenced by the river Vltava itself: specifically, by raising the level of the Kořensko reservoir, which was constructed in connection with building of the Temelín Nuclear Power Station. The systematic archaeological research, which took place at the site in the 1980s, is currently being evaluated. The current state of knowledge of this important locality mentioned above will be the focus of the presentation.

### 3 ON THE MOVE: ROUTEWAYS, NETWORKS, AND MEETING PLACES FROM COAST TO INLAND

**Abstract author(s):** Nimura, Courtney (University of Oxford) - Skoglund, Peter (Linnaeus University)

**Abstract format:** Oral

In this paper, we will explore the relationships between coastal and inland rock art in southern Scandinavia. Traditionally, the expressive and vivid rock art panels along the coasts of southern Sweden have attracted the most interest, while the rock art inland has garnered less attention. Based on field studies around lake Vänern and lake Vättern and adjoining river systems, we will include both inland and coastal sites to propose that these larger lakes and adjoining water systems could be seen as parts of routeways that connected people and promoted mobility. The high quantity of images concentrated at certain coastal locations, in combination with their more outspoken narrative character, indicates that coastal and inland places held various functions. We propose that they could have functioned as meeting places and aggregation sites, which served different functions in a larger communication network. We explore how the lakes and rivers of inland Sweden promoted mobility and interaction, but also discuss how they presented obstacles for those living by the sea.

### 4 FROM THE SOURCE TO THE SEA. BRONZE AGE WET-LAND AND RIVER DEPOSITS - CHANGES IN TIME AND SPACE

**Abstract author(s):** Beck, Malene (Østfyns Museer) - Frost, Lise (Moesgaard Museum)

**Abstract format:** Oral

In recent years the Museums of Eastern Funen (DK) have experienced a growth in Bronze Age wetland deposits. Intensive agricultural land use, also of former wetlands and meadows, combined with a growing interest in metal-detecting have brought several new finds to the light. In January 2020 the discovery of a deposit of female jewellery (Late Bronze Age period V) led to a small excavation and the rare opportunity to demonstrate a direct link between the find spot and a spring which fed the second largest river on Funen.

Both the new and old finds in the area indicate the significance of water – in various forms – relative to deposits. Moreover, issues related to landscape studies, place continuity etc. initiated a study of Bronze Age deposits and their changes in time and space on Eastern Funen. The area is rich in Bronze Age deposits, but no one has attempted to look at their context as regards to closer studies of the different landscape elements and relations to the rivers and wetlands in the region.

Initial studies indicate a connection between certain kinds of deposits and certain landscape affordances such as wetlands and specific parts of rivers. Some rivers seem to have attracted the attention for all kinds of offerings throughout the Bronze Age indicating place continuity through time, while others only seem to be used in a more restricted manner e.g. only in a shorter time span or for certain types of offerings.

Could these differences be explained by changes in the physical appearance of the rivers or parts of rivers, closeness to other relevant landscape elements or the relation to the sea? Or do they reflect changed settlement patterns and land use through time? These are some of the questions the study tries to answer.

### 5 WATERWAYS NETWORK AND ANCIENT COMMUNITIES AT THE FOOTHILLS OF THE OUTER EASTERN CARPATHIANS (ROMANIA)

**Abstract author(s):** Bolohan, Neculai („Alexandru Ioan Cuza” University of Iași)

**Abstract format:** Oral

Watercourses have become a leitmotif of archaeologists as they try to explain many of the smaller or larger histories of prehistoric communities. Apparently, the presence on the map of a river seems to represent the framework of a perfect model of approach that includes topography, possible living patterns, cultural features and a possible narrative.

On this occasion I will present a case study, which includes various observations on the role of a minor watercourse for a succession of prehistoric communities. This beginning of the narrative is focused on field survey carried out in a river basin located at the foothills of the Eastern Carpathians. The results obtained by relating several categories of observations tend to draw models of human relationship with the environment specific to different chronological levels (Chalcolithic, Bronze Age, Iron Age). For this I realized a path that included the acquisition of data from the field, understanding how natural topography influenced the arrangement and movement in the workspace, using data on the occupied environment and making predictions about water management. Older models as well as current living models seem to be built by joining roads and waterways. Some models of riparian settlement and community relations identified for the ancient times have survived to historical periods and prove the durability of successful behavior.

### 6 RIVER MOBILITY IN THE BELGIAN SCHELDT AND MEUSE BASINS

**Abstract author(s):** Dalle, Sarah (Department of Archaeology, University of Ghent; Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Snoeck, Christophe (Research Unit Analytical, Environmental & Geochemistry, Department of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Capuzzo, Giacomo (Anthropology and Human Genetics, Department of Biology of Organisms and Ecology, Université Libre de Bruxelles) - Hlad, Marta (Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Anthropology and Human Genetics, Department of Biology of Organisms and Ecology, Université Libre de Bruxelles) - Sabaux, Charlotte (Department of Archaeology, University of Ghent, Belgium; Anthropology and Human Genetics, Department of Biology of Organisms and Ecology, Université Libre de Bruxelles) - Salesse, Kevin (Anthropology and Human Genetics, Department of Biology of Organisms and Ecology, Université Libre de Bruxelles) - Sengeløv, Amanda (Anthropology and Human Genetics, Department of Biology of Organisms and Ecology, Université Libre de Bruxelles; Department of Archaeology, University of Ghent) - Stamataki, Elisavet (Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Anthropology and Human Genetics, Department of Biology of Organisms and Ecology, Université Libre de Bruxelles) - Veselka, Barbara (Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Research Unit Analytical, Environmental & Geochemistry, Department of Chemistry, Vrije Universiteit Brussel) - De Mulder, Guy (Department of Archaeology, University of Ghent)

**Abstract format:** Oral

Rivers are essential corridors that enabled people to navigate faster through the landscape than over land, especially before the construction of a reliable road network. The distribution of archaeological sites in Belgium suggests that people shaped the human landscape to large extent around access to these highways. This makes human-river interactions a vital study target in a landscape approach to mobility.

In this Belgian study, strontium (Sr) isotopes and concentrations from human cremated bone acquired in the framework of the CRUMBEL project allow us to assess how populations’ mobility was influenced by the presence of rivers, using the distribution of the sampled cemeteries as a starting point. The main objective is to investigate how closeness to rivers correlates to variability in the Sr record and if this effect of rivers is similar or different in the two dominant river basins in Belgium (i.e. the Meuse and Scheldt river basins). Natural variability in the bio-available strontium complicates this approach and has to be taken into account. The study aims to analyse where in the landscape rivers did or did not facilitate people to travel and how this changed over time. Seeing the abundant availability of human bone from the Metal Ages and Gallo-Roman Period, the primary focus of this paper lies on shifts between these two periods.

### 7 DYNAMIC ASSEMBLAGES AND EMBODIED FLOWS: HUMAN-RIVER ENTANGLEMENTS IN THE MESOLITHIC

**Abstract author(s):** Živaljevic, Ivana (Biosense Institute, University of Novi Sad)

**Abstract format:** Oral

With the global glacier retreat at the onset of the Holocene, unconstrained drainage systems gradually became colonized by a myriad of species – aquatic plants, fish, molluscs and water fowl, as well as humans who made their lives along flowing water. The clustering of a number of Mesolithic sites – e.g. along the Muge and Sado valleys in Portugal, in the Danube Gorges of the North-Central Balkans, and in the Dnieper Rapids region in Ukraine – reveals a close connection with riverine environments, through seasonal visits, more permanent settlement, or in the events of the burial of the dead. Numerous archaeozoological, stable isotope and lipid residue analyses indicate that aquatic food sources constituted an important part of the diet, insofar that the term ‘fishers’ rather than ‘hunter-gatherers’ is perhaps more accurate when describing many early-mid Holocene communities in Europe. While Mesolithic research has been firmly embedded in the study of the environment, it was primarily conceptualized as a resource to be exploited or a passive backdrop to human activity. In more recent times, the paradigm shift known as the Ontological Turn afforded new ways of thinking about actors and material worlds whose properties do not simply exist, but emerge through mutually constitutive relationships. With their constant flow and ever-changing form, shifting between the seasons of freezing and flooding, pulsing with life during migratory fish runs, shaped by human agency and shaping human experience of the world, the rivers quite literally embody the vibrant nature of entanglement. Far from being one-sided, or two-sided even, these interactions were interwoven with the dynamics of the ecosystem as a whole, eliciting various multispecies responses. In this paper, rivers flowing through Mesolithic worlds are considered as socialized landscapes, mediums which afforded specific experiences and interspecies encounters, and as dynamic assemblages of beings and abiotic actors.

### 8 A PASTORAL IDYLL: PREHISTORIC ANIMAL HERDING ALONG THE DANUBE FROM A STABLE ISOTOPE PERSPECTIVE

**Abstract author(s):** Gillis, Rosalind (ICArEHB, Universidade do Algarve, Faro)

**Abstract format:** Oral

The Danube has played an important role in the evolution and development of farming societies through time and space since their arrival in the late 7th millennium BC. This has been recognised by prehistorians, for example V. Gordan Childe and his use of ‘Danubian’ to describe the first farmers of Central Europe. Furthermore, ‘Danubian’ is often used to describe one of the main routes for the

spread of Neolithic communities bringing with new subsistence and cultural practices into Europe from Anatolia. During the late 6th /early 5th millennium BC settlements were located close to the Danube and its tributaries providing a fruitful environment to sustain and facilitate the development of complex societies. Stable carbon and oxygen isotopic measurements of incremental bioapatite samples from teeth can provide detailed information about seasonal herding practices. These values can also provide an insight into past environments and how communities used them to raise their animals, who were integral part of their subsistence economies. This presentation will provide a review of stable isotopic studies for the Danube region focusing on the late 6th /early 5th millennium BC material to discuss species specific herding practices and how communities used these seasonally dynamic fluvial environments to nourish their herds and support the evolution of prehistoric societies.

9 **GETTING HOOKED? THOUGHTS ON THE IDENTIFICATION AND INTERPRETATION OF FISHING EQUIPMENT IN NEOLITHIC COLLECTIVE GRAVES IN GERMANY**

**Abstract author(s):** Meyer, Christian (OsteoARC)

**Abstract format:** Oral

Rivers and other bodies of water surely were a source of food for people in different time periods, providing, for example, a variety of fish. Physical remains of diverse fishing equipment are known from numerous archaeological sites and may represent harpoons, hooks, nets, traps and other ways to catch and harvest aquatic resources.

Regarding prehistoric fishing equipment from Europe, this is mostly known from its durable parts that tend to survive in the ground. While waterlogged sites may preserve more than that, usually only the components made of stone, bone or metal are found. These have to be identified and interpreted correctly which is not always straightforward as not all fishing equipment is immediately recognisable as such.

In this presentation, a new interpretation of a type of worked bone artefact is presented that is associated with collective graves of the German Neolithic, mainly of the Wartberg Culture. These artefacts have been previously described as “bone hooks” but have not been firmly associated with inland freshwater fishing so far. Using a comparative approach, incorporating other archaeological as well as ethnographic examples, these bone hooks might be described as the sole surviving components of composite fishing hooks used to catch large, predatory freshwater fish, with pike as the most likely target.

As these hooks were occasionally included within collective burial chambers, either as parts of the funerary dress or as additional grave goods, they might symbolise even more than their presumed function in catching fish. Possibly, they signify a connection to riverine environments and the animals living there that has not really been explored so far. Based on the discovery of five new bone hooks a tentative interpretation is put forward which places the funerary presence of these hooks alongside the ubiquitous presence of perforated animal teeth, mostly of terrestrial carnivores.

10 **IN, ON, ABOVE, ACROSS AND BEYOND THE RIVER: THE ROLE OF THE DANUBE FOR THE TELL AT SZAZHALOMBATTA, HUNGARY**

**Abstract author(s):** Sorensen, Marie Louise Stig (University of Cambridge)

**Abstract format:** Oral

“It is a truth universally acknowledged, that a single man in possession of a good fortune, must be in want of a wife.” (Jane Austen 1813). Similarly, it is widely acknowledged that a site located next to a river - and especially if the site is a Bronze Age tell and the river is the Danube - must be in want of said river! But is that the case?

In this paper, I aim to scrutinise how the organisation of life on the tell of Szazhalombatta was informed by its nearness to the river. Several dimensions are obvious, such as the apparently limited importance of riverine resources, the potential and evidence of long-distance contact provided by the waterway, and the degree of visibility between tells along the river. Other aspects, however, have been given less attention: can we comprehend the significance of the view and the ability to overview a large stretch of land, or how living with a cliff-edge may have influenced site organisation? Furthermore, as different tells had different degrees of economic involvement with the river, would this also mean they had different ways of integrating it as part of their intimate environment, and what may that suggest in terms of our categorisation of them as essentially the same kind of settlements?

11 **TIME AND THE RIVER: PREHISTORIC COMMUNITIES AND MONUMENTS ON THE FENLAND OUSE**

**Abstract author(s):** Evans, Christopher (University of Cambridge)

**Abstract format:** Oral

Overviewing results arising from Barleycroft Farm/Over’s vast-scale investigations across both sides of the River Great Ouse in Britain’s East Anglian Fens, the paper will consider the changing roles of a great river in prehistory. When we first embarked on the programme 25 years ago, its main research directives seemed straightforward: when had the river been a territorial divide and/or a landscape corridor? Quickly, though, as the complexity of the floodplain’s buried topography and its myriad of palaeochannels emerged, all this had to rapidly change: there wasn’t one river but many. How in prehistory the Ouse’s mid-stream islands and their Bronze Age barrow cemeteries were approached and utilised will be explored, and also the insights provided by having ‘islanded’ fieldsystems. So, too, will the issue of just how long it actually takes to distinguish significant land-use patterning be explored, as the results – especially as regards Neolithic settlement – are not at all as had been expected.

12

**AN ‘EVERGLADES-LIKE’ LANDSCAPE? HUMAN-ENVIRONMENT INTERACTIONS WITHIN THE RIVERSCAPES AND WETLANDS OF THE HUMBERHEAD LEVELS, UK**

**Abstract author(s):** Whitehouse, Nicki (Archaeology, University of Glasgow; University of Plymouth) - Shilobod, Nika (School of Geography, Earth and Environmental Sciences, Plymouth University) - Chapman, Henry (Classics, Ancient History and Archaeology, University of Birmingham) - Bunting, M. Jane (Geography, University of Hull) - Gearey, Ben (Archaeology, University College Cork) - Davies, Kim (IMSET, Archaeology and Anthropology, University of Bournemouth) - Farrell, Michelle (Geography, University of Coventry) - Phil, Barratt (Archaeology, University of Glasgow)

**Abstract format:** Oral

Archaeological records show that humans have long been attracted to the range of resources available within river and wetland eco-systems, and that a wide range of settlement and economic activities occurred around the wetland-dryland interface. We explore changing wetland-dryland dynamics across inter-connected river-mere-wetlands and how these places were used and transformed over time. Our case study is the Humberhead Levels, eastern England, where there has been a long history of palaeoenvironmental and archaeological study. Today the land cover is mostly intensive agriculture, with a few protected areas centred on the remnants of heavily exploited lowland ombrotrophic mires, surrounded by the rivers and former meres of the Torne, Idle, Don, Went and Trent. Historical maps, accounts, and the sediments underlying the fields tell a different story, showing a landscape of inter-connected rivers, meres and wetlands; floodplains, open waters, marshes, water meadows, fen, wet woodland and mire, with human settlement and activity clustered on islands of higher ground. The rivers and wetlands were extensively utilised over prehistory for their resources and as routeways, whilst in the Roman and historic periods they were transformed for navigation, diverted, drained and canalized, representing a way of life and living-with-water that can be traced back through thousands of years, and which survived until the 17th century. What was it like to live in these waterscapes?

The diverse and complex character of river and wetland development and human-environment interactions is outlined through the combined use of GIS and LIDAR mapping, together with geoarchaeological mapping. An extensive archaeological database of over 5000 data points has enabled us to infer the nature and focus of human activity and land use, whilst pollen records allow us to reconstruct the land cover history of key archaeological periods, highlighting differing ways in which these riverscapes and wetlands were used over time.

13

**TEOTIHUACAN AND THE SAN JUAN RIVER: A RELATIONSHIP TO EXPLORE**

**Abstract author(s):** Moragas, Natalia - Pecci, Alessandra (University of Barcelona) - Barba, Luis - Ortiz, Agustin (Universidad Nacional Autónoma de México)

**Abstract format:** Oral

Teotihuacan (100 BC-650 AD) was the most important urban center in the Basin of Mexico during the Classic Period. In 2017 we started archaeological research in a specific area of the city that is defined to the north by the pyramid of the Sun and to the south by the so-called Río San Juan – actually a small river compared to many well-known large rivers in Europe and elsewhere. We have “always” known that the Río San Juan was diverted to follow the urban grid, making its course perpendicular to Teotihuacan’s “Street of the Dead”, and cutting this street almost to the middle.

Despite its importance the Río San Juan has not been the subject of many investigations. Yet it has been generally accepted that it played a crucial role in the life of the inhabitants of the city. However, the role of this “river” and its relationship with the city must be reassessed with specific questions. Our project, an academic collaboration between the University of Barcelona and the UNAM, originally started with different aims, but has now centered its focus on this interesting theme. The project is funded by the Palarq Foundation and the Ministerio de Cultura y Deporte de España.

**THE SHAPING OF WATER: INTERACTIONS BETWEEN LANDSCAPE, EXPLOITATION OF WATER, AND SETTLEMENT IN THE MEDIEVAL WESTERN ALPS**

**Abstract author(s):** Nejrotti, Luca (Ass. Cultura e Territorio - ACT; Aix Marseille Univ, CNRS, LA3M)

**Abstract format:** Oral

The study of hydraulic workshops can provide a privileged point of view on resource management, settlement dynamics and power relations in ancient communities.

This paper offers a summary of studies, including interdisciplinary analysis that has integrated written and material sources, carried out in different valleys of the western Alps from the Middle Ages to the early 20th century, focusing on medieval hydraulic plants: cereals, oil and hemp mills, as well as forges, fulling and paper mills.

The results of this study are encouraging and testify how, even in areas that are historically considered as marginal, the waterways were the engine of a lively economic life otherwise elusive to the scrutiny of researchers.

Mountain streams thus acquire a double role: enemies of the settlements, due to their capricious flow and the risk of floods, but also allies, able to free pre-industrial production from the slavery of muscle power. This dichotomy can still be read in the alpine landscape where the present-day settlements still choose dry places, but the roads and small production centres look for the most convenient banks of rivers and streams.

In addition, these kinds of studies, as well as having great scientific importance, open new perspectives for cultural valorisation of the landscape as a complex and entangled (natural and anthropogenic) entity.

However, some important limitations have also been highlighted: the material and written sources are often incomplete. This causes a flattening of the information which, by losing its diachronic depth, can easily fall into folklore.

Nevertheless, without indulging in excessive enthusiasm, the study of hydraulics in the western Alps allows us to find significant data on the history of the landscape, economy, and society; it also provides a wealth of information valuable for the valorisation of territories that must increasingly focus on tourism to avoid their actual marginalization.

THE AGE OF DEPOSITION OF ACCUMULATIVE FAN SEDIMENTS IN SERTEYKA RIVER VALLEY (WESTERN RUSSIA)

**Abstract author(s):** Ginter, Artur (University of Lodz, Faculty of Philosophy and History, Institute of Archaeology, Spectrometry and Luminescence Dating Laboratory, Lodz) - Kittel, Piotr - Piech, Wiktor (University of Lodz, Faculty of Geographical Sciences, Department of Geomorphology and Palaeogeography, Lodz) - Moska, Piotr (Institute of Physics - Centre for Science and Education, Division of Geochronology and Environmental Isotopes, Silesian University of Technology, Gliwice) - Krapiec, Marek (AGH – University of Science and Technology, Faculty of Geology, Geophysics and Environmental Protection, Krakow) - Sikorski, Jarosław (Institute of Physics - Centre for Science and Education, Division of Geochronology and Environmental Isotopes, Silesian University of Technology, Gliwice) - Hrynowiecka, Anna (Gdansk Polish Geological Institute - National Research Institute, Marine Geology Branch, Gdansk) - Stachowicz-Rybka, Renata - Cywa, Katarzyna (W. Szafer Institute of Botany Polish Academy of Sciences, Krakow) - Mazurkevich, Andrey (The State Hermitage Museum, St. Petersburg)

**Abstract format:** Oral

In the rich of archaeological sites dated from the late Palaeolithic to the Modern Period in the region of the Serteyka River, deposits of an extensive accumulative fan were studied in detail. The main goal of the research was an attempt to reconstruct the strict chronology and palaeoenvironmental conditions of development of the most prominent gullies’ system and accumulative fan in the lower sector of the present-day Serteyka River valley. An important part of the project has also checking usefulness of luminescence, radiocarbon, and lead methods of dating in determination of the age of inorganic deposits accumulation.

The studied fan is built by deluvial sediments transformed in the uppermost part into tillage diamicton. Numerous samples of sandy slope sediments and underlying organic deposits were taken for 14C, OSL, 210Pb dating to determine the age and phases of the fan’s development. 210Pb samples were taken from a monolith. Radiocarbon dating was made for selected plant macrofossils found within inorganic deluvial deposits, and from peaty-lacustrine deposit below accumulative fan.

The use of 14C and 210Pb methods of dating allows for elaboration of a reliable model of the evolution of modern slope processes from the 2nd half of the 17th c. to 2nd half of the 19th c. AD (i.e. during the younger part of the Little Ice Age). It was a period of human-induced deforestation, as confirmed by the results of palaeobotanical analyses. In addition, OSL dates have been obtained, but the acquired age significantly exceeded previous expectations. Three dates indicate the Neolithic period, and a chronological inversion of OSL dates can be seen. This may be due to incomplete bleaching of the sand grains during transport, which indicates that the material being transported had a relatively large volume. This further indicates not dispersed erosion, but rather the drainage of hydrated sediment.

FLOW REVERSALS IN RIVERS: A STUDY IN ARCHAEOLOGY OF FLOW

**Abstract author(s):** Edgeworth, Matt (School of Archaeology and Ancient History)

**Abstract format:** Oral

Reversal of flow in rivers can happen for natural or artificial reasons, or a combination of both. Here we look specifically at those cases where there is human involvement. Famous examples include the Chicago River, which used to run into Lake Michigan but now, thanks to construction of a canal linking watersheds over a century ago, runs away from it.

Not all engineered flow reversals are so well-known or on such a large scale. Yet they are more common than might be expected and mostly unrecorded, so must be deduced from material clues in the riverscape. Flow reversals are crucial events to pick up on when trying to unravel the story of the development of a stretch of river.

A case-study in archaeology of flow illustrates this point. The River Great Ouse in Bedford, England is comprised in part of multiple artificial features such as weirs, sluices, mill-races, ditched defensive boundaries, channels cut alongside railway embankments, and so on. It is a rich archaeological heritage that spans the time from prehistory to the present day. Yet what was really being acted upon by construction of such things was the flow of the river. Observing how the river flows today and working back, it should be possible to build a coherent narrative about river development through time. But there is one small stretch of river that is anomalous in the sense that it ‘runs the wrong way’, disrupting explanations. Did that small stretch once have its flow reversed? Why and how was this done, and when?

Answering these questions is a key that unlocks our understanding not only of why the river flows as it does today, but also how it flowed in earlier times, before the flow reversal.

LUXURY IN LIFE AND DEATH IN THE EUROPEAN IRON AGE. IDENTITY - ELITE NETWORKS - ECONOMY - ARTS AND CRAFTS

**Theme:** 6. Material culture studies and societies

**Organisers:** Fuerst, Sebastian (Curt-Engelhorn-Zentrum Archäometrie gGmbH) - Nordez, Marilou - Armbruster, Barbara (Laboratoire TRACES - UMR 5608, Université Toulouse 2 Jean Jaurès)

**Format:** Regular session

What defines an elite within a society? It may be the ability to exercise power and domination; it may be the access to specific resources. Or it can be conceptualized as the degree of centrality and connectivity within a communication and/or interaction network.

In the context of archaeological research, this last approach has the advantage that precious objects and materials, as remains of material culture, allow a reconstruction of relationships over long distances. During the Iron Age, luxury items made of precious or exotic materials were used by elite groups as symbols of power and prestige, and they were deposited as grave goods or in hoards. They can be seen as proxy variables to identify multiple highly dynamic and dense networks of influences from different regions, near and far.

The structures and mechanisms of these networks depend on the selected parameters: for example, a network of imported vessels is different from the network of precious materials like amber, especially when stylistic or craftsmanship characteristics are taken into account.

How do the networks of different precious materials and prestige objects differ? What conclusions can be drawn from this for the social structures of Iron Age societies? Do some places show a distinct betweenness or bridging centrality that made them operate as connectors between two cultures? And do other sites display a pivotal role as hubs or junctions within a local or regional social group, perhaps as centres of fine metalwork crafting?

In this session, we would like to bring together all these different perspectives on elite connectivity during the Iron Age, in order to obtain an even more detailed picture of the dynamic and complex processes during this period.

ABSTRACTS:

GOLDWORKING TECHNOLOGY IN THE IRON AGE – AN INDICATOR OF CULTURAL CONTACT AND EXCHANGE IN THE PRODUCTION OF LUXURY GOODS

**Abstract author(s):** Armbruster, Barbara - Nordez, Marilou (Centre National de Recherche Scientifique)

**Abstract format:** Oral

During the European Iron Age, fine metalwork is a prominent component of luxury items, comprising personal ornaments, vessels and decorative fittings. Function, style, shape and decoration of the gold and silver objects undergo a development in time and space. This evolution goes along with changes in the supply of raw materials, choice of alloy-composition and manufacturing techniques. Therefore, the luxury goods bear witness to traditions, local inventions, imitation and external factors such as contact, exchange and import in these manifold issues. The technological characteristics of metal objects reflect the artisan’s skill and knowledge, both with regard to production, technical, stylistic and ritual aspects, and his ability to materialize the cultural conception of a product. This paper deals with these aspects of advancement and change in Iron Age material culture, specifically in precious metalworking of the Western Hallstatt and Latène cultures in a diachronic perspective. It highlights external influences and interactions in the goldsmith’s craftsmanship in order to interpret elite networks, notably towards the Iberian and Italian Peninsulas and the eastern Mediterranean, but also towards Great Britain and Ireland.

WHICH BEHOLDER APPRECIATES THE BEAUTY? IRON AGE AMBER AS A (NON-) LUXURY COMMODITY IN ITS STORAGE, DISTRIBUTION AND PROCESSING CONTEXTS

**Abstract author(s):** Markiewicz, Joanna - Duleba, Przemysław (University of Wrocław)

**Abstract format:** Oral

The paper builds upon a case study of a Pre-Roman Iron Age site in Wrocław-Partynice (formerly Breslau-Hartlieb). Rescue excavations conducted there in 1906 and 1936 revealed remains of a Pre-Roman Iron Age settlement site. Among other features, the site yielded three storage pits filled with 1300-1500 kg of amber. Until now, the find remains the world’s largest recorded anthropogenic amber deposit. The discovery was initially dated to the latter half of the 1st century BC. However, our recent study of the available pottery assemblage suggests that it was at least 150 earlier and shall be connected to the late Jastorf culture communities. This chronology overlaps with the dating of the amber accessories and workshops from the La Tène culture sites, such as Nowa Cerekwia, Samborowice, Berching-Pollanten and probably Staré Hradisko, Stradonice and Zavist. The paper explores the purposes this – apparently – luxurious commodity served and what it communicated in various cultural contexts within its distribution network.

3 **FUR SUPPLIERS IN THE NORTH – WHAT CAN BE CONCLUDED BY STUDYING THE FUR PRODUCTS IN THE GRAVES**

**Abstract author(s):** Kirkinen, Tuija (University of Helsinki)

**Abstract format:** Oral

In Finnish archaeology, the role of east Fennoscandian populations as suppliers of furs for Scandinavian, Central European and Asian consumers is generally accepted. In this network, furs were valued foremost as exotic and rare products which reflected the high status of the carrier. In Finland, furs were not rare nor exotic. Instead, animal skins had use-value as warm garments. They also had trade-in value as they could be exchanged for metals, metal artefacts, and glass beads, maybe also for horses, valuable dogs, fabrics, and food.

In this presentation, the roles of fur products for the suppliers of animal skins are evaluated by studying animal hair remains from Iron Age and medieval graves. This material evidences that status fur items are relatively scarce. I base this argument on the low numbers of fur animal (European beaver, lynx, red squirrel, and mustelids) skins in graves. However, rare black variants of furs and the preparing of furs, e.g. by pulling off the coarse hairs provide evidence of their value. Also, the graves which were accompanied with skin or fur items, clothes or wrappings, seemed to be wealthier than the graves on average. These comparisons are, however, not unproblematic.

I hypothesize that skins of wild animals had specific agency in areas where the lives of humans and wild animals were closely engaged. This engagement was based on the need of meat and furs, and the relationship was built on a series of acts which covered hunting, handling of carcasses, preparing of food and skins, and on the using of these products. For people who didn't live with these animals, the products hypothetically represented otherness and were rare and exotic, even status items.

4 **PRIVILEGED NETWORKS: THREE CASE STUDIES ON FUNERARY ASSEMBLAGES (5TH CENTURY BC)**

**Abstract author(s):** Fuerst, Sebastian (Curt-Engelhorn-Centre Archaeometry; Saarland University) - Armbruster, Barbara (CNRS Maison de la Recherche Université de Toulouse 2)

**Abstract format:** Oral

This paper wants to examine the long-distance connections of the elites of the 5th century B.C. on the basis of a case study from three regions: The Champagne, the Dürrenberg near Hallein, and the area between the Moselle and the Rhine. All three are regarded as centres of the Latène culture, but each shows certain specific characteristics concerning grave goods and burial customs. As a proxy for an elite, this study compares in particular the gold-bearing graves, most of which could be analysed within the CELTIC GOLD project. In addition to stylistic features, technological aspects are also included in the considerations as well as burial customs. Network analysis proves to be a particularly suitable methodology for valuating these complex interregional connections. This allows us to identify not only regional sub-groups with similar objects and funerary rites, but also individuals which were connected to more distant regions. The emerging network structures allow a deep insight into the respective social structures.

5 **MULTIMETALITY IN AND BETWEEN CENTRAL MILIEUS – IRON AGE NETWORK-IMPLICATIONS OF THE PROJECT 'FROM THE CRUCIBLE AND AT THE ANVIL'**

**Abstract author(s):** Svensson, Andreas (Dept. of Archaeology and Ancient history, Lund University)

**Abstract format:** Oral

The connection between metal use and elite strata in Iron Age society has long been firmly established. This association is also spatially detectable with regards to the localities of metalworking milieus in the landscape. It is commonly held that non-ferrous metalworking, including precious metal use, were linked to elite milieus (i.e. central places including their zones of dominance). Ferrous metalworking, on the other hand, is normally attributed a different spatial pattern, located to resource zones beyond the central areas (i.e. peripheral outland zones). Contrasting this spatial pattern is the often-emphasised importance of iron production to economic affluence and, hence, social and political power in Iron Age society.

Within the project 'From the Crucible and at the Anvil', the macro-spatial patterns of metal use has been tested within the region of south-east Scandinavia. The results largely supports the spatial link between centrality and non-ferrous metal use and, likewise, the deliberate positioning of ferrous metalworking in connection to resource zones. There are however notable exceptions, suggesting important divergences to the main pattern.

The analyses of metallurgical debris from selected central sites within the study area have also revealed high ratios of ferrous metalworking within the crafts-milieus. This highlights the importance of ferrous metalworking in connection to socio-economic and political centrality, and above all, the networks between centre and periphery.

In this paper, the centrality of metal craftsmanship is discussed with specific focus on the divergences in the overall spatial pattern of non-ferrous metalworking. The spatial reach of "fine metalworking" is gauged and used to elucidate the 'betweenness' of metal use beyond the central milieus. The networks of both ferrous and non-ferrous metalworking evident from the spatial analyses that the project 'From the Crucible and at the Anvil' have produced will drive a discussion on socio-economic structures in the Scandinavian Iron Age.

6 **LATE LA TÈNE ELITES EITHER SIDE OF THE ENGLISH CHANNEL: SIMILAR TASTES BUT WHAT ABOUT SPACE?**

**Abstract author(s):** Lamb, Andrew (Independent Researcher)

**Abstract format:** Oral

Space may not be the final frontier in mortuary archaeology, but it is an underappreciated aspect of research. In contrast to settlements, where access analysis has effectively been used to demonstrate how space was utilised as a means to reinforce social positions, the space within graves has long been overlooked. This is slowly being rectified, with some studies undertaken for princely graves of the Hallstatt and early La Tène periods. By contrast, rich late La Tène elite burials continue to be examined primarily through grave good inventories, and to a lesser extent associated funerary architecture. The late La Tène period witnessed a resurgence in elite burials across a broad area of western Europe. With a few exceptions, the individuals in these graves were cremated and provisioned with items associated with feasting. Beyond these broad similarities, key regional differences can be detected in terms of the grave goods and funerary architecture provided to these burials. But what of the way in which space was utilised within these graves? What can the internal arrangement of these graves potentially tell us? This paper considers two of these elite groups: the Aylesford burials of south-east England, and those of the Hauts-de-France. These groups are closely related, utilising a common ceramic and numismatic tradition, employing a similar range of grave goods, and sharing some aspects of funerary architecture. In the past, the Aylesford group has even been considered an extension of the Hauts-de-France group. Through examining the internal layout of the graves themselves, with regards to the positioning of graves goods and human remains in relation to each other, it seeks to shed new light on how these elite groups portrayed themselves in death.

7 **POWER AND CONTROL: BURIAL MOUNDS AND THE AGENCY OF DEATH**

**Abstract author(s):** Trinder, Ermelinda (Staffordshire University)

**Abstract format:** Oral

Burial mounds were the exclusive form of burial during Bronze and Iron Age Albania. Their construction involved extensive work and was frequently accompanied by socialised eating and drinking ceremonies, either prior to burial or afterwards. Traditionally, the study of burial mounds in Albania has tended to focus primarily on the ethnic identity of the people buried within these mounds. Less considered to date, however, has been the role of social elites in the construction of burial mounds. This paper presents the hypothesis that a powerful and wealthy elite within society operated as an Agency of Death. It explores how the Agency of Death aimed to gain, display and sustain their power, authority and control over their community through organising, supporting and providing the resources, craftsmanship and skills necessary for the construction of burial mounds.

Through a series of case studies of Albanian publications, I will demonstrate the significance of natural resources such as stones from mountains and rivers, and how their ritualised meanings transformed these materials into precious and highly prized resources. Building on this, I will explore the role of the Agency of Death in collecting, transporting and distributing these materials and how this process required Agencies of Death at times to connect with, exchange and share materials and ideas with one another. Additionally, in this paper I consider how the Agency of Death could have influenced, organised and supported ritualised eating and drinking ceremonies during the construction of burial mounds to further gain control and to sustain and display their power and authority over the natural and unnatural world.

8 **EXOTIC GOODS AND ELITE GRAVES IN ARCHAIC CAMPANIA (8TH-6TH BC)**

**Abstract author(s):** Maudet, Ségolène (Université de Lorraine)

**Abstract format:** Oral

How can we use grave goods to study Iron age exchanges in a socio-political perspective? This question will be the center of my paper, using mainly examples from an Etruscan site, Pontecagnano, near actual Salerno in South Italy.

Graves are our main source of information about this site and about the whole area at this period. The use of formal methods, especially in a processual perspective, has aroused many debates in protohistoric archaeology. Pontecagnano offers a great opportunity to study funerary variability, since more than 500 graves have been published. I currently study an unpublished sector of 70 Orientalizing graves. How can I qualify the social level of this group? An original methodology, combining formal analysis but also a qualitative analysis using the postprocessual framework has been developed by M. Cuozzo. I will explain how I plan to adapt her methodology to fit the specificity of my data.

A second point of interest of my paper will be the link between allogeous grave goods and elite graves. This preferential link lies at heart of many theories about exchanges and socio-political evolution of Iron Age societies. It tends however to focus on prestige goods and on central Europe. Campania is a great case study to further examine this link, since it is a region deeply embedded in multiple networks of exchange. The diversity of societies (Greeks, Phoenicians, Etruscans, Oscans) also allows to propose a nuanced study of the socio-political distribution of allogeous goods. Some goods seem "reserved" to elite grave, but others are more commonly distributed : how can we establish that, and how can we interpret this diversity? I will present concrete examples from Pithekoussai, Cuma, Pontecagnano and the Sarno Valley, including some unpublished data.

PRECIOUS VESSELS FOR THE AFTERLIFE: POLYMATERIC AND ASTARITA TYPE JUGS

**Abstract author(s):** Taloni, Maria (Ministry of Cultural Heritage, Directorate-General for education, research and cultural institutes)

**Abstract format:** Oral

The experiment of realizing the same object in different materials, stressing the possibilities of that material itself, is well explained by few particular polymateric jugs and their ceramic imitations, better known as Astarita type jugs.

It was a virtuosity very appreciated, now as then, from the local orientalizing élites that commissioned those objects and it pre-sumed high technical skills that were passed on from artisans to artisans. This paper will focus on the morphological analysis of this group of vases and, where possible, on the examination of their contexts of discovery. By contrast, it will use the dataset to move beyond the consideration of the objects in isolation as a chronological marker, instead bringing them into the foreground as an index of the cultural exchange and interactions in the Mediterranean during the 8th and the 7th centuries BCE. The aim is to develop an historical reconstruction of the ancient pre-Roman society in the Italian peninsula and to explore the dynamics that led the jugs to be imported and imitated. Furthermore, the paper will point out the importance of circulating objects in the ancient Mediterranean: this phenomenon deals often with movement of people, techniques and ideas and it is fundamental for the birth of the so-called “Orientalizing period” and the élite networks in central Italy.

Lastly, it will focus the motif of female heads always represented on their neck, investigating the probable symbolic connotations apropos the vases functions.

10

THE “ORIENTALIZING” CONNECTION: LUXURY GOODS, ELITE CONNECTIVITY, AND THE RISE OF THE “ORIENTALIZING” IRON AGE OF SOUTHWESTERN IBERIA

**Abstract author(s):** Gomes, Francisco (UNIARQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities of the University of Lisbon; Foundation for Science and Technology - Portugal)

**Abstract format:** Oral

In the wake of the first contacts with merchants and settlers hailing from the Eastern Mediterranean during the early first millennium BCE, the local communities of the southwestern Iberian Peninsula underwent a series of social, political, and cultural changes, entering what has been recognized, by analogy with other Mediterranean areas, as an “Orientalizing” Period (9th/8th – 6th/5th centuries BCE).

The interpretation of this process, and of the “Orientalizing” nature of this chrono-cultural horizon itself, has undergone significant changes, from traditional perspectives predicated on acculturation and emulation models to more recent analyses inspired by post-colonial theory which have stressed the creative and negotiated nature of the new, so-called “Orientalizing” cultural discourses.

Focusing on luxury goods, this contribution aims to build on that discussion by offering an interpretation of this “Orientalizing” horizon in terms of elite connectivity. It will be argued that local elites, having become embedded in a wide and diverse socio-political network mediated by the Phoenician interface, needed to develop a common language to project and assert their (social) identity and status, and that they relied on discursive resources offered by that interface to do so.

An attempt will therefore be made to demonstrate that, far from reflecting cultural or even political homogeneity as some researchers have argued, the use of certain prestige elements relating to ritual, dress, adornment and bodily care, acquired or introduced through medium- and long-distance trade, was a function of the active role of local elites in a complex network of macroregional and transregional socio-political connections, but that it cannot be dissociated from local agendas, social discourses and political economies.

11

CONSUMING LUXURY IN IRON AGE PHOENICIAN SOUTH IBERIA (8TH-7TH CENTURIES BCE): THE FUNERARY RECORD

**Abstract author(s):** López-Bertran, Mireia (Universitat de Valencia)

**Abstract format:** Oral

It is generally agreed among scholars that the Phoenicians were responsible of crafting and trading luxury goods. The written sources, like the Odyssey (15, 118-119) mentions them as skilfully artisans, specialized in luxury items. It has been an implicit definition of luxury objects as non-utilitarian related to the Western idea of art created during the 18th century when the concept was divided into “fine arts” and “crafts” or “popular arts”. In this sense, portable luxury arts have been studied offering formal descriptions and iconographic and iconological interpretations to give semantic meaning to visual motifs. This methodology assumes an implicit immateriality to meaning as something that exists outside the object. Instead, contextual analyses of these objects offer an approach of their meaning based on the human-object interaction that strengthen meaning as a social process.

In this communication, I will explore the use and consumption of luxury objects in the Phoenician far-west, in the south of the Iberian Peninsula between the 8th and the 7th centuries BCE. My approach to luxury is based on the idea of performative practices that participate actively in the collective construction of the cultural identity of status-groups. I contend that luxury is, first and foremost, contingent, and a matter of degree and scale. These ideas will be analysed using the funerary contexts available to date, as tombs are the spaces where the so-called luxury items have been mostly documented, especially alabaster vases, jewellery and

ivory objects. In doing so, I will focus on the consumers of these objects, and how and to what extent luxury intersects with issues of gender, age and living conditions of these communities.

12

PRODUCTION, CONNECTIVITY AND SOCIAL INFERENCE OF THE IBERIAN SCULPTURAL MONUMENTALITY. LOS CUCOS (BOGARRA, ALBACETE, SPAIN) AS A CASE STUDY

**Abstract author(s):** García-López, Arturo (University of Alicante; Centro de Estudios de Arqueología Bastetana)

**Abstract format:** Oral

This study aims to revisit an architectural, sculptural, stone monumental ensemble from Los Cucos site (Bogarra, Albacete, España), discovered in the 1940s, wich has been roughly dated back to the end of the Middle Iron Age and practically forgotten to this day.

Anchored in the art history conventions, it has not been possible to construct a methodology to overcome the dating by stylistic comparative and symbolic interpretations lacking archaeological empirical support.

This is the reason why it was proposed to revisit Los Cucos and document by making use of archaeological prospection all the constructive elements and decorative monumental and sculptural fragments re-used on terraces or abandoned in ravines in order to form the necessary empirical basis to work on.

The characterization of the determined work processes allows us to speak of at least one turriiform structure not associable to an archaeological habitat or funerary context.

That is why, sheltered by the existence of similar structures in the south of the Iberian Peninsula and the north of Africa, we propose the existence of an isolated monument whose vocation would be fundamentally territorial, either signaling or bordering, perhaps linked to the funerary field.

To verify this hypothesis, we present our case study to the GIS analysis and its link with the organization of the contemporary settlement (late 6th century - early 5th century BC).

Characterizing this type of spatial functionality structures could help us understand how Iberian culture was related to the territory or how this space is not independent of economic-productive appropriations, both from the exploitation of raw materials and social coercion by the elites.

A.

SOME GIRLS ARE BIGGER THAN OTHERS. THE REPRESENTATION OF THE IBERIAN FEMALE WORLD THROUGH THE LADY OF DOÑA MENCÍA

**Abstract author(s):** García-López, Arturo (University of Alicante; Centro de Estudios de Arqueología Bastetana) - Moreno Alcaide, Manuel (Museo Histórico-Arqueológico de Doña Mencía) - Abelleira Durán, Manuel (University of Granada; Centro de Estudios de Arqueología Bastetana)

**Abstract format:** Poster

Talking about female representation is currently not a trivial topic, especially in the case of Iberian culture, for which we have the famous stone carvings of the so-called “Ladies” of Elche or Baza. These two refer to very specific models: containers for the cremated remains, in short, funeral urns. These are not the only female representations, since we only have to look for the offering Ladies of the Cerro de los Santos to realize the votive, and not funerary, character of these figures. In general terms, these manifestations can be limited between the 5th and 1st centuries BC.

Now, determining the nature or chronology of these pieces, even more so if we only know very fragmented remains, can provoke more than daring interpretations.

This is the case of the one nicknamed the “Iberian Lady of Doña Mencía.” It is the fragment of the hairstyle of a round female figure that stands as one of the most notable manifestations of the feminine sphere in the south of the province of Córdoba.

Although its dating has been intended to advance to the beginning of the 6th century BC. Due to stylistic criteria compared with figures from the Mediterranean area, we believe that only spatial contextualization with the settlement and occupation of the territory can indicate the true chronology.

And it is that we cannot approach the representation of the feminine world in Iberian times only from a stylistic or symbolic perspective. This exercise in contextualizing an isolated finding cannot be closed without proposing the work processes determined by what this piece has gone through, from the quarry to its consumption and disposal.

Only in this way can we understand from all possible perspectives a world as complex in the archaeological and symbolic as the representation of the feminine in Iberian culture.

A MARTIAL WORLD OR A DIVERSE COMMUNITY? GENDER, SOCIAL STRATIFICATION AND MINORITIES ON CASTLES

**Theme:** 6. Material culture studies and societies  
**Organisers:** Atzbach, Rainer (Aarhus University) - Blai

**Format:** Regular session  
This session seeks to explore the everyday society living in a castle or a palace between the 8th and 17th centuries. While the os-  
tensible major group of inhabitants – usually regarded as men in arms – seems to be well represented in written and archaeological  
data, other groups are less visible: For example, it is difficult to spot female inhabitants and children, but also minorities like vagrant  
minstrels, visitors or even the castle’s or palace’s owner and her/his family members. Another neglected dimension in castle re-  
search is religion outside the chapel building. Here, we could regard practices of prayer, the chaplan’s living conditions, but we might  
also face diverging religious groups (Jews, Moslems Orthodox, Catharists, Protestants and further denominations) within the castle  
walls. In this session, we want to discuss the subsequent questions with a departure point in medieval and renaissance castles and  
palaces in Central Europe and beyond:

- In how far are specific object types markers for social or religious groups?
- Is it possible to use combinations of objects for their identification?
- How does the interpretation of spatial concepts (e.g. apartment, chapel, bower) contribtute to revealing neglected  
spheres?
- How do archaeological sources witness the temporality of social spheres?
- How does a gender bias influence research?
- In how far does a comparative approach between different European regions improve our knowledge?

Contributions presenting individual case studies or more general surveys on methodical approaches and sources are welcome.

**2 THE MARKERS OF JEWISH PRESENCE BASED ON THE RESULTS OF ARCHAEOLOGICAL EXCAVATIONS  
IN THE CASTLE OF LORCA (SPAIN)**  
**Abstract author(s):** Eiroa, Jorge (Departamento de Prehistoria, Arqueología, Universidad de Murcia) - Martínez Rodríguez, Andrés  
(Museo Arqueológico Municipal de Lorca) - González Ballesteros, José - Celma Martínez, Mireia (Professional Archaeologist) - Mo-  
lina Campuzano, Isabel (University of Murcia)  
**Abstract format:** Oral  
In 2020, the University of Murcia and the Archaeological Museum of Lorca resumed the interdisciplinary research project in the  
medieval castle of Lorca (Murcia). An important Jewish quarter has been identified there. The judería was established inside the  
fortified enclosure in the 13th century and developed substantially in the 14th and 15th centuries, but was suddenly abandoned  
after the expulsion decrees of 1492. In the last twenty years, more than fifteen houses have been excavated, as well as a craft area,

a butcher’s and an exceptional synagogue, all of which allow us to know in some detail the characteristics of this Jewish quarter  
formed inside the castle.  
One of the objectives of the new archaeological research is to define the particularities, from a strictly material perspective, of the  
Jewish presence. In recent years, some archaeological indicators that allow us to identify the presence of Jews in late medieval  
domestic contexts have been defined. In particular, the study of both Hanukkah oil lamps and the zooarchaeological record have  
been developed, which can be understood as clear markers of their presence. The research project carried out in the castle of Lorca  
last year, confirms their usefulness and attempts to go even further, trying to deepen the anthracological and carpological analysis  
in order to define the existence (or not) of a specific strategy of exploitation of the natural environment by the Jewish communities.  
This paper presents the first results of these studies and introduces them into the general debate on the ability of archaeology to  
define the record of religious minorities. It also reaffirms the use of certain archaeological markers and attempts to place them in  
the context of a larger historiographical debate on a European scale.

**3 SOCIAL DYNAMICS AND MINORITIES IN THE CASTLE OF MOLINA DE ARAGÓN (GUADALAJARA): AN  
APPROACH THROUGH ARCHAEOMETALLURGY AND ZOOARCHAEOLOGY**  
**Abstract author(s):** Hernández-Casas, Yaiza (University of Granada) - García-García, Marcos (University of York) - Murillo-Bar-  
roso, Mercedes - García-Contreras Ruiz, Guillermo (University of Granada) - Banerjea, Rowena Y. (University of Reading) - Ros,  
Jérôme (Centre National de la Recherche Scientifique) - Mattei, Luca (University of Granada) - Brown, Alex D. (Wessex Archaeolo-  
gy) - Alexander, Michelle (University of York) - Pluskowski, Aleks G. (University of Reading)

**Abstract format:** Oral  
This paper presents the preliminary results of interdisciplinary research on the multicultural frontier of Molina de Aragón (Guadala-  
ja, Spain). For the first time, evidence from zooarchaeology and archaeometallurgy are used to explore the social dynamics between  
spaces such as the Molina castle enclosure and the Jewish quarter located outside, known as Castil de los Judíos.  
Being part of the Project "Landscapes of (Re)Conquest: Dynamics of Multicultural Frontiers in Medieval South Western Europe".  
(AH/R013861/1), our interest in this case lies in integrating the study of faunal remains and metal objects in order to study how the  
macro-political issues of wars, regime changes and the advance of borders affected everyday life.

On the one hand, by focusing on such a central human activity as eating, the zooarchaeological analysis allowed to shed light into  
two different spheres such as the production and distribution of animal products and, particularly, the preparation and consumption  
of meat products. The results reveal remarkable differences between Islamic, Jewish and Christian periods and areas of occupation  
in Molina, stressing the cultural significance of food consumption patterns and their potential use for identifying ethnocultural iden-  
tities.  
On the other hand, the characterisation of the metallurgical production of both medieval social formations, the Islamic and the feu-  
dal, allow to detect origin, technology, distribution and differences between them, as well as documenting the alloying practices and  
technology developed in the craft area dedicated to the production of copper, iron and possibly glass objects near the synagogue  
area, where small fires, a basin and abundant slag were found in the Jewish area.  
All of this finally means to present new analytical, spatial and socio-cultural results of a settlement whose archaeological record has  
much to contribute to our knowledge of social dynamics, their minorities and daily life in the Iberian medieval frontiers.

**4 SINGING ARROWS –NON-NATIVE SOLDIER IDENTIFICATION INDICATOR ON THE EASTERN SHORE OF  
THE BALTIC SEA**  
**Abstract author(s):** Blaževicius, Povilas (National Museum of Lithuania)  
**Abstract format:** Oral  
Weapons and their parts are not rare artefacts in European urban archaeological monuments. Most often, however, these are in-  
dividual parts or their fragments, less often complete articles – spears, axes, armour plates, etc. The largest number of finds con-  
sists of arrowheads fired in attack or lost in defence. These numerous finds attest to the great importance of firearms, and their  
abundance allows researchers to thoroughly analyse their typological developments, technological peculiarities, chronological and  
geographical distribution, etc.

This presentation is dedicated to a small and hitherto unexplored group of finds related to non-local archers in the Baltic Sea region.  
Arrow whistles, whistling arrowheads, archers` rings as well as specific bow arrowheads with widening blades in Lithuania are dated  
to the end of 13th – beginning of 16th cent. They were mainly found in a few most important centres of political and military power.  
The presentation aims not only to investigate specific features of these objects, but also to determine their origin. Given the non-in-  
digenous nature of the artefacts and their peculiar features, they could be linked to the expansion of the Mongol Empire in 13th  
cent. and its influence on the Grand Duchy of Lithuania.  
The material investigated helped identify non-local soldiers in castle crews and / or personal protection units of the Grand Dukes of  
Lithuania, which are also mentioned in written sources. In addition, it can be argued that the analysis of these artefacts also allows  
for the reconstruction and better understanding of intercultural exchanges of technology and knowledge.

5 A SPECIAL GROUP OF INHABITANTS: VILLAGERS AND THEIR DEAD WITHIN THE CASTLE WALLS

**Abstract author(s):** Nagy, Szabolcs (Eötvös Loránd University, Budapest)

**Abstract format:** Oral

Castles in general are not the regular sites for burials in the Middle Ages, except for elite tombs and shrines in the chapel. However, a few excavations unearth medieval graves at castle courtyards and other unexpected places, deriving mostly from a period prior to the castle walls. Since written sources seldom mention the existence of a preceding church and cemetery at the site, the most important markers for the departed community are the graves and tomb stones themselves – but sometimes only the disarticulated bone fragments, along with a series of finds once interred with the dead. Archaeological investigations revealed a few examples where a constantly used Christian cemetery around the parish church of the village was incorporated by a private castle in the Late Middle Ages. These castles were frequently the fortified and significantly enlarged versions of former noble dwellings which originally stood as manor houses separately but close to the church. The integration of the graveyard into the general layout of a castle also required serious decisions on the mortal remains, that is, the dead relatives of the surviving village community near the castle. Moreover, the annexation of the parish church raised further questions as well. Were these incorporated churches and their cemeteries continuously used by the whole community or became privileged zones with restricted access? Archaeological evidence suggests that sometimes the community outside the castle could have pursued burial practice and perhaps also kept on visiting the church – especially if there are no signs of a substitutive church. This paper aims to analyse the ways of managing incorporated graves of departed with different social background and also deals with the presence of villagers inside the castle attending mass or visiting their dead. The discussion will be built upon a handful of cases mostly from medieval Hungary.

6 ROYAL PALACES (10TH/11TH CENT.) IN LOWER SAXONY - STUDIES ON ARCHITECTURE, INTERNAL STRUCTURE AND INTEGRATION INTO THE LANDSCAPE

**Abstract author(s):** Blaich, Markus C. (Lower Saxony, State Service for Heritage Managment)

**Abstract format:** Oral

The starting point for this analysis of the royal palaces of the 10th/11th century in Lower Saxony and Saxony-Anhalt are the surviving royal sojourns. These were of varying duration and frequency, but must have occupied the resources on site. During these temporary stays, the royal household comprised - depending on the estimate - between 1000 and 2000 people. What evidence is there for the accommodation and provisioning of these people? And which persons were on site? Can we find indications of the size and tasks of this group?

According to the excavations in Pöhlde, the palace seems to have consisted of a larger ring wall complex and a building complex with a church several hundred metres away. A more recent analysis yielded further results on the architecture, but also on the possible total area of the complex.

A genetic analysis of the Königsdahlum settlement provides initial indications of the integration of the royal square into its immediate surroundings. The focus here is on the question of spatial organisation (villication system) and the demolition of the complex.

For Werla and Tilleda, the evaluation of the excavations provides new insights into the structure of the square, the architecture and its supply from the surrounding area. Considerations on the internal structure of the squares as well as archaeobotanical and archaeometallurgical investigations form the basis for a further environmental archaeological study.

7 WHO USES WHAT? ARTEFACTS AND CASTLE INHABITANTS

**Abstract author(s):** Krauskopf, Christof (Brandenburg Authorities for Heritage Management and Archaeological State Museum)

**Abstract format:** Oral

Archaeological excavations at castles usually reveal a multitude of different objects, from weapons to riding equipment and objects of noble leisure activities to kitchen utensils, tools and much more. However, the question of the social structure of the castle society is rarely asked. There are indications from account books, inventory lists and other written sources, but mostly only from the late Middle Ages. Members of the castle population outside the seigneurial family rarely appear in the sources.

In order to identify persons outside the lordly family and the usually easily comprehensible “military” personnel, the archaeological material is useful. It shows the most diverse activities and functions that existed in and around the castle. The question remains who used which objects - does the riding equipment show only the knights on horseback and their squires, or also servants? Did iron strap accessories belong only to servants and those made of other metals belong rather to the lord’s family? These questions already show that there will be no simple answers - not even for special finds such as tokens or jewellery.

To answer this question, it should first be determined which objects could have been used by which groups and where overlaps occur. A clear assignment to individual groups could be achieved through the spatial distribution of the finds, provided that room functions have been identified. For this analysis, however, we will deliberately not use “modern” castle excavations, where there are already individual measurements of finds for spatial analysis, but older excavations, where finds can at least be assigned to excavation sections or excavation areas. In this way, it should be possible to determine, in parallel, to what extent “old excavations” are suitable for straightforward analysis.

85 ISLAMIC ARCHAEOLOGY IN EUROPE AND BEYOND: WIDENING HORIZONS, BLURRING BOUNDARIES. PART 1

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Shingiray, Irina (University of Oxford) - Koval, Vladimir - Belyaev, Leonid (Institute of Archaeology, Russian Academy of Sciences, Moscow) - Govantes-Edwards, David (Newcastle University) - Carvajal Lopez, Jose (University of Leicester)

**Format:** Regular session

The main focus of the previous EAA sessions dedicated to the Islamic or Islamicate Archaeology in Europe was on the significance and the reassessment of Islamic pasts and their heritage in Europe. The major benefit of these meetings was the sharing of diverse experiences by archaeologists from different countries who work on a wide range of sites, locations, approaches to, and varieties of material culture pertaining to the Islamic past in Europe. At the same time, we have realized that keeping the scope within geographic Europe posed numerous limitations. The 2021 session seeks to widen the horizons and blur the boundaries of Islamic Archaeology in Europe by looking at the interconnections between past Islamic communities of Europe, and beyond, with other Muslim groups and centers, as well as with non-Muslim communities with whom they interacted, exchanged, and cohabitated. We invite papers that examine local, regional, and trans-regional Islamic cultures and connections archaeologically by placing them into the context of the Islamic globalization process of the past. We aim for a diverse scope of approaches, methods, and case studies that explore such interconnections in the world of Islam among urban, rural, and nomadic groups, and demonstrate how local and distant cultures, currents, and materials became assembled (and reassembled), entangled, appropriated, acculturated, and transformed through the networks of the wider Islamic world in the past.

ABSTRACTS:

1 TOWARDS A THEORY OF ISLAMISATION: DIFFERENCE AND REPETITION OF THE ISLAMIC

**Abstract author(s):** Carvajal Lopez, Jose (University of Leicester)

**Abstract format:** Oral

Islamic archaeology has developed for almost a century with little theoretical discussion pertinent to the status of Islam as a globally connected network. One of the topics that is in need of consideration is Islamisation.

Islamisation has been rarely discussed by archaeologists. For some, Islamisation is the same as conversion, whereas others see it more as a social and cultural change. Some would distinguish between Islamisation (from ‘Islamic’) and Islamicisation (from ‘Islamicate’).

Underlying this confusion about the term there is a much deeper issue that has to do with the question of what Islam is and how the concept can be encompassed within the limits of archaeological enquiry.

In this presentation I will build on the work of Ahmed (2016) and on assemblage theory to achieve two things: first, a critique of current approaches to Islamisation, based mainly on two tenets: a sacred-profane duality as part of Islam; and the need of individual human identities, characteristic of Cartesian dualism. The second part of my presentation will focus on proposals on how to approach the problem of Islamisation without the two tenets above. Ahmed encourages to think of Islam as not bounded by the concept of religion, but rather as the meaning-producing medium that is continuously made by Islamic people and that continuously makes Islamic people, allowing for the creation of paradoxes and contradictions as part of its constitution. Assemblage theory gives us conceptual tools to escape the trap of dualist identity and to find Islamisation in the movement generated by the repetition of the Islamic (repetition that is called ‘reproduction’ under other theoretical perspectives). It is possible therefore to conceive Islamisation not as the transformation that has a beginning and an endpoint, but as the continuous generation of historical circumstances that allow conversion to Islam.

2 ARCHAEOLOGY OF THE MOZARABS ON THE UPPER FRONTIER OF AL-ANDALUS (8TH - 11TH CENTURIES)

**Abstract author(s):** Brufal, Jesús (University Autònoma de Barcelona)

**Abstract format:** Oral

The history of the Mozarabs is well known through a corpus of various Arab and Latin documents. These sources have led to detailed research, like that by Cyrille Aillet, into the Mozarab social structure and identity as a group. However, the historiography of the archaeology of the Mozarabs has been short and disconnected from the dynamics of university research. In fact, the most plausible archaeological evidence, the Christian necropolis, has been dealt with from the interpretative reading of Late Antiquity by researchers as prestigious as Iñaki Martín Viso. At the same time, this funerary evidence has been interpreted either as Christian necropolises in the post-conquest feudal historical context or, by an anachronic historiography that defines these as evidence of Christian redoubts, alien to the Andalusian historical reality.

Either way, the archaeology of the Mozarabs has not been interpreted vigorously enough from the historical reality of al-Andalus. This paper proposal will present archaeological and historical data about Mozarab rural communities, integrated into the Andalusian institutional dynamic between the 8th and 11th centuries. Geographically, the focus is on the land north of the river Ebro, an area

that formed part of the Upper Frontier of al-Andalus, administered by the Andalusian districts of Lleida, Huesca and Tudela. The archaeological argument will focus on the study of the Christian necropolises of which we have obtained sufficient evidence to generate their own register. In practice, that means identifying the Christian funeral ritual with diverse variants, contextualising the individuals with C14, and placing the necropolises in space and time in order to understand the Andalusian configuration of the frontier territory where Christian and Muslim rural communities coexisted.

3 **RURAL LANDSCAPE SOCIAL LANDSCAPE. THE PROCESS OF ISLAMIZATION IN THE IBERIAN PENINSULA CENTRE**

**Abstract author(s):** Berrica, Silvia (Universidad de Alcalá)  
**Abstract format:** Oral

Between the 8th and 9th centuries, the Iberian Peninsula experienced an important moment of transition. The arrival of the Arab and Berber populations of North Africa (711 AD) supposed a substantial change in all the peninsular territory.

The study focuses on the central Peninsular area. The Islamization of the rural areas of the Marca Media, as well as the other al-Andalus areas, shows the same material evidence since the first phase of the Arabs’ arrival. Nevertheless, in the Marca Media different pottery appears due to the strong regionalization that characterizes this period. Another peculiar difference between the Marca Media is the presence of the Berbers, a North African population that was about to convert to Islam simultaneously to the conversion of the autochthonous population.

Thus, the eighth century highlights a process of gradual transition in society and culture. This transformation is manifested in archaeological study through materiality, architecture, and the profound modification of the landscape, up to a complete reorganization of the territory that begins at the end of the eighth century. It would manifest itself in the mid-ninth century when the strength of the Emirate State Independent showed itself through the urban planning of the peninsular centre.

Through the study of the materiality found in different rural areas of the peninsular centre, it will be demonstrated how the early medieval landscape is extremely dynamic, where through the diversification of the size of the towns, the constructive differences, the presence or absence of crafts activities, the presence of imports can show a hierarchy of the territory and the existence of an elite. Islamization affects the landscape, showing us the different developments that affected the social and cultural dynamics of this territory, during the 8th century.

4 **DEFENCE AND SETTLEMENT ON RURAL AL-ANDALUS: THE CASTLE NETWORK OF LA ALPUJARRA (GRANADA AND ALMERÍA, SPAIN)**

**Abstract author(s):** Rouco Collazo, Jorge (Universidad de Granada)  
**Abstract format:** Oral

The aim of this paper is to present the results of my PhD research on the Andalusian rural fortresses of the Alpujarra. The Alpujarra is located in the Spanish provinces of Almeria and Granada, being the southern slope of Sierra Nevada, the mountain range with the highest peaks of the Iberian Peninsula. This place has one of the broadest periods of Islamic population in Spain, since the 8th century to the 16th, including the huge Morisco uprising. For this reason, the Alpujarra is an area suitable for analyses from the longue durée.

The main objective of this PhD research was to gather new data about Andalusian rural life through the study of ḥuṣūn (rural fortresses), a classic topic of debate in al-Andalus archaeology. These fortifications were studied through Building Archaeology and Landscape Archaeology, along with new technologies of analysis, such as GIS, LiDAR or airborne photogrammetry.

These new perspectives were used to relate the fortresses with the settlement network and the irrigation systems, the productive base of these peasant groups. With the results of these analysis’ techniques in the castle network and its landscape we can deepen in the still ongoing debate of how rural communities organized their defence and productive space and their relation with the succeeding Islamic states in this area.

5 **BLURRING CULTURAL AND RELIGIOUS BOUNDARIES: A ZOOARCHAEOLOGICAL PERSPECTIVE FROM MEDIEVAL ISLAMIC COMMUNITIES OF GHARB AL-ANDALUS (SW IBERIAN PENINSULA)**

**Abstract author(s):** Aleixo, Patrícia (Independent researcher)  
**Abstract format:** Oral

Zooarchaeology has an important role to understand the human behaviour of the past and its interconnection with the surrounding environment, particularly through the relationship humans had with animals. This study aims to summarize the known zooarchaeological data of medieval Islamic sites of Gharb al-Andalus, the western region of al-Andalus, considering the taxonomic, taphonomic and biometric evidence. The main goal is to understand the relationship between medieval Islamic communities of this geographic area and animals in a sociocultural and economic perspective. In addition, faunal remains analysis can be contrasted with the historic sources to understand questions of cultural and religious identity of several communities, such as the Mozarabs (Iberian Christians who lived under Moorish rule in al-Andalus). The available data indicate a major consumption of domestic mammals, such as caprines and bovids, and also birds like chicken (Gallus gallus). In most of the sites wild species, such as cervids are often considered to be a complement, although they had an important role in some sites, especially in military settlements. The presence of swine and equid

remains, in several contexts, (specially with cutmarks) is certainly related with food production and consumption, despite pig (Sus domesticus), wild boar (Sus scrofa) and donkey (Equus asinus) are considered forbidden food (Harām) by the Quran. Horse (Equus caballus) is considered a disapproved food (Makrūk). The presence of fish and mollusk remains in some contexts indicates that aquatic species were also an important source of food, particularly for human communities living in river or coastal areas. This value is also seen in several al-Andalus food treatises.

6 **TERRITORIALISATION AND COMMERCIAL INTEGRATION OF THE CITY IN AL-ANDALUS DURING THE 12TH CENTURY: DATA FROM THE ARRIXACA SUBURB (MURCIA, SPAIN)**

**Abstract author(s):** Eiroa, Jorge (University of Murcia) - González, José (Professional Archaeologist) - Hernández, Alicia (University of Murcia) - Celma, Mireia (Professional Archaeologist) - Morales, Jacob (University of Las Palmas) - Velo, Almudena - Molina, Isabel (University of Murcia)

**Abstract format:** Oral  
In the last two years, the University of Murcia has been developing an interdisciplinary research project in the archaeological site of San Esteban, a part of the main arrabal or suburb of the Islamic city of Murcia. This site exemplifies the spectacular growth that the medina, founded in the 9th century, experienced from the second half of the 11th century and, especially, throughout the 12th century.

The urban development of the city of Murcia, like that of other mudun of al-Andalus around the same time (e.g Valencia), can be linked to an intensification of the city’s relations with its immediate surroundings and also to a greater insertion in the far-reaching commercial networks.

Both aspects are evident in the archaeological record and can be traced thanks to an interdisciplinary methodological approach. Anthracological and carpological studies show the use and consumption of plant species from the immediate environment, as well as other agricultural products from further afield. On the other hand, the ceramic and vitreous materials are not limited to local production and confirm the acquisition of products from distant geographical contexts. The archaeological data can be linked to information from other archaeological sites in the city of Murcia and its surroundings (Santa Clara palace, Castillejo de Monteagudo) and from Arab and late medieval Castilian written sources, which reveal the presence of foreign commercial minorities in the city at that time and confirm the city’s insertion into the commercial networks of the western Mediterranean in the 12th century, whilst also confirming the integration of the medina’s productive environments and the definitive ‘territorialisation’ of urban power.

7 **MUSLIMS IN THE ‘NATIONAL CRUSADE’: MOSQUES AND CEMETERIES OF COLONIAL TROOPS DURING THE SPANISH CIVIL WAR (1936-1939)**

**Abstract author(s):** Ayán, Xurxo (NOVA University of Lisbon)  
**Abstract format:** Oral

The military success of the rebel army in the Spanish civil war was largely due to the contribution of the colonial troops that were nurtured by soldiers from the North of Morocco, Sidi-Ifni and Western Sahara. The ‘Moors’ (as they were known at the time) fought on the front line in the main battles of the conflict, hence the very high number of casualties in their ranks. During the war, the wounded recovered in cities and towns in the rear. Mosques were built in or near these hospitals for convalescent prayers and cemeteries where the remains of deceased combatants rest. These architectures were the evident proof of a paradox: on the one hand, Franco’s propaganda saw in the secular struggle against the ‘Moors’ (‘Reconquista’) the origin of the unity of Spain and the Empire. But, on the other hand, these ‘Moors’ were one of the fundamental supports of the war effort of the rebels. After the conflict these materialities make up an uncomfortable past in which several issues converge. In the francoist regime, these soldiers were colonized and subordinate subjects, and, on the other hand, they had no place in the national Catholic ideology. In democracy the mosques and cemeteries that survived are seen as another material legacy of the victors of the war. They are vestiges of soldiers who also committed atrocities against the civilian population during the civil war.

In this communication we intend to vindicate an archaeology of this contemporary Islamic architecture and address two questions: what factors help to explain the destruction and / or conservation of these remains since the war? And what to do with this heritage from the civil war, what is the role of local communities and administrations in the recent processes of patrimonialization of this recent Islamic past in Spain?

8 **BURIAL IN THE ISLAMIC RITE IN SICILY, 9TH-13TH CENTURIES**

**Abstract author(s):** Carver, Martin - Wales, Nathan - Alexander, Michelle (University of York)

**Abstract format:** Oral  
Early medieval cemeteries in Sicily are being studied as part of the ERC project Sicily in Transition: the archaeology of Regime Change. This presentation will focus on burials in the Islamic rite, their form and social, anthropological and biomolecular context. Burials in the Islamic rite begin as expected in the 9th century, consistent with the documented arrival of Muslims in Mazara in 827 and in Palermo in 831. The eleven Islamic cemeteries that have been studied and sampled are presented in four phases. The first Islamic burials in Palermo north of the harbour (9th century), are followed by burials south of the harbour (9-10th century) and then cemeteries associated with Classical period monuments on hilltops and in one case by a former Roman villa (10-12th century). In the final

phase we have sites where both Christians and Muslims were buried in adjacent cemeteries overlapping in time (12-13th century). It will be seen that the Islamic rite does not cease with Islamic governance in the 11th century. The sites can be seen to have adopted a particular ‘mortuary language’ which makes reference to local Byzantine as well as Islamic practice in the east. Comparative examples are drawn from Spain, the Levant, the Maghreb and east Africa.

9 FROM VICUS TO MADINA TO CIVITAS: THE BIOGRAPHY OF THE CITY OF MAZARA IN SICILY THROUGH ITS WASTE

**Abstract author(s):** Molinari, Alessandra (University of Rome Tor Vergata)

**Abstract format:** Oral

Within the ERC SicTransit project (directed by MOH Carver and me) it was possible to study in a new way a large quantities of finds (ceramics, glass, seeds, fruits, woods, animal bones) and features (wells, cesspits and silos) emerged in previous emergency excavations. The results were surprising and allowed us to understand how a minor settlement in western Sicily became an important Islamic city, in which hygienic rules and food practices adapted to the new religion and culture. For example, a regular system of latrines was established, the prohibition of the consumption of pork was respected, new plants and new sets of ceramics and glass were introduced. After the Norman conquest, significant changes and continuities can be seen in various fields of daily life. For example, plants introduced in the Islamic period continued to be used and eaten, but pork began to be consumed at the same time; a different management of the economy can then be glimpsed from various indicators. Finally, in the fifteenth century everything seems to change in the management of daily practices and agricultural resources.

10 FĀS AL-ĶADĪD. FOUNDATION AND EVOLUTION OF AN ISLAMIC MEDIEVAL CITY IN AL-MAGHRIB

**Abstract author(s):** Almela, Iñigo (Alexander von Humboldt foundation)

**Abstract format:** Oral

According to written sources, in 1276 sultan Abū Yūsuf Ya’qūb (1259-1286) founded next to Fes, a city he called al-Madīna al-Bayḍā’ (the White City), also known since then as New Fes (Fās al-Yadīd). This ruler was not the founder of the dynasty, but he was the one who consolidated it, hence he undertook the construction of a government city destined to serve as command head for the entire sultanate and symbol of the new dynasty. Fes El Jdid comprises all basic elements of an Islamic city (congregational mosque, government house and main commercial street), as well as walls and residential areas. However, it corresponds to the type of isolated palatine city intended for housing the court and is divided into several sectors (inhabited medina, palatine area, assembly and meeting area, market, jewry and private orchards).

Despite the loss of many historical structures, Fās al-Ķadīd has survived largely as an inhabited neighbourhood, whereas the former organization has survived with alterations. Several architectural elements and substructures still remain and reflect the evolution of the city over the course of centuries and the sequence of historical periods. The foundational layout underwent an enlargement during Marinid period and it was later refurbished by Saadian and Alaouite sultans who tried to adapt the city to new administrative roles, defensive features, social organization, and economic circumstances.

11 ISLAM IN SOUTH-EASTERN AFRICA: MATERIAL ENTANGLEMENTS ALONG THE MOZAMBIKAN COASTLINE

**Abstract author(s):** Moffett, Abigail (University of East Anglia) - Simbine, Celso (University of Cape Town)

**Abstract format:** Oral

The east African coastline was connected via traders, objects and ideas to Islamic communities in the broader Indian Ocean rim from the later first millennium CE. While the development of Muslim Swahili communities along the coastal regions of modern-day Tanzania and Kenya has received a significant amount of scholarly attention, less is known about the nature of entanglements, religious, material and otherwise, further south, along the Mozambican coastline of south eastern Africa. In this paper we expand on research undertaken along the Mozambican coastline, drawing on earlier studies as well as ongoing fieldwork on Mozambique Island, to explore evidence of connections between this region and the wider Islamic world. In particular, we discuss the assemblage, and reassemblage, of ideas and materials; from imported objects such as glass beads, cotton cloth and foreign made ceramics, to architectural styles, writing traditions and non-material evidence related to the Muslim world within the regional context.

12 BUILD ON DIVERSITY: STATES AND COMMUNITIES IN MEDIEVAL SOMALILAND

**Abstract author(s):** de Torres Rodríguez, Jorge (Incipit - Institute of Heritage Sciences)

**Abstract format:** Oral

Between the 11th and the 16th centuries AD, the south-eastern half of the Horn of Africa was home to a number of Muslim states which extended their authority over very diverse geographical and ethnic regions, providing stability for trade and challenging the

powerful Christian kingdom of Abyssinia to the north. During this period, Islam played a key role in two historical dynamics in the region: as a shared space where communities with very different lifestyles could meet and collaborate; and as a binding force used by the increasingly controlling Muslim states which ruled the region.

This paper will present an overview of these two parallel and often overlapping phenomena, taking the region of Somaliland as a case study. On one hand, it will analyse the archaeological evidence of Islam in the groups that inhabited the region (nomads, urban dwellers, foreign merchants) and the importance of this materiality in creating a symbolic but stable frame where key activities such as international trade could be conducted. On the other hand, it will analyse the role of Islam as a political force used by local rulers to generate more cohesive –and controlled- state structures in the region.

Finally, the paper will discuss how this second strategy eventually led to the emergence of a more aggressive interpretation of Islam, which developed into a full scale confrontation with the Christian Abyssinian kingdom. That confrontation, which involved world powers such as Portugal and the Ottoman Empire, ended in the defeat and collapse of the Muslim states and the dismantling of the network of urban settlements and the diversity that characterized the medieval period in Somaliland.

A. ISLAMIC ARCHITECTURE OF KAZAN OF THE KHANATE PERIOD

**Abstract author(s):** Sitdikov, Ayrat (Kazan Federal University)

**Abstract format:** Poster

Khazan’s stone buildings from the Khanate period (15th-16th centuries) exhibit many characteristic elements of an Islamic city. They include mosques, the Khan’s palace, mausoleum, madrasah, and bathhouse, some of which are mentioned in written sources. Recent archeological research contributed much new data about the architecture.

Most stone buildings are concentrated in the fortified citadel. In the northern part the remains of a white-stone basement (18x24 m) in the Khan’s Palace were found. The Khan’s Mausoleums were excavated to the west of the Church of the Presentation of the Virgin Mary and the Syuyumbike Tower. East of the Mausoleum, the remains of the Khan’s Mosque (14x23 m) were discovered.

Excavations near the Annunciation Cathedral revealed an ensemble of stone buildings, mosques and madrasahs, interpreted as the Kul-Sharif Mosque of 1500-1525. Another religious structure west of the Annunciation Cathedral corresponds to the mosque described in the Cadaster of 1565-1568.

Written sources mention architectural structures outside the Kazan fortifications: Otuchev’s Mosque in the Kuraish village and Dair’s Bath somewhere on the bank of the Bulak River—exact location is unknown. Dramatic construction activity in Kazan at the beginning of the 16th c. is reflected in written sources. Thus, in 1509 Crimean Khan Mengli Giray appealed to Vasily III to return Master Yakub, who had been sent by him to build in Kazan. In 1504, an Italian Architect, Aloisio Lambert, completed the Khan’s Palace in Bakhchisarai and arrived in Moscow following Vasilii III’s request. These facts show close contacts in architecture between the three states.

The poor preservation of excavated monuments does not allow a reconstruction of their architectural design. Only external decorative elements found in the excavations (mosaic kashin inserts, gerihs, decoratively carved stones) provide the possibility to imagine the former exteriors of the Kazan Khanate Period buildings to some extent.

B. DEDICATORY INSCRIPTIONS OF MOSCOW STATE OF THE 16TH AND 17TH CENTURIES IN THE CONTEXT OF ISLAMIC ARCHITECTURE AND CALLIGRAPHY

**Abstract author(s):** Baranova, Svetlana (RSUH)

**Abstract format:** Poster

The epigraphy of the period of the Moscow Tsardom has been studied rather well. It includes inscriptions made by church wardens of the largest church establishments that placed such inscriptions on facades of buildings. There are inscriptions carved in stone among those inscriptions. They are executed as the text composed of the several lines. Another type of inscription is represented by the inscriptions composed of one line of the glazed tiles. A decorative font is common for all inscriptions performed in vyaz’ where letters are interconnected and form pictorial puzzles of a kind. Such inscriptions were distributed in the second half of the 17th century when the pottery industry developed. Among the most known examples of ceramic inscriptions are inscriptions from the New Jerusalem monastery near Moscow. It has been correctly assumed that the vyaz’ emerged under the influence of Arabian and Persian calligraphy. However there at least two more indications that point to the same suppositions. All inscriptions are performed in the same style: a dark blue background over which the inscription is executed in yellow (‘golden’) or white (‘silver’) letters. Inscriptions made on the facades of Muslim buildings (and not only inscriptions) are made exactly in that manner. They usually have blue glazing as the background. It is unlikely that this happened by chance: rather it was the result of the interaction of cultural traditions.

**Theme:** 1. Widening horizons through human-environment interconnections  
**Organisers:** Shingiray, Irina (University of Oxford) - Koval, Vladimir - Belyaev, Leonid (Institute of Archaeology, Russian Academy of Sciences, Moscow) - Govantes-Edwards, David (Newcastle University) - Carvajal Lopez, Jose (University of Leicester)

**Format:** Regular session  
The main focus of the previous EAA sessions dedicated to the Islamic or Islamicate Archaeology in Europe was on the significance and the reassessment of Islamic pasts and their heritage in Europe. The major benefit of these meetings was the sharing of diverse experiences by archaeologists from different countries who work on a wide range of sites, locations, approaches to, and varieties of material culture pertaining to the Islamic past in Europe. At the same time, we have realized that keeping the scope within geographic Europe posed numerous limitations. The 2021 session seeks to widen the horizons and blur the boundaries of Islamic Archaeology in Europe by looking at the interconnections between past Islamic communities of Europe, and beyond, with other Muslim groups and centers, as well as with non-Muslim communities with whom they interacted, exchanged, and cohabitated. We invite papers that examine local, regional, and trans-regional Islamic cultures and connections archaeologically by placing them into the context of the Islamic globalization process of the past. We aim for a diverse scope of approaches, methods, and case studies that explore such interconnections in the world of Islam among urban, rural, and nomadic groups, and demonstrate how local and distant cultures, currents, and materials became assembled (and reassembled), entangled, appropriated, acculturated, and transformed through the networks of the wider Islamic world in the past.

ABSTRACTS:

1 NOMADIC BURIALS, WAVES OF SOVEREIGNTY, AND ISLAM IN THE MEDIEVAL NORTH CASPIAN WORLD (LATE 9TH-14TH CENTURY)

**Abstract author(s):** Shingiray, Irina (University of Oxford) - Panteleev, Sergei (Institute of Archaeology, Acad. of Sciences of Rep. Tatarstan, Kazan)

**Abstract format:** Oral  
From the end of the 9th century, the emergence of the Islamic burial rite (janaza) in the North Caspian Steppe becomes manifest through archaeological evidence derived from nomadic interments in the region. This evidence corroborates information found in 10th-century medieval Islamic sources (such as those by Ibn Fadlan, al-Masudi, al-Muqadassi, etc.) which stress the central role of Muslims in the Lower Volga region. They were involved not only in trans-Caspian and transcontinental trade, but also in local administration, as well as the military and diplomatic affairs of the region that operated under the Khazar imperial sovereignty until the end of the 10th century. After the fall of the Khazar Empire, this region was dominated by nomadic groups of Qipchaqs from the end of the 11th century until the Mongol conquest of the 13th century. Some Qipchaq graves also demonstrate clear traits of the Islamic burial rite, even though the Islamization of the Qipchaqs is poorly understood. In the 13th century, the Mongol conquest brought a new wave of nomads (as well as settlers) into this region, adding to the social and religious complexity of the Caspian Steppe. This process resulted in rapid urbanization, as well as increased Islamization of the nomadic people, who represented the military elite in Ulus Jochi (or the western wing of the Mongol Empire). In this paper, we present a sample of burial evidence from medieval Islamic graves in that region and examine how the political change of the nomadic sovereignty affected Islamic burial rites and practices among the Caspian nomads.

2 NISHAPUR WITHIN THE EAST-WEST EXCHANGE NETWORKS OF THE ISLAMIC WORLD

**Abstract author(s):** Lorzadeh, Zahra (Independent Researcher) - Laleh, Haeedeh (University of Tehran, Department of Archaeology)

**Abstract format:** Oral  
Nishapur as a metropole of the Eastern Islamic world and one of the main urban centers- and the largest one- in Khurasan, had a broad domain expanded over a vast geographical area whose heartland and hinterland together constituted what can be called the extensive Nishapur. Throughout its apogee from 9th to 12th century CE, Nishapur was a major actor within the multi-continental East-West exchange networks.  
Geographically Nishapur can be considered inland to the Iranian plateau, since it lies on the south/southeast of Kopet Dagh and Balkhan mountains that separate the rest of Khurasan from the inner Iranian plateau. Thus, it was through Nishapur that the other parts of Khurasan were connected to the heart of Iran and far to the West. Nishapur was not only an important economic center through the transregional trade of its materials and products, but also a dynamic intellectual and artistic one with global reach in the socio-cultural and political sphere of the Islamic world. The vital interchange of ideas and currents of thought gave Nishapur a special status in East-West interrelations.

THE ABBASID NORTH ATLANTIC

**Abstract author(s):** Ó Riagáin, Russell (Independent Scholar)

**Abstract format:** Oral  
This paper will seek to reframe our understanding of the early medieval North Atlantic by exploring the impact that the Abbasid Revolution, its aftermath and the processes leading up to it had on the economics and politics of the North Atlantic. The paper will begin with a discussion of the apparent decline of the Atlantic Arc trade network indicated by the presence of Frankish and Mediterranean pottery in archaeological contexts in Ireland and western Britain up until the mid-eighth century was related to either the Umayyad expansion into Iberia, and the subsequent confinement of their power base to the western Mediterranean. However, the principal focus will be on ways in which the series of colonial encounters known as the Viking Age was in part an outcome of Central Asia politics, not least due to the flows of silver, slaves and luxury goods between Western and Central Asia and Northern Europe, and from there to the Atlantic. As first theorised by Klavs Randsborg in 1980 and Alex Woolf in 2007, interruptions in silver production brought about by political crises may have resulted in knock-on effects in the Baltic region, and beyond in the North Sea and North Atlantic. The paper will use the appearance and disappearance of dirhams or darāhim in archaeological contexts in Ireland, Britain and Norway, cross-referenced with the political dynamic in these regions known from other sources to explore the level of global interconnectedness. It will also examine whether or not cycles of raiding in the North Atlantic indicated by material culture and textual evidence correspond to crises in the Abbasid and Tang Empires, and theorise as to whether the decline in these empires corresponded to a major shift in Scandinavia’s relationship with the North Atlantic.

MUSLIMS IN MEDIEVAL RUSSIA: ELUSIVE TRACES

**Abstract author(s):** Koval, Vladimir (Institute of Archaeology RAS)

**Abstract format:** Oral  
The Eastern Slavs, who created the state of Rus and adopted Christianity in 988, had contact with Muslims throughout their history. These contacts began as early as the 8th century, when Islam first penetrated the steppes of Eastern Europe, into the territory of the Khazar Kaganate. At this time, Muslim merchants began to travel along the Volga River to buy furs from Slavic and Finnish-speaking tribes. In 921 Islam was officially adopted by the Volga Bulgars, with whom the Russian princes fought and traded. In the 1320s Islam was adopted by the khan of the Mongolian state “Golden Horde”, in whose subordination Russia was from 1237 to the end of the 15th century. All this time, Muslims constantly lived on the Slavic territory, and then on the lands of the state of Rus. These people are mentioned in the Russian annals. However, until now, no burials of foreigners, performed according to the Muslim rite, have been found in these territories.  
The problem is that Muslims do not have specific attributes of inorganic materials that would help establish their former presence (like Christian crosses). Various items with Arabic script (textiles, jewelry, weapons, etc.) were trade goods and do not mark the presence of Muslims. Christians (up to church hierarchs) used such things also.

One of the possible markers of the presence of Muslims in Russia can be copper and ceramic kumgans (or aftofa) - special jugs with tubular plums that are used by Muslims for ablution before performing namaz. Two such vessels from the 14th century were found in Moscow, one in Novgorod. Finding other evidence of the presence of Muslims in Christian lands is a challenge for future research.

ISLAMIC IMPORTS FROM THE EXCAVATIONS OF PERESLAVL (PEREYASLAVL) - ZALESSKY, RUSSIA

**Abstract author(s):** Zeyfer, Vladimir (Institute of Archaeology Russian Academy of Sciences)

**Abstract format:** Oral  
The first finds of eastern glazed utensils in Pereslavl-Zalesky were discovered in 2012. In 2013, three vast sites in the south-eastern part of the Kremlin were excavated. In the borders of one medieval estate, 357 fragments of kashi pottery produced in the Golden Horde Volga region, China, Iran, Crimea and Syria, dating from the middle to the second half of the 14th century, were found. Four fragments of 14th-century embossed pottery made in Khoresm were also discovered.  
We found more than 70 fragments of seven different Syrian and Egyptian vessels of 13th and 14th centuries and 27 fragments of a yellow glass painted Syrian vessel with colored enamel and gold of the mid-13th - the first half of the 14th century. From 2014 to 2017, some fragments of glazed utensils of eastern origin also were discovered. In general, the collection of Islamic ceramics found on the territory of the Pereslavl Kremlin and its historical suburbs has more than 350 fragments. All of them belong to household container utensils. Of the other categories of kashi pottery, one bead and one piece of button with turquoise-like glaze have been found. Analysis of ceramic fragments allowed us to distinguish more than fifty vessels with different decoration techniques.  
Thus, the presence within the same estate of high-status items, which are not at that time products of traditional trade, suggests a possible explanation. It likely indicates the probable location of the Golden Horde Mission (embassy) in the excavated area.

6 THE CHEMICAL COMPOSITION OF ISLAMIC GLASS IN THE CITIES OF VOLGA BULGARIA IN THE 10-14TH CENTURIES

**Abstract author(s):** Valiulina, Svetlana (Kazan Federal University) - Govantes-Edwards, Devid - Duckworth, Chloe (School of History, Classics and Archaeology - Newcastle University) - Koval, Vladimir (Institute of Archeology RAS, Moscow)

**Abstract format:** Oral

The report is devoted to a comparative analysis of the chemical composition of glass of Bilyar, Suvar and Bolgar, the three main cities of the Volga Bulgaria, - a Muslim state that existed in the 10-14th centuries on the Middle Volga. The analytical sample also includes materials from the workshops of an alchemist, glassmaker and jeweler of the late 12th - early 13th centuries in Bilyar and the products from the glass-jewelry workshop in Bolgar of the first half of the 14th century.

51 samples of glassware, window glass and jewelry were analyzed by EMPA, which confirmed and supplemented the earlier results. In terms of chemical composition, as well as morphology and technology, the glass of local production in the Volga Bulgaria and the main import was Islamic glass. A comparative analysis of the glass from the pre-Mongol cities of Suvar and Bilyar, materials of the central market from the Golden Horde and the Bolgar glass-making workshop of the 14th century made it possible to reveal the technological features of products of two chronological periods. The chemical composition of glass turned out to be one of the indicators of the general paradigm of the development of the Volga Bulgaria culture that changed after the Mongol conquest. In pre-Mongol times, the glass was mainly imported to the Middle Volga from the Middle East, primarily from Iran; local glassmaking in Bilyar appeared within the framework of the Middle Eastern craft tradition. During the period of the Golden Horde, there were vessels and lamps with golden and enamel decoration from Syria and Egypt in the cities of the Volga region, products of workshops in Central Asia. The production of glass beads and rings in Bolgar was established according to the Central Asian technology and style, probably with the participation of Central Asian masters.

7 BETWEEN WEST AND EAST: FORTIFICATION OF THE NORTH BLACK SEA AREA IN XIV-XV CENT.

**Abstract author(s):** Biliaieva, Svitlana (Institute of Archaeology of National Academy of sciences of Ukraine)

**Abstract format:** Oral

From the end of the XIV to the beginning of the XV century, due to the expansion of the Grand Duchy of Lithuania, a fortification line with many fortresses was constructed in the North Black Sea region. During the same period, a complex of fortresses in the Moldavian Principality was also erected in order to defend its lands, trade routes, and ports. For instance, the powerful fortress of Chetate Albe (Bilgorod) had a plan of the Constantinople type with a stone construction and a citadel modelled on a European castle. The same structural plan was also used in fortresses of the Grand Duchy of Lithuania in Lithuanian lands, Belarus, and in the fortification line of the Black Sea shore in the Ukraine. The Tyagin fortress was the most eastern of these fortifications. Its structural plan was also close to that of Constantinople: its stone walls contained counterforces and its upper part had a square donjon. The corners of the fortress were flanked by round towers. And the walls were covered with plaster, similar to many fortresses of Poland, Lithuania, and Belarus. One of the towers' outer corner was decorated with a Seljuk-style stone carving, analogies of which can be found in the XIV-XV-century monuments in Crimea, Turkey, and other regions of Islamic culture. The floor of the fortress tower was covered by wood boards; and, in that floor context, the end part of a cannon barrel was found—which so far is the first and the earliest finding of an artillery weapon in the eastern part of the North Black Sea shore. The possible dating of this tower to the first part of the XV century is suggested by the finds of Tatar and Polish coins in it: one of these coins was issued by the King of Poland Wladislav Warnenchik.

8 ISLAMIC ELEMENTS IN MOSCOW GRAVESTONES OF THE 16TH AND 17TH CENTURIES

**Abstract author(s):** Belyaev, Leonid (Institute of Archaeology Russian Academy of Sciences)

**Abstract format:** Oral

In the second half of the 14th century, the city of Moscow developed its tradition of gravestone ornamentation. Those gravestones had no inscriptions and were made by a technique that was used in everyday wood carving. At the end of the 15th century gravestones acquired their first inscriptions. Since the 16th century inscriptions became a commonplace and quite promptly developed into a decorative system which was called vyaz', meaning a compound weave of letters. The first gravestones with recessed bottom appeared at the same time. Floral ornamentation supplemented those two elements.

Vyaz' became widespread but those methods of decoration were used rarely. Examples of the use of these methods are concentrated in the period 1630s-1670s. A unique example from the 17th century is known, namely the elaborate compositions for the czars' gravestones in Archangel'skiy cathedral of the Moscow Kremlin. The general interrelation of Russian vyaz' and epigraphy and the art of calligraphy of Islamic Orient were noticed by many researchers, who, however did not provide direct evidence for this.

Russian craftsmen could have become acquainted with the art of Islamic calligraphy in the 16th century specifically via masters from Bulgar and Kazan' where the first examples of Islamic ornamentation in the decoration of purely Russian gravestones have been found.

The second source for borrowing from the Islamic tradition is Kasimov, the capital of a tributary Tatar principality on the Oka river. These examples illustrate how the development of art depended on political contacts. At the same time, Islamic carving remains an episode of arts and crafts that was not continued in the 18th century.

9 CERAMIC PRODUCTION AND CONSUMPTION IN CYPRUS DURING THE OTTOMAN PERIOD: LOCAL TRADITIONS IN THE MEDITERRANEAN EXCHANGE NETWORK

**Abstract author(s):** Živkovic, Jelena (The Cyprus Institute)

**Abstract format:** Oral

The Ottoman conquest of Cyprus in 1571 brought the socio-economic, demographic and administrative changes to the island. The integration of Cyprus into the Ottoman network in the Eastern Mediterranean and the Middle East influenced means of production, trade and land ownership. However, an impact of the Ottoman conquest on material culture of the island remains largely unknown. This paper aims to explore patterns of common pottery production and consumption in Cyprus during the Ottoman period (1571-1878), focusing on the long-terms development of production technology.

This is the first systematic study of the Ottoman-period archaeological ceramics in Cyprus and includes wares excavated at several sites located in Nicosia, Ayia Napa and Larnaca. Around 4,000 ceramic vessels were classified and quantified, allowing the well-contextual examination of consumption patterns during the Ottoman period. For the study of production technology and provenance, selected wares were subjected to petrographic and chemical analyses of ceramic bodies, slips and glazes. The results of macroscopic and microscopic analyses enabled a close examination of the local Cypriot traditions of pottery making as well as networks of exchange in the Eastern Mediterranean between the 16th and 19th centuries.

10 PAST REMAINING SPACES, CONTEMPORARY SOCIAL BEHAVIOR: THE CONTINUITY OF SOCIAL BEHAVIOR ACCORDING TO LATE ISLAMIC ARCHAEOLOGICAL EVIDENCE IN YAZD, IRAN

**Abstract author(s):** Azizi, Hamid (Archaeology, University of Tehran)

**Abstract format:** Oral

Cultural and social phenomena in our society have deep roots in the past. In other words, at least in part, the social behavior of current societies has its roots in their past, institutionalized in the subconscious memory of the citizens for hundreds or thousands of years. The cognition of social behavior of past societies and their structures could lead to a deeper and better understanding of contemporary social behavior. One of the most important ways in reconstructing social behavior of people in the past is the study of architectural and urban spaces. In fact, the most important issue here is the continuity of some social behaviors over a long period of time with emphasis on Islamic principles. Considering Iranian cities with historical heritage, the historical texture of the city of Yazd is well preserved. The reconstruction of the social structure of Yazd (emphasizing social communication) according to the remaining spaces from the past, and its possible continuity in contemporary society will be discussed in this paper. It seems that compact neighborhood, and some public spaces such as neighborhood mosques – in shaping of which, climate and economy have also played a role besides Islamic law – could have increased social interaction among neighborhood residents. Increasing the level of social communication, can not only increase the cohesion and solidarity between the residents, but also lead to the creation of a kind of informal social control in the neighborhood. However, some other architectural spaces and the archaeological evidence left by them, indicate the emergence of a different type of social behavior among residents. Some principles of Islamic religion like privacy, executed in private spaces, led to a kind of private life's spread, wholly hidden from the public eye, causing the pretention and dual character, which is still observable in the contemporary society.

11 THE FATE OF THE CHURCHES IN THE OTTOMAN HUNGARY

**Abstract author(s):** Mordovin, Maxim (Eötvös Loránd University)

**Abstract format:** Oral

The time of the Ottoman wars in Hungary had a rather heavy impact on all religious buildings in the country. Since before the Ottoman invasion, the population of Hungary was predominantly Christian, the buildings affected by the conflict were churches, chapels and monasteries. Their fate then depended on the circumstances that followed the conquest. The most fortunate case from the point of view of their survival was the rapid occupation of the site by the Muslim military. In this case, the invaders converted almost all of the churches into mosques keeping the main structures and destroying only the decoration and the movables. Much worse was when these buildings stuck in the border zone with the declining number of the local population, which used to maintain them, and with the increasing number of military clashes involving the structure itself. The latter inevitably led to a radical and complete transformation of the building and its closest environment. There were several possible stages of such alterations, from a simple enlargement and adoption of the surviving parts for the new military purposes, up to the almost complete demolition of the medieval structure, reusing only its foundations. In my paper, I present three case studies for each of these transformations. The first is a Franciscan friary in Szécsény, where the building complex became the seat of the local bey. The second case is the former Pauline friary of Gombaszög, transformed into a fortification in the mid 16th century. While the last is a simple, rural parish church at Somogysámson, wholly incorporated in an earth-and-timber fortification.

ISLAMIC EFFECTS IN CHRISTIAN COMMUNITIES IN EUROPE AND THE BALKANS

**Abstract author(s):** Zear, Asem - Shipoli, Elza (Pázmány Péter Catholic University)

**Abstract format:** Oral

Throughout its history, Islam has affected the other civilizations, when it expanded to different parts of the world starting in the 7th century. The purpose of this paper is to give an overview of how Islam influenced the culture, politics, economics, and trade growth in Europe and the Balkans area during the medieval period.

The regions considered in this paper include Bosnia, Kosovo, Albania, Spain, Sicily and Malta. Islamic influences reached Europe not just in terms of religion but by a variety of other methods with considerable success.

In this paper, I would like to discuss the newly-emerged Muslim communities in Spain (starting from the 8th century) and their connections with the Christian communities that retained their original religion after Spain accepted the new religion of Islam.

Secondly, I will describe the medieval Islamic naval fleet and its ability to reach the southern coastal regions of Europe like Sicily, the south of Italy and Malta. As a result of these invasions, Muslims were able to share their culture, religion and traditions with the local communities. This is reflected in the present language and the architecture in Malta for example.

Thirdly, in the 14th-15th centuries, the Ottoman Empire brought new Islamic influences into the Balkans—specifically, politics, religion, ideas, and also wars. As a consequence, they all had a profound impact on the Islamic world, reshaping Islamic architecture, including tombs and mosques, and its culture in general.

THE MATERIAL CULTURE OF ATTACHMENT: SOCIAL BONDS, CHILDHOOD AND EMOTIONALLY IMPORTANT OBJECTS

**Theme:** 6. Material culture studies and societies

**Organisers:** Lipkin, Sanna (University of Oulu) - Bell, Taryn (University of York) - Väre, Tiina (University of Oulu)

**Format:** Regular session

Humans are intensely social creatures, capable of forming strong emotional attachments to others throughout life. These bonds emerge during childhood between children and their caregivers, who ideally provide the child with a sense of security, which serves as the foundation of the child’s wellbeing and ability to thrive in other relationships in later life. Yet attachment is not exclusively interpersonal, but can also include material culture. Thus, as archaeologists, there is clearly scope to study these attachment bonds using archaeological approaches to material culture.

This session will discuss and theorize the archaeological evidence for attachment bonds, with a focus on both childhood and material culture. How can material culture or osteological evidence provide insights into these bonds or the lack of them? How do difficulties and trauma during childhood affect not only the lives of children but adults as well? What archaeological evidence exists for traumatic experiences to be inherited from one generation to the other? These may be evident through examining the evolution of child-mother bonds during breastfeeding, studying generational and intergenerational effects of conflicts, identifying signs of caregiving in osteological materials, or looking at funerary material through the lenses of attachment and resilience.

Similarly, while attachment is often studied in relation to childhood, this session also welcomes papers which explore the impact of attachment in adolescence and adulthood. Why do certain objects and places become so emotionally significant to us? What long-term impacts do these attachments have on our lives and our relationships with others? How can we, as archaeologists, look for traces of attachment in the archaeological record?

While the expression of attachment may be culturally bound, the theme is intercultural. We are interested in both theoretical approaches and research on and around the topic with wide cultural and temporal scope.

ABSTRACTS:

ARCHAEOLOGIES OF ATTACHMENT: UNDERSTANDING SOCIO-EMOTIONAL LIFE IN THE PAST

**Abstract author(s):** Bell, Taryn (University of York)

**Abstract format:** Oral

The notion that humans form socio-emotional bonds with other people is an underlying assumption of much archaeological work on social life in the past. Yet we have been slower to recognise the emotional role of nonhumans. From our relationships with objects, animals, religious beliefs and important places, we can gain intense, palpable feelings of security, which impact our cognition and social behaviour, and which provide a wealth of benefits to our mental and physical health and wellbeing too.

In this paper, I discuss how the psychological theory of attachment may provide useful insights into a variety of interpersonal and nonhuman socio-emotional relationships, helping us to understand why and how humans form attachment bonds. I will also discuss the significant, yet understudied, role played by so-called ‘compensatory’ attachment figures such as companion animals and cherished possessions.

Attachment theory provides a simple, yet useful, framework with which to think about bonds in the past, and so allows us to broaden our conception of who - and what - plays an important role in our social and emotional lives. This has broader relevance in the modern

PHENOMENOLOGICAL APPROACHES TO PREHISTORIC ATTACHMENTS. THE EVIDENCE FROM PREHISTORIC, COMPLETE, ANIMAL BURIALS OF THE EASTERN CARPATHIAN BASIN

**Abstract author(s):** Daróczi, Tibor (Aarhus University, Department of Archaeology & Heritage Studies)

**Abstract format:** Oral

One of the most meaningful, but at the same time also neglected aspects of past manifestations are human bonds, which are at the crux of all activities and relations, both in terms of human to human but also human to nature connections. Phenomenology provides possible explanations that take interpretations a step further from traditional material typologies of human bones and of anthropogenic material culture, while also providing us with a method of thinking that would allow the exploration of these faded, emic nuances. Graves are expressions of intense attachments of individuals of past societies, but also serve as beacons in times of emotionally and socially charged events. A way to approach the intensity and importance of these social connections is to look at a category of burials, which normally would be regarded as liminal or in essence, purely gastronomic, but due to the special care given to the disposal of the lifeless corpse, such an interpretation becomes naïve. These are the complete, animal burials, which are either encountered in graves of their possible human companions, in a burial ground but in separate graves or in a single standing burial ground. A phenomenological approach to the research of the funerary landscapes of the prehistoric Eastern Carpathian Basin revealed precisely such a group of burials, which, albeit non-human, indicate intense attachments between what we would call owners and their pets, attachments that were honoured and respected by the living. While the documented species change through the millennia, the strong bond is unaltered and can serve to provide further nuance as to the material culture of attachments in non-literary times.

MEN’S BEST FRIEND: NOTES ON ATTACHMENT BASED APPROACHES TO DOG BURIALS IN LATE NEOLITHIC SOUTHWEST IBERIA

**Abstract author(s):** Castanheira, Patricia (Universidade de Lisboa)

**Abstract format:** Oral

In recent years, dogs represent an important focus of attachment studies, both as subjects (Payne et al., 2015) and as figures of attachment (Rockett and Carr, 2014). But what about prehistoric dogs? Focusing on attachment in adulthood, specifically on attachment-based approaches to grief (Shear et al., 2007), we will try to perceive social bonds through the materiality of late Neolithic dog interments in southwestern Iberia.

Since the dawn of their domestication, with similar care to that recorded in human burials (and by care we do not mean a careful handling, rather the postmortem treatment they’ve both been subjected to), dogs appear to be more common than deviant in the funerary record of late 4th/3rd millennia BCE. The aim of this paper will thus be to compare dog and human burials, using an attachment-based line of inquiry: a) were these dogs figures of attachment? b) could the objects associated to them be representative of a bond of sorts? c) can we infer attachment bonds, object-relating and object-use (following Winnicott, 1969) from dog burials?

Focusing on three case-studies from the Alentejo hinterland, namely Horta da Morgadinha 2, Corça 1 and Alto de Brinches 3 (all in Serpa, Portugal), we will try to rehearse an interpretative exercise sustained mainly on archaeoethanatological readings. The main objective will be to explore the possible scope of attachment-based approaches to the interpretation of human-animal bonds in Late Neolithic Iberia.

CARING, COMPASSION AND CLEMENCY – A CASE OF FICTIVE KINSHIP

**Abstract author(s):** Tuovinen, Saara (University of Oulu)

**Abstract format:** Oral

A family bond is one of the strongest formed and known in human societies. It is often seen as an essential and ideal unit for child rearing, socialization and survival in general. The traditional family in the Western Christian world contains a wife, a husband and their offspring. This is a model that has been idolized as the most traditional family model but is now crumbling down due to new ideas, divorces and marriage becoming less and less common. However, this situation is not new, since many families in the past also had different kinds of relationships among them. Mostly because of the deaths of parents, spouses, children or siblings, but also because some social ties formed by caring, compassion and clemency were even more complicated forming fictive kinship. This presentation is a case study of a non-traditional family and household of Clementeoff’s from the early half of the 19th century Finland. With archaeological material and historical records, we can unfold a case of a foster family that was not typical for its own time.

5 **FRAGILE AND RESILIENT: MOTHER-INFANT BONDS IN 18TH TO 19TH-CENTURY FINLAND**

**Abstract author(s):** Lipkin, Sanna (University of Oulu)

**Abstract format:** Oral

The emotional bond between the primary caregiver and the child serves as a foundation for an individual's wellbeing both during childhood and later life. The evolution of these bonds may be a fragile process and is largely dependent on the caregiver's actions and mental wellbeing. Historically the primary caregiver has usually been the mother of a child. An avoidant and distancing mentality is usually inherited from a mother to her child and has long historical roots between generations. This paper will look into the roots of indifference and rejection that mothers have directed towards their children. Neglect may be due to both personal and social traumatic events, such as wars or famines, as well as every day repetitive trauma. A combination of historical sources and archaeological evidence provide a base for discussing mother-infant bonds both from theoretical and factual perspectives. In this presentation cultural perceptions towards and practices related to high infant mortality, stillborn infants, infant and child death as well as burial and commemoration will be discussed based on the 18th to 19th-century evidence from Finland. To examine the generational effect, this information will be examined through the experiences and practices of those who survived childhood and became parents themselves.

6 **DETACHED MOTHERS?**

**Abstract author(s):** Väre, Tiina (Archeology, University of Oulu)

**Abstract format:** Oral

Breastfeeding is held in high regard as the foundation of lifelong somatic but also psychological wellbeing. It profoundly effects the formation of attachment between the infant and the primary caregiver. Much like the current official recommendations, in the past, full breastfeeding was typically encouraged. Yet, it is known to have been avoided out of vanity as well as necessity. The breastfeeding practices during the 18th and 19th centuries in certain areas of present-day Finland and the related massive infant mortality raised concerns. However, instead of worries over the wellbeing of children, the motivation behind statements made over the matter at the time was the dissatisfactory rate of population growth. The stable isotope studies of dentin collected from archaeological remains dating to the period may bring clarity to the problem of whether the mothers indeed neglected childcare. In addition, these results allow further considerations on the topic of investment in parenthood and caretaking in the populations concerned. They can function as a base for conversation on how children were perceived as members of the family and society at large in different geographic areas during different periods. Full breastfeeding happens at the expense of maternal energy balance and fertility. Therefore, in many traditional societies lacking effective contraceptives, typical weaning ages reflect the reproductive and parenting strategies at the population level.

94 **DECISION-MAKING IN ARCHAEOLOGICAL HERITAGE MANAGEMENT: MOVING FORWARD**

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Verschuur, Marjolein (Cultural Heritage Agency of the Netherlands) - Kreiter, Eszter (Castle Headquarters Ltd.)

**Format:** Regular session

In march 2018 the Europae Archaeologiae Consilium (EAC) published it's Making Choices report on decision-making in archaeological heritage management. This was a result of a survey that sought to understand the way in which decision-making in archaeological heritage management was undertaken in the context of the Valletta and FaroConventions. The survey made clear that four major themes needed to be explored further:

- Guidance on assessing and articulating significance
- Developing national research frameworks
- Making the case for development-led archaeology - public benefit of archaeology
- Managing archives – guidance on selection in archaeological archiving and the digital archiving

Since then the EAC has established working groups that aim to give guidance on these topics. In this EAA session the results of the working groups will be presented. We will also present the outcomes of the EAC annual meetings discussions on Covid-19 and archaeological heritage management. Furthermore we invite speakers to present their own research regarding these themes. Aim of the session is to share the results of the working groups, but also to share experiences and good examples on any of the themes.

**ABSTRACTS:**

1 **ARCHAEOLOGY AND PUBLIC BENEFITS: MAKING THE CASE**

**Abstract author(s):** Sloane, Barney (HE - Historic England; European Archaeological Council)

**Abstract format:** Oral

The 1954 European Cultural Heritage Convention (the 'Paris Convention' ) the 1969 European Convention on the Protection of the Archaeological Heritage (the 'London Convention' ) and the 1992 Valletta Convention have incrementally connected the fostering of unity in the European community with the appropriate management of archaeology in the context of land development and state

planning procedures. As a result 'Development-led' archaeology, whether state-sponsored or privately funded, is now a fundamental feature of the practice of archaeology across Europe. Expenditure across the whole of Europe has never been accurately calculated but it will almost certainly have exceeded €1Bn in 2018.

Representing archaeological heritage management of 33 member states, EAC recognises that collectively we have been poor at providing the evidence of the range of tangible public benefits (economic and social) arising from this very significant sum. This is an important consideration in the light of recurring and occasionally very significant state pressures to relaxing planning laws or to constrain public spending. This paper will provide a short summary of the work EAC is doing to ensure that state decision-makers, land developers, archaeologists – and of course the public – can be clear about the tangible benefits of this large investment; and to equip them with the evidence for advocating its continued support in policy and practice.

2 **INTERACTING WITH THE PUBLIC TO MAXIMISE BENEFIT FROM ARCHAEOLOGY: NEW APPROACHES ON DEVELOPMENT-LED WORK**

**Abstract author(s):** Watson, Sadie (MOLA)

**Abstract format:** Oral

We have spent the last few years discussing the need to increasing the public benefit of our work as archaeologists, with a renewed focus on our positive impacts for society. The Europae Archaeologiae Consilium (EAC) are partners on a 4 year research project intended to provide useful and relevant ways of measuring and evaluating our public benefit. Sadie will outline this project, its progress so far and aims for the future. She will also present initial results from a large public survey launched in 2021 to assess the level of interest in development-led archaeology and how we can better target our efforts from a social justice and well-being perspective. Arguably, the best determinants of public benefit are the publics themselves, as they are aware of their strengths, as well as the outcomes they desire from any work happening in their area. The research project adopts a social justice paradigm, seeking to promote greater access to, and decision-making power in, developer-led archaeology, particularly for those who have traditionally been excluded members of society.

3 **SELECTING ARCHAEOLOGICAL ARCHIVES – AN OLD TOPIC STILL TO BE DEALT WITH**

**Abstract author(s):** Novak, David (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic) - Oniszczyk, Agnieszka (National Heritage Board of Poland)

**Abstract format:** Oral

Archaeologists deal with choices every step of their professional way: from defining what an archaeological site is, through the choice between the in situ preservation and intrusive fieldwork and selection of research methodologies, up to compiling archives for permanent storage. Whatever these choices are, they should be explicit and conscious. They should result from a clearly formulated selection and retention strategy. Selecting for archaeological archives has been much discussed in recent years, mainly due to the pressure on storage space at archive repositories that has arisen from increasing archaeological activity. It is important that archaeologists are not drawn into debates on finances, where they may have little influence, but instead establish an archaeological approach to alleviate this problem. We should, first, overcome certain prejudices towards selection of archaeological archives, because the term often seems to be identified with throwing away archaeological artefacts. Discarding finds is not obligatory but it is obligatory to consider selection in every archaeological project. After all, it is not only about finds and samples but also the documentary archive in traditional and digital form. Clear formulation of strategies, explaining what is going to be kept in perpetuity and why, will allow archaeologists, curators and heritage managers to justify archaeology – related expenditures to developers, authorities and the wider public. Transparent, explicit and well-founded argumentation for preserving certain elements of archaeological heritage for the future will contribute to strengthening archaeology as a science and translating the value of archaeological heritage to non-archaeologists.

4 **MAKING CHOICES: DEVELOPING GUIDANCE ON NATIONAL RESEARCH FRAMEWORKS**

**Abstract author(s):** van der Jagt, Inge (Cultural Heritage Agency of the Netherlands) - Miles, Daniel (Historic England)

**Abstract format:** Oral

This presentation will highlight the work undertaken so far to provide a suite of guidance to support those people who are considering developing national research frameworks. The results of the EAC Making Choices survey showed that only a few national research frameworks existed across Europe, but the need for information, guidance and support on how to develop one was flagged up as a priority. The working group was set up and has been working collaboratively to create a number of resources and supporting materials. These resources include:

- Reviews of current frameworks – to show the different types, format, content, scope and ownership that exist. This will help showcase the broad nature that the frameworks can take and that can support different needs and situations.
- Setting out the strategic value of research frameworks – why have one, who they are for, what can they be used for?
- Case studies of European countries that are interested in developing a research framework to highlight their individual situations and their requirements
- Web-based practical guidance on the process of creating a framework.

5 SCARED OF MAKING CHOICES? DEFINING ARCHAEOLOGICAL HERITAGE BETWEEN POLICY AND PRAXIS IN ITALY

**Abstract author(s):** Benetti, Francesca (Historic Environment Forum)

**Abstract format:** Oral

Archaeological heritage is usually deemed important for the nation and it is considered to have public interest. On these premises, European countries developed specific legislation about it, even though in different time frames. However, the notion of archaeological heritage is not so easy to be defined legally. This presentation deals with the legal definition of archaeological heritage in the evolution of Italian legislation, compared with the development of the archaeological discipline. It will demonstrate that the legal notion of archaeological heritage in Italy is still blurry and open to different interpretations. For example, 20th-century archaeological heritage (such as WWI heritage) is not always treated as “archaeological”, not only in practice but also in legislation. This blurry definition was probably born to leave room for the state to designate sites according to the current advances of the disciplines. However, it can also denote a fear of “making choices”. This has also significant consequences in assessing public benefit and significance. This presentation aims to foster a discussion with the other participants in order to compare the different definitions of archaeological heritage in Europe.

6 STAKEHOLDER MANAGEMENT IN THE FLEMISH ARCHAEOLOGICAL SECTOR

**Abstract author(s):** Bornauw, Freija (KU Leuven; VUB) - Hermans, Rosalie (VUB Maritime Cultures Research Institute - MARI) - Dooms, Michael (VUB department of Business - BUSI, Unit Management and Strategy)

**Abstract format:** Oral

Over the last two decades, archaeological practices have transformed dramatically. From 1992 onwards, the Valetta Treaty led to a major increase in development-led archaeology in Europe. Several scholars have since then expressed their concerns and critiques regarding the national practices that have resulted from the Valetta Treaty. Past critiques have addressed problems with knowledge enhancements, deficits in quality management and a lack of public outreach.

Many past contributions briefly mention the stakeholders who are involved in archaeological practice, but only few have thoroughly focused on these stakeholders. Such stakeholders include archaeologists, government employees, developers and the general audience. The aim of this research was to better understand these stakeholders and their relationships, both internal and external, as well as their (perceived) power and interest.

In Flanders, too, archaeological excavations are paid for by developers. There is a commercial framework in which the government determines both criteria for ‘archaeological obligation’ and quality standards. For this study, respondents were questioned from four stakeholder groups in Flanders, more specifically the government (both the Flemish Heritage Agency and local players), academics (from three different Flemish universities), commercial archaeologists (both umbrella organizations and small businesses) and developers.

Following the theoretical stakeholder framework of Ackermann & Eden, the power and interest of each stakeholder group was mapped in relation to other stakeholder groups. Several novel conflicts could be identified regarding these interrelationships, such as the altering role of governmental players and the lack of transparent communication between several actors. We are convinced that a better understanding of these relationships and conflicts of power and interest is a condition for improving development-led archaeological practices not only in Flanders, but on a European level.

7 TO DIG OR NOT TO DIG? TO PRESERVE OR NOT TO PRESERVE? CONTEMPORARY DILEMMAS OF ARCHAEOLOGICAL HERITAGE MANAGEMENT IN ROMANIA

**Abstract author(s):** Bors, Corina Ioana - Damian, Paul (National History Museum of Romania - MNIR)

**Abstract format:** Oral

Although member of the European Union, since more than a decade Romania’s is no longer active in the framework of the Europae Archaeologiae Consilium (EAC), despite the fact that such a participation is more than obviously needed. Only if to think that there are still gaps in the way the Valletta Convention was implemented in the specific Romanian legislation concerning the protection of the archaeological heritage, but also the fact that no public debate about the necessity for ratifying of the Faro Convention was ever initiated by the relevant public authorities. Or considering that throughout the last 15 years the government agenda includes a specific aim for the Code of the Heritage. But constant delays and adjournments occurred in setting a much more appropriate framework for the archaeological heritage, while the general development rhythm of the country in various perspectives determines a much more applied and conscious approach regarding this sensitive issue, as well as adequate strategies for it. The authors of the paper will present the results of their research on a series of specific aspects, such as determining and understanding the significance of the archaeological heritage in the framework of development-led archaeology, the use of historic archives in documenting the presence of archaeological vestiges or the public benefits of development-led archaeology etc.

8 FROM ARCHAEOLOGICAL EXCAVATIONS TO PERMANENT EXHIBITION SPACE: THE THIRD LIFE OF THE NEBELIVKA TEMPLE

**Abstract author(s):** Videiko, Mykhailo (Kyiv Borys Grinchenko University) - Motorzhyna, Mariia (Department of Culture and tourism of Kirovograd Domain State Administration)

**Abstract format:** Oral

The Nebelivka temple (20 by 60 meters size) was the largest public building in the Cucuteni-Trypillya Culture 6000 years ago. Its study was part of a British-Ukrainian archaeological project in 2012-2014. The project was presented at the EAA meeting in Istanbul in 2014. Now is the time to prove by his example the possibility of public benefit from archaeological research. The current project envisages a re-exposition of a permanent exhibition space to present achievements of archeological investigations. The ancient cult building will be recreated graphically and reflected with authentic elements of architecture and decoration. Material remains will demonstrate the purpose and role of the building in the religious and social life of ancient society. The new exposition will reflect the geographical coordinates of cross-border cultural routes between Ukraine, Romania and Moldova which have at their territory more than 4300 sites of Trypillia-Cucuteni Culture. The realized goal of the project will allow to rethink the social role of cultural heritage and will open its economic potential for community development and formation of a creative environment around archeological objects.

The uniqueness of the project lies in the reproduction of architectural monuments, namely - a cult building that existed 6,000 years ago. Given the creation around the tourist network, later, the creation and implementation of a virtual tour of the object, as the next stage of development. In the future, this approach will open access for people with disabilities to see the unique world of ancient history, without leaving home to see and feel the grandeur of ancient times. The main goal of the project is to adapt and reproduce archeological finds, using IT technologies, scientific information about the archeological object from the Copper Age.

95 ARTS IN WORK: ABOUT THE INTERACTION OF SOUNDSCAPES AND TASKSCAPES IN ANTIQUITY

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Garcia-Ventura, Agnes (Universitat Autònoma de Barcelona) - Bellia, Angela (Institute of Heritage Science at the Italian National Research Council) - Ferrer Martin, Meritxell (Universitat Pompeu Fabra) - López-Bertran, Mireia (Universitat de València)

**Format:** Regular session

Working and music/sounds are two topics of research that have been almost unexplored together so far in studies of material culture, especially due their ephemeral nature. On the one hand, when dealing with music, working environments are not usually considered. On the other hand, when dealing with work and production the focus is often on administrative and economic aspects, as well on the so-called chaîne opératoire, but not on soundscapes. In this session we aim to fill this gap discussing several aspects of the interaction between working and music/sounds through a fresh look of material culture that shed light on the potentialities of objects and architectures as creators of a wide array of sounds that participated in the creation of taskscapes in working environments. Notice that we use indiscriminately and intentionally music and sounds as synonyms as we also aim at discussing the definition of their boundaries. In doing so, we aim to include in the debates on soundscapes issues as diverse as work songs, traditionally considered “music”, but also the crackle of fire or the pounding of mortars, to name two examples, traditionally considered “sounds” (or even “noise”). How do we define these conceptual borders in working environments? Why? Are they useful for our analysis or they hide more than what they show?

To discuss all these issues we encourage contributions by scholars dealing with any period and geography as well as various perspectives: history of religion, archaeomusicology, archaeoacoustics, sound archaeology, ecoarchaeology, classics, anthropology, and art history. Interdisciplinary and multidisciplinary research will be welcome, especially research on archeoacoustics based on contemporary analysis like Soundshed Analysis GISTool among others.

ABSTRACTS:

1 INTRODUCTION: THE MATERIALITY OF SOUNDSCAPES AND TASKSCAPES

**Abstract author(s):** López-Bertran, Mireia (Universitat de Valencia) - Bellia, Angela (Institute of Heritage Science at the Italian National Research Council) - Ferrer, Meritxell (Universitat Pompeu Fabra, Barcelona) - Garcia-Ventura, Agnès (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The study of soundscapes and taskscapes are two topics of research that have a rather short history in the archaeological debates of the last thirty years. However, the results are multiple and varied. On the one hand, we follow T. Ingold’s (1993) definition of taskscape as a socially constructed space of human activity which is always in process, and recognizes that all tasks are interlocking. We find this term useful as allows a comprehensive approach of working environments. On the other hand, the study of sound archaeology and soundscapes points out the importance to consider the complete acoustic ecology of any site in order to recover the significance of this trait in the human activities for a wide array of reasons (subsistence, ritual, working and so on). In this Introduction

we want to highlight the relation between the two concepts and show the potentialities of their connection in order to analyse social aspects of the past societies such as the gender constructions when singing during work activities, the role of gossiping in working environments as mechanisms of social control and the exploration of ritual and daily soundscapes alike to recreate a more vivid idea of the aural environment. We are certainly aware that in order to succeed, it is necessary to use different methodologies like the analysis of the lyrics of worksongs, organological and archaeoacustical studies, spatial analysis, phenomenological perspectives as well as the application of GIS technology to model soundscapes in order to know how people heard their wider working surroundings.

2 WORK AND SOUND ENVIRONMENTS IN ETHNO-MUSICARCHAEOLOGICAL PERSPECTIVES

**Abstract author(s):** Stomberg Lund, Cajsa (Linnaeus university)

**Abstract format:** Oral

This paper will deal with work situations and their sound environments in music-archaeological perspectives, which also include ethnomusicological and historical aspects. A small selection of contextual studies of ancient working and sounds will be discussed. They are presented in the form of snapshots. The studies are based primarily on archaeological finds of various musical instruments and sound tools in sea as well as on land, such as boatswain’s call, drum, bell, buzz disk, buzz bone, hazelnut whistle, bone flute and fiddle. These were found in different places in Europe, such as the Nordic and Mediterranean countries, respectively, and are dating from different times, for example the Mesolithic, the Middle Ages and the 17th century. Ethno-musicarchaeological methods, problems and approaches concerning ancient soundscapes and sound environments will be in focus. A basic question will be the music-archaeological concept of music: what is music, what is not any longer music, what is not music!

3 WOMEN'S WORK IN THE 'WEAVING HOUSE': SOUNDSCAPE AND TASKSCAPE IN THE SANCTUARIES OF SOUTHERN ITALY (VIII C. B.C.)

**Abstract author(s):** Bellia, Angela (Institute of Heritage Science - National Research Council of Italy)

**Abstract format:** Oral

Current studies on sound experiences and musical practices pay insufficient attention to the role of sound and music within the sphere of work in the sacred context. Whenever scholars do turn to sound and music in sacred sphere, they generally focus on certain types of music and/or choral performances. What they have particularly overlooked are spaces in sanctuaries and sacred structures dedicated to work where sound events and music activities were performed. These activities as well as their relation to working practices and religious experiences, have been given little thought. In addition, insufficient attention has been paid to the role of musicians and dancers at festivals, processions and rituals related to relevant ancient working activities.

This paper aims to address these lacunae by bringing together considerations on woman’s work in the sanctuaries in Southern Italy, where weaving activities related to female divinities took place. It will be addressed the following questions: a) What archaeological evidence of music and dance performances linked to weaving activities at sanctuaries exists? b) Which “cultic soundmark” was distinctive to the cults’ locale, where women worked? c) Who were the music and dance performers at festivals related to weaving activities? Which instruments were played in these ceremonies? d) What was the sonic experience like in these sacred and work spaces?

Thanks to the analysis of a case-study in the Oenotrian-Achaean regions in Southern Italy (VIII c. B.C.), it will be explored how sound-scape might have enhanced the relationship between working environment and social interactions.

4 THE SOUND OF ¿SILENCE? MUSIC AND OTHER SOUNDS IN THE RITUAL AND FUNERARY WORSHIPS

**Abstract author(s):** Niveau-de-Villedary, Ana María - López-Sánchez, Natalia (University of Cadiz)

**Abstract format:** Oral

In this communication we focus on two specific contexts from the Phoenician-Punic funerary and ritual landscape of Gadir (Cádiz, Spain): the Phoenician cremation necropolis dated in the 6th century BC, and the so-called Punic ritual wells used in the 3rd century BC. Is it possible to talk about “soundscapes” in these contexts where the emotional and experiential component is very present?

Although these two contexts have been traditionally considered as silent spaces, where prevailed the absence of sound, in this study we suggest that this was not completely true. In both cases different sounds adapted to the different sensory and emotional experiences of the participants interact with silence. The soundscape is product of both, the sensu stricto ceremonial activities, as well as the different ancillary tasks carried out during the “ritual operative chain”.

Regarding the cemetery, the sound of cutting wood, stacking the firewood, clearing the bushes of the area or, the crackle of the fire of the funeral pyre would have been mingled with the distinctive silence of the funeral environments. In these examples, the prayers of the officiants and the weeping of the relatives would have also participated in the funerary soundscape. In the case of the ritual wells, it is possible to discriminate those activities -and their sounds- performed inside these structures from those executed outside them. Besides, the former ones would be modulated by the special acoustics of these underground structures -echoes and reverberations that could be added to the low sounds of the aerophones. Moving to the sounds from outside, they would have been dominated by the laments, the noise of the sacrificed animals or the bustle of the feasting. In short, studying these two contexts from this perspective presents a new space to be explored, felt... and to be listened to.

5 SOUNDSCAPES OF ANCIENT KUSH: EXPLORING CULT-RELATED, ARTISANAL AND PASTORAL SOUNDS AT MUSAWWARAT ES-SUFRA (SUDAN)

**Abstract author(s):** Kleinitz, Cornelia (German Archaeological Institute - DAI, Commission for Archaeology of Non-European Cultures - KAAK)

**Abstract format:** Oral

Current research on the multi-sensory experience of cult at the major Kushite sacral site of Musawwarat es-Sufra (Sudan) includes a study of its ancient soundscape. This concerns, for example, acoustic properties of the circular valley of Musawwarat, which may have influenced the location of temples and other buildings, as well as investigations of the built structures themselves, which acted as foci for the various cult performances. Activities related to cult will have taken place at various scale on a day-to-day basis and on exceptional occasions with greatly varying sound effects and volumes. Constructing, maintaining and supplying the cult-related infrastructure at Musawwarat necessitated a number of specialised working environments in the valley of Musawwarat, such as quarries, work areas, workshops or kitchens, with their respective sounds. While these aspects of the Musawwarat taskscape are quite easy to define and study on the basis of the archaeological record, others are less tangible. This includes pastoral activities, which are more difficult to pinpoint archaeologically. The appearance of cattle motifs in temple reliefs, where they appear in relation to what appear to be local cult activities, or the rich record of pictorial graffiti on temple walls, suggest that pastoralism played a significant role at the site and/or its vicinity. This paper presents an initial investigation of the soundscape of Musawwarat by focusing on cult-related, artisanal and pastoral working environments of the past as well as taking the soundscape of the valley of Musawwarat of today as a guide to better understanding less tangible multi-sensory aspects of taskscapes of the ancient past.

6 MUSIC AND WORK IN ANCIENT EGYPT

**Abstract author(s):** Köpp-Junk, Heidi (University of Trier; Egyptian Archaeology at the Institute of Mediterranean and Oriental Cultures, Polish Academy of Sciences Warsaw)

**Abstract format:** Oral

In ancient Egypt, the fact that certain works in pharaonic time were accompanied with music is known on the basis of different representations. For example, clapsticks were used for wine pressing and flutes for grain harvesting in the Old Kingdom (about 2500 BC). The earliest of these scenes of musical accompaniment of work date to Dynasty 4 (ca. 2600 BC) and is the most unique one: It shows the female musician Meri on a boat with seven rowers and two other people at the helm. This is the only scene throughout Egyptian history showing work accompanied by music performed by a woman and the only one depicting the musical support of the rowing process. The lecture discusses the reasons for that in the context and background of the other work scenes in which music occurs.

But also songs should support the expiration of work procedures like e.g. the carrying of a sedan chair with the sedan chair song. In addition, shepherds’ songs, Nile boatmen’s songs, fishermen’s songs and craftsmen’s songs have been handed down. The texts of these work songs consist of accompanying texts to the corresponding scenes. The question arises to what extent the address as “song” is actually justified. Is it possible to determine whether the texts were sung or shouted? Are the texts to be understood as vocalizations at all, or rather as explanatory or illustrative asides to work scenes? Why are only scenes showing male workers accompanied by those “songs”?

These topics have not been in focus in previous research as intended in this lecture. The period under study extends from the Old Kingdom to the New Kingdom (2600-1070 BC).

7 SOUNDSCAPES AND TASKCAPES IN GRINDING PRACTICES: A CASE STUDY OF THE ANCIENT NEAR EAST

**Abstract author(s):** Garcia-Ventura, Agnes (Universitat Autònoma de Barcelona) - López-Bertran, Mireia (Universitat de València)

**Abstract format:** Oral

Work songs are privileged sources to discuss several aspects of the interaction between working and music/sounds. So far, they have been studied mainly in two geographical and chronological contexts: contemporary United States of America on the one hand, and in the Aegean, dealing in this case with ancient Greek sources and with 20th century CE evidence. However neither work songs nor the interaction between soundscapes and taskcapes have been considered as themes for research in ancient Near Eastern studies.

It is our intention to cover this gap by analysing a case study of the second half of the third millennium BCE in ancient Mesopotamia. More specifically, we will consider the task of grinding grain through the “The song of the Millstone”, a composition where a miller woman urges the millstone to work fast and to keep on moving so that she can finish her work. The analysis of the lyrics will allow us to focus on the interaction between soundscapes and taskcapes highlighting the materiality of this task. In addition, we will do it from a gender perspective as grinding grain was a task mainly carried out by women in the Ancient Near East not only in domestic contexts, but also in institutionalized spheres, as recorded by administrative texts and archaeological materials alike.

8	<p><b>ANCIENT GREEK WORK MUSIC, SONGS AND DANCES</b></p> <p><b>Abstract author(s):</b> Liveri, Angeliki (Greek Ministry of Education and Religious Affairs)</p> <p><b>Abstract format:</b> Oral</p> <p>This article presents literary sources and images of people in Ancient Greece, who worked listening to music (performed by a musician), singing and/or dancing, if their activity allowed dance movements. This human behavior is already mentioned by Homer. It is also confirmed by representations in various artistic works, such as vase-paintings and figurines. Domestic, agricultural or other work activities could be made more enjoyable with the accompaniment of music and songs, either individually or collectively. The music sounds were mixed with work sounds/or noise produced a particular soundscape in the available space. This paper will examine music, dances and work songs during female and male activities, such as e.g. preparing food and bread (grinding cereal grains, sifting flour, kneading and making bread), wool processing, creating threads and then weaving on the loom, and water transfer to vessels from a spring, viniculture, pressing grapes, grazing and guarding herds. We aim to classify the musical entertainment in work according to the activity and the gender. Therefore, it would be possible combining both written sources and archaeological evidence to reconstruct the Ancient Greek customs during work and to understand better the interaction of the aforementioned soundscapes and taskscapes.</p>
9	<p><b>MAYA SOUNDSCAPES. SOUNDS DURING THE CONSTRUCTION OF THE TEMPLE OF THE GREAT JAGUAR OF TIKAL</b></p> <p><b>Abstract author(s):</b> Vidal Lorenzo, Cristina (Universitat de València. Departamento de Historia del Arte) - Muñoz Cosme, Gaspar (Universitat Politècnica de València. Centro de Investigación Pegaso)</p> <p><b>Abstract format:</b> Oral</p> <p>Maya artistic expressions have several iconographic elements that represent concepts related to hearing, sight and smell. Through their contemplation ancient Maya could invoke these senses, and at the same time convert these artworks, imbued with living qualities and soul, into active agents during the celebration of their religious ceremonies. The most important ones were performed in the public arenas of the big urban centers, and were conducted by the rulers and priests at the top of the pyramid temples. One of the most emblematic is the Temple of the Great Jaguar, built in the city of Tikal as the funerary temple of King Jasaw Chan K’awiil. To recreate these events of the past, which were attended by hundreds of people and where colors, music and aromas played an important role, is an exciting topic that has been investigated in depth by the so-called “archaeology of the senses” in recent decades. But, how to recreate the sounds that were heard during the construction of this temple that was built by a large number of workers? We are aware that it is not easy to recreate them with total certainty, but as a result of our field experience during the research and restoration of this building, which we carried out between 1993 and 1996, we will attempt in this contribution to describe in detail these sounds that accompanied us every day in this working environment in the middle of the tropical forest. Sounds like those of the howler monkeys at dawn and those of the myriad of birds and other animals at dusk, or the sounds produced by the work tools, the murmur of the workers, the crackling of the fire blended with the smell of the corn tortillas at lunchtime, or the sounds of the intense rainfall during the wet season.</p>
10	<p><b>SURROUND SOUND: SONIC ECOLOGY, COMMUNITY IDENTITY AND CERAMIC PRODUCTION IN BRONZE AGE CRETE</b></p> <p><b>Abstract author(s):</b> Day, Jo (University College Dublin) - Minos, Chase (Knossos Research Centre, British School at Athens)</p> <p><b>Abstract format:</b> Oral</p> <p>Bronze Age Crete is renowned for the abundance and variety of ceramics recovered over the century since ‘Minoan’ civilisation was first discovered. This material has been subject to a wide variety of analyses, ranging from stylistic to archaeometric to experimental. Our understanding of the actual manufacture of this pottery on the island in the third-second millennia BC also has increased as excavations and studies reveal workshops, kilns, and other production-related materials. Drawing on our research into the experimental reproduction of Minoan pottery and the study of a third millennium BC kiln and its associated features excavated at Priniatikos Pyrgos in eastern Crete, we present here the first study of soundscapes relating to ceramic production in the Aegean Bronze Age. While recognising that ‘sound’ is culturally constructed, consideration of diachronic and regional contrasts in ceramic production allows us to explore and embed the sonic ecology of craft activity within the shifting social relations on Crete. We investigate differing regional ceramic traditions, comparing that of the south coast around Phaistos with the northern Mirabello area, as well as the change from hand-made pottery to the use of rotative devices and the intensification of ceramic production in relation to the rise of palaces. Changes within and between each of these unique soundscapes are considered as key developments that had implications for the diverse ‘communities of sense’ that inhabited the island during the Bronze Age.</p>

11	<p><b>FEMININE TASKSCAPES AS ARENAS OF SOCIAL CONTROL: A VIEW FROM THE MEDITERRANEAN IRON AGE</b></p> <p><b>Abstract author(s):</b> Ferrer-Martín, Meritxell (Universitat Pompeu Fabra)</p> <p><b>Abstract format:</b> Oral</p> <p>Some Greek and Phoenician literary and iconographic references, as well as archaeological evidences, allude to certain tasks specifically carried out by women that not always belong to the same household group. These tasks -such are water collection, grain milling, textile weaving or food baking- are usually presented as monotonous actions undertaken in a reiterative sounding atmosphere: the roaring of the water, the pouring of the mills or the clinking of the loom weights. In the hegemonic narratives, these tasks are traditionally belittled because of their subsistence nature and their strong relationship with the feminine sphere, being usually considered as irrelevant actions, without any importance in the social and political dynamics of the community.</p> <p>Conversely to these interpretations, the main aim of this paper is to visualize the importance of these feminine taskscapes in relation to the economic, social and political dynamics of the household groups to which their main agents belong to, and by extension to their communities. To do this, on one hand, I will present the importance of these activities for the survival and the wellbeing of the household. On the other, I will present these taskscapes as social arenas which actively participate in the political and social configuration of the community through the informal transference of private information among different households, the reaffirmation of social norms and even the creation of some resistance practices.</p>

97	<p><b>REDRAWING LINES IN THE SAND: NEW ARCHAEOLOGICAL APPROACHES TO ADDRESSING CLIMATE IMPACTS [CCH]</b></p> <p><b>Theme:</b> 2. Pandemics and climate change: responses to global challenges</p> <p><b>Organisers:</b> Martens, Vibeke (NIKU - Norwegian Institute for Cultural Heritage Research) - Ayers-Rigsby, Sara (Florida Public Archaeology Network, Florida Atlantic University Anthropology Department) - Graham, Elinor (Department of Archaeology, School of Geosciences, University of Aberdeen)</p> <p><b>Format:</b> Regular session</p> <p>The pandemic and the global response has brought modern society’s resilience and capacity to change into sharp focus and forced us to confront our ability to respond effectively – or not – to such global crises. Modern climate change poses an even greater and more fundamental challenge. It is already affecting our society with far ranging impacts. These can be mild, such as people having to alter commutes due to heavy rains, or severe, such as entire communities forced to move permanently or at least evacuate temporarily. Climate change is radically altering cultural heritage as well. Impacts to historic properties and archaeological sites are destroying legacies of communities across the globe, and these impacts will worsen as temperatures and sea levels rise.</p> <p>This session aims to reflect on how archaeology as a sector can adapt to these challenges and contribute to a wider societal response. It will examine how archaeologists can adjust our approaches and embrace innovative techniques to help us more effectively respond to increasingly urgent climate driven threats. This session will invite papers which consider issues such as prioritisation in the face of unstoppable loss, how to ensure representation of a diversity of voices in assessing the significance of heritage, and the development of pro-active approaches to address the threat of loss.</p>

COASTAL CHANGE AND MANAGING LOSS THROUGH DRONE BASED SURVEY METHODS

**Abstract author(s):** Graham, Ellie (University of Aberdeen)

**Abstract format:** Oral

As archaeological sites face the increasing impacts of climate-driven change, heritage managers must make difficult decisions. Where demand outstrips resource, systems of prioritisation and frameworks of loss must be developed to support informed decision making about how and when interventions can and should be made.

At the Scottish coast, rapid surveys (1996-2010) over 35% of the coastline recorded the archaeological resource, desk-based prioritisation (2010) highlighted those most vulnerable to erosion and loss, while a citizen science project (SCHARP, 2012-2016) updated and ground truthed site records, highlighting those most threatened, most significant, and most valued by local communities.

Building upon this work by the SCAPE Trust, new doctoral research aims to deploy emerging remote sensing and drone-based survey methods to examine some of these sites in greater detail, track past coastal change, and project climate change impacts on the coast to explore the potential extent of future loss. Extension of survey into hinterland areas which are vulnerable but not yet actively eroding will inform our understanding of as-yet-unknown archaeological resources and assist in the pro-active planning of interventions in advance of threat. Site and landscape-level assessment aims to resolve the scalar issues of national assessments of erosion threat, develop a methodology to help understand the most threatened resources and assist in the management of heritage threatened by climate-driven coastal change.

3

CLIMATE CHANGE: IMPACT ON HUMAN REMAINS

**Abstract author(s):** Roshem, Irmine (University of Aberdeen)

**Abstract format:** Oral

The interest in the impacts of climate change on archaeology has mostly concentrated on built archaeology because of its touristic value. Therefore, here the focus is placed on buried archaeological human remains, and in situ preservation in the future in light of predicted climate changes. This research aims to highlight the importance of the combination of archaeological and environmental data to predict bone preservation. This study was carried out by using the Pictish phases from two sites in Scotland, Laig and Dunkeld. In combination, the 90th percentile model of the high emission scenario generated by the ‘United Kingdom Climate Projection 2018’ tool was used as a climate model. The key factors of bone decay considered are temperature, water and pH. The results revealed that the annual temperatures, as well as rainfall percentage, were expected to rise at both sites; however, the differences between winter and summer seasons become more significant with time. Therefore, under this worst-case scenario, by 2100 the survival of the remains is highly unlikely. The increasing climate differences between summers and winters might affect bones in one of two ways. Either the annual decay rate will stay fairly constant as summers slow down the process of decay while winters accelerate it, or the frequent oscillations between dry and wet seasons will cause great damage to bones and accelerate decomposition. The results suggest that in situ preservation is not a sustainable solution for archaeological materials, emphasising the need for methods to prioritise sites for optimal resource use (workforce, funding).

4

IDENTIFYING AND MITIGATING CLIMATE CHANGE IMPACTS IN THE DERWENT VALLEY MILLS WORLD HERITAGE SITE, UK

**Abstract author(s):** Knight, David (York Archaeological Trust; Derwent Valley Mills World Heritage Site Research Group) - Howard, Andy (Landscape Research & Management)

**Abstract format:** Oral

The Derwent Valley mills and their associated infrastructure of workers' housing, schools, churches, canals, railways and other built remains were inscribed on the World Heritage List in 2001 in recognition of their importance for the early development of the factory system. These heritage assets and the environment within which they are set are especially vulnerable to the impacts of climate change upon the frequency and magnitude of flooding and landslides. Key issues include flood damage to historic mills and their associated water management structures, erosion of lead smelting, mining and other archaeological sites on valley slopes impacted by high surface runoff, and the potential for the release from deposits disturbed by fluvial erosion of pollutants associated with lead mining and other industrial activities. The DVMWHS Management Plan for 2020 to 2025 highlights the need for initiatives to raise community awareness and for risk management and disaster planning to mitigate the potential impacts of climate change upon the cultural heritage resource, ensuring that owners and partners have plans in place to accommodate natural disasters. Attention will be focused upon recent initiatives to develop methodologies for assessing the potential impacts of predicted climatic changes upon geomorphological processes and heritage resources, the identification of areas which are high priorities for action and some of the mitigation strategies that are being developed within and upstream of the World Heritage Site.

5

DEVELOPING PRO-ACTIVE APPROACHES TO ADDRESS THE THREAT OF LOSS: HISTORIC SITES AT SVALBARD THREATENED BY NATURAL DECAY AND TRAMPLING TOURISTS

**Abstract author(s):** Flyen, Anne-Cathrine (NIKU - Norwegian Institute for Cultural Heritage Research)

**Abstract format:** Oral

Arctic Archipelago Svalbard is commonly regarded as one of Europe’s last wilderness, but people have left their mark here for more than 400 years. To this day, the archipelago is rich in historic sites that testify to how whalers, fur hunters, miners, and others have utilized the natural resources of this barren and rough landscape. According to the Svalbard Environmental Law all human traces dating from before 1946 are automatically listed. These historic traces are threatened by nature and human wear. As climate change in the Arctic is currently accelerating more than anywhere else on the planet, the effects on cultural heritage additionally might reveal what to expect elsewhere.

Based on field work at four historic sites on west-coast Spitsbergen this paper outlines how heritage sites at Svalbard are threatened by fungal decay, coastal erosion and tourism. The fieldwork clarified that these three degradation parameters are among the most serious and the assessments revealed highly degraded wood, coastal erosion that undermines buildings and other cultural monuments and tourists having difficulties understanding the cultural remains and thus wearing them down by trampling on them and using parts as wood for the fire.

Pro-active methods that are tested in the case areas and reviewed in the paper are 3D documentation of the cultural environments, various measurement methods for monitoring fungal decay and training and awareness of guides and tourists. The paper also presents monitoring methods using drone.

6

SVALBARD ARCHAEOLOGY UNDER THREAT: RUSSEKEILA HUNTING STATION

**Abstract author(s):** Martens, Vibeke (NIKU - Norwegian Institute for Cultural Heritage Research; CCH - Climate Change and Heritage)

**Abstract format:** Oral

Russekeila hunting station at the mouth of the Linné River at the western end of the Ice Fiord (Isfjord) in Svalbard was first used by Russian seasonal hunters from a. 1700-1859, then by Norwegian hunters from a.1860. The Russian Pomor people hunted walrus, furred animals, gathered eider down, fished, and utilised all the natural resources – and so did the Norwegian seasonal hunters when they took over the site.

The remains consist of (more or less) clearly visible house structures, one of the largest sites of this kind in Svalbard. The site also holds a large number of graves and foundations for large crosses (grave markers), in addition to refuse layers.

This paper presents some of the archaeological remains from these settlements and their changes in preservation caused by modern climate change. It also looks at the impacts of increasing Arctic tourism on these fragile remains. The paper discusses the most imminent threats to the site and possible management and adaptation measures to answer these problems.

7

THE NORTH AMERICAN HERITAGE AT RISK PROJECT

**Abstract author(s):** Miller, Sarah (Florida Public Archaeology Network) - Cochran, Lindsey (University of Georgia) - Gaillard, Meg - Smith, Karen (South Carolina Department of Natural Resources) - Lee, Lori (Flagler College) - Murray, Emily - Dietrich, Emma (Florida Public Archaeology Network)

**Abstract format:** Oral

The North American Heritage at Risk (NAHAR) Project began during the pandemic as a result of monthly meetings to discuss developing a standardized system of identifying, monitoring, documenting and triaging at-risk cultural sites prior to loss. Partners in Florida, Georgia, and South Carolina developed a working group that expanded to 55 members as of early spring 2021 in other states and countries.

Approximately 11,109 cultural resources located on the southeastern Atlantic coastline are at risk due to erosion from storm surge and rising sea levels with just a 1 m increase in sea level (Anderson et al. 2017). In addition to the known risks, southeastern coastlines are experiencing sea level rise six times higher than the global average (Valle-Levinson et al. 2017:7878), increasing the urgency to address this looming threat.

The vastness of the Atlantic coastline and shores negate the ability of professional archaeologists to actively address the increasing threat to cultural resources. The NAHAR Project, building from models established by global organizations like SCAPE and with predictive models from SLAMM/MEM, will establish a standardized identification, monitoring and documentation protocol in collaboration with tribal representatives, the Gullah Geechee Corridor Commission, statisticians, geographers, geologists, climatologists, hydrologists, biologists, cultural anthropologists, coastal engineers, and information science to name a few. Once this protocol is established, citizen scientists, residents and tourists alike, will be asked to join professional archaeologists in their efforts. The purpose of this project is to encourage non-specialists to identify at-risk resources and continue to revisit those sites to document the rate and type of site erosion and destruction. When rapid or triage-level excavations are required, professional archaeologists will work with citizen scientists to extract data prior to total loss. Effectively establishing postmortem collections of cultural heritage for future research, interpretation, and outreach.

8

MONITORING, MODELING AND COMMUNITY CONVERSATIONS: ADDRESSING CLIMATE IMPACTS THROUGH FLORIDA’S HERITAGE MONITORING SCOUTS (HMS FLORIDA) PROGRAM

**Abstract author(s):** Murray, Emily - Dietrich, Emma - Miller, Sarah - Boggs, Robbie - Kemp, Kassie - Meyers-Gidusko, Patrisha (Florida Public Archaeology Network)

**Abstract format:** Oral

The Florida Public Archaeology Network (FPAN) utilizes a wide variety of tools and methods to document heritage at risk through Heritage Monitoring Scouts (HMS Florida). This program, founded in 2016, aims to engage citizen scientists to help understand and track impacts at sites throughout Florida. Volunteers collect data including confirming site locations, noting observable threats, and providing an overall site condition, as well as take photographs to help visually document the site at that point in time. This data is collected in the HMS Florida Arches database, accessible to researchers, land managers and other stakeholders. In addition to basic monitoring efforts, staff also seek to gain a more nuanced understanding of the most at-risk sites by using tools like an Arrow 100 GNSS receiver to map and track shoreline erosion and migrating marshes, and a FARO Focus 350s terrestrial laser scanner to digitally document sites.

Florida’s archaeological sites are at extreme risk and archaeologists are left making tough decisions on which sites to prioritize for triage and mitigation efforts. The data collected through the HMS Florida program can be used to help guide these decisions moving forward. However, this data only provides one point of view centered around archaeological significance and threat levels. In order to take a more holistic approach to site prioritization, staff are seeking to gain a wider understanding of how the community values their local sites through a workshop series, Community Conversations on Heritage at Risk. Each workshop asks the local community to answer the same questions about their local heritage, what it would mean to lose it, and what their aspirations are for it in the face of climate change impacts.

This paper summarizes these community-based engagement programs and includes lessons learned along the way.

9

SMALL GOVERNMENT PRIORITIES: ARCHAEOLOGY AND CLIMATE CHANGE AT THE COUNTY LEVEL

**Abstract author(s):** Ayers-Rigsby, Sara (Florida Public Archaeology Network) - Ransom, Jeff (Miami-Dade County)

**Abstract format:** Oral

Climate change is at the forefront of local government policy in South Florida. The built environment is threatened and local leaders must make decisions about where to place critical infrastructure and develop areas in a sustainable way. These decisions will impact cultural resources spanning 9000 years. While all cultural resources have historical significance not all levels of significance are equal. As such difficult decisions are going to have to be made regarding the level of mitigation necessary both inter and intra municipal borders.

This paper will explore prioritization of threatened archaeological sites, discuss the South Florida Regional Climate Change Compact, and explore how prioritization can inform academic research as well as infrastructural improvements. Case studies from Palm Beach County and Miami Dade will be explored in order to highlight how archaeologists and regional planners collaborate to form a sustainable future that incorporates the historical and archaeological record while preserving current lifeways.

10

SALT MARSH AND INTERTIDAL SITE VULNERABILITY AND NATURE-BASED RESILIENCE: THE DELAWARE BAY, USA

**Abstract author(s):** Wholey, Heather - Nikitina, Daria (West Chester University)

**Abstract format:** Oral

The Delaware Bay is the second largest estuary along the U.S. Atlantic coast and has been occupied by humans for approximately 22,000 years. Most of the estuarine shoreline is fringed by salt marshes that are being lost at a rate of up to an acre per day due to sea-level rise (SLR). There are over 2000 known coastal archaeological sites along the Bay, many of which are buffered from SLR by marshlands. We have applied the probabilistic approach to sea levels (Kopp et al. 2019) using the Representative Concentration Pathway (RCP) climate scenarios consistent with IPCC AR5, and projected hurricane threats using the Sea Level Affecting Marshes Model (SLAMM). Dozens of cultural resources are likely to be jeopardized by SLR, coastal erosion, and tidal flooding in the next decade, and hundreds more by 2100. Landscape planning and management tends to operate with little consideration for cultural aspects (Eliasson et. al. 2018), and communities, towns, and governments typically disassociate cultural/historical resources from natural resources in planning and development (Brabec et.al. 2015). We argue that research and reporting of archeological sites that is aligned with scientific assessments of risk hazards may enhance the visibility and impact of coastal archaeological research and management. Where appropriate, site prioritization schema should align with conservation programs, particularly those that utilize natural infrastructure and nature-based solutions. Such approaches are motivated to protect and enhance the resiliency of coastal communities by providing human well-being and biodiversity benefits. Heritage resources arguably enhance human well-being by providing historic time depth, place identity, and an integration between culture and nature. Case studies from the Delaware Bay illustrate how archaeology and heritage could be incorporated with existing natural infrastructure development and estuarine ecosystem management and restoration programs to mitigate the impacts of storm surge and coastal erosion on those resources.

11

PRIORITIZING WHAT WE DON’T KNOW: CLIMATE CHANGE AS A CATALYST FOR UPLAND SURVEY

**Abstract author(s):** Nash, Carole (James Madison University)

**Abstract format:** Oral

The upland forests of the Appalachians are among the most diverse natural communities in the temperate world, providing the setting for a study of change and flexibility as an essential feature of existence, both for pre-contact and historic cultures. However, upland archaeology has lagged due to the long-held belief that upland sites have limited signatures and are thereby less likely to provide significant information on cultural processes. Currently, archaeological sites here are compromised by climate change processes such as drought and high winds that create conditions for frequent wildfires, as well as extreme precipitation events that lead to severe erosion, flash flooding, or rapid mass wasting. The lack of research makes it difficult for decision-makers to develop prioritization plans in the face such threats. A GIS-based analysis of settings that are most likely be impacted by catastrophic climate-related events, coupled with archaeological models of pre-contact site locations, provides a process for identifying areas in the greatest need of survey. Such work is being carried out in Shenandoah National Park, where archaeologists ground truth the geospatial analysis to further refine decision-making for future work.

100

TO GENDER OR NOT TO GENDER? EXPLORING GENDER VARIATIONS THROUGH TIME AND SPACE [AGE]

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Gaydarska, Bisserka (Durham University) - Rebay-Salisbury, Katharina (Austrian Academy of Sciences) - Ramirez-Vallente, Paz (University of Nottingham) - Fries, Jana Esther (Niedersächsisches Landesamt für Denkmalpflege)

**Format:** Regular session

A recent controversial study of Neolithic gender as opposed to Bronze Age gender in Europe (Robb & Harris 2018) necessitates further discussion. In a field encompassing enormous gender diversity through time and space, it is important to tease apart social constructions (is there ‘gender’?) from analytical categories (what kind of gender?). Defining the relationship between sex/gender/identity/society through time has left some commentators believing that mainstream gender archaeology argues for a single understanding of ‘gender’ across time and space.

One of the aims of this AGE session is to refute such a claim, in overcoming binary thinking as the guiding principle of exploring gender and inviting case-studies with representations of binary, as well as non-binary, gender symbolism. Two types of contributions are invited:

1) Theoretical papers discussing whether a structuralist approach is justified by the need to have a ‘fixed’ category of gender that will enable meaningful comparison between different times and places. Is there really a moment in human development when we can no longer speak of sex-based behaviour but rather of gender-based behaviour? And if yes, when did it happen and why? Did this happen just once or at different times at different places? And was it uni-directional or are there cases of reversed behaviour from gender-based to sex-based? Did the size of the group affect the sex-based and gender-based behaviour and what were the implications for gender diversity? Answers to these questions can come from a wide range of case studies with broad spatial and chronological coverage.

2) Zooming into European Prehistory - can we really say that Neolithic gender is exclusively contextual and fuzzy, while Bronze Age gender is exclusively cross-contextual and binary and Copper Age gender represents a transition from one to the other? Presentations of case-studies exploring such a trichotomy are encouraged from across Europe.

ABSTRACTS:

1

UNBRIDLING THE NARRATIVE: INFLUENCES OF GENDER ASSUMPTIONS ON THEORIES OF REINDEER DOMESTICATION

**Abstract author(s):** Hull, Emily (University of Oulu)

**Abstract format:** Oral

Reindeer have been a keystone species for survival of many peoples in the circumpolar North, and domestic reindeer herding makes up a fundamental part of the culture and history of the people of Fennoscandia. Theories about reindeer domestication, however, make many assumptions about reindeer and human interactions, many of these predicated on gendered norms within the societies of the zooarchaeologists who study these regions. Many of these studies ascribe a single, gendered behavioral norm to animals according to biological sex, and do not account for the fluctuations in behavior and socialization through periods of annual hormonal change. The area which captures the interest of most theorists is in fact the time period of shortest duration; that of mating season. Reindeer behavior and the subsequent behavior of the peoples hunting and herding them is not limited to this small period of their lives, and the inappropriate gendering of animal behavior leads to several wide gaps and even mischaracterizations in theories of domestication. This study seeks to examine the points in which human expectation of animal “gender” overrides the behavior of animals themselves, and thus blinds us to alternative theories of animal domestication.

2 **GENDER DIFFERENTIATION IN LIFE AND DEATH: SOCIAL REPRODUCTION IN HUNTER-GATHERER-FISHER SOCIETIES OF THE SOUTHERNMOST TIP OF THE AMERICAN CONTINENT**

**Abstract author(s):** Carracedo Recasens, Robert (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

This paper focuses on the analysis of social norms, and specifically on the sexual division of labour between hunter-gatherer-fisher societies through the study of funerary practices. Norms, like sexual division of labour, are neither intangible nor immaterial and are shaped by the relationships between men and women. The main question are how we can shape gender differences in hunter-gatherer societies and how can we access to the social norms through the study of funeral practices in hunter-gatherers' societies. We propose an ethno-archaeological approach to sexual division of labor in Hunter-gatherer societies through the analysis of ethnographic literature and archaeological funerary contexts. This involves the dialectical confrontation between theoretical developments on one side, and the archaeological practice on the other, as well as the use of ethnography in known historical hunter-gatherers' societies.

The present research is focused on three historical societies from the southernmost tip of the American continent: the Kawésqar, the Yámana and the Selk'nam, as well as their respective zones of occupation. In all three cases, the ethnographic data provide information about the strict sexual division of labour and the discrimination of women. Moreover, several funerary contexts localized in this region from different chronologies allow to analyze the treatment of bodies. The confrontation of both sets of data allow to discuss on the archaeological visibility of gender differences.

The work have the aim of shaping a theoretical and methodological structure relevant to the archaeological study of past societies. The results show that it is possible to get to know the sexual division of labour in hunter-gatherers' societies through the research of funerary practices and the materials associated to them.

3 **GENDER IDENTITIES IN MESOLITHIC, EARLY AND MIDDLE NEOLITHIC IN CENTRAL EUROPE**

**Abstract author(s):** Nordholz, Daniela (none)

**Abstract format:** Oral

Researchers into the past carefully articulate their conclusions, with an awareness that they are only transitional. This certainly holds true for gender archaeology, which evolved from focusing on man the hunter to focussing on woman the gatherer, settling briefly on woman the hunter, and eventually arriving at the realisation that gender is

flexible. Despite this progress, however, there is still a faint echo of 'division of labour', of 'male and female spheres' and 'male and female grave goods'. The questions therefore are: was there gender identity in the Mesolithic, and if so, was it fully formed, just as we presume for modern societies or was it still in its 'infancy'? Did it change and evolve during the course of the Mesolithic? How did it present itself in the Neolithic? Was it similar? Or totally different? In this paper, I will compare gender identities and gender relations in a sample of Mesolithic, Early and Middle Neolithic burials in Central Europe through the number and definition of grave goods and changes therein.

4 **NEOLITHIC GENDER VIEWED FROM FRANCE. ANTHROPOLOGICAL AND THEORETICAL FRAMEWORKS, FIRST RESULTS AND LIMITS**

**Abstract author(s):** Augereau, Anne (INRAP - National Institute for Preventive Archaeological Research)

**Abstract format:** Oral

Gender studies are not common in French Neolithic archaeology. However, in recent years, some archaeologists dealing with prehistory and the Metal Ages developed such an approach, basing their studies on anthropological and ethnological knowledge and studies of gender theory developed in Anglo-Saxon countries. By integrating those frameworks, in this paper, we shall show how the material culture of the first farmers can be used in a gender archaeological study, First, we shall define the categories and manifestations of gender (identities, roles, sexual division of labor, gender apprenticeship and construction, power and inequalities, etc.) and their materializations in archaeological finds. Then, we shall present the first results of such an approach for the Neolithic Linearbandkeramik culture (LBK), which extended from the Carpathian Basin to the Paris Basin. Based on individual burials, we shall try to identify relevant axes of differentiation within the population and thus determine the system of social segmentation at work during the emergence of the productive economy. Finally, a comparison with sociological and anthropological studies, where gender is observed in living populations, highlights the limits of the perception of gender in archaeology.

5 **TO GENDER OR NOT TO GENDER? INSIGHTS FROM ASEXUAL AND DOUBLE-SEX FIGURINES OF THE NEOLITHIC AEGEAN**

**Abstract author(s):** Ramirez Valiente, Paz (University of Nottingham)

**Abstract format:** Oral

Traditionally archaeologists have interpreted Neolithic figurines as representing predominantly women, significantly influenced by Gimbutas's "Mother Goddess" theory (1989). This theorisation has subsequently led scholars to various interpretations regarding women's role and gender difference in the Neolithic. However, the categorisation of sex in existing scholarship has followed ques-

tionable criteria. The presence of voluptuous bodies, protrusion of buttocks or ample hips and thin waist have been used as sole indicators of the female sex (e.g., Kokkinidou and Nikolaidou 1997; Marangou 1992; Mina 2005). A reassessment of those criteria may reveal a different picture to the "clear" predominance of female figurines, suggesting that a considerable percentage lack any representation of sex.

Furthermore, focusing on the male/female dichotomy restricts and neglects the multiplicity and fluidity of gender constructs that could characterise Prehistoric societies. Asexual and double-sex figurines are the most interesting categories regarding sex, raising questions such as:

- Did asexual figurines just represent a general shape of the human body?
- Did asexual or double-sex figurines represent a different gender category than male/female, i.e. a 'third gender'?
- Was the representation of sex unimportant in Neolithic societies?
- Did double-sex figurines represent different gender roles?
- Could the lack of sexual traits be an allusion to a specific age group?

This paper will put forward a working hypothesis for the different interpretation avenues for asexual and double-sex figurines, moving beyond the binary dichotomy. It will focus on two case studies from the Neolithic Aegean. In Neolithic Crete, female and asexual figurines predominate, and other axes of differentiation may be at play, such as age rather than gender. In Neolithic Thessaly, double-sex figurines are represented similarly to Male figurines, perhaps suggesting a similar gender role. The approach to understanding the meaning of figurines needs to be a contextual analysis and an emphasis on intersectionality to go beyond gender.

6 **EVERYTHING YOU WANTED TO KNOW ABOUT SEX, BUT WERE AFRAID TO ASK: NON-BINARY GENDER SYSTEMS AND ASSYMETRIES IN PREHISTORIC GREECE**

**Abstract author(s):** Mina, Maria (University of the Aegean)

**Abstract format:** Oral

When gender archaeology emerged in the 1980s, it was expressly committed to studying gender identities. In the decades that followed, postmodernist theory led to the deconstruction of gender and the critique of the epistemological orthodoxy of fixed definitions, such as 'male' or 'female'. Undoubtedly, the introduced relativism exposed traditional gender stereotypes on the grounds of the indisputable 'sex' and highlighted the pluralism of gender-related experiences. Regrettably, the pursuit of embodied social identities led the proponents of cultural relativism to criticise gender archaeology for imposing a predefined set of social categories to past societies. Such an emphasis on individual experiences, has undermined the validity of a gender approach, and gender, as a culturally arbitrary and elusive construct, has been replaced by the concept of embodiment.

In the proposed presentation, a case is made in favour of gendering the past in a way that is sensitive to time and space. We can continue to employ gender as an analytical category, while maintaining the necessary check on our inherent biases, by examining gender-related patterns which are specific to the period, region, and culture under study. The argument will draw on archaeological evidence from prehistoric Greece to explore whether binary gender systems were in place, and whether such structures may have hindered or favoured the development of gender asymmetries. Furthermore, the observed gender system can provide the basis from which we can revisit some of the questions originating from the feminist past of gender archaeology, which to this day remain valid. When did patriarchal social order emerge and what are the conditions that may foster its development? Finally, it is proposed that prehistoric gender systems will need to be viewed within the constraints of the operating social structures to which members are expected to conform, a point that postmodern theory tends to overlook.

7 **THE RELATIONSHIP BETWEEN GENDER AND A NESTED IDENTITY APPROACH TO THE NEOLITHIC AND CHALCOLITHIC OF OLD EUROPE**

**Abstract author(s):** Chapman, John (independent scholar)

**Abstract format:** Oral

Robb & Harris' (2018) paper on the changing form of gender relations in the Neolithic, Chalcolithic and Bronze Age implies the growing significance of gender through time by showing increasing diachronic clarity of definition and separation of binary genders. But is it possible to highlight gender in social relations in this way without taking other aspects of identity into account?

In my synthesis, "Forging identities in Balkan prehistory: dividuals,

individuals and communities, 7000 – 3000 BC" (Sidestone, 2020), I seek to develop a person-centered relational approach to identity by identifying four widely applicable nested components of identity – the individual, the dividual, the communal and global – local relations. A conclusion perhaps surprising to some was the fundamental importance of dividual relations. But how does gender fit into this scheme?

In this paper, I wish to examine contrasting examples of the interface between gender and the four components of identity. The evidence for the contribution of gender relations in global-local relations is the hardest to find, although the future combination of isotopic and aDNA studies of the sex of exotic persons who were long-distance specialists could provide useful indicators. Communal values were often underlined through burial traditions and settlement planning but gender relations were strongly dependent on community size. Examples of dividual relations were the most common, whether in the strongly gendered mortuary zone or in the four forms of personhood defined for Old Europe. The wider question for the narrative of individuality is the degree to which

each person can be considered an ‘individual’. However, the individualizing tendencies of the costume graves at Varna remind us that individual personhood played an important role within the network of dividual biographies. There are also good grounds for the identification of gendered individuals in Old Europe in the realm of ‘portrait’ figurines.

## 8 EXPLORING GENDER AT POLGÁR-CSŐSZHALOM, A LATE NEOLITHIC SITE IN NE HUNGARY

**Abstract author(s):** Anders, Alexandra (Eötvös Loránd University, Institute of Archaeological Sciences, Budapest) - Nagy, Emese (Déri Museum, Debrecen)

**Abstract format:** Oral

Polgár-Csőszhalom is one of the key sites for gaining a better understanding of European history in the fifth millennium BC owing to its complexity incorporating a single-layer and a tell settlement as well as a multiple and a double enclosure system, its long occupation between 4920–4460 cal BC, the intensity of its occupation and the relatively high number of excavated graves totalling 147 burials. Taken together, the site offers an exceptional possibility for exploring gender in a Late Neolithic community. The burials were uncovered in different areas of the site and they represent all age groups. The mortuary rite as well as the richness and diversity of the objects deposited in the burials provide the necessary background to exploring gender identities in detail.

In this presentation, we shall integrate the findings of the archaeological assessment and the archaeometric analyses in order to gain a better understanding of the salient features of this key site. What levels of gender representation can be discerned in the mortuary domain? How was gender constructed from childhood onward, were there any changes during an individual’s lifetime? Was the strict binary system, which affected both the ritual and the grave goods, truly as exclusive as it appears at first sight? Why are gender/sex and certain age groups under- or over-represented on the site as a whole and even more so in certain locations? How were various artefacts and personal adornments used for expressing gender? While addressing these questions, we shall also show how our perception and interpretation of these issues changed during the past decade.

The research project is funded by a grant from the National Research, Development and Innovation Fund (Grant K124326).

## 9 GIRLS WHO WANT BOYS WHO LIKE BOYS TO BE GIRLS –THE FUZZINESS OF SEX AND GENDER IN BURIAL ARCHEOLOGY

**Abstract author(s):** Pape, Eleonore - Ialongo, Nicola (Georg-August-Universität Göttingen)

**Abstract format:** Oral

When based on prehistoric burials, numerous hypotheses regarding sex and gender in Prehistory build up in most parts on data provided by two interdependent disciplines: physical anthropology and archaeology. While the former relies on the morphological and metric traits of skeletal remains and refers to what we consider biological sex, the latter draws inferences of what could be understood as gender, based on archaeologically sexed objects. The critical aspect of such an interdependence is that validation is often mutual, thus increasing the risk for circular arguments.

Although archaeological gender interpretations are being increasingly questioned, it seems as if anthropological sex determinations are rarely critically considered by archaeologists.

We, the archaeologists, tend to rely on the results of our anthropologist colleagues as if we would with an accountant calculating our taxes, perhaps diminishing the scientific value of their work. At the same time, critical appraisal is limited by the fact that the raw data of and the argumentations for anthropological determinations are rarely – if ever – made accessible to their full extent for the majority of the published burial sites. This inevitably leads to a lack of transparency and reproducibility and, to more ‘radical’ interpretations of critical anthropological data by the archaeologists themselves.

We suggest that gender and sex are always fuzzy, in the Neolithic as well as in the Bronze Age, and that such a fuzziness is not only dependent on cultural factors. Based on a selection of Neolithic and Bronze Age burial sites in Central Europe, we will show the difficulties of comparing sex and gender determinations. We will discuss how they affect archaeological interpretation and explore possible solutions.

## 10 BIOLOGY AND CULTURE IN GENDERED BURIALS OF THE BRONZE AGE

**Abstract author(s):** Rebay-Salisbury, Katharina (Austrian Academy of Sciences)

**Abstract format:** Oral

The analysis of sex-specific gene segments and sex-specific protein fragments in dental enamel have recently contributed to the accuracy of identifying the genetic sex of a buried person. Whilst intersex variations and disorders of sex development still cannot easily be recognized, this presents a major stepping-stone for the investigation of gender.

Morphological characteristics of the skeleton are shaped by biological, social, and environmental interaction and are no suitable indicators of sex for children before puberty. This obstacle for the investigation of sex-b(i)ased differential treatment of children can now be overcome by the wide application of genetic sex determination.

Since sex and gender of a person may or may not be relevant for all aspects of life and death, including nutrition, health status, access to material culture and burial treatment, the scientific advances present new research opportunities.

This paper will present case studies from Bronze Age communities of present-day Austria, and investigate gendered burial practices such as different body placement for females and males and gender-typical material culture in the light of the results from testing for sex-specific peptides in dental enamel.

The aim of the paper is to discuss how sex, gender and age interlinked in Bronze Age Central Europe, and raise the broader question if and how an ever more accurate understanding of a buried person’s sex lead to a better understanding of gender.

## 11 GENDER IN BECOMING THROUGH THE NEOLITHIC/BRONZE AGE TRANSITION IN IRELAND AND SCOTLAND?

**Abstract author(s):** Houghton, Mark (University of Cambridge)

**Abstract format:** Oral

This contribution traces the development of gender representation in the burials of the later Neolithic and earlier Bronze Age in Ireland and Scotland. Although it is clear that a binary gender system did not replace a non-binary one during this transition, some wider trends do suggest a relation to the broader story developed by Robb and Harris (2018). However, hints of complication and dynamism suggest the negotiation of gender extending well into the Bronze Age and local pictures tell radically different stories.

This apparent contradiction will be resolved by a careful attention to the actions of local communities at the graveside. Taking a different approach to Robb and Harris, this paper investigates gender representations from the bottom up, privileging the local scale of lived experience. Burials are affective creations for those who partake in and/or witness them, and this realisation is key to understanding the gendered stories which they present. Overall, this evidence does suggest some relation to the broader narrative traced by Robb and Harris, but this is shown to be complicated and variable, in ways which hint at Bronze Age gender dynamics which are more open than is often acknowledged. Ultimately, this paper reflects on the privileging of grand narratives in the study of pre-history, and the consequences for our understandings of prehistoric life.

## 12 GENDER ANALYSIS IN EUROPEAN LATE PREHISTORY: BROADENING THE SOCIAL AND GEOGRAPHICAL SCOPE

**Abstract author(s):** Gonzalez-Marcen, Paloma (Centre d'Estudis del Patrimoni Arqueologic de la Prehistoria; Universitat Autònoma de Barcelona) - Díaz-Zorita, Marta (University of Tübingen; Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters)

**Abstract format:** Oral

Approaches to the analysis of gender identities in European late prehistory have tended to be constructed in terms almost exclusively of funerary evidence and taking as a fundamental reference only the archaeological record of certain European regions. We will argue that this perspective leads to an oversimplification of the complexity of social practices and of the cultural structuring of their agents, at the same time that concrete sequences of continuity and change are projected as general models of historical interpretation.

This contribution aims, on the one hand, to broaden the analysis of gender identities to other types of variables that are articulated with the social and cultural organization of these communities, including elements of analysis that complement the funeral information. On the other hand, we intend to provide archaeological information that suggests historical trajectories different from those that make up the interpretive mainstream of European late prehistory, specifically from existing studies on the Neolithic and Bronze Age of Iberia.

## 13 TO GENDER IN AL-ANDALUS: MAINTENANCE ACTIVITIES IN THE FUNDUQ

**Abstract author(s):** Hernández Robles, Alicia (University of Murcia) - Celma Martínez, Mireia (Professional Archaeologist)

**Abstract format:** Oral

The dichotomy between the binomials male-public Vs. female-private had always been approached as a theoretical premise in traditional Medieval archaeology, as well as in all Social Sciences. However, recent studies have been emerging to defend a greater interrelation in the use of both public and private spaces.

The aim is to revise the maintenance activities that were carried out in the fanādiq (pl. of funduq) of al-Andalus and to determine the agents who carried them out. Specifically, the structures’ spatial distribution and the bio and archaeological remains recovered are analysed to define private and public rooms in the funduq of the Arrixaca neighborhood excavated in San Esteban Archaeological Site (Murcia, Spain) (www.sanesteban.um.es).

Documentary sources report the activities in the daily life of the fanādiq in medieval Mediterranean cities, where travelers and merchants could lodge, deposit their merchandise, and trade. Apart from merchants and travelers, other people participated in the fanādiq such as widows, prostitutes, and homosexual men because of certain economic circumstances, civil status, or heteronormativity break affected them. There were fanādiq in which guests had to bring their own food and wood to cook in there, but in other fanādiq, where widows permanently lived, women could be in charge of the maintenance activities. These buildings used to have a large interior courtyard and more than one floor, a fact that would not make it difficult the balance between the public and the private sphere, where other not so moral and socially unaccepted activities would be carried out too.

101 ON THE SHOULDERS OF PROMETHEUS: INTERNATIONAL COLLABORATION AND THE ARCHAEOLOGY OF THE SOUTH CAUCASUS

**Theme:** 7. From global to local: Baltic-Pontic studies

**Organisers:** Everill, Paul (University of Winchester) - Intagliata, Emanuele (Aarhus University)

**Format:** Regular session

Despite some high-profile exceptions, the archaeology of the South Caucasus remains marginalised and often overlooked - not receiving the wider exposure it deserves. Its higher current profile probably owes as much to conflict in Syria and Crimea, which has forced a range of international projects to relocate to more favourable locations, as it does to greater awareness. This situation is partly a consequence of decades of occupation and academic isolation, and partly because of an unfortunate, and incorrect, perception that the South Caucasus is simply peripheral to the archaeologies of Europe and Asia.

This session will showcase examples of collaborative working in the South Caucasus, projects which have enabled a sharing of ideas and scholarly traditions, helping to develop new methodologies, and bringing new technology and scientific advances to bear on regional archaeological debates. This session is a celebration of both the archaeology of the South Caucasus, and of the power of scholarly cooperation to bridge divides and widen horizons.

ABSTRACTS:

1 REMAINS OF ANCIENT WINEMAKING FROM KVEMO KARTLI AND KUTAISI (GEORGIA)

**Abstract author(s):** Hamburg, Jacek (Krukowski Polish-Georgian Interdisciplinary Research Center) - Jalabadze, Mindia (Georgian National Museum) - Isakadze, Roland (Georgian National Museum; National Agency For Cultural Heritage Preservation of Georgia, Kutaisi Historical Architectural Museum - Reserve; Akaki Tsereteli State University)

**Abstract format:** Oral

Since 2014, in the framework of the international project called Georgian Vine and Wine Investigation, carried out archaeological research at Gadachrili Gora and Shulaveris Gora. Neolithic sites dated to 6th Millennium BC are located near the village of Imiri (Marneuli municipality) on Kvemo Kartli plain in southeastern Georgia. The project was made with the support of the Government of Georgia, National Wine Agency, Georgian National Museum, Georgian Wine Association and the University of Toronto.

Since 2017, in the framework of the Polish-Georgian Expedition for the Kutaisi Archaeological Landscape (EKAL Project), interdisciplinary research was carried out in the area around the Gabashvili Gora and Dateshidze Gora located in the heart of Kutaisi city.

Archaeological excavations in all of these sites and the interdisciplinary analyses of organic remains and ecofacts from different periods are one of the main goals of both projects. Scientists from research laboratories and universities around the world (Georgia, Canada, Poland, Israel, USA, France, Italy, Denmark and Finland) participate in both of them. All samples taken from excavations were sent for several analyses like chemical, biomolecular, radiocarbon, palaeobotanical, palynological, genetic and palaeoecological.

According to the results of interdisciplinary research, it was established that in the 6th Millennium BC Eastern Georgia and Kvemo Kartli itself was the region, where the wild vine was cultivated and the history of grapevine and wine production have 8000 years old. Thanks to the archaeological research in Kutaisi, the presence of charred grape seeds and grapevines is also confirmed in the western part of Georgia, in the Imereti region, where the Late Bronze Age Colchian culture developed in the second half of the 2nd Millenium BC.

Cooperation between Georgian and foreign specialists continues, and the results of joint archaeological research bring more innovations in the history of the ancient viticulture in Georgia.

2 THE IMPORTANCE OF ARMENIAN GOLD FOR CULTURAL DEVELOPMENT IN BRONZE AGE CAUCASIA

**Abstract author(s):** Kunze, Rene (Martin-Luther-University Halle-Wittenberg)

**Abstract format:** Oral

The Gegharkunik region on the south eastern edge of Lake Sevan (Armenia) is a part of southern Caucasia uniquely suited to demonstrate the intensive interchange between pre-Christian settlement and gold mining. The enclosed landscape can be seen in this regard as a prehistoric terra incognita due to the wholesale lack of archaeological and archaeometallurgical investigations to date. It has been proven that there was major exploitation of gold from the defined geographical area in antiquity. One of the largest gold mines in Middle East is still located there today. The mines position on the Sotk pass, which is the direct connection between southern and eastern Caucasia and thus has a strategic importance for the entire region, is also of significance. Initial approaches revealed outlines of the prehistoric settlement patterns which could be placed in relation to contemporary gold mining in a clearly delineated natural corridor along this superregional communication and trade route. The intention is to implement an intensive holistic-archaeological and archaeometallurgical investigation of the settlement network in the surroundings of the gold mine and an interdisciplinary attempt to imbed these structures in the larger ecological and anthropogenic environment. The existence of placer

gold in several local rivers as well as ancient mining traces has already been demonstrated. The findings of placer gold, along with the geochemical fingerprinting of primary and secondary gold sources from this region make it possible to analyse the origins of golden artefacts found in the wider vicinity of the area. The opportunity to study gold items from numerous Age finds from Armenia, e.g. from Lori Berd and Metsamor, allow for an extensive reconstruction of the early use of gold and its importance in ancient Near Eastern cultures.

3 THE EAST GEORGIAN SANCTUARIES OF THE LATE BRONZE AND EARLY IRON AGES

**Abstract author(s):** Arnhold, Simone - Blocher, Felix (Martin-Luther-Universität Halle-Wittenberg) - Bukhrashvili, Paata (Ilia State University, Tbilisi) - Davitashvili, Shorena (Martin-Luther-Universität Halle-Wittenberg; Ilia State University, Tbilisi)

**Abstract format:** Oral

During the Late Bronze Age to Early Iron Age, several sites are concentrated in what is present-day East Georgia, consisting of a round to oval enclosure, which are conspicuous for their sometimes rich find material and have no direct connection to settlements or cemeteries: the so-called sanctuaries.

After most of the known sanctuaries were uncovered in the 1960s and 1970s in the course of rescue excavations, work on these sites has been resumed since 2017 in a Georgian-German cooperation project. For the first time, not only the central enclosure could be recognised as an architectural element of a sanctuary, but the Nazarlebi and Samreklo ruins show that the surrounding area was also elaborately designed. Here, wide surrounding terraces stretch around the hill of the same name, which were secured by stone packs and still strikingly characterise this and other sites today. Further characteristics are the rich deposits of up to several hundred metal objects and a remarkable accumulation of miniature pottery in various contexts.

Due to a still crude chronological model and a lack of radiocarbon dates, a more precise dating of the sites is only rudimentarily possible from the middle of the 2nd millennium BC to the first centuries of the 1st millennium BC. Current research at Ilia State University, Tbilisi and Martin Luther University, Halle-Wittenberg is presently dedicated to two of these sites in the Shiraki Plain in the extreme east of Georgia and, due to their exposed construction, also suggests that the sanctuaries had a long-distance effect. Further research on the sanctuaries is ongoing.

4 PRESSING CONCERNS: MISSING URARTIAN WINE PRESSING EQUIPMENT

**Abstract author(s):** Newson, Victoria (University of Sheffield)

**Abstract format:** Oral

Armenia has a long and significant history of grape cultivation and wine production, such that 8th century BCE Urartian kings referred to it as “the land of vineyards”. Likewise, Assyrian armies marvelled at the vast quantities of wine and chose to take wine as tribute rather than precious metals. The most notable ‘stains’ that grapes and wine made on ancient economies and societies occurred in three distinct periods: 1) the Chalcolithic/Early Bronze Age, specifically at the site of Areni-1; 2) the Iron Age Urartian wine economy and 3) the Medieval Period (Christian wineries).

However, the archaeological evidence of wine production from the Urartians period (9th-6th centuries BCE) has mainly been textual (primarily Urartians and Assyrians) and ceramic based (i.e. karases), with minimal evidence of the technology of grape processing and winemaking (i.e. archaeobotanical data in association with specific wine production equipment). To help fill this gap in the archaeological record, the (minimal) chronology of wine production equipment in Armenia will be explored, along with contemporary production equipment from surrounding areas (eastern Mediterranean and the Levant). The ethnography of production equipment will be used as a heuristic tool to explore the possible locations for wine production and what types of production equipment were utilized to create such a significant wine industry during the Urartian Period.

5 NOKALAKEVI-ARCHAEOPOLIS: TWENTY YEARS OF ANGLO-GEORGIAN COLLABORATION

**Abstract author(s):** Everill, Paul (University of Winchester) - Murgulia, Nikoloz (Georgian National Museum) - Lomitashvili, Davit (National Agency for Cultural Heritage Preservation of Georgia) - Colvin, Ian (University of Cambridge) - Lortkipanidze, Besik (Georgian National Museum)

**Abstract format:** Oral

The ruins in the small village of Nokalakevi in Samegrelo, west Georgia, have attracted scholarly interest since the first half of the 19th century. They were first excavated in 1930, confirming their identification with the remains of the fortress of Archaeopolis described in early Byzantine historical sources, also known as Tsikhegoji (the fortress of Kuji) or ‘the triple-walled fortress’ by the Georgian chroniclers. The fortifications, on the northern edge of the Colchian Plain, enclose a naturally defensible area of approximately 18ha, with a steep limestone gorge carved by the River Tekhuri to the north, west and (to a lesser extent) the south. A hilltop citadel stands more than 200m above the lower town – a strip of relatively level ground between the hill and the river on which most of the known buildings were situated. The modern name of the village, Nokalakevi, translates as “ruins where a town was”, and while this might refer to the Byzantine ruins it is perhaps not coincidental that it was known as Archaeopolis (ancient city) to those who built even those, suggesting that the remains of the Hellenistic period settlement may still have been visible at that time.

The site has seen significant excavation since 1973 including, since 2001, a collaborative Anglo-Georgian project that has trained over 250 Georgian and British students in modern methods. As the longest running collaborative project in Georgia, the expedition

6

has played a key role in bridging scholarly traditions and fostering a spirit of friendship and cooperation between the two nations that continues to this day.

6

**NEW FINDINGS ON THE PELTA-SHAPE ORNAMENTS FOUND ON THE ROMAN LAMPS DISCOVERED DURING POLISH-GEORGIAN EXPEDITION IN ASPAROS (GONIO, GEORGIA)**

**Abstract author(s):** Jaworska, Maria (University of Warsaw)

**Abstract format:** Oral

In 2014, a Polish team from the University of Warsaw joined the Georgian expedition to carry out excavations at the Roman fort at Apsaros (modern Gonio, Adjara, Georgia). During that period several new findings such as the praetorium with a room decorated with a mosaic floor as well as many small artefacts including coins, glass and pottery vessels were discovered. Recent exploration conducted in the two sectors directly east of the centrally located principia brought to light two terracotta lamps adorned with three evenly distributed pelta shapes on the base.

The paper presents the latest research on the distribution of pelta-shape motif on various types of lamps dated from the 1st up to the 3rd century AD. Current literature regarding the lamps found in Apsaros and research conducted at the Batumi and Gonio museums have not yielded any information on the lamps decorated with the discussed motif. It seems that this type of decoration of the lamp base had previously been unknown in Colchis, therefore, conclusions regarding its chronology and potential provenance yield new information concerning the exchange and movement of everyday goods in the coastal fort of Apsaros and, in a broader context, its history and the connections of the whole region with other areas of the Roman Empire, especially with Asia Minor and Crete.

7

**EARLY CHRISTIAN (4TH-6TH CENTURIES AD) MONUMENTS OF THE KINGDOM OF LAZIKA, WEST GEORGIA**

**Abstract author(s):** Murgulia, Nikoloz (Georgian National Museum) - Lomitashvili, Davit (Georgian National Museum; National Agency for Cultural Heritage Preservation of Georgia) - Lortkipanidze, Besik (Georgian national Museum)

**Abstract format:** Oral

At the beginning of the 4th century AD, the Roman Empire was weakened by the growth of foreign powers, including Goth and Hun attacks on Roman territory; and the strengthening of Persia. As a result, Rome lost control of its eastern provinces, including West Georgia. In this period one of the most powerful West Georgian tribes, the Laz, appear to have seized the opportunity presented by Rome's weakness, and annexed the neighbouring tribes, uniting West Georgia and creating the new Kingdom of Lazika (also referred to by its Georgian name, Egrisi).

Many early Christian (4th-6th cc AD) temples have been discovered and studied in West Georgia as part of long-term archaeological investigations since the mid-20th century, for example at Nokalakevi-Archaeopolis (capital of Lazika), Vashnari, Petra, Pitsunda, Kutaisi and other contemporary sites. The results of these investigations indicate the following:

1. The first Christian communities appeared along the Black Sea east coast (e.g. Pitsunda) as early as the 2nd-3rd cc. AD
2. Christianity seems to be the state religion of Lazika from the beginning of the 4th century, with ruins of churches excavated in the royal area of the capital, which are dated to the early 4th century;
3. However, according to archaeological and written sources, Christianity had not spread throughout the country until 523 AD, and even then local kings used religion as a political tool in their dealings with two great empires – Rome/Byzantium (Christianity) and Sassanid Persia (Zoroastrianism);
4. Archaeological investigation shows that a number of churches, at several locations across Lazika, had been destroyed and rebuilt over a short period in the 4th-5th centuries. This destruction does not appear to be the result of war, but most likely represents a complex relationship between religion and socio-political elites, including the nobility, and military, etc.

8

**PRAYING AT THE FOOT OF THE GREATER CAUCASUS. PRELIMINARY RESULTS OF THE EXCAVATIONS AT MACHKHOMERI (KHOBİ MUNICIPALITY, WESTERN GEORGIA)**

**Abstract author(s):** Intagliata, Emanuele (Centre for Urban Network Evolutions, Aarhus University) - Papuashvili, Revaz (Georgian National Museum) - Naskidashvili, Davit (Ivane Javakishvili Tbilisi State University) - Chitaia, Gogita (Khobi Municipality)

**Abstract format:** Oral

This contribution aims to present the results of the excavations conducted in 2019 and 2020 at Machkhomeri (Khobi Municipality, western Georgia) by the Georgian National Museum, Khobi Municipality and the Centre for Urban Network Evolutions – Aarhus University. The site is traditionally believed to have played an important role as part of the defensive system of the Kingdom of Lazica in Late Antiquity (4th–6th centuries CE). The excavations have targeted the site's fortifications and a church. The excavations of the church has exposed a central nave, a narthex and an annexed multi-burial chamber to the north of the apse. Comparanda for the church at Machkhomeri include case studies from cities along the eastern Black Sea coast. This reflects the role of urban settlements as nodes for the transmission of building traditions in the region. The numerous Greek inscriptions recovered in 2019 and 2020 provide clues of the significant religious role of Machkhomeri and support the hypothesis that the site was more than a simple fort.

**SAMSHVILDE - UNTAPPED ARCHAEOLOGICAL SITE IN GEORGIA (SOUTH CAUCASUS)**

**Abstract author(s):** Berikashvili, Prof. David (the University of Georgia)

**Abstract format:** Oral

Samshvilde, a settlement in southern Georgia, is a complex and multi-period archaeological site. The historical city occupies a strategic and impregnable location on a basalt cape flanked by the gorges of the Khrami and Chivchava rivers. This distinctive landscape position, combined with environmental conditions that include a mild climate and an abundance of natural resources, have attracted human occupation for millennia. Samshvilde and its surroundings may have been inhabited since the Neolithic era, but the urban complex dates mainly to the medieval period, under the control of Georgian Royal family, when it became the region main fortress and political-economic centre. Proximity to the northern branch of the Silk Road further increased the site's importance. Samshvilde was therefore a place where various ethnic groups and cultures converged. Despite the site's importance and longevity, until recently there has been little concerted archaeological study of Samshvilde.

In 2012 the Samshvilde Archaeological Expedition was initiated by the University of Georgia (Tbilisi, Georgia) which has taken a multi-disciplinary approach to the site. Future expansion of the project is envisaged through cooperation between the University of Georgia and research institutions and individual specialists who will bring new perspectives to the study of the medieval occupation in the Armenian-Georgian border region. The main features, chronological phases and crucial artefacts discovered in Samshvilde in last 3 years will be presented on the conference. The challenges and problems connected with the study of this unique site will be also presented.

**PRESERVING TRANSFORMATIVE ‘PALIMPSESTS’: THE ROLE OF DIGITAL HERITAGE AND PARTICIPATIVE APPROACHES IN CURRENT URBAN ARCHAEOLOGY**

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Guttormsen, Torgrim (Norwegian Institute for Cultural Heritage Research. NIKU) - Pastor Perez, Ana (University of Barcelona) - Guzman, Paloma (Norwegian Institute for Cultural Heritage Research. NIKU) - Fouseki, Kalliopi (UCL - University College London, Institute for Sustainable Heritage) - Bonacchi, Chiara (University of Stirling)

**Format:** Discussion session

Towns and cities are complex, densely populated settlements that are in constant transformation. However, many of the strategies undertaken to conserve and disseminate the value of heritage sites within present-day cities does not value transformation. Differently, they tend to prioritize certain historical periods whilst others remain overlooked. This results in the discontinuity of historical layers and the loss of integrative dialogues and descriptions of day-to-day life.

We argue that cities as archaeological palimpsests are ‘deep cities’ - the depth of which needs to be explored, identified and promoted in a participatory and socially inclusive manner (JPI ‘Deep Cities’ project [www.deepcities.eu](http://www.deepcities.eu)). This session will search for more socially inclusive forms of preservation and management of urban heritage. By exploring new participative methods to preserve urban multi-temporal palimpsests, as theoretical approach to understand temporality in a relative manner (Lucas 2005). Under the concept of deep cities, we aim to broaden the understanding of historical continuity through the layers of social values and multivocal narratives. We are looking for conceptual frameworks and empirical case studies that draw on digital tools, co-production and archaeological research. The narratives that can arise from this debate and how they can be integrated into the objectives of a broader social archaeology, could also be discussed.

- In short, this session will address key questions including but are not limited to:
- How are current archaeological practices embedded in urban transformations?
  - What is the role of heritage management professionals and archaeologists in valuing social dimensions in heritage conservation within constantly changing urban contexts?
  - How can participatory, people-centred, and digital approaches contribute to the ongoing transformation of deep cities? What new sustainable futures can open up for our cultural heritage?

**BORN-DIGITAL, DIGITISED AND ‘ANALOGUE’ METHODS TO ASSESS THE SOCIAL VALUES OF URBAN HERITAGE**

**Abstract author(s):** Bonacchi, Chiara - Jones, Sian (University of Stirling)

**Abstract format:** Oral

This paper presents initial results of the quantitative and qualitative analysis undertaken online and offline to capture and assess social values associated with urban heritage. It evaluates the effectiveness of different born-digital, digitised and ‘analogue’ methods. These include web data analysis, surveys and participatory approaches such as crowdsourcing, rapid ethnography and photo elicitation within focus groups. These were developed and applied to the case study of a rapidly changing neighbourhood: Woolwich, in London, UK. The aim is to inform the negotiation between different sets of values to support sustainable urban transformations.

The authors will draw on the research they undertook on this topic with researchers Elizabeth Robson and Alex Hiscock (University of Stirling), as part of the ‘Deep Cities project’ (2020-2),\* funded by the JPI-CH scheme and involving partners from the Norwegian Research Institute for Cultural Heritage Research (Norway), the University of Barcelona (Spain), the University of Florence (Italy) and UCL (UK).

## 2 TO KEEP OR NOT TO KEEP: PUBLIC ART DOCUMENTATION AND THE ARCHIVAL MEMORY

**Abstract author(s):** Xiradakis, Polyna (University of the Aegean; Urban Layers) - Kyriakopoulou, Emmanouela (National and Kapodistrian University of Athens; Urban Layers)

**Abstract format:** Oral

According to the historian Pierre Nora, “modern memory is, above all, archival”. In modern society, we are constantly overwhelmed with a plethora of stimuli, which compete with each other for our scarce attention. Our decision to hold on to some traces from the abundance of events that surrounds us, is the way that the fabric of collective memory is being created. This paper is focusing on these decision-making practices and the documentation strategies, which are dealing with the ongoing history of now. Along this procedure, UrbanLayers will be used as a case study. UrbanLayers’ goal is to develop a community for the “survival” of the thoughts, ideas, and anxieties of society depicted upon the city’s walls. UrbanLayers’ vision is the development of a digital platform for public art, which will record street art pieces through time (4-dimensional documentation), supported by community-based activities. The act of writing on public walls is multidimensional, omnipresent and continuously changing, so it emerges as one of the most suitable fields to test the methods which are applied to the creation of an archive. UrbanLayers is being used as the starting point and as a model for the documentation strategies and the way they can be applied in the field of street art history. We will examine how the results of the documentation process can be presented to the public and finally explain why, within our decentralized society, a practice that seems really beneficial for the creation of a part of the body of social memory is to open up the archival processes to a diverse audience. Every community is interwoven with its history, which is being shaped in the here and now, so the multivocality is being turned into an essential component regarding the development of modern archives and, ultimately, the identity of urban space.

## 3 UNPACKING PARTICIPATION IN BARCELONA

**Abstract author(s):** Pastor Pérez, Ana (University of Barcelona; Group of Public Archaeology and Heritage) - Castillo Mena, Alicia (Complutense University of Madrid) - Díaz-Andreu, Margarita (Catalan Institution for Research and Advanced Studies - ICREA; University of Barcelona)

**Abstract format:** Oral

Participatory processes are one of the main tools for the socialisation of heritage. In recent years, participatory governance has been introduced in some local authorities led by political parties supporting the anti-austerity movement. The scope of this paper to discuss the participatory strategies related with urban transformations and heritage that have been implemented in Barcelona over the last five years. In 2016 Barcelona City Council created the Decidim Barcelona platform, a digital tool aiming to channel participatory governance. It is meant to allow associations and individuals to debate with the municipality about issues related to the running of the city.

So far, the implementation of participatory governance in Barcelona has represented a before and an after in decision-making processes at administrative level, and this has resulted in some examples related to urban heritage conservation strategies. Yet, in Barcelona the safeguarding and caring for spaces related to cultural urban heritage had traditionally been undertaken by self-managed neighbourhood groups. With the arrival of Decidim Barcelona controversies have arisen given that it is been perceived by associations as a way to remove their already established bottom-up processes and self-managed sense of ownership. Some citizens argue that local authorities and experts are hijacking their decisions.

In this paper we analyse how successful has participatory governance been in Barcelona. We try to answer whether participation is actually being taken into account or whether it is being used to endorse already taken institutional decisions about urban heritage. We would like to explore if a sector of non-expert voices are been silenced and how we could, as academics and experts, turn this participation towards horizontality, recovering its previously established grassroots essence. In the later part of the paper we reflect on the future of participation in urban heritage processes.

BC reveals fundamentally different places in terms of social organisation and connectedness. At around the same time social crises and collapse took place within several parts of Bronze Age Europe. Such rapid, transformative phenomena had a wholesale effect on domestic, subsistence, mortuary, ritual, economic and political spheres. The contemporaneity of such rapid developments across a broad region suggests possible causal connections.

A basic tenet of archaeology is to explain how such sharply punctuated changes transform the material features of an established socio-political order. However, simple mono-causal models explain poorly why and how societies collapse. Longer-term, integrative perspectives that explore the lead up, unfolding and aftermath of collapse horizons may better reveal the character of material and social change. Alongside papers that explore what is lost during crises, a core tenet of collapse studies, contributions exploring the nature of resilience in social change are also sought for this session.

A comparative approach to Late Bronze Age societies between the Atlantic and southwest Asia within a narrow window of time (1300-1000 BC) will be developed. This enables exploration of factors shaping change that go beyond the parameters of any given social network. Uniquely, this session draws upon contemporary complex urban and non-urban case-studies. Our contributors will focus on the pace, nature and physical markers of social change in the decades around 1200 BC using a variety of evidence from Europe, southwest Asia and north Africa. We will explore theoretical approaches which seek to explain rapid and catastrophic cultural change, and ultimately, how this specific period of crisis unfolded on a large geographic scale.

### ABSTRACTS:

## 1 NEW OPPORTUNITIES IN TURBULENT TIMES: ATTICA IN THE 12TH C. BC

**Abstract author(s):** Salavoura, Eleni (Greek Ministry of Culture)

**Abstract format:** Oral

Mycenaean civilization survived the disasters of ca. 1200 B.C., however the 12th century on Mainland Greece and the Aegean was clearly a period of upheaval. The centrally administered palace economies of the 13th c. gave way to more dispersed forms of economic organization. Athens was not highly centralized, and the Attic countryside, especially its western, eastern coast and the plain of Mesogaia, flourished in the palatial times. In the 12th c., the continuity of occupation in Athens and the eastern coast of Attica indicate a region that did not suffer a major destruction or abandonment. The fragmented landscape of the Postpalatial Aegean points to the existence of new decentralized coastal and maritime networks, which frequently consist ‘small worlds’. Any narrative of collapse in Attica has to be compatible with the foundation and century-long life cemetery of Perati, a site with imports from Cyclades, Dodecanese, Crete, Cyprus, Egypt and Syria. A second Late Helladic IIIC chamber tomb cemetery, 2 km western from Perati, at Porto Rapti: Drivlia, as well as Mycenaean finds from nearby sites of the eastern coast indicate that Attica participated in long-distance trade, but it was also incorporated in a mainland-looking network.

This paper will focus on the networks around the Saronic and Euboean gulf, and their connectivity with the wider Eastern Mediterranean world. In order to understand the ascendance and decline of these regions and microregions, and even individual sites, network analysis will be used, attempting to identify the changes of the maritime networks from Palatial to Postpalatial times, as well as to the transition to the 11th century BC. The study of the archaeological finds along with the changes detected in the settlement pattern will contribute to review Attica’s role, suggesting that times of crisis and recession are also times of new opportunities.

## 2 HEGEMONY AND FRAGILITY: THE CASE OF MYCENAEAN GREECE

**Abstract author(s):** Middleton, Guy (Newcastle University)

**Abstract format:** Oral

Whilst a series of high profile studies (eg. Kaniewski et al. 2019; Kaniewski and Van Campo 2017) have maintained a rigid fixation on finding evidence for climate change that can then be blamed for the c. 1200 BC collapse of the Mycenaean palace societies, a number of recent studies on collapse have shifted the focus away from the identification of external causes and towards a recognition of the inherent structural fragility of many ancient states and empires (Scott 2017; Yoffee 2019; already Kaufman 1988). Fragility studies force us to acknowledge that complex societies and political units can and do collapse without any impact from climate change or indeed any external drivers – collapse can take place within distinct culture zones and/or political unites for purely historical and particular reasons. This is clearly the case, for example, with some of the Classic Maya polities (Demarest 2014), and ‘empires’ within Mesopotamia (Yoffee and Seri 2019).

Rather than focusing on external causes and constructing narratives of apocalyptic collapse, a much more simple and local explanation for the Mycenaean collapse c. 1200 BC may be more plausible. That is, that in competing with each other and seeking to extend hegemony and influence, the activities and ideologies of the palace states and their rulers resulted in mutual and eventually self-destruction, resulting in an end to the palace-system and its culture. In addition, it could be plausibly suggested that the social fallout from this period may have been an increasingly egalitarian social ideology.

## 114 1200 BC FROM THE ATLANTIC TO ASIA: SOCIAL COLLAPSE AND RESILIENCE IN REGIONAL PERSPECTIVE. PART 1

**Theme:** 2. Pandemics and climate change: responses to global challenges

**Organisers:** Molloy, Barry (University College Dublin) - Vandkilde, Helle (Aarhus University) - Yasur-Landau, Assaf (University of Haifa) - Orfanou, Vana (University College Dublin)

**Format:** Regular session

East Mediterranean societies in the 13th century reached a zenith of connectivity and material affluence. This globalised world suffered a dramatic collapse around 1200 BC in less than 100 years. A comparison of East Mediterranean between 1300 and 1100

3 DIFFERING TRAJECTORIES OF COLLAPSE IN THE LATE BRONZE AGE ARGOLID: MYCENAE AND TIRYNS FROM 1250 BC TO 1100 BC

**Abstract author(s):** Zeman, Piotr (Adam Mickiewicz University in Poznań, Faculty of Archaeology)

**Abstract format:** Oral

Argolid was one of the core regions of the Mycenaean civilization, which dominated the Aegean in the Late Bronze Age (Late Helladic period = LH, 1700 – 1050 BC). In the 14th century BC it formed a locally specific palatial culture and entered an era of complex, urbanized, functionally and structurally organized settlement networks, centred around palatial towns, formed of palaces and lower towns surrounding them. In the Argolid, a Mycenaean state developed around the site of Mycenae, with another palatial town at Tiryns, serving probably as a secondary capital and a main harbour. However, this dynamic changed in the 13th century BC, when a series of events started to unfold that ultimately lead to the collapse of the Mycenaean palatial system around 1200 BC. Although both natural disasters and human agency contributed to the fall of the palaces, the chain of events and their results seem to differ in Mycenae and Tiryns. In the post-palatial period (LH IIC, 1200 – 1050 BC) Mycenae experienced a gradual loss of political and economic status, while Tiryns soon expanded as a settlement and became the main centre of the region. This paper, built on a comparative perspective, aims at elaborating and explaining differing trajectories of collapse and resilience, of both palatial towns of the Argolid. Drawing from the systematic, relational approach to settlement studies and urbanization, as well as the entanglement theory, I discuss the disintegration of palatial culture and urbanized settlement networks as a long-term, multi-causal and gradual process of de-urbanisation and disentanglement of the social and economic networks organized around the palaces, which in the same time formed a new, post-palatial Mycenaean world.

4 VULNERABLE MYCENAEANS? A HUMAN-ENVIRONMENT PERSPECTIVE

**Abstract author(s):** Weiberg, Erika - Finné, Martin (Uppsala University, Department of archaeology and ancient history)

**Abstract format:** Oral

The breakdown of the seemingly thriving Mycenaean palatial societies on the Greek mainland around 1200 BCE has received a lot of attention, not least because similar processes played out in other areas in the Eastern Mediterranean at roughly the same time. A combination of internal and external drivers been suggested as contributing to the outcome, including a recent focus on the possible negative effects of climate change. However, any effects of climate change, negative or positive, depend on the societal as well as environmental settings in the study area. It is thus crucial to consider a broad spectrum of factors and the co-evolution of changes leading up to 1200 BCE events. Few attempts have been made to understand the breakdown of the Mycenaean palatial societies in view of the preceding periods during which the Mycenaean ways of life first emerged and thereafter consolidated over time into the scenario that can be reconstructed for the final decades of the palatial period, and for its post-palatial repercussions. In this paper, we take on a human-environment perspective, assessing evidence for climate change, in parallel with a discussion of the overall scale of human activity and resourcefulness, socio-political control functions, societal cohesion and land use. Such factors likely contributed to the vulnerability load of these societies, affecting their inherent sensitivity and adaptive capacity and making them more or less able and willing to adapt to and to utilise changing environmental conditions stemming from climate change.

5 TAKING THE PULSE OF BIOMOLECULAR AND BIOARCHAEOLOGICAL INSIGHTS INTO MOBILITY AND CHANGE CA. 1200 BC IN SOUTHEASTERN EUROPE

**Abstract author(s):** Molloy, Barry (University College Dublin) - Fibiger, Linda (University of Edinburgh) - Michael, Dimitra (University College Dublin) - Nafplioti, Argyro (Ancient DNA Lab, Institute of Molecular Biology & Biotechnology - IMBB; Foundation for Research & Technology - Hellas - FORTH)

**Abstract format:** Oral

Mobility is commonly linked to social change in archaeology, though in more recent years we have returned to discussions of mobility and population change. As the pendulum has swung back towards the movement of people as a catalyst for social change, fresh debates are emerging particularly around cases where there is a history of debate about migration in archaeology. The East Mediterranean and southeastern Europe is one of these important venues – from tales of Dorian Invaders to Sea Peoples, migration has been seen as a fundamental component of collapse since the early days of archaeology. While the debate remains simmering, it is due for a robust revival in the coming years as a number of projects currently analysing ancient human DNA are published.

This paper takes the pulse, so to speak, of where we are currently with respect to models of mobility and the current, quite limited, state of the art of palaeogenomics and stable isotope research for this specific period of crisis and change. Our intent is two-fold, to reflect on what kinds of questions archaeological-led enquiry may pose and in so doing, to consider the potential insights biomolecular research may contribute. We run a real risk as these data come online of invoking problematic stale old paradigms for migrations or at the very least, not adequately accommodating current theoretical models which are already breaking down inflexible culture-historical identities such as Minoan or Mycenaean. Moving beyond fixed models of (material) cultural identity, it is also obvious that people were not constrained by genetics or places of origin, but by lifeways, experiences and choice. Since these are things not accessible through biomolecular research, we will assess how they can be made relevant when evaluating if or how mobility played a role in crises and ultimately collapse around 1200 BC.

6 GENETIC CHANGE AND POPULATION MOVEMENT C. 1200 BCE: A VIEW FROM THE NORTH AND WEST

**Abstract author(s):** Armit, Ian - Bleasdale, Madeleine - Büster, Lindsey - Fischer, Claire-Elise (University of York) - Booth, Tom (The Francis Crick Institute) - Patterson, Nick - Isakov, Michael (Harvard University) - Evans, Jane (British Geological Survey) - Hamilton, Derek (SUERC) - Reich, David (Harvard University)

**Abstract format:** Oral

The last centuries of the second millennium BC were a period of intense connectivity in Central and Western Europe. This is clear from studies of material culture that demonstrate the widespread distribution of specific objects, the exchange of raw materials, and shared patterns of deposition.

A new study of whole genome ancient DNA from Bronze and Iron Age populations, focusing on Britain but including substantial new datasets for areas of continental Europe, has also identified major genetic changes in the Middle-Late Bronze Age (c. 1300–800 BCE). In Britain specifically, a rise in ancestry derived from Early European Farmers (EEF) appears to represent an influx of people from a region most likely located in present-day France. Due to a paucity of aDNA coverage in the potential source region(s), it is presently impossible to determine whether the movement of people was reciprocal or unidirectional. It is striking, however, that many of those who moved appear to have been female. Similar genetic changes are evident in the Netherlands and Czechia, although based on fewer samples, while in Iberia we see a decrease in EEF ancestry.

Taken together, the genetic data suggest a period of complex connectivity between regions in Central and Western Europe, including significant movements of people. The underlying social processes are likely to be complex and not reducible to the simple outward spread of a single population. While there is presently no genetic evidence to link these population movements with upheavals seen in the east Mediterranean c. 1200 BCE, their chronological proximity is striking. This paper will discuss the recent genetic results in the context of broader archaeological understandings of the period in Central and Western Europe and consider their potential relevance to events further afield.

7 WHEN THE PENDULUM SWINGS BACK: THE 12TH CENTURY BCE AS THE BEGINNING OF A PERIOD OF GROWING EUROPEAN INTEGRATION

**Abstract author(s):** Gorgues, Alexis (University of Bordeaux Montaigne)

**Abstract format:** Oral

As the title of this session clearly emphasizes, the beginning of the 12th century BCE is considered in the Eastern Mediterranean as the first step in the quick dismantlement of the sophisticated Late Bronze Age social and political structure. Such a point of view would likely be dismissed by an archaeologist studying Western European Late Prehistory. In western context, the 12th century may rather be considered as the beginning of increasing connectivity (thus giving birth to wide complexes such as the Atlantic one), growing technological complexity (development of copper alloy sheet hammering and lost-wax technique), dynamic social changes, etc.: the beginning of a new dynamic that would last until the 10-9th centuries BCE at least, with strong regional variations. In some regions, as in the north-western Mediterranean, it is probably the beginning of longue durée processes, that will develop well into the Late Iron Age.

This paper will defend the idea that the “collapse” observed in Greece will mark the beginning of a period when social and political structures were more akin to forms observed elsewhere in Europe, in particular in Western Mediterranean Europe. Last, this paper will question the possible dynamics of this process (without trying to provide an explanation to the fall of the Palaces!) and to broadly assess its consequences. This will lead us to have a glance beyond the threshold of the 2nd millennium into the first centuries of the 1st millennium BCE, if the organizers allow me.

8 1200 BC: A PERSPECTIVE FROM THE NILE DELTA

**Abstract author(s):** Franzmeier, Henning (Università di Bologna; Roemer- and Pelizaeus-Museum Hildesheim)

**Abstract format:** Oral

The reliefs of Ramesses III’s temple at Medinet Habu are still being used as a central argument in many if not the most, broader discussions of the period around 1200 BC in the Eastern Mediterranean. In addition, texts and archaeological evidence are brought in which in their vast majority come from Upper Egypt, especially the Theban area. Archaeological evidence from the Nile Delta is rarely referred to, even though the region is central to one of the most important events – the battles between the Egyptian forces and the sea peoples.

The lecture will take the perspective from the site of Pi-Ramessé, Egypt’s capital during this time and discuss the results of more than 40 years of archaeological research and their implications for the discussion. While no large-scale destruction layers can be observed, the end of the New Kingdom seems to have been preceded by an end of monumental construction in the capital. Moreover, official buildings seem to have been used as squatter residences. These results will be analyzed within the framework of the general historical development in Egypt.

One of the central points which need to be discussed is whether the events around 1200 BC and their aftermath were really behind the end of New Kingdom Egypt which took place only about 100 years after the end of the Late Bronze Age.

9

DECENTRALISED COMMERCIAL STRATEGIES IN THE MEDITERRANEAN AFTER 1200 BC AND THE ROLE OF CYPRUS

**Abstract author(s):** Georgiou, Artemis (University of Cyprus)

**Abstract format:** Oral

The spectacular collapse of the majority of the palatial and imperial political regimes in the eastern Mediterranean ca. 1200 BC, and the disintegration of the centralised commerce that characterised interregional connectivity in the previous centuries, had a profound impact on the Cypriot communities, whose prosperity relied heavily on the extra-insular bulk transshipment of copper. The transformations of the island's settlement pattern and material culture notwithstanding, the 12th century BC in Cyprus does not correspond to the disruption of the island's idiosyncratic politico-economic forms. For instance, the persistence of the indigenous syllabic writing system indicates an impressive level of continuity. More importantly, it was during this transformative era that the Cypriot communities rose to the forefront of the emergent interregional commercial strategies in the Mediterranean, which were characterised by entrepreneurship in smaller and regional spheres.

The presentation will elaborate on the transformed character of copper trade in the eastern Mediterranean, aggregating new data from contexts within Cyprus and beyond. The study will also focus on the commercial links between Cyprus and the Levant, as evidenced by the deposition of Cypriot finewares in Levantine contexts. Finally, a critical indicator of the uninterrupted trading connections between Cyprus and the rest of the eastern Mediterranean are the large numbers of imported Maritime Transport Containers recovered in Cypriot contexts of the 12th century BC. The sheer quantities of these ceramic containers, predominantly "Canaanite Jars" produced in various centres of the Levant, but also Egyptian Jars and Minoan Transport Stirrup Jars, are indicative of the scale of maritime trade during the post-"crisis" era. The contribution ultimately aspires to address the transformations in the character of interregional connectivity in the Mediterranean after ca. 1200 BC, and to highlight the role of Cyprus as an important nexus within the emergent decentralised commercial strategies.

10

USING MACHINE LEARNING TO ILLUMINATE SOCIAL CHANGE: INTEGRATING DATA SETS FROM 1300-1000 BC FROM THE ATLANTIC TO SOUTHWEST ASIA

**Abstract author(s):** Bell, Carol (UCL)

**Abstract format:** Oral

Advances in machine learning have yet to find widespread application in Archaeology even though this technology is used extensively to identify patterns in, for example, economic, financial and medical data. The ability to sift efficiently through the enormous, and rapidly growing, literature on Late Bronze Age and Early Iron Age Eurasia, from the Atlantic to Southwest Asia, using machine learning could be an important step in advancing understanding of how the scope and intensity of long-distance interactions and external factors, such as climate change, contributed to cultural change over time.

This paper evaluates the potential of applying machine learning to identify and correlate the markers of cultural change and societal resilience between 1300 and 1000 BC across Eurasia. It will highlight the value of this method in rapidly extracting meaningful trends from academic literature and digital sources written in multiple modern languages and across multiple disciplines (archaeology, philology and all relevant scientific disciplines including climate, provenance studies and ancient DNA analysis). Assembling relevant evidence efficiently in this way paves the way for resources to be directed towards evolving research questions and building, and testing, explanatory hypotheses for cultural change in Eurasia between 1300 and 1000 BC.

11

RADICALLY DIFFERENT? RESPITE AND RESILIENCE OF THE BRONZE AGE IN THE NORDIC REGION

**Abstract author(s):** Ahlqvist, Laura - Vandkilde, Helle (Aarhus University)

**Abstract format:** Oral

The paper discusses the extent to which '1200 BC' impacted S. Scandinavia. The Nordic Bronze Age was utterly reliant on European metal trade and should logically respond to interrupted channels of metal transfer. Indeed, significant changes occurred in the North during this tumultuous time: they tie up with European-scale crises, but were also rooted in the preceding period. An environmental downturn is observable immediately prior to 1200 BC, seemingly linked to generations of unsustainable, aggrandizing mound construction (land) and house-building (timber). The Lössen glacial maximum (c. 1300–1100 BCE) may be understood as an overall background of environmental instability.

In Scandinavia, the time around 1200 BC appears generally less troubled by collapse and crisis than other parts of the Bronze Age world. The 'fall' of 1200 BC in the North marks a significant threshold out of which the culturally distinct Nordic Bronze Age (c. 1600-600 BC) appeared born anew through the integration of rooted tradition with Urnfield and Mediterranean ideas. Especially the period 1000-750 BC was a booming climax driven by European partnerships and political control of metal trading until interrupted c. 750-700 BC when deep crisis began to manifest likely connected to the Göschenen glacial maximum (c 800–700 BCE).

The paper asks how susceptible Scandinavia was to change and collapse in the Bronze Age world through complex explanatory models. A *longue-durée* approach looks for continuity and disruption, degrees of success and failure. Should the Nordic region be regarded as 'respite' or 'resilience'? Drawing on evidence from mortuary traditions, hoarding, conflict, landscape use as well as ritual and spiritual developments, glimpses of crisis as well as resilience transpire. These fluctuations appear intertwined with accelerat-

ing influx of impulses from the Urnfield region and even further away, which encourages a renewed cultural frame of reference for people in the Nordic region.

1200 BC FROM THE ATLANTIC TO ASIA: SOCIAL COLLAPSE AND RESILIENCE IN REGIONAL PERSPECTIVE. PART 2

**Theme:** 2. Pandemics and climate change: responses to global challenges

**Organisers:** Molloy, Barry (University College Dublin) - Vandkilde, Helle (Aarhus University) - Yasur-Landau, Assaf (University of Haifa) - Orfanou, Vana (University College Dublin)

**Format:** Regular session

East Mediterranean societies in the 13th century reached a zenith of connectivity and material affluence. This globalised world suffered a dramatic collapse around 1200 BC in less than 100 years. A comparison of East Mediterranean between 1300 and 1100 BC reveals fundamentally different places in terms of social organisation and connectedness. At around the same time social crises and collapse took place within several parts of Bronze Age Europe. Such rapid, transformative phenomena had a wholesale effect on domestic, subsistence, mortuary, ritual, economic and political spheres. The contemporaneity of such rapid developments across a broad region suggests possible causal connections.

A basic tenet of archaeology is to explain how such sharply punctuated changes transform the material features of an established socio-political order. However, simple mono-causal models explain poorly why and how societies collapse. Longer-term, integrative perspectives that explore the lead up, unfolding and aftermath of collapse horizons may better reveal the character of material and social change. Alongside papers that explore what is lost during crises, a core tenet of collapse studies, contributions exploring the nature of resilience in social change are also sought for this session.

A comparative approach to Late Bronze Age societies between the Atlantic and southwest Asia within a narrow window of time (1300-1000 BC) will be developed. This enables exploration of factors shaping change that go beyond the parameters of any given social network. Uniquely, this session draws upon contemporary complex urban and non-urban case-studies. Our contributors will focus on the pace, nature and physical markers of social change in the decades around 1200 BC using a variety of evidence from Europe, southwest Asia and north Africa. We will explore theoretical approaches which seek to explain rapid and catastrophic cultural change, and ultimately, how this specific period of crisis unfolded on a large geographic scale.

ABSTRACTS:

1

THE CULMINATION AND DECLINE OF MONUMENTAL ARCHITECTURE DURING THE NORDIC EARLY BRONZE AGE (1500-1200 BC) IN JUTLAND, DENMARK

**Abstract author(s):** Egelund Poulsen, Martin (Museet Sønderkov)

**Abstract format:** Oral

During the Nordic Bronze Age Period II and early Period III, 1500 - 1200 BC, South Scandinavia experienced an increase in the construction of barrows and longhouses. In the westernmost region, the peninsula of Jutland, longhouses were particularly large robust structures. Especially in the western and southern parts of Jutland, house walls were constructed using the bole-wall technique that demanded a large quantity of timber resources. Here, the largest and richest turve-built barrows were constructed as well. In recent years, new excavations and radiocarbon dates have confirmed that monumental architecture in Jutland reached its peak in late Period II or the 14th century BC. Thereafter, a gradual decline occurred during early Period III.

The construction of barrows had the most dramatic effect on the landscape, demanding thousands of grass and heather turves from the surrounding areas for each mound. The timber-consuming bole-walled longhouses were constructed in regions that already lacked suitable timber resources. Hence, the building material was most likely imported from forested regions further east. In contrast to other contemporary house types, the bole-walled construction represented an architecture of conspicuous consumption. Beside its resource consuming character with imported timber, the settlements with bole-walled houses were placed at visible and communicative locations along important land-routes and waterways.

Around 1200 BC the tradition of bole-walled architecture had come to an end along with monumental barrow and house building in general. Barrows hereafter were smaller and fewer in number. At the same time house architecture became less resource demanding and had a more ephemeral character. This radical change is often interpreted as the result of an extensive ecological crisis caused by the tradition of conspicuous monumental architecture. However, it should be explained by the collapse of established regional and international exchange networks as well.

### SETTLEMENT, ECONOMY AND SOCIETY IN LATE BRONZE AGE EASTERN HUNGARY: THE START OF A NEW RESEARCH PROJECT

**Abstract author(s):** Szeverenyi, Vajk - Priskin, Annamária (Déri Múzeum, Debrecen) - Czukor, Péter (Móra Ferenc Múzeum, Szeged) - Szalontai, Csaba (Hungarian National Museum, Archaeological Heritage Protection, Budapest)

**Abstract format:** Oral

The period around 1200 BC saw significant transformations of many aspects of the life communities living in Eastern Hungary – and generally the Carpathian Basin: major changes occurred in settlement forms and patterns, multiple aspects of material culture, burial forms and depositional practices. The aim of our paper is to present the starting point and aims of a new research project investigating these changes focusing on settlement patterns and socio-economic change in Late Bronze Age eastern Hungary. We present briefly the evidence available on fortified megasites in southeast Hungary that appear around 1300 BC and are abandoned around 1100 BC and their relationship to smaller secondary fortified centres and non-fortified sites, and some of the evidence for socio-economic organization at this time. Our main questions include why such a pattern with forts of such immense size emerged and then collapsed, and how this relates to the wider changes around 1200 BC in western Eurasia.
- 3

### A NEW PLAYER IN 13TH C. BC OF SOUTHEAST AND MEDITERRANEAN EUROPE? THE TISZA SITE GROUP IN ITS REGIONAL CONTEXT

**Abstract author(s):** Bruyere, Caroline (University College Dublin) - Jovanović, Dragan (City Museum of Vršac) - Molloy, Barry (University College Dublin)

**Abstract format:** Oral

At the same time as the Mycenaean palaces and the Terramare, a dense settlement system was developing in the South Carpathian basin along the lower Tisza. Between 1500 – 1200 BC, after a transition period of divergence from classical MBA traditions, large enclosed settlements up to 200+ ha were established in an area that hadn't been substantially populated in the Middle Bronze Age. This group, which we have called Tisza Site Group (TSG), has 70+ sites and counting. With the pattern of distinguishing features shared by TSG sites only recognized a few years ago, research is still in its early stages. In archaeology, periods of crisis and collapse are often characterised through site abandonment or depopulation. In the 13th century, the South Carpathian Basin was linked through increasingly standardized material culture, yet current absolute dates at a limited number of published LBA sites indicate a reduction of activity or abandonment of settlements before 1200 BC. As a unit within this wider cultural zone, the TSG was necessarily involved in this pattern. It is well understood that collapse is multi-causal and in this presentation we will focus on the social dynamics involved with new data from our project SILT (Survey in the Lower Tisza). The basic tenet of our approach is that to understand collapse, we must understand stakes and stakeholders in a community. Hence, new C14 dates, material from survey and excavation, and spatial analysis data generated on the ERC “The Fall of 1200 BC” project (GA#772753) are integrated with the aim to characterize the TSG in its wider cultural context.

### CONTINUITIES AND DISCONTINUITIES IN LUXURY GOODS: THE CASE OF GLASS IN POST-PALATIAL MYCENAEAN GREECE

**Abstract author(s):** Nikita, Kalliopi (Ephorate of Antiquities of East Attica)

**Abstract format:** Oral

The proposed paper deals with the production, exchange and use of glass in post-palatial Mycenaean Greece, namely in the LHIIIC period (12th-11th centuries BC). The flourishing glass industry of the principal Mycenaean period saw the consequences of the destruction of palatial centres and the collapse of Linear B administration system. Distinctive blue glass jewellery, mass-produced in the Mycenaean palaces, was widely distributed across the Aegean and in Cyprus during Late Helladic IIIA-B (14th-13th centuries BC). In post-palatial contexts, Mycenaean glass beads either rarely occur or they are unevenly distributed whilst the main bulk of glass seems to have been imported either from an eastern or from a western producing centre.

Material evidence from the cemeteries of Perati in Attica and from Elateia-Alonaki in Phthiotis will be used as a means for understanding the occurrence of glass as a luxury good in its context. The paper aims to trace continuities and discontinuities in the manufacture of glass beads in mainland Greece as well as in the importation of glass from contemporaneous glass-producing centres in the Eastern Mediterranean and in Italy. Owing to the quantity and quality of glass found in both sites their comparative study will shed light on continuities and discontinuities in the use of glass coming from earlier palatial traditions as well as in the role that glass had in the new elites that appeared in post-palatial Mycenaean society.

### MORS TUA VITA MEA? NURAGIC’S RESILIENCE STRATEGY AFTER THE 1200 BC COLLAPSE OF METAL-TRADING NETWORKS

**Abstract author(s):** Matta, Valentina - Vandkilde, Helle (Aarhus University)

**Abstract format:** Oral

While 1200 BC represents a time of social and economic upheaval and collapse for many Mediterranean societies – following the 14th-13th centuries BC peaks – crisis does not seem to manifest markedly in Nuragic Sardinia. The island’s Bronze Age witnesses two apparently diverging phenomena: on the one hand, an internal socio-economic crisis transpires in the reorganization of settle-

- ments toward nucleation, and on the other hand, a remarkable maritime-trading expansion began. These two phenomena could well be connected. After 1200 BC, while Mycenaean polities were unable to continue successful commodity trading, Nuragic Sardinia rather adapted to the East Mediterranean crisis by changing its strategy and trading partners, thence creating new advantages for Nuragic communities.
- What are the actual archaeological proxies for Nuragic resilience after 1200 BC? Researchers have addressed the Sardinia’s resilience in several different ways. We argue that tracking the metal-led networks inside and outside the island has the potential to reveal changes over time in Nuragic society. We also argue, however, that there is a dire need for Sardinian high-precision chronology to establish a frame for trailing the changes and continuities in settlement habitation and in founding central sanctuaries. Firstly, we evaluate how the resilience concept has been addressed in the context of Nuragic Sardinia and its network. Secondly, we discuss signs of change, internally and externally, in Nuragic political economy over the Late/Final Bronze Age into the Early Iron Age. Thirdly, we propose a model of interaction spheres to hypothesise the island’s changing role after the collapse of the Aegean polities.

### BRONZE AGE SETTLEMENT DYNAMICS IN THE NORTH-EASTERN PO VALLEY (ITALY). THE CHRONOLOGICAL AND CULTURAL BACKGROUND OF A 1200BC RESISTANCE PHENOMENON

**Abstract author(s):** Dalla Longa, Elisa (Dipartimento dei Beni Culturali, Università di Padova)

**Abstract format:** Oral

The North-Eastern sector of the Po Valley (Italy) is known for being a crucial region in the development of the palafitticolo-terramaricolo culture, that evolved in the whole Po Valley between the Early and the Recent Bronze Age. After the EBA settlement phenomenon of pile-dwellings around the southern shore of Garda Lake and its intra-morainic basins, in that North-Eastern sector of the Po Valley an occupation of the plain zones occurs. During the Middle and the Recent Bronze Age this settlement phenomenon continues, with the first terramare sites and significant variations in the number of settlements, maybe also ascribable to local climate-driven hydrographic variations. A progressive preference emerges for settling in the southern- and eastern-most areas. Since the MBA3/RBA phase a polity of terramare sites develops in the lowlands of Verona province. These sites, and in particular their central place Fondo Paviani, show traits of peculiar richness and a central role in long distance exchange routes, connecting the Alps and Central Europe - through Adige river system - to the Po and the Mediterranean. At the end of RBA, a peculiar settlement dynamic interests the area: while the Southern Po Valley terramare system collapses, the North-Eastern sector, even if experiencing a crisis, resists and continues to be occupied in the Final Bronze Age, with a new settlement distribution and a territorial shifting of the central pole on Frattesina settlement, on the Po delta. Moving from the general analysis of this settlement trend, the present contribution aims at examining how specific human choices (as typologies of settlements and punctual locations of sites) alter following the trend. The resistance phenomenon after 1200 BC crisis can be better understood through the analysis of the nuanced changes of settlement aspects and settlement distribution occurred during the whole Bronze Age.
- 7

### THE TERRAMARE CRISIS BETWEEN COLLAPSE AND RESILIENCE. PARALLEL BUT DIFFERENT HISTORIES AT NORTH AND AT SOUTH OF THE PO RIVER

**Abstract author(s):** Cupitò, Michele - Vicenzutto, Daivid (dBC - Università di Padova)

**Abstract format:** Oral

Between 16th and mid-12th century BC, the historical trajectory of the terramare actualized in the Central-Eastern Po Valley. The phenomenon was characterized by the fast diffusion of fortified settlements, together with the formation of a farmland provided with complex hydraulic infrastructures and the affirmation of an intensive agro-pastoral economic exploitation of the territory. The terramare culture had made Po Valley one of the more advanced sector of all Bronze Age Europe and the mediator between this area and the Aegean and Eastern world. Between the end of 13th and the beginning of 12th century BC, this civilization got into a crisis due to a series of correlated anthropic and environmental factors that rapidly lead to the collapse of the system. The crisis fell down on the whole territory, but its outcomes North and South of the Po river show many differences. In fact, while the Southern Po Valley system completely imploded and the territory depopulated, the Northern Po Valley one underwent a contraction but also put in place some resistance processes – and, in some ways, some resilience processes – that lead to the formation of totally new territorial entities, first of all the one pivoted on the international central place of Frattesina. The presented contribution aims at the first systematic analysis on the reasons that determined such different reactions and historical outcomes, despite the cultural and socio-economical homogeneity of the initial context. From the methodological point of view, the analysis will focus essentially on the plain zones and it will follow a comparative approach, following two integrated lines of inquiry. The Norther Po Valley sector and the Southern Po Valley one will be compared in parallel both from the cultural profile and for the environmental one, with the specific objective of highlighting analogies and differences between the two systems.

8 **NOT ONLY TERRAMARE. THE 12TH CENTURY BC CRISIS AMONG THE THE PILE-DWELLINGS OF THE EASTERN SHORE OF LAKE GARDA**

**Abstract author(s):** Albertini, Ilaria - Cupitò, Michele - Vicenzutto, David (dBC- Università di Padova)

**Abstract format:** Oral

As it is known, between the end of 13th and the beginning of the 12th century BC the terramare system underwent a crisis and collapsed within a few generations. This system had dominated the Central-Eastern Po Valley for 400 years ca., making this sector of the plain one of the most advanced of all Bronze Age Europe and the mediator between this area and the Aegaeen and Eastern world.

Thanks to the studies and the critical works performed in the last twenty years, the reasons that lead to the collapse of the system – an historical break of fundamental relevance for Italian and European protohistory – and the different ways in which the phenomenon occurred in the diverse areas – first of all, between the areas at North and at South of the Po river – were delineated in a sufficiently clear way.

However, in the general overview of this issue there is an aspect that the critical works have only superficially examined, without giving any overall synthesis: the development trend of a system that was distinct and different from the terramare one, but also intimately linked to it on the cultural and socio-economical level. We are talking about the wet environment settlements gravitating around Lake Garda.

The presented contribution aims to give the first precise definition of the entire historical trajectory followed by the Lake Garda pile-dwellings system – and in particular its Eastern sector – integrating all available archaeological, dendrochronological and paleo-environmental data. The specific objective is to highlight analogies and differences with the trajectory followed by terramare system and its behaviour in the crucial moment of the crisis. In this sense, a specific detailed study about the fundamental settlement pole of Peschiera will be performed.

9 **COMPARATIVE TRENDS OF ITALIAN SOCIETIES BETWEEN 1300 AND 1100 BCE**

**Abstract author(s):** Vanzetti, Alessandro - Palazzini, Flavia - Pizzuti, Elisa (University of Rome “La Sapienza”)

**Abstract format:** Oral

Italy and the Central Mediterranean were intensely involved in the boom-and-crisis phase of the Mediterranean Late Bronze Age. It has been highlighted that Mediterranean connectivity did play a role in the development of new material productions, economic strategies and possibly social structures in the Central Mediterranean, even if the scale of the foreign influence is still disputed. At the end of the connective boom, the Mediterranean crisis around 1200 BCE saw differential responses in the different interconnected areas of Italy and the main surrounding islands: in some areas crisis was evident; in other neighbouring territories resilience or even prosperity was the case. What more, the innovations that came into use during the former connective boom were somewhere totally rejected, somewhere instead maintained or developed.

Arguments discussing these outcomes have focused in the past mainly on the social structure of the Italian communities, arguing for a higher resilience by more hierarchical and structured societies. This can be partially maintained, but it seems that another factor should be considered in connection with social structure: the capacity of societies to assume change as a relevant factor of their adaptive strategy.

It can be argued that societies more open to change did result in a better global resilience than self-referential social milieux. We will present some cases to describe comparatively the proposed arguments.

10 **CHANGE AND ADAPTABILITY DURING THE LATE BRONZE TO IRON AGE TRANSITION: INSIGHTS FROM RADIOCARBON AND POTTERY IN THE SOUTHERN LEVANT**

**Abstract author(s):** Webster, Lyndelle (Austrian Academy of Sciences) - Kleiman, Sabine (Tübingen University)

**Abstract format:** Oral

The transition from the Late Bronze to Iron Ages in the southern Levant has been the subject of intense debate concerning the timing and nature of major, multifaceted cultural and political changes. During this period, local communities suffered a series of catastrophic events, witnessed the stepwise collapse of their centuries-old city-state system and observed the nonlinear decline of Egyptian ‘colonial’ rule; in addition, they were confronted with new cultural influences and migrating/displaced peoples.

Key to elucidating the complex chain of events and adaptive response of societies during the Late Bronze/Iron Age transition, are ceramic studies and radiocarbon dating (14C). An accumulating body of 14C data now enables an absolute chronological framework that is independent of external factors such as Egyptian texts and foreign material parallels. It confirms some aspects of the traditional chronology while challenging others and bringing clarity to the most debated issues. The date of widespread destruction events, the end of Egyptian rule, and the introduction of local Aegean-style (so-called ‘Philistine’) material culture can each be addressed in considerable detail.

Pottery studies, on the other hand, can illuminate the relative chronological framework of the Late Bronze/Iron Age transition. Ceramic studies in the southern Levant – specifically the coastal ‘Philistine’ heartland and adjacent Shephelah region – have tended to emphasize new foreign elements at the expense of the indigenous ‘Late Bronze-style’ pottery traditions. However, close examination of the latter provides particular insight on how communities preserved and adapted their traditions through the tumultuous

13th–11th centuries BCE. It seems that the local artists were influenced by the appearance of foreign potters and adapted their own traditions within the indigenous ceramic workshops. Such insights allow a fine-tuning of relative chronology that neatly corresponds the 14C evidence, while also providing a crucial window on the resilience and adaptability of southern Levantine society.

11 **RETHINKING THE “CRISIS YEARS” IN THE SOUTHERN LEVANT: CANAANITES, PHILISTINES, CONTINUITY AND CONNECTIVITY CA. 1250-1050 BCE**

**Abstract author(s):** Yasur-Landau, Assaf (University of Haifa)

**Abstract format:** Oral

New data from fieldwork on land and underwater in Israel, a decade of experimentation with new scientific methods in archaeology, and new methodologies for addressing questions of mobility and networks allow re-assessment of the transition from the Bronze to Iron Age in the southern Levant. Initial results indicate a long and turbulent period of transformation ca. 1250-1050 BCE, rather than a clear-cut watershed event around 1200. A wave of destructions does occur but is begins already in the 13th century, while a growing number of large sites continue well into the 12th century. The migration of the Philistines into the southern coast and the creation multicultural society with the local Canaanites should be seen is part of highly variable and region-specific phenomena of Mediterranean mobility over land and sea. Furthermore, maritime trade does not end ca. 1200 yet shift its scale and gradually and the directionality of traded goods, with the Carmel coast continues to be a hub for maritime connectivity.

12 **FROM COLLAPSE TO CREATIVE DESTRUCTION IN THE LATE BRONZE AGE SOUTHERN EUROPE AND THE EASTERN MEDITERRANEAN**

**Abstract author(s):** Orfanou, Vana (University College Dublin)

**Abstract format:** Oral

During the last 20 years, the empirical applications of resilience theory in archaeology have intensified. A combination of current social and environmental challenges, alongside the ever-evolving discussions of past crises and collapse episodes have provided a solid impetus for archaeologists to explore past societal resilience. Mass population movements, social upheavals, extreme climatic and environmental phenomena, and public health crises have marked past societies, as they are currently affecting our global community. According to the adaptive cycle model, often used alongside resilience theory, societies follow iterations of cycles of growth, conservation, release, and reorganisation. The nature and duration of these iterative loops are determined by varying degrees of connectedness and potential of each cultural unit (Bratdmöller et al. 2017). According to the adaptive cycle model, a form of creative destruction (release) is needed for the reorganisation of cultural systems. However, often in archaeology we still talk in terms of crises and collapse as the end of a linear process, instead of as a necessary regenerative step in the life history of a society. Based on an overview of case studies of empirical applications of resilience theory in the study of past social collapse episodes, I aim to explore the potentials and limitations of such approaches for revisiting the collapse of the Late Bronze Age highly hierarchical and centrally organised social systems in southern Europe and the eastern Mediterranean. I will also discuss how definitions of societal resilience emerge from empirical studies in archaeology, as resilience theory and the adaptive cycle model tend to encompass fluid definitions.

116 **THE ARCHAEOLOGY OF MAGYAR RAIDS IN WESTERN AND EASTERN EUROPE**

**Theme:** 6. Material culture studies and societies

**Organisers:** Lemm, Thorsten (Centre for Baltic and Scandinavian Archaeology, Stiftung Schleswig-Holsteinische Landesmuseum) - Hedenstierna-Jonson, Charlotte (Department of Archaeology and Ancient History, Uppsala University) - Katona, Cséte (Department of Medieval Studies, Central European University) - Kalmring, Sven (Centre for Baltic and Scandinavian Archaeology, Stiftung Schleswig-Holsteinische Landesmuseen)

**Format:** Regular session

In the 9th and 10th centuries Western and Eastern Europe suffered from the raids of highly mobile Magyar horsemen. Only with the Battle at the Lech in 955 the East-Frankish King Otto put an end to nomad incursions into Western Europe, while attacks on the Byzantine Empire continued until 970.

Whereas the contemporaneous “Viking raids” are almost omnipresent in the scholarly and public discourse, the “Magyar raids” are comparably little established. Nevertheless, material evidence of the Magyar can be found both as direct evidence in the context of single finds and graves and as indirect evidence in the form of fortifications as attempts of countermeasures. In various regions the interaction between Magyar and other ethnicities is archaeologically visible through a hybridisation of material culture, in particular relating to weaponry and martial attire. On the Eastern spheres of the continent e.g., evidence of Viking and Magyar warfare even merge in joint campaigns and court services performed in territories from Scandinavia to the Kievan Rus and Byzantium.

This session – which originally was accepted for the EAA Conference in Budapest 2020 – wants to discuss the Magyar evidence in Western and Eastern Europe between the poles of warfare and cultural adaptation (in the light of the written sources) during the

period preceding the settlement of the Carpathian Basin and especially at the dawn of the Kingdom of Hungary. The session will address the following questions:

What is the material evidence of the Magyar within the Carpathian Basin? How do we interpret Magyar armoury from different contexts found outside their homelands? What made the Magyar raiders so successful? What countermeasures were undertaken by their opponents? Is it possible to identify plundered objects from Eastern and Western Europe in the Carpathian Basin? Can we pinpoint the interfaces of technology transfer and cultural adaption?

ABSTRACTS:

1 THE TENTH-CENTURY MAGYAR MILITARY CAMPAIGNS AND THEIR ARCHAEOLOGICAL LEGACY

**Abstract author(s):** Langó, Péter (Research Centre for the Humanities, Budapest; Pázmány Péter Catholic University, Budapest) - Bácsatyi, Dániel (Research Centre for the Humanities, Budapest, Hungary) - Bede, Ilona (Sorbonne, Archaeology Department)

**Abstract format:** Oral

The tenth century is a vital period in European and Hungarian history. Modern Western historiography traditionally viewed the Magyar raids in a European context as a phenomenon which triggered social and economic developments. Apart from regarding Magyar raiders as brutal nomadic tribute collectors who interrupted local economic boom, it has been recognized that these incursions served as catalysing factors for the centralization of the people of the continent, an important step on the way of becoming a nation for many.

After the antecedents of the 1960s, in the last decades newer approaches question both the significance and the destructiveness of the Magyar incursions, quite akin to the effects of similar invasions like that of the Normans'. In the light of such investigations, mistrust in the written sources increased (e. g. Albert D'Haenens). Nevertheless, scepticism towards the importance of the Magyar campaigns could sometimes lead to hypercritical results (Hervé Mouillebouche). In the present paper, we side with the approach that generalizations ignore the specific historical and geographical contexts of these military undertakings and thus they should be avoided. Instead each and every source should be examined in its own context. In the second part of the paper, we will concentrate on the archaeological legacy of the Magyar raids in Western Europe, which offer new results in Austria (Gnadendorf), Germany (Lechfeld) and France (Aspres-lès-Corps). We will present the latest research on the route of Magyar military campaigns, as well as evaluate the material remains that may indicate such operations. To sum up, the presentation will review the material findings and the written evidence associated with Magyar military campaigns and will summarize the lessons learned so far.

2 ADVERSARIES OF THE MAGYARS IN THE WEST – RECONSTRUCTING THE OTTONIAN CAVALRY

**Abstract author(s):** Lemm, Thorsten (Centre for Baltic and Scandinavian Archaeology)

**Abstract format:** Oral

The topic of Magyar incursions into the East-Frankish Kingdom under Ottonian rule is inevitably related with two military incidents – the victories of the kings Henry I and Otto I at Riade in AD 933 respectively at the Lech in AD 955. The latter finally ended nearly 100 years of Magyar raids into Central and Western Europe once and for all. Although at both occasions the East-Frankish army very likely for the largest part consisted of foot soldiers, the cavalry was essential in order to counter the highly mobile Magyar warfare based on sturdy horses and mounted archers on the battlefield. In line with this, the mounted fighting men were highlighted in the written sources – such as Liudprand of Cremona´s Antapodosis (II, 31), according to which Henry I prior to the battle of Riade gave his cavalymen specific orders on how to charge the enemy – and still today dominate people´s ideas on Ottonian warfare.

However, a reconstruction of the Ottonian cavalry regarding the weaponry and equipment proves to be rather difficult – at least from an archaeological point of view alone. The absence of burials with grave goods within the former borders of the East-Frankish realm can only to a limited extent be compensated by stray finds and objects from fortresses or settlements. Hence, a reconstruction to a high degree has to rely on archaeological material from neighbouring regions that were strongly influenced by the East-Frankish Kingdom. Moreover, besides the archaeological evidence and a few historical documents especially pictorial sources have a special role to play. This applies particularly to the 10th century Book of Maccabees, which contains several realistically portrayed battle scenes.

The paper will discuss the possibilities of reconstructing the Ottonian cavalry based on a combination of these sources.

3 SILK AS BOOTY OF THE TENTH-CENTURY MAGYAR RAIDS

**Abstract author(s):** Harangi, Flórián (Pázmány Péter Catholic University, Institute of Archaeology) - Langó, Péter (Pázmány Péter Catholic University, Institute of Archaeology, Budapest; Research Centre for the Humanities, Institute of Archaeology, Budapest) - E. Nagy, Katalin (Independent researcher) - Türk, Attila (Pázmány Péter Catholic University, Institute of Archaeology, Budapest)

**Abstract format:** Oral

Written sources describing tenth-century Magyar raids in Western- and Southwestern Europe suggest that besides captives and objects made of silver and gold, the most valuable booties for the marauding Magyars were clothes and items made of silk.

These products were buried in the graves of Old Hungarians later in the Carpathian Basin in the 10th century. We know several graves and cemeteries among them which are extremely rich in silver objects and in these graves, under metal objects often small fragments of textiles-often silkfragments- were discovered.

Most of the silk finds recovered so far have been 'samite', almost without exception, demonstrating that this was a generally widespread type of fabric this period. These weft-faced compound twill silks are well known from Western European treasuries and written sources from the 10th century. These facts and the archaeological heritage of the 10th century in the Carpathian Basin (such as the presumably solitary grave at Fonyód) suggest that, these silks could be the booty of the Western raids.

A different type of silk (taqueté,weft-faced compound tabby) was excavated first at Tarpa (in 2012) and then in 2016 at Derecske. These taqueté silk remains are absent from Western Europe or the famous Viking finds in Northern Europe. Maybe this type of textile has arrived in the Carpathian Basin from the Near East on the Transeuropean trade route(s). All this suggests that Hungarians had access to a different sources of silk in the 10th century beside the Western raids, but their role is not negligible.

The dirhams and the taqueté silk finds suggest, that Old Hungarians kept their trade contacts with Central Asia even after their conquest in the Carpathian Basin in 895 AD.

4 ARCHAEOLOGICAL TRACES OF THE MAGYARS IN SLOVENIAN TERRITORY: SMALL FINDS FROM VARIOUS CONTEXTS

**Abstract author(s):** Karo, Špela (Institute for the Protection of Cultural Heritage of Slovenia, Centre for Preventive Archaeology)

**Abstract format:** Oral

Only few artefacts that can be related to the Magyar presence in the territory of present-day Slovenia have been discovered so far. These finds encompass items of equestrian equipment, as well as weapons: iron stirrups of various forms, heart-shaped pendants, parts of belt sets and straps, arrowheads, and the remains of an arrow quiver. They originate from various types of findspots: hilltop sites, settlements, cemeteries, and a river. The prevailing type, however, is hilltops (Gradišče above Trebenče, Ljubična above Zbe-lovska Gora, Gradišče above Bašelj, Veliki gradec near Drežnica, and Zidani gaber above Mihovo). In the majority of cases the finds were discovered with metal detectors and therefore come without precise location data or stratigraphic contexts. The iron stirrup discovered in the Ljubljanica river is also a chance find. In rare cases, Magyar finds have been discovered in systematically investigated sites such as Ajdna above Potoki, Tonovcov grad near Kobarid, and Pristava in Bled. Arrowheads from debris or charred layers in these settlements likely testify of Magyar invaders. Magyar burials in Slovenian territory are an exception. Only two graves from the Ptuj Castle cemetery can allegedly be ascribed to the Magyars.

The collected artefacts from Slovenian sites are therefore studied predominantly from the typological perspective and dated on the basis of comparable sites and artefacts from neighbouring regions, especially from graves in the Carpathian Basin. Their presence in Slovenian sites can be explained by frequent Magyar incursions to the west between the end of the 9th and the middle of the 10th century, which crossed also territory of present-day Slovenia and are reported in historical sources.

5 MILITARY CO-OPERATION OF STEPPIC AND VIKING WARFARE IN EASTERN EUROPE

**Abstract author(s):** Katona, Csete (Central European University)

**Abstract format:** Oral

Viking retinue members in Eastern Europe – known as Varangians and/or Rus' in contemporary sources – were present in Constantinople, the Kievan Rus and the Khazar capital, Itil. Even though firm evidence is lacking, there is a possibility that Scandinavians entered local service in three other areas, namely Poland, Hungary and Volga Bulgaria. In all these places, the written sources testify that alongside mercenaries of Scandinavian ethnic backgrounds, people of Turkic origin also took service at the same time. Courts in Eastern and South-Eastern Europe could have become first hand cultural transfer zones for Scandinavian retainers and nomadic warriors might have had an effect on Viking retainers in a military-cultural sense. During common guard duties and military campaigns, steppic warfare techniques were introduced to the Scandinavians. While Vikings originally preferred to fight on foot in closed combat, some contextual and archaeological evidence suggests that Vikings became accustomed to fighting alongside an ally of horsemen and that some of their groups might have acquired nomadic fighting habits, including archery or mounted warfare. Attention will be devoted to Scandinavian type of weapons with typical Eastern embellishments, and nomadic weapons with Nordic decorations found in Eastern Europe, as well as grave furnishings of 'mixed' cultural ties. All these imply that ties between some Scandinavian and Turkic groups might have been quite close.

6 MAGYAR AND ORIENTAL ARTEFACTS FROM HEDEBY

**Abstract author(s):** Kalmring, Sven (Centre for Baltic and Scandinavian Archaeology)

**Abstract format:** Oral

In the Historical Sources, the northernmost Magyar raid is documented for the year AD 915 to Bremen in Lower Saxony. In maps on the Hungarian Invasions of Europe, though, often one arrow even points into Danish Southern Jutland. While the basic 15th century AD-account certainly needs to be doubted in its source-critical reliability, in Scandinavia some astonished finds of Magyar origin are recorded. These, however, only cluster in East-Central Sweden and the area of Lake Mälaren. In Birka, Magyar and Steppe Nomadic finds are generally being tied to the shifting networks of the early town from Western- to Eastern Europe, i.e. the Rus', Byzantium and

the Arabic World after AD 860. Viking-age Denmark instead, due to its topographical situation, predominately maintained contacts with Anglo-Saxon England and the Continent and thus appears to be far poorer in Eastern artefacts in general. Thus it seems only consequent that neither in Hedeby, being virtually situated on the border between Viking-age Scandinavia and Continental Europe – and despite Magyar raids reaching as north as Bremen (and possibly even Denmark) – any Magyar finds have hitherto been acknowledged. Yet despite the fact that the grave goods from Hedeby’s burials are comparably poor due to early Christian influences, upon closer inspection a few individual artefacts of Magyar origins can be identified among the settlement finds. Were they a result of directs contacts with the Magyars raiding in Western Europe prior to the Battle at the Lech in AD 955, obtained in a process of hybridisation the vast Rus’ and Steppe Nomadic expanses on the Road to Byzantium or do they even witness Scandinavian mercenaries in the army of the Byzantine Emperors until AD 970? The paper will present and discuss Hedeby’s eastern artefacts and its closer find contexts.

## 7 THE SCANDINAVIAN MAGYAR (OR THE MAGYAR SCANDINAVIAN)

**Abstract author(s):** Hedenstierna-Jonson, Charlotte (Dep. of Archaeology and Ancient History, Uppsala University; The Swedish History Museum)

**Abstract format:** Oral

The interactions between Scandinavians and Magyars can be traced in the material culture, both within Scandinavia and in present day Hungary, especially in connection to the warrior and martial society. Although the material, at present, is limited, it contains highly interesting evidence of hybridisation that begs the question of how this material and its users were considered. How do we discuss objects in terms of culture, ethnicity and affiliation when they convey a complex mixture of all these aspects? The material provides important and noteworthy indications of interaction between different cultures, but also the development of something new. The intensity of these interactions has left traces both in the material culture, but also in more complex contexts like particular battle techniques and its designated weaponry. The aim of this paper is to discuss the character and outcome of the interactions that lay behind this hybrid expression of material culture and reflect upon if the bearers considered themselves Magyars, Scandinavians or something completely different.

## 8 MAGYAR EVIDENCE IN THE MORDVA BURIAL GROUNDS ON THE LOWER OKA

**Abstract author(s):** Zelentsova, Olga (Institute of Archaeology Russian Academy of Sciences)

**Abstract format:** Oral

The Magyars affected many peoples of the forest zone in Eastern Europe as they walked across the East European steppes to the west, to Panonia. They made a distinctive mark on their history. We can see it in material culture and funeral rites. We find the evidence of such contacts in the soldiers’ graves in the burial grounds of Mordva on the Lower Oka. In the Armory there is a quiver of arrows, swords and daggers. These weapons, as well as the horse equipment in burials, is the evidence of borrowing military traditions of the nomadic world. Innovations appear in men’s clothing too. Earrings or Saltov earrings as a marker of military status. Military costume accessories included belts decorated with silver or gold-plated overlays, and waist bags. Buttons prove the use of a caftan that was not traditional for Mordva. All these clothing and equipment details of Magyar warriors became popular with the Finno-Ugric people of Pooch at the end of the 9th-first half of the 10th century.

In Mordva, such items were found in almost half the male graves of that time. We cannot make a reliable conclusion about these warriors’ ethnicity. These people were buried according to the customs that were typical of the local population. We can’t classify them as nomads. In this case, we might be dealing with the hybridization of material culture, when the effectiveness of Magyar raids caused the fashion for “Magyar” jewelry, and also encouraged the spread of weapons and tactics of warfare. This does not exclude that some Magyar raiders were part of the local army, which played a special role on the North-Eastern border of Khazaria. Such an example is the burial of a man with silver eyecups in the Armiyevsky Mordva burial ground.

## 9 RESEARCH OF DOUBLE EDGED SWORD FROM THE 10TH-CENTURY CARPATHIAN BASIN. RESULTS AND PERSPECTIVES

**Abstract author(s):** Zágórhidi Czigány, Bertalan (Pázmány Péter Catholic University, Institute of Archaeology, Budapest) - Langó, Péter (Pázmány Péter Catholic University, Institute of Archaeology, Budapest; Research Centre for the Humanities, Institute of Archaeology, Budapest) - Katona, Csete (Central European University) - Harangi, Flórián (Pázmány Péter Catholic University, Institute of Archaeology, Budapest)

**Abstract format:** Oral

The study of tenth-century double-edged swords has a long tradition both in international and Hungarian research. Nevertheless, the topic still has several unexplored aspects which became the subject of recent research in Hungary. While many archaeologists have dealt with these objects during the 20th century, an up-to-date monography about the 10th century swords from the Carpathian Basin is still absent, despite the huge number of discovered specimen (around 140 in number).

Our newly formed research group (including students and collegaues from the Pázmány Péter Catholic University, the Janus Pannonius Museum, the University of Miskolc and Central-European University) aims to fill this gap. The research groups will attempt to answer questions regarding the origin of these objects, the date of their appearance and distribution in the Carpathian Basin, the social background of their owners, as well as the significance of swords in burial contexts. In a broader perspective, the historical

aspects related to the use of such weapons in combat will be examined with a particular focus on the tenth-century Magyar raids. Special attention will be devoted to fighting techniques, and the problematics of the so-called „sabre hilted swords”, a special typological variation of weapons with a straight-doubled-edged blade and a curved sabre handle. An archaeometallurgical study of the weapons in question will be presented by specialists of the research group in a separate conference paper.

## 10 METALLOGRAPHIC EXAMINATIONS OF THE DOUBLE-EDGED SWORDS FROM THE 10TH CENTURY CARPATHIAN BASIN – PRELIMINARY RESULTS

**Abstract author(s):** Tóth, Boglárka (Pázmány Péter Catholic University, Institute of Archaeology, Budapest) - Haramza, Márk (Janus Pannonius Museum, Department of Archaeology, Pécs) - Török, Béla (University of Miskolc, Institute of Metallurgy, Miskolc)

**Abstract format:** Oral

The complex examination of medieval double-edged swords has been a significant research area during the 20th century in Europe. Despite the popularity of this research field, a general work on double-edged swords from the 10th century Carpathian Basin supplemented by archaeometallurgical examinations, is still missing. Within the framework of a multiannual project, the major aim of our research is the interdisciplinary investigation of these weapons.

In the study of double-edged swords, the examination of technological features of weapons using laboratory techniques is a quite well-established method. In addition, several archaeological interpretations of archaeometallurgical results have been published (Košta-Hošek 2015; Mehofer 2006; Moilanen 2015). With this in mind, it is considerable to acquire adequate knowledge of the material, manufacture process and mechanical properties of the swords we are investigating.

The examinations of the swords using archaeological and archaeometrical methods (portable XRF, optical microscopy, SEM-EDS, Vickers hardness test) have provided new results, that are relevant to both archaeology, and military as well as technical history. In narrower aspects, exploring of the traces of processing in order to characterize the possible manufacturing technology and to model the presumable technological transfer is also an important object of the research.

Despite the fact that some similarities (e.g. the fine pearlitic structure) can be observed in the microstructure of examined swords, we can also establish that the used techniques and technologies during the manufacturing process are diverse. Comparing our results with those of international research will provide a deeper insight into the history of 10th century European sword manufacture.

## 11 BOJNÁ - ANONYMOUS’ MYSTERY HILLFORT BANA?

**Abstract author(s):** Robak, Zbigniew (Slovak Academy of Sciences; Römisch-Germanisches Zentralmuseum Mainz)

**Abstract format:** Oral

Based on the results of archaeological excavations at the hillfort Bojná (Slovakia) and information from written sources about the Moravians role in the Hungarian raids in Europe in the first half of the 10th century, the presentation attempts to answer the question whether the hillfort could be the mysterious Bana stronghold known from the Anonymous’ Gesta Hungarorum. Furthermore, the author will consider the role of the hillfort in the defensive system from the times of Great Moravia collapse and Hungarian conquest of the Carpathian Basin.

The oldest known Hungarian chronicle, Anonymous’ Gesta Hungarorum, describes the Hungarian conquest of the northern part of the Carpathian Basin in the first quarter of the 10th century. Previously, the area was an integral part of Great Moravia, referred to as the Nitra Principality (today’s Western Slovakia). Among Great Moravian hillforts captured by the Arpadian troops, there is a mysterious hillfort: Bana. Unlike other defensive objects mentioned by the chronicle, the hillfort has not been successfully identified yet. Despite the existence of information indicating approximate location of the Bana hillfort, historians and archaeologists ignored Bojná as a potential candidate.

This omission was most likely caused by old erroneous dating of the site suggesting that the hillfort was used only at the beginning of the 9th century. Recent archaeological research on the Great Moravian hillfort Bojna, including dendrochronological analysis, suggests that the object continued to be used still in the first half of the 10th century—i.e., precisely the times mentioned by the chronicle. Apart from the dating, also the hillfort location is consistent with the information provided in Gesta Hungarorum. Not to mention a similar name as well. Another factor that corroborates the hypothesis is the abundance of deltoid arrows typical for the nomads found in the hillfort and its vicinity.

## 12 ANCIENT HUNGARIAN SIEGE OPERATIONS IN THE WESTERN CARPATHIANS: THE ARCHAEOLOGICAL EVIDENCE

**Abstract author(s):** König, Tomáš (Comenius University in Bratislava)

**Abstract format:** Oral

Archaeological finds from the territory of south Moravia allow us to clearly associate the demise of the Great Moravian empire with the invasion of the ancient Hungarian army, evidence of which comes in the form of destruction layers accompanied by the discovery of flat tanged arrowheads at several local fortified settlements, but above all, at the central fortified lowland settlement of Mikulčice.

In contrast, the territory of Slovakia has not thus far been associated in the literature with the destructive raids of the ancient Hungarians. The prevailing image derived from an interpretation of the text of the high medieval chronicle is that the conquest of the southwest part of Slovakia happened only after the demise of Great Moravia.

Southwest Slovakia was a peripheral zone of the territory settled by the ancient Hungarian population. This extended into the immediate vicinity of Nitra, one of the Great Moravian central lowland settlements, but no evidence of fighting with the ancient Hungarians has been found there to date. However, arrowheads of ancient Hungarian origin have been found at other fortified positions, especially at hillforts in the mountainous regions of Slovakia.

The concentration of ancient Hungarian military equipment in an area away from the settlements of this population is probably direct evidence of military operations, the objective of which was to quell the hotspots of armed resistance by domestic elites defying the ancient Hungarians. In addition to their own army, the ancient Hungarian military powers also had the support of allies among the Great Moravian elites with their central seat in Nitra. Thus, Nitra not only avoided destruction but became a stable centre of power that later played a role in the foundation of the Kingdom of Hungary.

119 ON CLASS, ELITISM, AND POVERTY: ARCHAEOLOGY AND SOCIAL CLASS

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Ribeiro, Artur (Kiel University) - Ion, Alexandra (Institutul de Antropologie “Francisc J. Rainer”)

**Format:** Discussion session

One of the most confounding issues of our age concerns ‘social class’. Does it still make sense to talk about social class today? Does the tripartite class system separating the lower/middle/upper class represent current and social and economic reality? Or are we perhaps being deceived into thinking that we are all just middle-class?

In a discipline where gender and ethnic politics play a big role, we question why the topics of social class, elitism, poverty, have not had the same amount of discussion. This is particularly strange when we take into consideration that Marxist theory, and its examination of class, remains one of the most popular theoretical approaches used in archaeology. In fact, in recent years, the rise of anarchist theory in explaining past economic behaviour should have inspired discussion on class politics, but this has yet to happen. Likewise, recent aDNA studies has generated some discussion on populist movements across Europe but not much of this discussion has focused on class, elites, or poverty.

The aim of this session is to generate that discussion. This means a twofold focus – we wish to examine whether it remains useful to archaeology to think of past societies in terms of social class, namely can we see past (e.g. prehistoric) elitism and poverty as we understand those terms today; additionally, we want to discuss the social class of current archaeological practitioners. In particular, our aim is to analyse subtle class disparities, such as that separating contract archaeologists from academics; we also want to discuss differential access to funding within Europe and what that means to our understanding of transnational archaeological phenomena; and finally, we also want to discuss where archaeologists come from, in terms of their general social and economic background.

ABSTRACTS:

1 ARE WE THE BADDIES? WHY WE NEED TO TALK ABOUT CLASS

**Abstract author(s):** Ribeiro, Artur (Christian-Albrechts-Universität)

**Abstract format:** Oral

Archaeology, especially in academia, seems remarkably aware of difficulties when it comes to issues concerning gender and ethnicity. From adherence to the #metoo movement to projects of decolonization, archaeology continues in its identity politics struggle. But as many events of these last years have demonstrated, from Trump’s rise and fall to the effects on the economy caused by Covid-19, there seems to be a general reluctance to address the thorny issue of class politics.

In general, there seems to be an acceptance that everyone is now middle-class, with the exception of the insanely rich (e.g., Bezos, Musk), but is this really accurate? As Owen Jones demonstrates in his insightful book “Chavs”, in the UK at least, there is still a working class, which the higher classes have demonized and scapegoated for everything that is going wrong in that country (e.g., xenophobia, Brexit, sexism). Similarly, in the US, the rise of Trump is blamed on “rednecks” and “boomers”, many of which belong to the lower/working class. In archaeology, there are claims of misuse of aDNA information by the “populist right”, even though populism, as argued by the likes of Chantal Mouffe and Thomas Frank, has been primarily a left-wing project.

To stoke discussion, I ask: how did the political left, so well represented at universities, lose the working class? Is academia the very elite that the working class wants to topple over? Can a working-class person actually make it through the ranks of academia? There are subtle signs of elitism In European archaeology, from outdated rites of passage, which are used to demonstrate social superiority, to the dismissal of commercial archaeology by academics, to private excavations (and universities) that only those with deep pockets can attend. Have we, in academia, become “the baddies”?

2 SURVEYING THE NEXT GENERATION OF ARCHAEOLOGISTS: WHAT WE LEARNED ABOUT ACADEMIC PRACTICES, INEQUALITY AND POVERTY

**Abstract author(s):** Brami, Maxime (Johannes Gutenberg University Mainz) - Emra, Stephanie (Ludwig-Maximilians-Universität München) - Milić, Bogdana (Koç University) - Muller, Antoine (Hebrew University of Jerusalem) - Malagó, Aldo (Römisch-Germanische Zentralmuseum)

**Abstract format:** Oral

ECA is a grassroots initiative of the European Association of Archaeologists, designed to listen to, and communicate the issues that particularly affect early career archaeologists (ecarchaeologists.com). In 2021, we organised an online survey to identify the challenges faced by postgraduates, postdoctoral researchers and non-salaried scientists who plan to stay in academia. We asked a broad range of questions, from academic status to level of earnings, periods of unemployment and under-employment, career breaks, mobility, and more subjective questions about professional and personal outlook, bullying and gender discrimination. The responses have been overwhelming and paint the picture of a disenfranchised generation that has been badly let down by academia, especially through the Covid-19 pandemic. This contribution will focus on the background to the ECA initiative and the statistical results of the survey. Further work will examine the working lives of archaeologists from other fields, such as commercial, public archaeology and museum work.

3 AND WE HAVE TO FEEL BAD FOR BEING PRECARIOUS, BECAUSE AT LEAST WE DO WHAT WE LIKE

**Abstract author(s):** Almansa-Sanchez, Jaime (Incipit, CSIC)

**Abstract format:** Oral

Precarity defines archaeology today. We suffer many problems such as unstable work, both in academia and contract; very limited funding that hardly manages to cover basic costs of research, nor to talk about low salaries; increasing requirements that make people overwork until they burn out or settle (in a context where privilege has a lot to do with the final outcome); just to name a couple of scenarios.

We could be comforted in the fact that the whole world is lately like this. But “the sorrow of many is a fool’s consolation” (as we say in Spain). This situation is a result of the neoliberal drift in contemporary Western societies, and in general, the world. Archaeology is becoming embedded into the global economy, and we have become unable to fight against this. If anything, we do the opposite. Once we settle, we empower the system because we believe that since it was difficult for us, it should be just as difficult for those who follow.

We know what is failing, over the last forty years critical archaeologies have called for action, since the political turn of the 80s to the latest movements on gender, disability or colonialism. Still, the discipline keeps going towards a less reflexive practice as part of some sort of machine that needs to keep running for the benefit of... who?

And while some would say: “that’s not my reality”, nevertheless, I believe this is the reality in most of Europe and the world, and we need to call for a halt and reconsider the path archaeology is taking. We control most of the process, so why are we not even considering changing it?

4 CLASS-BASED DIVIDE IN CURRENT ARCHAEOLOGICAL FIELDWORK: THE CASE OF GREECE

**Abstract author(s):** Giamakis, Christos (University of Sheffield)

**Abstract format:** Oral

For scholars fascinated by class structure, elites and power dynamics, archaeologists are often incapable of identifying these very same issues within the discipline itself. Present social movements such as Black Lives Matter and theoretical frameworks such as postcolonialism have successfully revealed the various forms of inherent discriminations against past people in archaeological contexts. Yet, despite their accomplishments, these approaches have failed to address more subtle discriminations such as those based on class or wealth. The aim of this paper is to explore notions of class and elitism in current archaeological practitioners by focusing on archaeological fieldwork in Greece, a country which has been aptly described as a crypto-colony. More specifically, this presentation will focus on a number of foreign-led excavations conducted in Greece in recent years as well as field schools organised by the same institutions. Particular emphasis will be given on examining the supposed proclaimed cultural exchange between foreign and local students and the alleged dissemination of new techniques to local archaeologists by the foreign ones. By analysing data regarding the ratio of foreign to local students and participation fees in archaeological projects in Greece this paper will argue that ‘we are not all middle class’. Social class, personal wealth, access to resources and networking have substituted, at least to a certain extent, merit and knowledge. Consequently, archaeology especially in the academic sector, still largely remains a privileged person’s occupation. Both foreign and local students from disadvantaged social backgrounds have limited access to experiences which would prove to be crucial for their future professional development. Therefore, a new approach, one that would encourage people from the lower social strata wanting to join archaeology to do so is indeed needed in order to turn the tide and really assist archaeology in re-inventing itself.

5

**A BEGGAR’S BANQUET: RECONSTRUCTING THE LIVES AND MOVEMENTS OF MARGINALIZED GROUPS IN THE ANCIENT ROMAN CITY**

**Abstract author(s):** Siegenthaler, Sarah (Institute of Classical Archaeology, University of Basel)

**Abstract format:** Oral

Since the beginnings of classical archaeology there has been a strong focus on upper-class spheres. Partly due to a lack of material finds but also due to a former lack of interest connected to many archaeologists’ own social standing, poverty and marginalized groups remained underrepresented in research. As a result, social history encompassing lower classes is a comparatively young branch within classical archaeology. In this talk, I aim to illustrate this correlation of social backgrounds and research interests and the need for more diversified perspectives to more accurately shape our perception of the past.

To this end, I will incorporate the example of my MA thesis as a new type of research in progress, where I focus on the role of street-beggars in Roman antiquity, who are a common part of every modern urban landscape as well as in antiquity. Nevertheless, they have always been an invisible group to archaeologists, since – apart from a potential lack of research interest – we do not have any material remains of their lives and their voices also remain silent in the textual sources. I will connect the images (statuettes, terracottas, reliefs, oil lamps) of individuals associated with begging with textual sources mentioning beggars and try to reconstruct possible locations or movements of this marginalized group within a cityscape. Considering current sociological discourses on beggars in major cities today, I will further try to retroactively infer conclusions on the behavior of beggars and the public perception of them in Roman antiquity.

6

**WHY EAST-WEST INEQUALITIES MATTER IN EUROPEAN ARCHAEOLOGY**

**Abstract author(s):** Ion, Alexandra (Institute of Anthropology Francisc I. Rainer)

**Abstract format:** Oral

In my talk I aim to address two issues which stem from my experience as an Eastern European in transnational archaeology. 30 years after the fall of the Iron Curtain we still see important inequalities between the East and the West, which I think are often absent in the EU public discourse. On the one hand, there is inequality in accessing large grants, such as European Union research funding, which turns Eastern researchers in “lower class” researchers. This is mostly due to structural issues, with lack of investment in several countries, or well-equipped universities and laboratories, which in turn make candidates coming from Central and Eastern Europe less likely to win large grants. According to a paper by Quirin Schiermeier on [www.nature.com](http://www.nature.com) (22.12.2020), in the last Horizon 2020, out of the €60 billion funds, 40% were shared by “the EU’s three biggest economies: Germany, France and the United Kingdom”, whereas “Poland, Slovakia, Bulgaria and Romania were among the least successful participants, securing a combined total of just over €1 billion”. I want to discuss why this is the case, and how this impacts contemporary archaeology, where access to funding is tied up with prestige and academic success. At the same time, on a theoretical level, there is a growing trend that values local knowledge and indigenous voices, destabilising the “western point of view”. In reality though this trend seems to focus almost exclusively on former colonies, even though non-Western countries comprise a large number of the EU population, their local values and ways of thinking about archaeology are still overlooked.

120

**WHAT IS “SOCIAL” IN SOCIAL ARCHAEOLOGY? RE-EVALUATING SOCIAL THEORY AND ITS IMPACT IN EUROPEAN PREHISTORY**

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Staniuk, Robert (Kiel University, Institute of Pre- and Protohistoric Archaeology) - Ion, Alexandra (Institute of Anthropology of the Romanian Academy) - Ribeiro, Artur (CRC 1266)

**Format:** Regular session

In their attempt to interpret past social dynamics, archaeologists still mostly rely on theories produced in the 1980’s and 1990’s. But this has become increasingly challenging when trying to incorporate new data on aDNA, globalized interaction, emergence of innovation and logic of change. Additionally, the different sociological concepts and terminologies are embedded in larger theoretical frameworks, which sanction the existence of dichotomies such as agency and structure, actors and communities, or state formation and anarchist flexibility. However, in archaeology this conceptual capacity often becomes the means of classifying archaeological data and not necessarily explaining the studied phenomena.

With this session we want to discuss whether the ideas derived from social theory actually help us conceptualize the lives of past societies and if the concepts we normally use allow us to investigate what is “social” about the past. We are interested in integrating new archaeological data into traditional social theory concepts and, should this generate obstructions, examine the possible solutions. From a spatio-temporal perspective we are especially interested in papers discussing these aspects from the perspective of Chalcolithic and Bronze Age Eurasia.

**ABSTRACTS:**

1

**INVENTING TRADITIONS: FROM EXPLANATORY MODELS TOWARDS EXPLORATORY RESEARCH**

**Abstract author(s):** Staniuk, Robert (Institut für Ur- und Frühgeschichte CAU Kiel)

**Abstract format:** Oral

The idea of tradition as repeated instances of social engagement has been used to explain the presence of persistent choices of prehistoric communities. In other words, whenever a continuity is observed, it has been assumed that this continuity can be explained by tradition.

Following this premise, prehistoric phenomena or groups were treated in an essentialist fashion, perceived as constituted by an inherent set of characteristics or attitudes prevalent irrespective of individual historical trajectories or events. From this perspective, the explanatory potential of tradition is reduced to re-affirming pre-defined assumptions, as well as avoidance of any potential explanation why societies would remain unchanged.

However, if tradition is considered a phenomenon characterized by constant re-construction – an established referential system justified on the basis of temporality – then continuities remain open for exploratory research, which requires addressing why certain aspects should become treated as traditional. In addition, it creates a possibility to determine inventions of traditions and use that information to try to understand the historical processes of coming together and explaining why things do not last.

2

**PERSPECTIVES ON THE HOUSEHOLD – SEARCHING FOR THE SOCIAL IN AN AMBIGUOUS CATEGORY**

**Abstract author(s):** Wunderlich, Maria (Institute of Pre- and Protohistoric Archaeology, University Kiel)

**Abstract format:** Oral

As one of the of main category of material remains within the prehistoric archaeological record, settlement sites are of special interest when it comes to the interpretation of socio-political organization of past communities. Within this framework, settlements can be seen as a hub, in which economic strategies, communal structures and also political interaction influence and merge into each other. As such the different parts of a prehistoric settlement are of special interest for the exploration of the social within the broader organization of a settlement.

Connected to the description and analyses of settlement organization are different levels of inquiry and description. One social unit which received a high degree of attention is certainly the household. But what are we trying to address with reference to the household and by which levels of inquiry are we trying to do so? This paper aims to explore the analytical and interpretational attention and perception the household was and is given in prehistoric research. To address this aim, selected examples of the analysis and interpretation of households are given in a diachronic framework, focusing on the modern areas of western Slovakia, eastern Austria and southeastern Czech Republic. Within this comparison, it will be addressed how the perception, description and interpretation of households vary within different prehistoric phases and research traditions.

The difficulties to detect and explain the social within the archaeological unit of a house or household are obvious. In order to address potential misconceptions and shortcomings of archaeological perceptions of households, socio-cultural anthropological data on characteristics of households will be used to address the specific forms of social interaction observable in recent contexts.

3

**FROM ‘COMMUNITIES OF PRACTICE’ TO ‘TRANSLOCALITY’ – REVIEWING TWO CONCEPTUAL TOOLS REGARDING THEIR SOCIAL ARCHAEOLOGICAL POTENTIAL**

**Abstract author(s):** Heitz, Caroline (University of Oxford, School of Archaeology; Institute for Archaeological Sciences, University of Bern)

**Abstract format:** Oral

The paradigm of cultural history and the equation of archaeological cultures with peoples, ethnic groups or whole societies still have an influence on how the social is imagined in the Archaeology of the prehistoric past. Even if the ethnic interpretations of cultures have long been rejected, the prevention of replacing them with more sound approaches to the social has led to a blind spot, which was filled unintentionally by top-down projections of social categories onto the past. Accordingly, there might be still a lack of discussion on what determines different forms of organizing social life and how they could be approached epistemologically in archaeology.

In recent years, two concepts deriving from the intersection of sociologically, learning theory and geography have become popular in the archaeology of Neolithic Central Europe: ‘Communities of practice’ (Lave/Wenger 1991) and ‘translocality’ (Greiner/Sakdapolrak 2013). From the bottom-up, I would like to discuss their potential and limitations as conceptual tools for gaining a deeper understanding of the material traces of spatial and temporal social configurations and thus social archaeology (cf. Meskell and Preucel 2004) by drawing on Neolithic wetland sites of the Alpine Foreland.

4

**QUESTIONING PREMISES OF SOCIAL ARCHAEOLOGY: A POSITIVE VIEW ON CLASSLESSNESS IN PAST SOCIETIES**

**Abstract author(s):** Szilagyi, Kata (Mora Ferenc Museum) - Furholt, Martin (University of Oslo, Institute of Archaeology, Conservation and History)

**Abstract format:** Oral

One of the most prominent habits of archaeologists is to take something that exists today and trace ‘its roots’ in prehistory, i.e. the first appearance or the oldest letter, alphabet, writing, burial, monument, enclosure system, etc, thus generating a teleological narrative which mostly leads to glorification or even naturalisation of our current conditions. This is very much the case for the emergence of social inequality, stratified society, chiefs and elites, often portrayed as an evolutionary process of gradual unfolding of a natural, or unavoidable social state. This critique is directed both at the Liberal as well as the Marxist tradition. Recent theory, for example in the context of Degrowth and Post-colonialism, has objected that these traditional schools of thought presuppose a universality of material extraction, the accumulation of material goods, and an imperative of growth as the main values underlying the formation of social systems, and pointed out that these are in fact not human universals but specific historical characteristics of the modern capitalist world-system. Similarly, Anarchist perspectives in anthropology, history and archaeology have pointed to a second set of faulty premises baked into traditional Political Economy accounts, namely the idea that competition, dominance behaviour, war, racism and xenophobia would be the main drivers of history, while the empirical evidence and experience of cooperation, mutual aid, altruism, solidarity and common property are systematically ignored as factors shaping social systems. We want to use these insights to discuss the alternative scenarios of social organisation such a change of perspectives will have for our view of prehistoric social organization.

5

**THE DILEMMAS OF OLIGARCHIC ELITES AND APPROACHING ANARCHIC SOCIETIES WITH ANARCHIST THEORY**

**Abstract author(s):** Araque Gonzalez, Ralph (University of Freiburg)

**Abstract format:** Oral

Prehistoric societies rarely left unambiguous clues on their political organization, and their records often reveal puzzling dynamics. Archaeologists often use the term “society” interchangeably for “community” in typically decentralized contexts. Collective accomplishments, such as monument building or the maintenance of long-distance exchange networks, have been ascribed to “elites.” This fashionable term is still used indiscriminately for an ill-defined ruling class, rather resembling an oligarchy, especially in narratives of the Bronze Age. Institutional authorities have been regarded as an anthropological precondition for cultural complexity. Correspondingly, Marxist archaeology analyzed prehistoric societies according to historic materialism, despite problems in recognizing social classes. On both sides, alternative approaches are still being suspiciously eyed.

However, some archaeologists shifted their paradigms in recognition that societies cannot be classified by traditional typologies. Notions of heterarchy and anarchist theory were exemplary novel approaches. Harold Barclay (1993) conveniently defined anarchic societies as “having leadership but no government or true legal sanctions.” Nonetheless, the term has connotations causing great reluctance as well as confusion of “anarchic” (condition) and “anarchist” (ideology). I want to address these dilemmas and the often haphazard use of terminology in social archaeology that sometimes obstructs relevant analysis.

I propose that collective undertakings in prehistory must be examined for indicators of cooperation based on trust and reliability that could only be obtained through shared interests of the participants. The concept of centralized power in the distant past is often used to rationalise contemporary political and economic structures by considering them essential for humanity’s social evolution. This is why critical social archaeology is of relevance for the present world. The importance of cooperation for human societies has to be reconsidered instead of anticipating a competitive system, inevitably evolving into capitalism. However, archaeologists must clarify some relevant concepts and basic terminology.

6

**“THE SOCIAL” IN SOCIAL THEORY AND PHILOSOPHY: SOME MAIN LINES OF THOUGHT AND THEIR APPLICATION IN ARCHAEOLOGY**

**Abstract author(s):** Arponen, VRJ (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

This contribution charts two main lines of social theoretical and philosophical thought about “the social”. Modern linguistic philosophies often conceptualise “the social” in terms of the “social ontology” of socio-culturally shared mental dispositions to perceive social processes in particular ways (e.g. Searle, Elder-Vass). An alternative conceptualisation –and one that is currently perhaps somewhat out-of-fashion– sees value in thinking of “the social” as a meso or macro level structure (Marx, Parsons) or “social fact” (Durkheim) over and above, and more than the sum of, micro level individual perceptions. The implications, strengths, and weaknesses of these approaches are discussed with reflective and critical reference to some archaeological interpretations given of Chalcolithic and Bronze Age social processes. For example, social memory, ideology, and identity based interpretations hark back to something akin to social ontology approaches. By contrast, on the face of it, assemblage, emergence, and relationality based interpretations would seem to evoke the older structuralist sensitivities even while the proponents of these views might dispute such connections. Finally, in archaeology and social theory alike –sometimes associated with the concept of structuration from Gid-

dens– dualisms of all kinds from agency and structure to anthropocentric and non-anthropocentric and beyond, have been sought to be transcended in favor of some hybrid positions.

7

**THE CHALLENGES AND SOLUTIONS FOR A COMPREHENSIVE EPISTEMOLOGY IN CONTEMPORARY ARCHAEOLOGICAL THEORY**

**Abstract author(s):** Radchenko, Simon (University degli studi di Torino; New archaeological school, Ukraine)

**Abstract format:** Oral

The latest advances in archaeological theory are based on the new concepts of ‘ontological turn’, mainly multiple ontologies, actor-network theory and object-oriented ontologies. Indeed, the concepts, proclaimed by this new movement affect our understanding of social interactions between humans and things in a crucial way. However, since it is entirely ontological, e.g. focused on being rather than cognition, it requires additional epistemological instruments to fit into current theory of interactions in archaeology. The main reason for that demand is a distinction between the ideas of “archaeological complex” (that is distant from the researcher in the 21st century) and “archaeological assemblage” that also includes all actors who are interconnected with the artifacts, both ancient and contemporary ones.

For culture and literature studies such obstacle has been overcome by an epistemological approach that is developing of post-post-modern, mainly metamodern philosophy, introduced recently by Dutch philosophers Timotei Vermeulen and Robin van der Akker. In fact, unlike previous epistemological paradigms, metamodernism requires a consensus of the social interconnections inside one system. This consensus is necessary due to the idea of multiple ontologies as it is the only way to reach a theoretical and ontological agreement between the different elements of archaeological assemblage — researchers, ancient actors and artifacts.

Though contemporary social theory and archaeological theory in general is focused on ontological concepts, a comprehensive epistemological paradigm is needed to make the whole theoretical system work. I argue that metamodernism proposes a basis for such paradigm. Moreover, it fits a number of different theoretical models and issues (i.e. a concept of transdisciplinarity, the use of big data for archaeological research, the concept of time in archaeology and the previous advances of archaeological epistemologies) into one holistic frame that is still to be developed.

8

**CAN POSTHUMANISTIC AND NEW-MATERIALISTIC THEORIES PROVIDE FRESH INSIGHT INTO THE SOCIAL ASPECTS OF CONTEMPORARY BURIALS?**

**Abstract author(s):** Shay, Talia (Technion, Israel institute of technology, dept.of humanistic studies and arts)

**Abstract format:** Oral

Developments in science and technology have brought about, in recent decades, a shift in the attitudes toward materiality and the natural sciences in archaeology. These developments, hailed by some as the third scientific revolution are attractive both to conventional archaeologies, which still embrace modernistic ideals of an objective positivistic science, and to new-materialistic and posthumanistic archaeologists, who oppose the older anthropocentric ideas that maintain strict boundaries between the human, the animal, and the technological. Additionally, archaeologies have always been interested in the social and cultural aspects of the material remains. For that reason, it is essential to inquire whether new-materialistic and posthumanistic theories can provide fresh understanding of the socio-cultural and political spheres of archaeology.

This question is examined through an analysis of the contemporary mortuary practices of Russian-Jews who migrated in the 1990s from the former USSR to Israel, where as a minority, they encountered difficulties from the authorities in burying their loved ones. Recently I completed a comprehensive study of the burial customs of several communities of Russian-Jews (Shay 2021) based on the general categories of mortuary practices - the cultural-demographic features, burial treatment and after-burial treatment - corroborated by interviews with relatives of the deceased. My conclusions were that each community of Russian-Jews living in Israel maintained a singular and distinct assemblage of burial features dependent upon its specific history, time and space.

The present paper will examine the question whether methodologies informed by new-materialistic and posthumanistic theories can provide new insight into questions of power, inequality, conflict or change reflected in the burial practices of the communities of these Russian-Jews.

**BIG-BIO: OPPORTUNITIES AND CHALLENGES OF BIG DATA WITH A FOCUS ON BIO-ARCHAEOLOGY**

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Fulminante, Francesca (Bristol University; University Roma Tre) - Salesse, Kevin (Université Libre de Bruxelles; Université de Bordeaux) - Farinetti, Emeri (University Roma Tre)

**Format:** Regular session

A series of recent enterprises and collaborations produced rich datasets of archaeological information achieved due to the intensive work undertaken by both academic and commercial archaeologists in excavations (e.g. ARIADNEplus; Fasti-online), surveys (e.g. the Roman Hinterland Database Project), and also, more specifically, bio-archaeological data (e.g. the IsoArch initiative) or comprehensive interfaces (e.g. ManLand, Kiel; the Oxford Roman Economy Project, Oxford).

In this session we would like to explore the impact of data from large archives and synthesis projects and discuss the opportunities and the challenges for archaeology in a number of ways: from practical, theoretical and methodological issues in data collection, management, use and interpretation, to examples of impact or potential impact of such datasets to identified or foreseeable difficulties in maintaining and further developing these datasets.

Specifically, this session will examine what the strategy and good practices are in dealing with large datasets? What opportunity do they offer for a better contextualization of present challenges for example through datamining or modelling (e.g. the PANDORA/IsoMemo initiative; Alan Turing Institute in London)? And especially how on-line accessibility (with or without simple/essential restrictions for preservation of vulnerable sites) might help dissemination of knowledge and initiate further research especially when mobility and visits to physical or digital archives are limited or impossible (e.g. pandemic situations, countries in war, etc.). Hence, we invite contributions and experiences across different geographical and chronological settings and from different fields of expertise.

## ABSTRACTS:

### 1 SESSION INTRODUCTION

**Abstract author(s):** Fulminante, Francesca (Bristol University; University Roma Tre) - Salesse, Kevin (Université Libre de Bruxelles; Université de Bordeaux) - Farinetti, Emeri (University Roma Tre)

**Abstract format:** Oral

A series of recent initiatives have produced large archaeological databases as a result of intensive and collaborative works between archaeologists of all horizons. In this session, we will explore the impact of data derived from large repositories and synthesis projects and discuss the opportunities and challenges for archaeology in a number of ways: from practical, theoretical and methodological issues in the collection, sharing, management, and use of data, to examples of (potential) impact of such newly constructed datasets, to identified or foreseeable difficulties in maintaining and further developing the databases.

Specifically, this session will examine what the strategy and good practices are in dealing with large datasets? What opportunity do they offer for a better contextualization of present challenges? How can data mining or modelling applied to large datasets bring new understanding to archaeological questions? How online accessibility might help dissemination of knowledge and initiate further research especially when mobility and visits to physical or digital archives are limited or impossible (e.g. pandemic situations, countries in war, etc.). How to manage sensitive information and the preservation of vulnerable archaeological sites? With a strong attention to bioarchaeological data, the session will welcome contributions from different fields (zooarchaeology, archaeobotany, anthropology, etc.) and focus (osteology, funerary archaeology, science-based approaches, etc.). This paper will introduce these different initiatives and share some views about best practices in open science through the example of the IsoArch database ([www.isoarch.eu](http://www.isoarch.eu)).

### 2 PRACTICAL AND THEORETICAL ISSUES ON THE METHODOLOGICAL IMPLEMENTATION OF THE EPISTEMOLOGY OF SPACE: DATASETS AND ANCIENT CITIES

**Abstract author(s):** Filippi, Dunia (Faculty of Classics - University of Cambridge)

**Abstract format:** Oral

In recent years Lefebvre's and epigones' theories on space challenged current studies on ancient cities. The essential approach is that space is a process, and therefore researchers can meaningfully de-codify it as such. Building on this assertion I have implemented the Lefebvrian epistemological paradigm through a methodology that permits to classify data relating to spatial inquiries. In order to examine and interrelate ancient spaces, I built up a relational database (DBMS) reflecting this theoretical approach and linked the data to their geo-referenced graphic representation using GIS, which makes possible to investigate ancient space as a product of physical and social parameters. Here I will discuss the structure of the database, along with the methodological and theoretical issues, using the Roman Forum: this case study permits to test the DBMS in terms of quality (it is a complex long term site), and of quantity (the availability of enormous quantity of data). I will analyse the process of structuring the DBMS in a step to step approach: the realization of an holistic archive of available sources (geological, archaeological, literary, epigraphic, iconographic, etc.) via a source-critical assessment; aggregations of screened data in meaningful components of space, i.e. the planning of an open area (the square as a project = component of conceived space), the construction of the square (the square as built space = component of perceived space), the interactions taking place there (the social use of the square = component of lived space). The main issues are related to the origin of data (direct/indirect) and in reducing a social action to a string of attributes, but only entering the specificity of empiric reality, it is possible to reach the intimate logic of the social world.

### 3 THE ROMAN HINTERLAND DATABASE PROJECT

**Abstract author(s):** Jongman, Willem (University of Groningen)

**Abstract format:** Oral

Roman studies have a tradition of detailed analysis of fragmentary information to extract as much information as possible. However, zooming out may be a better strategy to overcome the chronic lack of data than zooming in because it gives both more data and avoids random error. Also, bigger stories may be more interesting than small ones.

This is all the more obvious with Roman field survey data. Many projects were focused on the local, and thus were not concerned with the interoperability with other survey datasets. Thus, these prime data for the history of the Roman countryside have barely made it into the larger historical narratives. The Roman Hinterland Project was an attempt by an international consortium to develop a methodology to integrate initially three large survey datasets from around the city of Rome covering a period of more than a millennium, the Tiber Valley Project, the Suburbium Project and the Pontine Region Project. We took the lid off these datasets, homogenized periodization and site and object classifications as much as possible, often down to the level of individual finds, and created a new integrated database that includes almost all of the original detail, and can be analyzed for both larger trends and regional differences.

In the next phase we will extend our geographical scope with other high quality survey data from elsewhere in Italy, and later also from elsewhere in the Empire. We also hope to incorporate archaeobotanical and zoological data, even if we do not yet know how to do that best. This is important because people in the country were primarily farmers. What were small peasants growing, and what big farmers, and what was grown where? Did any of this change over time?

### 4

### MEETING THE NEEDS OF ROME (SUB)URBS. MATERIAL CULTURE AND CHANGING LANDSCAPES FROM MID-REPUBLIC TO LATE-ANTIQUITY

**Abstract author(s):** Capanna, Maria - Carafa, Paolo - Ferrandes, Antonio (Sapienza Università di Roma)

**Abstract format:** Oral

In ten year of systematic and intensive survey, that has covered an area of about 200 sq km, equal to 17.65 % of the territory of the Municipality of Rome, the Roman Suburbium Project has collected a large data-set with a great deal of records: nearly 6000 Topographical Units and more than 330.000 pottery fragments.

Surveyed areas are in a different part of the Roman Suburbium – on North of the Anio, between the via Salaria and Nomentana, in the southern-east suburb, between the via Latina and Casilina, and on the right bank of the Tiber, along with the via Aurelia -, and they have revealed different histories.

In this contribution, we will show the changing landscapes in the Roman Suburbia, from Mid-Republic to Late-Antiquity. We will analyse the rural settlements, their types, characters and functions and the relationship between the settlements and pottery distribution.

The analysis will be focused on five classes (Black Glaze, Thin-walled, Terra Sigillata Italica, African Red Slip and Amphorae), with a large number of typologically identified fragments, which allowed us to tell the story of (sub)urban supply, both as regards local products and imports.

### 5

### ROMAN ARCHAEOFAUNAL AND ARCHAEOBOTANICAL DATA INITIATIVES

**Abstract author(s):** Schmidtova, Dominika - Klontza-Jaklova, Vera (Faculty of Arts, Masaryk University) - Zach, Barbara (Department of Archaeology, Max Planck Institute for the Science of Human History) - Marinova, Elena (Laboratory for Archaeobotany, State Office for Cultural Heritage Baden-Wuerttemberg) - King, Anthony (University of Winchester) - Fernandes, Ricardo (Faculty of Arts, Masaryk University; Department of Archaeology, Max Planck Institute for the Science of Human History; School of Archaeology, University of Oxford)

**Abstract format:** Oral

Food consumption beyond being essential to sustain human life intercepts multiple facets of human societies such as forms of social organisation, technological developments, cultural traditions, or trade. The research of past human subsistence relies on multiple lines of evidence, including, the study of archaeofaunal and archaeobotanical data. The availability of significant volumes of such data determines the necessity for creation of standardized databases which allow us to explore the bioarchaeological datasets for studies covering large spatial (and temporal) scales.

We will present initiatives that aim to bring together a community of data compilers and experts on Roman archaeofaunal and archaeobotanical remains. These initiatives are part of the Pandora network which bundles an array of historical and archaeological databases devoted to the study of the human past. In particular, we will describe and bring to discussion the efforts made to achieve common data standards for Roman archaeofaunal and archaeobotanical data.

Preliminary uses of compiled data will be presented in selected case studies. These will highlight how collaborative data collection efforts can offer major insights into Roman socio-economic structures, developments in agricultural practices and trade, or in religious and wider cultural practices.

### 6

### THE URKESH GLOBAL RECORD (UGR): OVERVIEW AND ZOOM ON THE BIOANTHROPOLOGICAL DATA

**Abstract author(s):** Kharobi, Arwa (Bournemouth University; University of Bordeaux) - Kelly-Buccellati, Marilyn (University of California) - Buccellati, Giorgio (Cotsen Institute of Archaeology, UCLA) - Buccellati, Federico (Freie Universität Berlin)

**Abstract format:** Oral

The ancient city of Urkesh (Tell Mozan) was occupied starting in the Halaf period and reached its greatest moment of prosperity during the second half of the third millennium (2350-2100 BC). From the beginning, the strategy of the excavation presupposes a

scholarly organization of data where each element must be documented using a set of pre-defined parameters. This method has brought about the creation of a formal management system called Urkesh Global Record (UGR). In the field, each observation is registered using pre-printed forms according to parameters defined by the application of the model of the grammatical categories of reference. Afterwards, in the lab, the existing traditional paper format documentation is re-written in the digital format of an ASCII program, then saved in the server used for the final on-line data entry. Each file must include: – the excavation area; – the current data (date of entry into the system, initials of the person who acquired the documentation on the field); – a short definition of its contents; – the extension of the file. As a final step, a browser edition available on (www.urkesh.org) has been created in a way to allow updating the contents in any moment, without costs. Hence, the UGR becomes an exhaustive instrument which allows specialists to access complete archaeological documentation, as well as an easy vehicle of communication to reach the wider public, thus demonstrating that these different types of users are not incompatible. This online database is the pivot around which this paper revolves with a particular interest into the bioanthropological data derived from the funerary space of Urkesh (Bronze age 2000-1600 BC) within hundreds of individuals and primary graves. The UGR is part of a broadly based approach to digital publishing, which, in the case of archaeology, has a unique epistemological status.

7

## BUILDING THE BASICS WITH BIG DATA: SEX ESTIMATION AND BIOARCHAEOLOGY

**Abstract author(s):** Bethard, Jonathan - Bews, Elizabeth - Reeves, Vanessa (University of South Florida)

**Abstract format:** Oral

Bioarchaeologists routinely reconstruct the past through the contextualized analyses of human skeletal remains recovered from archaeological sites. In many instances, generating demographic estimates of individuals and/or populations is a compulsory first step in the bioarchaeological process. Additionally, bioarchaeologists recognize that human skeletal remains embody intersectional realities of the lived experience influenced by myriad sociopolitical factors. In both of these examples, bioarchaeological datasets comprised of metric dimensions of the post-cranial skeleton are useful for investigating these questions. For example, Ruff and colleagues (2017) amassed a large, freely available dataset in a ten year study focused on documenting broad changes in skeletal form from the upper Paleolithic to the twentieth century. In this landmark volume, researchers examined numerous questions related to functional morphology and also generously provided metric postcranial data for other scholars to use. Additionally, other researchers have assembled a large volume of postcranial data for studies related to ecogeographic variation (e.g., the Goldman Osteometric Dataset). In this presentation, we will demonstrate how these datasets are useful to bioarchaeologists interested in creating simple tools for sex estimation and the examination of sexual dimorphism across time. We demonstrate that bioarchaeologists working in understudied regions of Europe may find that this is an easily adoptable approach and we highlight the benefits related to shared osteological data.

8

## AN ONLINE REPOSITORY FOR EARLY MEDIEVAL BURIALS IN AUSTRIA -THANADOS

**Abstract author(s):** Brundke, Nina (Austrian Archaeological Institute) - Eichert, Stefan (Natural History Museum)

**Abstract format:** Oral

THANADOS - The Anthropological and Archaeological Database of Sepultures - aims on providing data on early medieval burial grounds in nowadays Austria and present them in a modern way to researchers and the broader public.

From the early Middle Ages, mainly burial grounds are known in the area of today's Austria - settlements have been archaeologically investigated to a much lesser extent. They are thus the main source of information about everyday life in the early Middle Ages. About 500 cemeteries can be assigned to the period between the 6th and 11th centuries. The information published on them is normally available in the classic form of catalogs and plates. Working with the data out of the box is therefore not possible. In order to provide easier access, the information given in the publications is recorded in a structured way (CIDOC CRM), georeferenced, and made available online with images and persistent identifiers within THANADOS. Information on 251 cemeteries can already be accessed on thanados.net. In addition to archaeological parameters, results of anthropological analyses and scientific data can also be accessed. In addition to multiple options for downloading data, queries within and between sites are possible. Furthermore, diagrams and statistics provided in the dashboards allow easy exploration of the data. In addition, network visualizations can be created for each burial ground.

Great emphasis is placed on open source, open data, and FAIR principles. Thus THANADOS enables the dissemination of archaeological and anthropological data in a modern form and easily accessible to all.

9

## FORTH TO THE PAST: MODELING COMPLEX SCIENTIFIC ANCIENT DNA PROTOCOLS

**Abstract author(s):** Theodoridou, Maria (Information Systems Lab, Centre for Cultural Informatics, Institute of Computer Science, Foundation for Research and Technology - Hellas, Heraklion, Crete) - Vassou, Despoina (Ancient DNA lab, Institute of Molecular Biology and Biotechnology, Foundation for Research and Technology - Hellas, Heraklion, Crete) - Felicetti, Achille (PIN, University of Florence) - Tabakaki, Eugenia - Psonis, Nikolaos - Kafetzopoulos\*, Dimitrios (Ancient DNA lab, Institute of Molecular Biology and Biotechnology, Foundation for Research and Technology - Hellas, Heraklion, Crete)

**Abstract format:** Oral

The development of high-throughput sequencing (HTS), as well as advances in the recovery of ancient DNA (aDNA), have revolutionized aDNA analysis. Protocols and methods for the analysis of precious and unique archaeological biological findings are con-

tinuously being improved and expanding, aiming to extract the maximum information such specimens have to offer. Analysis of ancient DNA involves several steps, starting from estimating the suitability of a specific sample, sample preparation, documentation, different steps of analysis, data generation, exploitation of the results etc. Ancient DNA analysis protocols are precise scientific investigation methods that allow for inferring, approximating or excluding causes from measured or observed effects. In the context of ARIADNEplus project, we analyzed informal descriptions and formal metadata related to the scientific aDNA analysis workflow in order to produce a suitable application profile based on AO-Cat, CIDOC-CRM and the family of its compatible models. Modeling scientific workflows usually focuses on the digital data produced and ignore the experimental steps that are described only in the scientists' lab-books. In our approach, we analyzed all steps of an aDNA project, starting from sampling, storage, DNA extraction, genomic library construction, sequencing, bioinformatics analyses, interpretation of the results and conclusions up to the publication of results. Moreover, we are working on the alignment of the aDNA application profile with CRMhs, another application profile, designed for heritage science and the modelling of scientific analyses (e.g. C14 or XRF) carried out on biological objects and cultural artefacts. Our goal is to specify an adequate form and extent of metadata that allows for effective control of provenance ensuring quality, validity, and FAIRness of data. Making data findable, accessible, interoperable and re-usable is essential for building the ARIADNEplus research ecosystem for digital archaeological research where scientific data such as aDNA, C14 or XRF data have a significant role to play.

10

## CREMATIONS, URNS AND MOBILITY IN PREHISTORIC AND HISTORIC BELGIUM: INTERLINKED ARCHAEOLOGICAL AND BIOLOGICAL INFORMATION IN THE CRUMBEL DATABASE

**Abstract author(s):** Capuzzo, Giacomo (Research Unit: Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles) - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Dalle, Sarah (Department of Archaeology, Ghent University; Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - De Mulder, Guy (Department of Archaeology, Ghent University) - Hlad, Marta (Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Research Unit: Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles) - Sabaux, Charlotte (Department of Archaeology, Ghent University; Research Unit: Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles) - Salesse, Kevin (Research Unit: Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles; UMR 5199: "PACEA - De la Préhistoire à l'Actuel: Culture, Environnement et Anthropologie", Université de Bordeaux) - Stamatakis, Elisavet (Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Research Unit: Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles - Veselka, Barbara (Maritime Cultures Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel) - Vercauteren, Martine (Research Unit: Anthropology and Human Genetics, Faculty of Science, Université Libre de Bruxelles)

**Abstract format:** Oral

The CRUMBEL project studies the collections of cremated bone found in Belgium dating from the Neolithic to the Early-Medieval period using state of the art analytical and geochemical analyses. Due to its multidisciplinary character, a large variety of qualitative and quantitative data is treated and produced within CRUMBEL, such as archaeological information, osteoarchaeological results, isotopic values and elemental concentrations, FTIR data and radiocarbon dates. The organization of this big amount of data (n. sites>1050; n. osteological reports>650; n. samples>1300; n. 14C dates>1100) required the development of a database that could store, preserve, and provide easy access to the information to PIs, post-docs and PhD students involved in the project.

A relational database composed of five different tables, which allows to identify and access data in relation to another set of data in the database, was chosen as a backbone of the project. The database was developed in FileMaker Pro 18 due to its user-friendly interface that enables to introduce data and modify the database structure by people with various skill levels in database design and management, and to ensure the possibility of an easy link with most used GIS software.

The five tables contain information, respectively, on the "Sites" where cremations between ca. 3000 BC and 700 AD were recovered in Belgium, the features of the "Burials", the results from "Osteoarchaeology", all the biogeochemical and infrared analyses analyses carried out on "Samples" and the "Radiocarbon" dates. The users can query the data stored and interlinked in these different tables, thus obtaining new knowledge that can foster novel interpretations on past social dynamics.

11

## CHALLENGES AND POTENTIALS OF INTEGRATING HETEROGENEOUS RESEARCH DATA: THE LANDSCAPE ARCHAEOLOGY GEOPORTAL 'LANDMAN'

**Abstract author(s):** Strohm, Steffen (Department of Computer Science, Kiel University - CAU) - Hamer, Wolfgang (Department of Geography, Kiel University - CAU) - Renz, Matthias (Department of Computer Science, Kiel University - CAU)

**Abstract format:** Oral

With every year passing more and more research data is generated or becomes available. In order to utilize the acquired data, researchers need to deal with questions about storing, maintaining, updating and analyzing their data. This data does not only include the premises of their analyses, but also obtained results. While this holds for a lot of disciplines in general, it is also a specific challenge for the members of "CRC1266 – Scales of Transformation" at the Kiel University (CAU). One of the cornerstones of managing

and integrating research data in the DFG-CRC1266 is the Landscape Archaeology Geoportal (Landman), where data from different projects is integrated into a single data base with the goal of enabling cross domain research. In this presentation we focus on presenting the approach behind Landman. At first, challenges of integrating heterogeneous data from diverse fields, e.g., archaeobotany, archaeology, geophysics, ecology and others will be highlighting our motivations. Then the design and current progression of Landman is presented, which is already part of the answer to those challenges. In a third step the potentials but also limits of transforming the data into a heterogeneous information network representation will be illustrated from the perspective of archaeoinformatics and data science.

12

PRESENTING PANDORA: A BIG DATA INITIATIVE FOR THE STUDY OF THE HUMAN PAST

**Abstract author(s):** Fernandes, Ricardo (Max Planck Institute for the Science of Human History; University of Oxford; Masaryk University)

**Abstract format:** Oral

It is often difficult to identify the main driving causes that explain historical developments. Human societies make up complex systems which themselves can be categorized into sub complex systems across multiple spheres (e.g. social, economic, cultural) and are also part of a larger environmental complex system. These systems are intertwined, often in non-linear manners and subject to loop feedback mechanisms. Under these circumstances, the accurate reconstruction of historical causal webs requires the collection of large amounts of data representative of multiple disciplines which can then be subject to modelling by powerful machine learning tools.

The Pandora initiative aims at reconstruction past causal webs by: 1) promoting the uncentralized and non-hierarchical creation of databases and networks of databases on diverse subjects (e.g. artefacts, isotopes, aDNA, archaeobotany, archaeofauna, osteology, written sources) devoted to the study of the human past; 2) promoting and undertaking data collection efforts. This includes offering the necessary data infrastructure, including methods to recognize research efforts involved in both data production and data collection; 3) developing modelling tools easily accessible by the research community particularly within the field of artificial intelligence. This work is done in tandem with the IsoMemo initiative.

In this presentation, Pandora’s philosophy, organisation, and infrastructure will be presented. The Pandora initiative is also involved in multiple interdisciplinary projects that exemplify at various scales its research potential. Several of these examples will be presented.

131

THE PLACE OF QUEER THEORY IN CURRENT ARCHAEOLOGICAL DEBATES: ALL T, NO SHADE? [AGE]

**Theme:** 6. Material culture studies and societies

**Organisers:** Jensen, Bo (Kroppedal Museum) - Matić, Uroš (Austrian Archaeological Institute)

**Format:** Regular session

Some 25 years ago, queer theory emerged as a field of critical theory. Building upon feminist and gay/lesbian deconstructions of essentialist understandings of gender and sexual identity and their consequences, it found its way into archaeological debates in the 1990s and early 2000s. Most of the pioneering work done under the umbrella term “queer archaeology” focused on deconstructing heteronormative assumptions about the past, or on investigating past understandings of sex and gender which may have differed from modern heteronormative sex/gender bind. Few other topics were extensively debated, leading some critics to dismiss “queer archaeology” as being limited to the search for same-sex practitioners in the past. Three decades later, archaeological debates are more or less dominated by postcolonial approaches (subalterns; creole; hybridity; mimicry; third space), by the so called “third science revolution” (aDNA; stable isotopes; big data; large funding) and by the ontological turn (non-human agency; entanglement; cosmological perspectivism). Outside of academia we are witnessing rises in nationalism, racism, and homophobia. Gender studies are under attack for being ideological, and relevant academic programmes are being shut down. Scientific racism plays a role in these developments. If the crucial characteristic of queer theory is its instability and its potential to constantly re-invent itself in response to changing definitions of normativity, then its use for archaeology should be equally re-invented. The aim of this AGE (Archaeology and Gender in Europe) session is to reflect on how queer theory in archaeology can contribute to other questions than those related to LGBT and situate the role of queer theory in current archaeological debates, to ask what is normal in these debates, how this norm came to exist and who is excluded or oppressed by this normality. We invite all contributions which investigate normal and abnormal archaeologies and pasts in the vast network of modern states, capitalism, neo-colonialism, heteronormativity and homonationalism.

ABSTRACTS:

1

SESSION INTRODUCTION

**Abstract author(s):** Jensen, Bo (Independent) - Matić, Uroš (Austrian Archaeological Institute)

**Abstract format:** Oral

In this introduction, we introduce the background to this session, the vast network of modern states, capitalism, neo-colonialism, heteronormativity and homonationalism. We briefly present some of the dominant themes in current archaeological debates: post-

colonial approaches (subalterns; creole; hybridity; mimicry; third space), by the so called “third science revolution” (aDNA; stable isotopes; big data; large funding) and by the ontological turn (non-human agency; entanglement; cosmological perspectivism). We also introduce political trends beyond academia, specifically nationalism, racism, and homophobia. Here, gender studies are under attack for being ideological, and relevant academic programmes are being shut down.

We argues that if the crucial characteristic of queer theory is its instability and its potential to constantly re-invent itself in response to changing definitions of normativity, then its use for archaeology should be equally re-invented. We argue that queer theory can contribute to other questions in archaeology than those related to LGBT and situate the role of queer theory in current archaeological debates, to ask what is normal in these debates, how this norm came to exist and who is excluded or oppressed by this normality.

2

TO BOLDLY GO WHERE NO QUEER THEORIST HAS GONE BEFORE

**Abstract author(s):** kok, marjolijn (Bureau Archeologie en Toekomst)

**Abstract format:** Oral

In this paper I want to imagine what queer theory could be in the future. How can we move beyond the binary? How do we extend the notion of diversity without the necessity of hierarchy? In my opinion queer theory could not only be an interesting perspective for doing gender archaeology but should extent to the field of archaeology as a whole. We may need to think in new ways decoupling characteristics from judgement. Following our chains of relations and refiguring if the paths we take have validity. Are our conclusions based on prejudices or actual archaeological evidence? How often can we be surprised by another woman warrior?

In what way do societies organize themselves and how open are we for recognizing cooperation or resistance? Are there moments of refusal? What if entanglement is our framework? How do we deal with affect? The framework I will propose is theory embedded in method, where the researchers question themselves every step of the way. Queerness is about thinking carefully about how we engage with the world without assuming too much from the start about all the entities we encounter.

3

HOW QUEER WERE CROSS-ONTOLOGICAL SEXUAL ENCOUNTERS IN ANCIENT EGYPT?

**Abstract author(s):** Matic, Uros (Österreichisches Archäologisches Institut)

**Abstract format:** Oral

This paper takes a queer turn on the ongoing discussions on flat ontology by exploring various forms of erotic encounters between humans and deities in ancient Egypt. According to available textual and iconographic evidence, deities were part of erotic networks during festivals. Direct sexual intercourse, which crosses ontological boundaries, was (exclusively) restricted to a god and a woman, i. e. the mother of the king. Egyptian gods Amun and Osiris prefer married women or non-virgins. Erotic encounters between mortal men and goddesses were considered dangerous and were therefore avoided. What immediately catches attention is the gender structure of what was considered to be normative cross-ontological sexual intercourse. An intercourse between a god and a woman as normative, contrasts an intercourse between a man and a goddess. In fact, the normative cross-ontological intercourse was not widespread but restricted to deities and women of the royal family. Bearing in mind the overall supremacy of men in ancient Egypt and the avoidance of intercourse between a human male and divine female, one wonders if the reason behind this is the danger of reversing the ontological order and hierarchy through penetration. A goddess penetrated by human male would not only be a passive and subordinate partner but also the mother of a child of a human father with all of its accompanying rights. This and many other problems with cross-ontological sexual encounters in ancient Egypt should not only be described in order not to assume any ontological primacy (sensu Latour) but also thought through in order to understand the gender structure behind them. Consequently, when some are excluded from such encounters and others frequently experience them, we should indeed think about the primary agency, possibly even ideology, a queer word in discussions on ontology in archaeology and anthropology.

4

NO SAME-SEX FOR THE WICKED ROMAN SOLDIERS: EXPLORATIONS INTO THE MASCULINITY AND SEXUALITY OF THE ROMAN ARMY SOLDIERS

**Abstract author(s):** Ivleva, Tatiana (Newcastle University)

**Abstract format:** Oral

Within the archaeological scholarship on gender and sexuality in the Roman provinces there is nearly no critical discussions about dimensions of gender and variability in sexual relations in provincial settings. Queer theory has not penetrated the Roman provincial scholarship with scholarly preference confined to gender and sexualise provinces by formal analogy, such that the nature of provincial sexual relations, including marriages and other relationships, has been studied almost exclusively from a heteronormative perspective.

This paper investigates same-sex sexual relations of the Roman soldiers serving and living in northwest provinces and frontiers of the Roman Empire in the first-third centuries A.D. Using epigraphic evidence it focuses on how male sexual identities were expressed in performances of masculinity in Roman military settings by arguing that traditional heterosexual reading of the data was based on the androcentric narratives and gender stereotypes. Furthermore, by discussing the sexual norms, roles, and practices from the empire’s core, and comparing and contrasting it with the evidence deriving from the provinces and frontier, the paper

proposes a new framework for conceptualising and studying masculinity and sexuality in the Roman army and Roman provinces by emphasising how Roman soldierly masculinity and sexuality were not two sides of the same coin.

5  
**USES AND MISUSES OF QUEER THEORY IN FUNERARY ARCHAEOLOGY**

**Abstract author(s):** Algrain, Isabelle (Université libre de Bruxelles) - Mary, Laura (Recherches et Prospections archéologiques)

**Abstract format:** Oral

The study of funerary contexts offers to archaeologists a privileged access to a specific individual and, through funeral offerings, to certain elements constituting his/her identity, as it was considered by the group that buried him/her. For ancient societies where gender was strictly binary, the presence of stereotypical objects such as jewelry or weapons in funerary material often prompted researchers to assign a gender to the deceased, without even resorting to osteological or DNA analyzes. However, when these analyzes and the objects seem to mismatch - most of the time when a woman is buried with rich material and/or weapons - some archaeologists have preferred to use queer theory rather than revising their positions on the roles of women in these societies. On the other hand, some other cases have been overlooked by archaeologists but might shed some light on occurrences of non-binary, fluid or occupational genders, for example in Greek or Merovingian societies. Through a reflective and theoretical approach, and on the basis of a few case studies, this paper considers the question of non-binary genders, gender fluidity and transidentities in ancient societies that are a priori strictly binary and examines how archaeologists have misused and should use these gender diversities into the interpretation of funerary contexts.

6  
**HOW QUEER IS THAT? HOW IS THAT QUEER? WOMEN VIKING WARRIORS, ADNA AND MODERN UNEASE WITH PAST IDENTITIES**

**Abstract author(s):** Jensen, Bo (Independent)

**Abstract format:** Oral

In this talk, I address bold claims that aDNA may finally resolve the old discussion of women warriors in the Viking Age. I suggest that whereas aDNA provides important new data, these are not qualitatively different from those already available from oesterology. Moreover, I argue that epistemologically, this research forecloses any discussion of the social meaning of gender, reducing gender to mere biological sex. In effect, we can finally know if people “were” men or women, at the cost of giving up ever understanding what this meant in their time and society. We can know the fact of “woman” (sub specie eternae) if we sacrifice all hope of understanding the meaning of “woman” (in the local, contemporary context).

Moreover, the status of aDNA evidence for women warriors hinges on a premature resolution of the vexed question of warrior identity. Again, we may know the fact a “warrior” by giving up all hope of ever understanding what this label meant.

I think not.

Here, I propose a different approach: let us unsettle, let us queer the debate and ask, why do modern researchers and readers engage so passionately with this? Why are women warriors so popular and controversial today? What is so queer about this sexed biology in combination with those grave-goods, and what does this tell us about the observer paradox? Why are our colleagues so eager to close discussions at existence, instead of proceeding with the important work of understanding where, when and why women warriors, and women ritual experts, may be visible in some communities, invisible in others? I suggest that the queerness of the past is much more widespread, much more profound and much more radical than simple transgressions of Victorian gender norms.

**THE CARETAKER AND THE MILITARY: WOMEN WITH THEIR OWN AGENCY IN A MILITARY HOSPITAL ENVIRONMENT IN MODERN LISBON**

**Abstract author(s):** de Carvalho, Liliana (Research Center of Anthropology and Heath, University of Coimbra) - Henriques, Susana (EON-Indústrias Criativas) - Amarante, Ana (Centre for Functional Ecology, University of Coimbra) - Wasterlain, Sofia (Research Center of Anthropology and Heath, University of Coimbra; Centre for Functional Ecology, University of Coimbra)

**Abstract format:** Oral

When studying funerary contexts, it must be acknowledged that the history of death and social history are inseparable. The attitudes surrounding death consistently mirror the worldview and organization of a given society. When looking at osteological material from large contexts with a marked demographic bias, such as necropolises in monasteries or those related to military contexts, bioanthropologists have an interesting opportunity to surpass the female-male dichotomous analysis provided by the usual sexual diagnosis, that gives us no more than biological sex. Such approach looks at individuals whose biological sex was in the minority, generally neglecting elements outside the social norm. In this perspective, these minority individuals would be the helpers of the opposite sex, like the monastery’s handmen, who would be tolerated out of necessity. An alternative approach requires looking not only at the biological sex per se, but also to the context, and this is where the possibility of thinking about gender identity arises.

In the present study, the necropolis excavated in Rua do Recolhimento 7/9, in São Jorge Castle (Lisbon, Portugal), and the cemetery of the Military Hospital, located nearby (active between the 16th and 18th centuries) will be analysed. In the second and third excavation phases, 948 individuals were exhumed, and of the 642 that allowed sexual diagnosis, 96.6% were male. Although the remaining 22 individuals were diagnosed as females (from the point of view of the bioanthropology), apparently, they presented similar funerary rituals to the male ones, either in terms of deposition, type of funerary goods, and even location in the necropolis.

Two possible readings, one focused exclusively on biological sex and one integrating gender identity on the analytic framework to approach the presence of women, men, and others in between in a powerful masculine environment will be performed.

**COMPENSATION IN ARCHITECTURE AND ARCHAEOLOGY - ON COMPENSATION AS A CONCEPT, METHOD, AND PROFESSIONAL PRACTICE**

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Rönn, Magnus (Kulturlandskapet, Chalmers University of Technology) - Teräsväinen, Helena (Aalto Univerisity) - Kalakoski, Iida (Tampere University) - Kouzelis, Athanasios (National Technical University)

**Format:** Session with precirculated papers

This session focuses on compensation as a concept, method, and professional practice in the transformation of cultural environments. Compensation represents a significant challenge reflected in a myriad of environmental laws and in local policies. The concept has many definitions and, from a planning perspective, can be defined as overall demands, specific measures, actions and changes of design taken in order to appease criticism.

The transformation of environments can be approached from two main perspectives. On the one hand, there is a risk of negative impacts on cultural heritage when exploitation interests are in power. Project developers, reinforced by political interests, can ignore the values and architectural qualities of cultural heritage in places subject to exploitation. A protected milieu, thus, can be perceived as an obstacle to development rather than a common resource of public interest. On the other hand, there have been calls for a rethinking of compensation as means to recreate and safeguard cultural and architectural values and qualities affected by developments. In such approaches, how can issues related respect for the history and protection of cultural heritage, be combined with a reconstruction of the values associated with and the adaptive re-use of buildings?

This session calls for a multidisciplinary approach to compensation. How should it be understood as a concept, method, and practice by architects, architectural conservators, and archaeologists. The session welcomes papers discussing compensation as (a) a part of the measures and functions aimed at restoring lost cultural values and architectural qualities, (b) conservation and protection through rules and regulations in city plans and urban planning, (c) requirements for design of new buildings, (d) tools and methods for balancing interests between exploitation and preservation and (e) problem solving approaches to modify proposals that impact cultural environments.

**ABSTRACTS:**

1  
**CULTURAL HERITAGE COMPENSATION**

**Abstract author(s):** Rönn, Magnus (Kulturlandskapet) - Grahn Danielson, Benjamin (Picea)

**Abstract format:** Oral

“Cultural heritage compensation” is a proceeding from a research project in Sweden. The project investigating how compensation is expressed in designing detailed development plans in areas with heritage values and architectural qualities. The overall objective has been to produce new knowledge about heritage compensation as a concept, method, and tool in planning processes. The practical benefit lies in the development of empirical findings of how professionals handle cultural heritage and architectural qualities in the transformation of sites and environments.

Ten scholars from Finland, Norway, Denmark, Sweden, United Kingdom, and Greece present findings in the proceeding on compensation in alterations that have impacts on heritage values and architectural qualities. Their contributions are developed from an international workshop – called “Architecture, cultural environment, and compensation in planning processes.” The workshop took place at Gothenburg, 16-17 September 2019, and was organized as a joint venture between Kulturlandskapet and Chalmers University of Technology. The theme in the invitation to the workshop was summarized in the following way: On compensation as a concept, method, and professional practice by architects, architectural conservators, and archaeologists in planning processes.

Compensation comes from the Latin word compensate and is used in the environmental code in Sweden. The concept is used in the sense of indemnifying, balancing, settling, restoring, and reaching a balance, etc. One controversial issue is whether heritage values and qualities are unique and always fixed to a specific plot, or whether they are mobile and can be redesigned at another site. Architects, architectural conservators, archaeologists, and other heritage professionals work differently and have different approaches to this issue in the transformation of areas. In the Swedish context, there is a strong connection among professionals to introduce compensation as problem-solving actions in the planning and design of environments with cultural values and architectural qualities.

2  
**ARCHITECTURE AND COMPENSATION - RENEWAL AND EXPANSION OF THE CITY LIBRARY IN GOTHENBURG**

**Abstract author(s):** Rönn, Magnus (Kulturlandskapet)

**Abstract format:** Oral

The paper deals with renewal and preservation in a combined architecture and detailed development plan-project, including cultural values and architectural qualities. The focus is on how compensation actions, cultural values, and architectural qualities are ex-

pressed in the expansion of the City Library in Gothenburg. In this case, the detailed development plan regulates both land-use and architectural design. The transformation of the City Library occurred in an area with heritage values of national interest.

The objective is to investigate, analyze, and discuss compensation in architecture and planning processes. The specific goal is to produce knowledge on how key players practice compensation and understand heritage values and architectural qualities. The research is based on a single case study. From a selection of 39 contemporary detailed development plans obtained from the City Planning Office in Gothenburg, one plan has been chosen for investigation in this paper. The motive behind this selection is that the expansion provides both an interesting background to quality issues and raises important questions concerning the renewal of a public building at a site of great value for citizens.

Key documents in the case study have been analyzed through close-reading. Knowledge has also been developed through analyses of drawings, illustrations, site visits, and discussions at seminars.

The detailed development plan can be understood both as a product and a process. Seen as a product, compensation measures are embedded in the plan as fixed regulations to support renewal as well as to safeguard values and architectural qualities. These regulations concern both land-use and architectural design. Compensation thinking as part of the planning process is expressed through changes based on comments from key-actors, starting with the design of the expansion of the library, and is continued in the transformation to make the renewal possible through the detailed development plan.

3 **NARRATIVES OF FISH, TRADE AND COASTAL COMMUNITIES: USE AND RESOURCE MANAGEMENT AS A TOOL FOR HERITAGE AND ENVIRONMENT COMPENSATION**

**Abstract author(s):** Davies, Tom - Smith Wergeland, Even (Oslo School of Architecture and Design) - Standal, Anja (Norwegian University of Life Sciences)

**Abstract format:** Oral

To be entered under: Compensation as a tool, method and measure for protection, restoration, reconstruction and relocation of cultural values and architectural qualities in areas of exploitation.

Building on the inherent reappraisal of priorities from tangible to intangible, this paper considers use and resource management, through the medium of Norwegian coastal communities, as a transdisciplinary tool for heritage and ecology. The preconditions of natural resources these coastal localities (islands, coastline and

fjords), essentially their limits of exploitation in sustaining communities are appraised as the basis for a transdisciplinary approach. It considers how relative permanence and impermanence of such environments and the opportunities afforded by ample cod-stocks and other fish and the maritime trade have defined these

communities over time. Arguably starting with the development of Norway's West and North Coast from the 1200s with the Hanseatic League to the present day, this has determined these cultural landscapes and the lives of their communities. This provides the basis for enquiry to consider what lessons communities determined by their environment and opportunities to such an extent can provide for today's challenges for both heritage and environment.

Examples are drawn from literature review, ongoing teaching and professional work, looking at the Fjord Landscape of West Norway supported by other reference studies. The study considers changing land and sea use over time drawing on historic maps and written sources, early film and photography and a variety of current community and municipal projects looking to recover coastal communities from the decline they typically experienced in the late 20th Century. As part of which current challenges and opportunities for livelihoods and conservation are considered within the context of the overall narrative.

4 **HOW TO COMPENSATE THE IRREPLACEABLE? A CASE STUDY OF TWO PROTECTED BUT ENDANGERED BUILDINGS**

**Abstract author(s):** Teräväinen, Helena (Aalto University)

**Abstract format:** Oral

Old Paukku in Lapua, Finland is a former cartridge factory, which was transformed into a culture centre in 1990's (Teräväinen 2006, 2009, 2018, 2020). In the beginning the cultural heritage of the industrial buildings was not recognized, but later it was listed on national level heritage (RKY 2009).

2020 the town started again to revise the plan of Old Paukku to cancel the conservation regulations and then to demolish the only wooden building in the area, the Canteen. The planning documents show a suggestion, taht another city-owned wooden building from school yard to be pulled down and then re-place the Canteen. Both buildings have been neglected and empty, and Lapua has several times tried to get exceptional permits to dismantle these protected buildings.

According the negotiation notes from planning meetings the provincial museum, representing The Finnish Heritage Agency, seemed to accept the Canteen to be demolished, in consequence of the poor condition it should be mostly re-built and accordingly the authenticity of the building would disappear. Removing the other building from its original place was not seen as crucial, and the museum sounds satisfied: "at least one of those endangered buildings could be saved". It is difficult to imagine who now would use and pay the re-placement (compensating) building, because the town's culture division haven't found any use for the Canteen in two decades.

The aim of this paper is to investigate the place, the authenticity and the compensation thinking (Grahn Danielson 2015, Rönn 2018, 2020) in the planning context. The cultural heritage in the environment has both tangible and intangible parts, and so it should be understood together with the place and the identity, not only counting the amount of new pieces in the renovation.

5 **ADULIS ARCHAEOLOGICAL SITE: HERITAGE VALUES AND CONTEMPORARY CULTURAL LANDSCAPE IN ERITREAN COASTAL LOWLANDS**

**Abstract author(s):** Bortolotto, Susanna - Cattaneo, Nelly (Politecnico di Milano) - Massa, Serena (Università Cattolica del Sacro Cuore di Milano)

**Abstract format:** Oral

Since 2011 an Eritrean-Italian research has been conducted on Adulis Archaeological site (Eritrea). Its position represented a key factor in the development of the main emporium town of the Horn of Africa between the III century B.C. and the VII A.D., when a natural catastrophic event destroyed it. The project is led by the Eritrean Ministry for Culture and Sport and by the Research Centre on the Eastern Desert, in collaboration with Italian Universities, and aims at enhancing the site also through the creation of an archaeological park.

Adulis is of great interest for researchers worldwide, nevertheless its current context is peripheral and marginal to the main Eritrean centres. The local inhabitants are committed to subsistence farming and goat breeding in a semiarid context. The unexcavated archaeological area itself has been a common grazing land. The balance between livelihood and local scarcity of resources represents an intangible heritage shaped in centuries, enhancing the diversification of activities and the community over the individual, thus ensuring a high level of resiliency.

What would happen to this local intangible heritage when the main trigger for economic development is an archaeological site of international interest? The socio-economic process promoted by tourism industry, as suggested by many cases worldwide, can endanger a heritage whose values have not been acknowledged or whose loss has been considered an acceptable side-effect of development. To prevent from this irreversible loss, the current project VITAE, started in 2020-21, has considered the understanding of local cultural values as part of the actions, promoting local economy and community ties. Beside addressing the wide literature dealing with compensation in the field of archaeological risk assessment, the contribution aims at reflecting on the concept of compensation and mitigation when applied to intangible heritage and to cultural values which rely on processes more than artifacts."

6 **DESIGNING WITH DECAY**

**Abstract author(s):** Kalakoski, lida (Tampere university)

**Abstract format:** Oral

The subject of this study the former hospital area of "Kulkutautisairaala" (infectious disease hospital) in proximity of Tampere city center, Finland. The existing buildings were built in several phases from 1890's to 1950's. After their original use, the buildings have served for example as student apartments. Now, most of them are unused, in a very bad condition and waiting for planning decisions.

Taking into consideration the topicality of the site and the challenging state of the buildings, we decided to take the district for the project site of the Management of Built Heritage course in Tampere University in spring 2021. The students were encouraged to widen their perception of architectural conservation in order to preserve some qualities of the site and at least one of the buildings using creatively methods of transformation, preservation, renewal and infill building.

This study explores the spectrum of different practices suggested by 24 group works done by over 60 Finnish and international students. The investigated practices are juxtaposed with the concept of and definitions of compensation.

7 **THE OPEN-AIR ARCHAEOLOGICAL MUSEUM AS A MODEL OF CULTURAL COMPENSATION**

**Abstract author(s):** Kouzelis, Athanasios (N.T. Univ. of WA, Athens)

**Abstract format:** Oral

Our inquiries concerning the cultural design praxis are shifted by a flow of considerations in the field of its utility. There are some factors that affect us to think how a proper design method can draw a practical usability from the terms of compensating losses in architectural and cultural inheritance. Cultural heritage is not only just about the past – it also defines who we are and shapes the future. Archaeological evidence demonstrates that heritage assets serve as a catalyst, not only for conservation, historical cohesion, cultural development and education, but also for design job creation, infrastructure development, investment and economic development.

The design management of archaeological and cultural sites has become an important and major component of heritage discourse. It inspires and gives context to modern design and planning approaches as well as it constitutes a source of cultural compensation.

Given that archaeological heritage is a material record of past human activities, it constitutes an outstanding instrument for a better knowledge of the past and for introducing cultural novelty that emerges within a given territory's historical 'genius loci'. As such examples we can consider the use of the reconstructed ancient Panathenaic stadium in Athens, the theatre of Epidauros and the initiatives for the reconstruction of Plato's Academy in the same place of its ancient location.

8	<b>HERITAGE COMPENSATION IN CHANGING ENVIRONMENTS: THE CASE OF THE WEST LINK INFRASTRUCTURE PROJECT, GOTHENBURG</b> <b>Abstract author(s):</b> Dore, Maitri (Gothenburg University; Heriland research and training network) <b>Abstract format:</b> Oral Major urban infrastructure projects in old cities often encounter material historical features during planning or execution, presenting several challenges for local heritage management. Using the case of the West Link in Gothenburg, Sweden, this paper discusses compensation as an approach to integrating heritage conservation with new urban development. Compensation, in this understanding, denotes a rethinking of heritage values and qualities, and fosters new development directions. While recognised as an important planning instrument (Grahn Danielson, et al, 2013; Rönn, et al, 2017), compensation more broadly, also includes thinking of heritage in terms of the heritage paradigm (Ashworth, 2011), as a vector in spatial planning (Janssen, et al, 2017), and more. The paper analyses how all these approaches reflect in practice in one specific case. The West Link is a railway line currently under construction in Gothenburg. It burrows through the city’s 17th century fortifications, ancient agricultural properties, and historical parks – all of which are ‘national interests’ with architectural historical value. Since the project is deemed to be a threat to the cultural heritage, the Swedish Transport Administration (STA) – responsible for the project – and the City of Gothenburg are in talks on how best to work with the heritage. Their proposals for adapting it reflect their ideas about its values and qualities. The STA seeks to minimise heritage damage, while the City additionally proposes to ‘strengthen’ its value through new urban design programmes and increased accessibility to hidden sites. The paper situates their proposals and positions within the wider discourse on compensation. It further highlights the potential of cultural heritage to not only coexist with new development, but even become a decisive force in shaping future cities in moments of major transformation. This work forms part of a PhD on heritage planning in changing environments resulting from infrastructure projects.
9	<b>COMPENSATORY MEASURES IN ARCHAEOLOGICAL HERITAGE MANAGEMENT - OVERCOMING THE NATURE-CULTURE-CULTURE DIVIDES</b> <b>Abstract author(s):</b> Hueglin, Sophie (Newcastle University; University of Basel; University of Tübingen) <b>Abstract format:</b> Oral To reduce, avoid or offset the potential adverse environmental consequences of development the EU Environmental Impact Assessment (EIA) Directive mentions three mitigation measures: preventative, corrective, and compensatory measures. The third and last resort in case of unavoidable impact – compensatory measures – so far have not been demanded by archaeologists as it seems to contradict their conventional conservation concept. They think archaeological heritage should be protected and if that is not possible excavated or possibly relocated, but how could it be compensated? To understand this, heritage policies must be thought through to their extreme ends. Here two policies will be contrasted: the site-centered vs. the landscape concept. The site-centered concept would identify a site, classify it, put a fence around, restore and try to upkeep it. The landscape concept would describe a historic environment, characterize its elements, but involve the stakeholders of a specific planning process to evaluate it. In this latter concept heritage potentially is everywhere and could possibly even be (re-)created during development through compensatory measures. Using examples from Germany and all over Europe, the weaknesses of current practices of heritage protection will be demonstrated. Alternatives – including compensatory measures – will be proposed. Archaeologists would profit from adopting strategies from nature preservation. To be successful, they must seek constructive co-operation in planning and conservation processes with the public as well as other major nature and culture conservation organisations.
10	<b>SAVE WHAT CAN BE SAVED AND TELL THE STORY – BALANCING DAMAGE ON INDUSTRIAL HERITAGE BY ARCHITECTURAL INTERPRETATION</b> <b>Abstract author(s):</b> Nilsson, Urban (Nyréns Arkitektkontor) <b>Abstract format:</b> Oral It takes more than preservation of buildings to convey the history of a site to residents, visitors and users of a new district. To clarify the narrative of the heritage its matter has to be shaped by architectural means thus interpreting it. When the pervasive conversion of the industrial site Lövholmen is completed many years have passed. This long process holds many participants – from property owners over experts in different fields to citizens. The latter as practitioners of their democratic rights. Through this large teamwork it is possible to take care of physical remains that are carriers of cultural significance and to convey the history of the site through architectural interpretation. Lövholmen in central Stockholm is an ongoing planning process and it will be used as a case study. One of the conditions for this development is hash exploitation figures which will lead to the demolition of several buildings. However a critical mass of the physical heritage will be reused and the loss will be compensated for by the telling of the history of the site. The study focuses on different ways of interpretation by architectural means using the existing bedrock, landscape, structures and buildings as basis for the design. Through landscape architecture the remaining rock of the archipelago can be highlighted. Squares

can be paved with designed patterns, maps of the cement distribution network for instanse. The concrete industry Cementas plant used the key for transhipment distributing cement to building sites around Stockholm. To reuse parts from the silos in new contexts or to use the forceful architecture of the silos as inspiration for the design of new housing blocks are other examples.

Tomorrow, when the conversion is carried through, Lövholmen will still reflect significant cultural values and tell stories about the people who lived and worked there.

141

BETWEEN BONES AND BELIEFS: HUMAN-BIRD RELATIONS IN CENTRAL AND NORTHERN EUROPE IN THE 1ST MILLENNIUM AD

**Theme:** 1. Widening horizons through human-environment interconnections  
**Organisers:** Karpinska, Klaudia (Museum of Cultural History, University of Oslo) - Smallman, Rebecca (HumAnE Bioarchaeology, University of Exeter) - Oehrl, Sigmund (Department of Archaeology and Classical Studies, Stockholm University)  
**Format:** Regular session

Human-avian relationships developed in many ways throughout the Iron Age, particularly in the 1st millennium AD in Central and Northern Europe. These airborne animals foraged and scavenged close to settlements, inviting interactions – wild birds were hunted, and domesticated poultry were bred for meat, feathers and eggs; other birds were kept for entertainment or sport, with raptors trained for falconry. Aves also played significant roles in pre-Christian beliefs and rituals of Iron Age societies: they were sacrificed as votive offerings, included in funerary rites, used for divination, and feature as symbols in both pre-Christian and early Christian iconographies.

Bird remains are frequently recovered from a range of everyday and ritual contexts (e.g. settlements, pits, wells, graves). Avian iconography features on many objects (e.g. jewellery, weaponry, carved stones) in different manners (e.g. Germanic animal styles). Written sources – such as Roman (e.g. Pliny the Elder’s The Natural History) and Medieval accounts (e.g. Old Norse literature) – tell of the roles birds played in these cultures.

The main aim of the session is to discuss interdisciplinary research on human-bird relations in the 1st millennium AD in Northern and Central Europe. During the session, we will examine the roles of birds in daily life and their symbolic meanings in pre-Christian and early Christian belief systems of Iron Age cultures, including Roman influences. Papers regarding Eastern and Mediterranean parallels are also welcome. We would like to invite researchers who study such themes not only in the scope of archaeology, anthropology, and zooarchaeology, but also history, art history, history of religions, and philology.

ABSTRACTS:

1	<b>FROM SPECIAL ANIMALS TO CHICKEN DINNER: EXPLORING THE CHANGING ROLE OF CHICKENS</b> <b>Abstract author(s):</b> Best, Julia (Cardiff University) - Doherty, Sean (University of Exeter) - Foster, Alison (Freelance) <b>Abstract format:</b> Oral Chickens are the world’s most widespread and abundant domestic animals. They number more than 23 billion and provide much of the world’s primary meat and egg resources. However, the timing and circumstances of their spread across the globe, and their transition into a food resource have been poorly understood. During the 1st millennium AD chickens underwent something of a revolution. This paper combines c14 dating, proteomics, and zooarchaeology to discuss the chicken’s shift from a rare, exotic, special bird to a common food source. We present new evidence for the timing of the spread of chickens across Europe, and their use on arrival. We use tarsometatarsal spur fusion and metrics to reconstruct age profiles and sex demographics of domestic fowl in Britain during this period, uncovering the advanced age that cockerels often lived to. Using proteomics and medullary bone studies we also explore the creation of repeated egg laying and its impact on the chicken’s role in food production. Combined these approaches investigate the changing dynamics of human-chicken relationships.
2	<b>FEATHERS FOR THE AFTERLIFE. INVESTIGATING SPECIES COMPOSITIONS OF FEATHERS FROM SCANDINAVIAN IRON AGE BURIALS REVEAL NEW PERSPECTIVES ON HUMAN-AVIAN INTERACTIONS</b> <b>Abstract author(s):</b> Berglund, Birgitta (Norwegian University of Science and Technology - NTNU, University Museum, Department of Archaeology and Cultural History) - Rosvold, Jørgen (The Norwegian Institute for Nature Research) <b>Abstract format:</b> Oral Several Late Iron Age high-status burial sites where the buried individuals were lying in beds stuffed with feathers are known in Northern Europe, a.o. Sutton Hoo in England, Jellinge in Denmark, Birka in Sweden and Oseberg in Norway. According to written sources, feathers were harvested in Northern Europe in the Faroe Islands and at the coast of Northern Norway at least from the 15th century. The North-Norwegian chieftain and seafarer Othere told king Alfred in England in the 9th century that the Saami payed him feathers as taxes. At the coast of Helgeland in North-Norway, people have for centuries built nesting houses for Common Eiders to obtain feathers, thus building a close relationship between man and birds. The species composition of the ancient feathers in six burial sites in Norway, from Oseberg in the south to Øksnes in the north, were investigated microscopically and the results are presented here. While Anseriformes (duck, goose and swan) are most common, the

species compositions were varied and with some distinct geographical differences. The results were compared with a corresponding investigation of feathers from the pagan cemetery at Valsgårde in Central Sweden.

The species composition of the feathers revealed that it was not accidental which species the feathers came from in the bed-clothes. The investigations gave new perspectives on the interactions between man and birds in the Late Iron Age Scandinavia. Norse mythology indicated that the feathers may have had a deeper meaning.

**WHY DID THE CHICKEN CROSS THE NORTH SEA? THE INTRODUCTION OF CHICKENS INTO NORWAY; NEW EVIDENCE FROM THE BORGUND KAUPANG**

**Abstract author(s):** Walker, Samuel (University Museum of Bergen, The Department of Natural History) - Hansen, Gitte (University Museum of Bergen, The Department of Cultural History)

**Abstract format:** Oral

The domestication of chickens has been hugely successful, and due to their size and ease of transportation, they have become established across the globe. It is estimated that there are now 25 billion chickens inhabiting earth at any one time. Given this, it seems surprising that they have not always been present and were in fact a relatively late introduction to Norway.

Despite Norway's incredible links to trade it is a mystery as to why chickens were such a late introduction in this country. We have identified that by 1300 CE chickens become more common place on sites, and prior to this they are present in small numbers from the beginning of the Medieval period (1030 CE). Pre 1000 CE we have very little evidence for chickens in Norway. We believe that our recent work on the deserted Viking Age/Medieval town Borgund, outside today's Ålesund holds some of the answers to this mystery. It has been possible to significantly add to our knowledge of domestic fowl in Norway through the NFR funded Borgund Kaupang Project. Through inter-disciplinary research we now have securely dated chicken remains from Viking Age contexts.

The earliest domestic fowl from Borgund have been C14 dated to 887–986 CE. Currently representing some of the earliest chickens in Norway. Borgund was a main trading site on the west coast of Norway, with connections to Britain, Germany, France, amongst others. Borgund may have been one of the routes by which chicken were introduced to Norway. As the Borgund project continues we believe we will be able to link these remains with the pottery and other exotic items to help identify possible origins for the importation of chicken into Norway. This research has significant implications to human-avian relationships in Norway and Scandinavia.

**HUNTING WITH RAPTORS IN THE OLD NORSE SOCIETY - UNDERSTANDING THE PRACTICAL SIDE OF FALCONRY IN THE VIKING AGE**

**Abstract author(s):** Hagen, Ellen (Arkeologisk museum, Universitetet i Stavanger)

**Abstract format:** Oral

As a raptor leaves the glove of a falconer, nature enfolds on proximity. A brief chase between predator and prey, both evolved to catch or escape each other. Birds of prey, with or without a falconer, hunt daily to survive. The role of the falconer is to care, train and serve the raptor, it is a lifestyle and artform, on which the Holy Roman Emperor, Frederick II, finished a book on in the 1240s, and that is recognized as an Intangible Cultural Heritage by UNESCO. Falconry is hunting with a raptor in a particular human-animal relationship. However, physical remains of falconry in history can be hard to find.

The few traces of falconry from the Norse society in Norway are therefore of high importance, and by looking closer at archaeology, skaldic poetry, picture stones, laws, Norse mythology and language linked with birds of prey, it is possible to describe the practical daily care of the raptors in historical falconry - how and where the raptors were kept, fed, and trained, and which species were used for what kind of hunting, trade, and status. It is even possible to understand how the mere presence of a raptor has been of influence on all these levels.

A core element of falconry is the connection to nature, and the old hunting kings, 'veidekonger', were masters of various hunting styles, and having the skills of a falconer was seen as a good trait of a leader. A raptor needs to be served because it will obey no master, therefore, falconry is a noble art, as the raptor is the true judge of a falconer's character.

**'FALCONER BURIALS' REVISITED (SWEDEN AND NORWAY, GERMANY, CZECH REPUBLIC AND ESTONIA; 500-1000 AD); ON THE DIFFERENCES IN EVIDENTIAL VALUE**

**Abstract author(s):** Grimm, Oliver (Centre for Baltic and Scandinavian Archaeology - ZBSA)

**Abstract format:** Oral

Burials with birds of prey (mainly goshawks) which date to the second half of the first millennium AD have been known since a long time in Sweden and Germany. However, it is only in the past decades that this has found broader reception, triggered by one particularly well-preserved burial from mid-east Sweden: the one from Rikeby, north of Stockholm, a wealthy warrior's grave from the seventh century AD, excavated in the year 1980. This burial has very high evidential value for falconry inasmuch as three raptors typically used for this kind of hunting (goshawk, sparrowhawk and peregrine falcon) have been recorded plus hunting dogs plus potential prey.

Against the background of Rikeby, the c. 40 Swedish 'falconer burials' will be shortly highlighted as a group with distinct features before turning to the much less numerous materials from Norway (royal ship grave from Gokstad with goshawks) and Germany (a few burials, with goshawks). In addition, woman's burials from Germany and the Czech Republic with falconry imagery have to be taken

**FUNERARY PRACTICES MOST FOWL: PATTERNS OF SYMBOLIC CHICKEN DEPOSITION THROUGHOUT IRON AGE AND ROMAN BRITAIN**

**Abstract author(s):** Smallman, Rebecca (HumAnE Bioarchaeology, University of Exeter)

**Abstract format:** Oral

Recent studies are revealing that domestic fowl (Gallus gallus domesticus) first arrived in Britain during the Iron Age, becoming widespread with Roman occupation – and that chickens held sociocultural significance far beyond their nutritional value, including roles in cockfighting and ritual practices. Details of British Iron Age and Roman rural sites were collated to map the arrival, spread and depositional contexts of chickens, examining temporal and regional patterns of funerary and ritual deposition. While the majority of early chicken-human graves occur in southern England, notable early chicken depositions were also seen in northern England contrary to previous expectations; such early co-burials are seen to testify to the 'exotic' value of the newly-arriving species. Ritual depositions of chickens show continuity of some Iron Age practices into later Roman periods, as well as Roman votive and sacrificial offerings of domestic fowl, and potential burials of prized cockerels; presence of other domesticates and wild birds in some depositional contexts additionally suggest interlinked animal symbolism and worldviews.

**EGGSTRA QUESTIONS ANSWERED: USING PROTEOMIC APPROACHES FOR EXPLORING THE RELEVANCE OF DOMESTIC CHICKEN IN VIKING AGE POST-CREMATION RITES**

**Abstract author(s):** Jelcic, Anna (Stockholm University) - Demarchi, Beatrice (University of Turin)

**Abstract format:** Oral

The rarity of eggshell finds originating from cremation graves and the traditional lack of interest in cremation-related organics, combined with the small and fragmentary samples collected and available for analysis, limit the current state of understanding regarding many facets of past egg use in burial rituals. However, methodological advances in biomolecular archaeology can heighten the informative potential of this traditionally overlooked object category. This study demonstrates the advantages of peptide mass fingerprinting techniques (also known as "ZooMS" - zooarchaeology by mass spectrometry) in obtaining information on very small eggshell fragments, especially those originating from old excavations and thus with unclear excavation and post-excavation histories. Samples of ten eggshells from Viking Age cremation burials of Central East Sweden, excavated during the period 1873-2003, are analyzed in order to determine the biological origin of the fragments. As a result of this effort, enhanced interpretation is now possible on issues such as the preferences with regard to the avian species targeted, the treatment of the eggs prior to deposition, the issue of time-depth of post-cremation practices, and the phenomenon of inclusion of non-pyre-related objects into the cremation sequence.

**AVIAN ICONOGRAPHY ON THE GOTLAND PICTURE STONES – VENDEL AND VIKING PERIOD BIRD SYMBOLISM**

**Abstract author(s):** Oehrl, Sigmund (Institutionen för arkeologi och antikens kultur, Stockholms universitet)

**Abstract format:** Oral

Birds are omnipresent in the art and iconography of Late Iron Age Scandinavia. All kinds of birds, in particular raptors, corvidae and water fowl, are frequently depicted in the Migration Period, Early Medieval, and Viking animal styles. Bird images occur on jewellery and weaponry, rune stones, textiles, amulets, and coinage, sometimes emblematic, sometimes as ornament or incorporated into narrative scenes. In many cases, these images of birds can be interpreted on the background of intercultural parallels and written sources, in particular Old Norse poetry. They can be regarded as servants of gods or as deities in bird shape respectively, as symbols of regeneration or symbols of death, as companions of heroes, eating the corpses on the battlefield and drinking the blood of the slain, as cosmological beings and symbols of power. Pagan, Christian, as well as secular seeming contexts are to be considered. The possible meanings and functions of birds and bird images in Germanic and Viking Age iconography and world view are numerous and remarkably diverse.

In this paper, the diversity and the possible meanings of bird depictions will be discussed based on the example of the Gotlandic picture stones. The picture stones from the Baltic isle of Gotland are among the internationally most famous archaeological monuments from Sweden. These richly ornamented memorial stones, dating to about AD 400–1100, offer a unique source for studies of Late Iron Age material culture and, most importantly, they constitute an unparalleled source for information on pre-Christian cults and religions. On Vendel and Viking Period Gotlandic picture stones, different birds species occur in various contexts, as helpers during the journey of the dead, representing valkyries, among the beasts of the battle field, as companions of gods and heroes, and in the context of hunting.

**Abstract format:** Oral

The studies of early medieval Slavic religion, beliefs and magic have a very long tradition. The scholars focused primary on analysing negligible written sources, archaeological sources and finally on ethnographic and linguistic materials. In this paper I would like to show small part of animal studies, focused on the role of birds in Slavonic religion and beliefs. The simple, but complex world of the early medieval Slavic iconography shows birds both, as the independent artefacts, and as the elements of larger representations. Both categories were probably related directly to the mythical reality, showing the role of birds in myths, rituals and beliefs. One of the most excited context is the Slavic cosmology, where in some examples birds play roles of creators of the universe. Selected iconographic representations from various categories of artefacts (e.g.: bronze fittings, jewelry, images on ceramic vessels, images on stones) as well as information from the pages of written sources, will be discussed. In written sources we can find information about swallows having a nest on the breast of Rugiaevit. Also we can find medieval texts informed us about the sacral roles of birds and their functions in the divinations. The corpus of artefacts constructed in this way, will be examined from the comparative perspective. All of this will allow for an anthropological interpretation of birds in the religion of early medieval Slavs. This research is a part of the Project financed by National Science Centre in Poland - "Religions and their things. Comparative analysis of early medieval objects connected with religiosity discovered on the territory of Poland".

**Abstract format:** Oral

During the Viking Age, people interacted with various species of birds. These animals were observed during daily works and distant traveling (e.g. perching birds), hunt for meat (e.g. ducks), trained for falconry (e.g. Northern goshawks), or breed (e.g. geese). Some of these feathered beings were also significant parts of rituals and beliefs (e.g. common raven, eagles). Among this great variety of bird species, were also wild and domesticated gamefowl (order Galliformes). Animals belonging to this order were not only connected with everyday human life but they were elements of funerary ceremonies. Domestic chickens were sacrificed during cremation and inhumation rituals, and their eggs were placed in different graves. Wild galliforms (e.g. black grouse, peafowl) were killed during elaborate inhumation burials. Furthermore, gamebirds are also mentioned in Ibn Fadlān's Risāla, Saxo Grammaticus' Gesta Danorum, and several Old Norse written sources as sacrifices during elaborate funerals, mysterious offerings and occupants of the otherworld.

As current research has shown, wild and domestic gamefowl remains were present in the humble and very elaborate graves of women, men and children. Bones of domestic chickens (both hens and cocks) and wild galliforms have also been documented together with the remains of other birds (e.g. raptors) and mammals (e.g. dogs, horses). Interestingly, some of the chickens were not burnt on pyres and placed later in the grave pits with ashes.

The main aim of this paper is to discuss the different aspects of interactions between humans and gamefowl in the scope of funerary rituals in Viking Age Norway and Sweden. This paper will take into account not only new analyses of Viking Age graves with remains of gamefowl but also the descriptions of these airborne beings known from Eddic poems, sagas and non-Scandinavian written sources.

**Abstract format:** Poster

Wood Quay remains one of the most important Viking settlements uncovered outside of Scandinavia. Dating from the arrival of the Vikings in the 9th Century, the site tells an unprecedented amount about the people who settled there and established the city over generations. Huge amounts of artefacts were found preserved in the wet riverside mud. Among animal bones there were also various raptor species, presumed to be food stuffs and or for arrow quills.

However, one artefact possibly sheds new light on the presence of falconry remains at Wood Quay. A satchel, presumably from a monastery, contained a raptor's foot which was estimated to have belonged to an eagle. The design of the bag is exactly like the hunting bag that every falconer around the world uses to this day – a large over-the-shoulder pouch into which hunting equipment and game can be carried out of sight of the possessive hunting bird. I am in the process of tracking down these bones to have them re-examined. It is plausible that the bone fragments inside are not those of an eagle species but one of the larger falconry species that we know the Vikings availed of – a hawk or a falcon. A large female goshawk or gyrfalcon would have a very large foot, and if the remains were only fragmentary, it could be that they were misidentified as an eagle. Falcon remains were also found at the Fishamble side of Wood Quay where a bustling marketplace stood at that time. Vikings harvested falcons and traded these birds as a commodity, and my theory is that the raptors at Wood Quay might also have been intended for falconry. The presence of these remains is worthy of discussion in the context of falconry activities in Hiberno-Norse trade.

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Shindo, Lisa (ROOTS cluster of excellence, Christian-Albrechts Universität, Kiel) - Wazny, Tomasz (Nicolaus Copernicus University, Toruń)

**Format:** Regular session

Wood has been used by many human societies as a basic building material and for everyday life. On archaeological sites, it is found in various forms: waterlogged, dry or carbonised, and in various dimensions: from small particles to large-sized constructions. Numerous disciplines related to archaeology are dependent on investigations of wood remains. Dendrochronologists, anthracologists, wood anatomists, historians, engineers and representatives of other disciplines provide information on ancient silvicultural and wood-technological practices, and make it possible to reconstruct past landscapes shaped by various forms of human activity.

Because of their quantity, variety and good preservation, waterlogged wood remains are the most suitable material for this type of study. But what about dry and carbonised wood? How can studies not only at the single site scale, but more complex and over a large area contribute to our knowledge about past societies and their use of wood?

We invite all researchers who study wood to present and compare their analyses from all periods. We want to identify the extent to which dendrology and dendrochronology can play a part in the investigation of past human-environment interactions and then extend our current knowledge in an interdisciplinary framework.

ABSTRACTS:

**Abstract author(s):** Bleicher, Niels (Underwaterarchaeology / DendroLab City Of Zürich)

**Abstract format:** Oral

Dendroarchaeology in the Northern Alpine Foreland has repeatedly postulated the existence of managed woodland as early as during the Neolithic. This hypothesis is based on dendrotypological results. Dendrotypology is a combination of archaeological typology and dendroecology. For the study of woodland management practices based on historic and early modern material, however, dendroecologists adopted different approaches.

The typological idea was then taken up and adapted by anthracologists who endeavor to reconstruct modes of fuelwood exploitation based on small fragments of charcoal. Similar to dendrotypology, anthracotypology compares archaeological datasets to modelled data of idealised woodland types and the remains that these are expected to produce in the archaeological record.

Recently, the idea of managed woodland has been challenged on the basis of diameter/age analyses of waterlogged wood from different sites in Europe.

Thus, four approaches from three disciplines are being used for similar questions and give sometimes different answers. This talk compares the methods and offers a possible solution to apparent contradictions, based on landscape archaeological considerations.

**Abstract author(s):** Picornell-Gelabert, Llorenç (Universitat de les Illes Balears) - Dufraisse, Alexa (Sorbonne Universités, CNRS, Muséum national d'Histoire naturelle. **Abstract format:** Oral

Anthracology has been largely developed as the archaeobotanical discipline dealing with charcoal fragments as archaeological remains of past woodlands and human-forest interactions. In doing so, the discipline has faced diverse challenges, as the difficulty to move beyond taxonomical identification in order to build a comprehensive approach to woodland management practices. In this sense, dendro-anthracology has recently emerged as a prospective venue to deepen the interrogation of anthracological assemblages through the analysis of tree-ring width and convergence of ligneous rays. In this context, the aim of this presentation is to show the diverse dendro-anthracological tools and parameters developed to further interrogate the minimum diameter estimation (charcoal-pith distance), radial growth patterns (tree-ring width), and heartwood formation. By combining these three parameters for each charcoal fragment we have defined the anthraco-typology approach as an intuitive way to organize dendrological information and to characterize the studied assemblages, especially tree organ provenance (i.e., trunk vs. branch). We have built up referential datasets and adapted the anthraco-typology approach to wood anatomy of both broadleaved trees (Quercus petraea/robur) and

### AUTOMATED 3D TREE-RING DETECTION AND RING-WIDTH CALCULATION FROM X-RAY COMPUTED TOMOGRAPHY

**Abstract author(s):** Martinez, Jorge (Lucerne University of Applied Sciences and Arts, School of Engineering and Architecture, Horw) - Stelzner, Ingrid - Stelzner, Jörg (Römisch Germanisches Zentralmuseum Mainz) - Gwerder, Damian - Schuetz, Philipp (Lucerne University of Applied Sciences and Arts, School of Engineering and Architecture, Horw)

**Abstract format:** Oral

Tree ring analysis is essential in the understanding, modelling and assessment of the evolution of wood samples over time. It provides quantitative data about the whole ring structure which can be used, for example, to measure the impact of the fluctuating environment on the tree growth, to support global vegetation models and for the dendrochronological analysis of archeological wooden artefacts. There currently exist several methods for tree-ring detection and tree-ring parameters estimation from imaging data. However, despite advances in computer vision and edge recognition algorithms, detection of tree-rings is mostly limited to 2D datasets and performed in some cases manually. This contribution presents a new approach to extract the whole 3D tree-ring structure directly from X-ray computed tomography data and illustrates how average tree-ring widths can be estimated from it. The approach relays on a modified Canny edge detection algorithm, which detect fully connected tree-ring edges throughout the measured image stack. The obtained results show that the approach performs well on six tree species having conifer, ring-porous and diffuse-porous ring boundary structure. In our study image denoising proofed to be a critical step to achieve accurate results.

### RECONSTRUCTION OF FOREST DEVELOPMENT IN THE MEDIEVAL ORE MOUNTAINS: PROS AND CONS OF USING WOOD DENSITY OF MINING TIMBER

**Abstract author(s):** Ahlgrimm, Svenja - Scharnweber, Tobias (University Greifswald)

**Abstract format:** Oral

The Ore Mountains are one of the most important medieval mining areas in Europe. Interdisciplinary approaches have been used to understand the development of the area as a highly dynamic cultural landscape. During excavations of mining complexes from the 12th and 13th centuries a remarkable amount of thousands of construction timbers were recovered and dendrochronologically dated.

In addition to tree-ring width, we also measured annual maximum latewood density (MXD) on a subset of historical wood samples. This parameter shows better correlations to summer temperatures and can be used to cross-date shorter tree-ring sequences. Furthermore, the positive relationship between elevation and latewood density can provide a basis for reconstructing origin of timbers and thus helps in dendroprovenancing.

However, wood decay and post-sedimentary processes such as concretions of iron or manganese in wood can bias the measurements. Therefore, we studied different extraction techniques and quantified their impact on absolute/relative wood densities and on element concentrations. Our results reveal that especially medium (decadal) time frequency signals in annual wood densities are affected by metal concretions. In order to reduce this bias, we propose a new extraction technique.

Despite these methodological limitations, this unique archive can provide new insights into aspects of landscape and climate history. Focusing on the parameter of wood density, we would like to discuss how our dataset can contribute to our knowledge of the composition and resilience of the medieval Saxon primeval forest as well as human interventions.

5

### BEYOND CHARCOAL ANALYSIS. WOOD USES AND WOODLAND MANAGEMENT FROM BRONZE TO IRON AGES IN NORTHERN IBERIA

**Abstract author(s):** Martin Seijo, Maria (Universidad de Cantabria)

**Abstract format:** Oral

Charcoal is the most common archaeobotanical remain recovered from archaeological contexts dated to Bronze or Iron Ages in northern Iberia. Up to now, a large number of charcoals have been analysed in the last decade providing an excellent opportunity to test the possibilities of going beyond taxonomic identification. In our research we have systematically combined charcoal analysis in tandem with registering dendrological and taphonomic attributes. This has provided information to better characterise the kind of wood resources managed, the combustion process, the state of wood before burning and the depositional and post-depositional processes affecting to archaeobotanical assemblages. But it has also been obtained information about wood uses, woodland management practices, and even about the relationship established between people and their environment. This presentation will

summarise the results obtained from several case-studies dated from the Bronze to the Iron Ages in the northern part of the Iberian Peninsula which have allowed the identification of specific uses of wood as well as sylvicultural practices.

6

### THE POTENTIAL OF CHARCOALS ANALYSES TO DISCUSS GREEK COLONIZATION PROCESSES: PRELIMINARY RESULTS FROM KRANIA - PIERIA, GREECE (850-550 BC)

**Abstract author(s):** Godefroy, Lou (Vrije Universiteit - Amsterdam; Muséum National d'Histoire Naturelle - Paris) - Margaritis, Evi (Science and Technology in Archaeology and Culture Research Center, The Cyprus Institute Institute - Nicosia) - Zech-Matterne, Véronique (Centre National de Recherche Scientifique - Paris) - Salavert, Aurélie (Muséum National d'Histoire Naturelle - Paris)

**Abstract format:** Oral

In the frame of the NWO project “What went into the melting pot ? Land-use, agriculture, and craft production as indicators for the contributions of Greek migrants and local inhabitants to the so-called Greek ‘colonization’ in Italy (ca. 800-550 BC)”, science-based methods are employed to analyze and compare the organization in the Greek motherland and in the indigenous-colonial milieu in Italy. As part of the subproject ‘Flora & Fauna’ which focuses on farming practices, subsistence strategies and surplus production, the Iron Age material from the settlement of Krania in the Pieria region in Greece was analysed as part of the dataset. The site was excavated in 2001 and revealed occupation phases from the 3rd millennium BC to the Hellenistic period. The amount of ceramics demonstrates the important trades with the rest of Greece, in particular Corinth, supporting long-standing contacts and networks. Two pit structures contained a high concentration of charcoals. Krania’s material constitutes an interesting case study as a regional comparanda with other Greek assemblages. This presentation attempts to discuss how anthracological analyses can contribute to our understanding of human-environment interactions, anthropogenic practices and environmental management.

7

### MIDDLE AGES DENDROPROVENANCING: MAPPING WOOD EXPLOITATION AND CONSUMPTION FOR SAN ESTEBAN ARCHAEOLOGICAL SITE IN THE 12TH AND 13TH CENTURIES

**Abstract author(s):** Celma Martínez, Mireia - Baño López, Ana (Professional Archaeologist) - Eiroa Rodríguez, Jorge (Departamento de Prehistoria, Arqueología, Historia Antigua, Historia Medieval y Ciencias y Técnicas Historiográficas Facultad de Letras, Universidad de Murcia) - González Ballesteros, José Ángel (Professional Archaeologist) - Hernández Robles, Alicia - Haber Uriarte, María (Departamento de Prehistoria, Arqueología, Historia Antigua, Historia Medieval y Ciencias y Técnicas Historiográficas Facultad de Letras, Universidad de Murcia)

**Abstract format:** Oral

This research has focused on the probable dendroprovenance of woody taxa determined for San Esteban (<http://sanesteban.um.es/>) archaeological site through charcoal analysis, the revision of the medieval written sources, GIS proposal, and the complementary bioarchaeological analysis as an interdisciplinary synthesis.

4,620 charcoal from different contexts (maqbara, main streets, funduq, building II) were analysed and resulted in 36 woody taxa. The determined taxa correspond to different ecological and plant-bearing realities. The current topographical layout presents an ecological niche at the bottom of the valley through which the Segura river flows, and where Medina Mursiya was founded. The local acquisition is considered from the basis of bioclimatic stages natural environment of the determined taxa for the Thermo-Mediterranean, Meso-Mediterranean, Supra-Mediterranean, and typical riverside vegetation, in addition to the orchard fruit-tree production and if they were all able to grow in the surrounding territory.

The aim is to approach the site into the woods and cropland nearby environment woody taxa available and to analyse the demanded trade input when a lack of timber and wood fuel existed in every developed activity.

Firstly, a combined methodology analyzing charcoal from both by hand and light/heavy floatation fractions, introducing soft sieving to divide the remains into >2 mm and > 4mm, allowed to deepen increasing the number of taxa and the possibilities for further paleoecological and paleoeconomic interpretation for all contexts. Secondly, a review of the synchronic medieval written sources was gathered to explore traded wood and its provenance. Thirdly, a GIS was developed to locate taxa on its ecological environment and bioclimatic stages according to the historical transformation of the landscape. Finally, complementary bioarchaeological analyses are being produced to review and connect the archaeological record with the geographical chemical indicators, and to revise the reliability of the written sources.

8

### MODERN TAR KILN FROM THE BIAŁOWIEŻA PRIMEVAL FOREST. ARCHAEOLOGICAL AND DENDROLOGICAL STUDY

**Abstract author(s):** Szubski, Michal - Szubska, Magdalena (Cardinal Stefan Wyszyński University in Warsaw) - Klisz, Marcin (Forest Research Institute) - Wojnar, Joanna (Cardinal Stefan Wyszyński University in Warsaw) - Langer, Jerzy (Faculty of Chemistry, Adam Mickiewicz University in Poznań)

**Abstract format:** Oral

The Białowieża Primeval Forest is one of the largest forested areas in Poland, it occupies nearly 1500 km<sup>2</sup> of which 42% is in Poland and the rest is located in Belarus. Significant part of this area is covered by various types of protected zones including the Białowieża Forest World Heritage site.

As part of the project “Cultural and natural heritage of the Białowieża Forest”, over 1700 archaeological features with preserved anthropogenic relief were discovered with archival query and aerial laser scanning. Many of them are remnants of the modern charcoal production - over 250 charcoal kilns and 54 tar kilns have been located. They often occur near prehistoric barrows, creating a palimpsest-like cultural landscape.

The tar kiln in the Łozice Forestry has 20 meters in diameter. A trough-shaped depression (tar kiln) is surrounded by a circular heap, approx. 50 cm high, which is ditched in the southern part by a channel that drains tar to three reservoirs. During the field excavations, the remains of a burnt wooden structure were discovered, as well as a tar tank coat with clay and fragments of tar. The pottery shards obtained during the research allow the site to be initially dated to modern times (18th century).

The obtained samples were then itemized by specialist analyzes. The preserved pieces of wood were dendrological analyzed, while tar substances were studied with microscopic and Fourier Transform Infrared (FTIR). Additionally, the soil from the tar kiln area was sent for chemical composition analyzes.

This first attempt of interdisciplinary research of this kind of kiln in the Białowieża Primeval Forest show us big opportunities of investigating modern features and will be continue in the future. They are an example of human interaction with the forest for the production of tar and charcoal, which is still visible in the landscape.

NEOLITHIC WOOD USE AT THE SCHELDT RIVER BANKS IN BOUCHAIN (HAUT-DE-FRANCE)

**Abstract author(s):** Leroy, Gilles (DRAC Hauts-de-France, Service régional de l’archéologie – UMR 8164 Halma - CNRS) - Jaouen, Gwénaelle (Independent Researcher) - Tegel, Willy (Institute of Forest Sciences, Chair of Forest Growth and Dendroecology, Albert-Ludwigs-University Freiburg) - Salvador, Pierre-Gil (Univ. Lille, Univ. Littoral Côte d’Opale, ULR 4477) - Boulén, Muriel (Paly-nologist, Institut National de Recherche en Archéologie Préventive - INRAP – UMR 7209 - CNRS-MNHN) - Salavert, Aurélie (UMR 7209, Archéozoologie, Archéobotanique: sociétés, pratiques et environnements - CNRS-MNHN)

**Abstract format:** Oral

Archaeological sites with wetland or waterlogged conditions provide excellent preservation conditions for organic material, particularly wood, making one of the most important prehistoric sources for dendroarchaeological studies available. Dendroarchaeological research allows detailed insights into ancient technologies, wood selection and utilisation. Furthermore, annual resolved dendro-chronological dates can deliver important information on the spatio-temporal development of prehistoric occupations.

The site of Bouchain (Haut-de-France, dep. Nord) is located on the bank of a paleochannel close to the Scheldt river, which flows from south to north into the North Sea. As a result of regularly floods with different intensity, the site conditions are waterlogged leading to formation of peat. Archaeological evidence reveals activities between the Middle Neolithic and the end of the Late Neolithic (4260 to 2475 cal BC). Six excavation campaigns between 2014 and 2019 discovered vast amounts of wooden remains. Wooden artifacts have been sampled for dendroarchaeological analyses within an interdisciplinary program, further involving palynological, carpological and anthracological studies. A total of 1450 individual wood objects were studied including architectural elements (posts, stakes and planks), tools (axe handles), hunting weapons (arrow shafts and bows, throwing sticks, slingshot balls), tableware, production waste from woodworking (chips) and finally two log boats. In addition, natural wood residues from peat and alluvial layers were collected in order to obtain a more comprehensive picture of the Neolithic forest vegetation on-site.

The dendroarchaeological investigations combined with other environmental studies will provide first results regarding environmental reconstructions, the dating of various Neolithic occupations, the management of wood resources and wood working techniques.

FROM DENDROCHRONOLOGY TO BRONZE AGE WOODLAND AND COSMOLOGY: TWO TIMBER CIRCLES ON ENGLAND’S EAST COAST

**Abstract author(s):** Robertson, David (Forestry Commission England)

**Abstract format:** Oral

In the late 1990s two timber circles were discovered on a north Norfolk beach. The one now known as ‘Seahenge’ was fully excavated; the second circle was recorded over the next fifteen years as it was gradually destroyed by the sea. Peat and waterlogged conditions ensured excellent preservation of timbers in both structures, providing insights into the ways wood was utilised in practical and potentially symbolic ways. Dendrochronology dated the felling of the trees used to build both monuments to the spring or summer of 2049 BC, a few centuries after the introduction of metal tools. Studies of Seahenge’s timbers revealed the largest assemblage of Bronze Age toolmarks then known from the United Kingdom.

This paper will explore how Seahenge’s timbers can help us understand the species, size, age, and number of the trees used in its construction. It will use this information, and associated palaeoenvironment remains, to attempt a reconstruction of the Bronze Age woodland in which they stood prior to felling. It will go onto consider the layout, dating and direct association of the two circles, offering one possible explanation for their erection and use. In the process the paper will touch on how the treatment, positioning and orientation of timbers may reveal Bronze Age beliefs associated with the sky, celestial bodies, and an underworld.

WOODLAND MANAGEMENT IN THE PILE DWELLINGS OF THE LJUBLJANSKO BARJE, SLOVENIA, IN THE ENEOLITHIC?

**Abstract author(s):** Out, Welmoed (Moesgaard Museum, Dept. of Archaeological Science and Conservation, Højbjerg) - Hänninen, Kirsti (BIAX Consult, Zaandam) - Merela, Maks (University of Ljubljana, Biotechnical Faculty, Department of Wood Science and Technology, Ljubljana) - Velušček, Anton (Research Centre of the Slovenian Academy of Sciences and Art, Institute of Archaeology, Ljubljana) - Vermeeren, Caroline (BIAX Consult, Zaandam) - Čufar, Katarina (University of Ljubljana, Biotechnical Faculty, Department of Wood Science and Technology, Ljubljana)

**Abstract format:** Oral

Woodland management, i.e. coppicing and pollarding, is regularly suggested to have taken place in Europe from the Mesolithic or at least the Neolithic onwards. Is this actually the case? This study focuses on prehistoric pile dwellings in the Ljubljansko barje (Ger. das Laibacher Moor), Slovenia, dating to the Eneolithic period, between 3700 and 2400 BC. These settlements were inhabited by people of different cultural groups and are all characterized by a highly developed copper metallurgy. Due to waterlogged conditions, organic material at these sites has remained preserved through time.

Archaeological excavations since 1995 have enabled systematic collection of waterlogged wood for dendrochronological dating. This resulted in the collection of a large data set of over 8,500 wood samples from 16 pile dwellings, allowing a regional analysis of wood exploitation. The wood assemblage includes 11 genera and is dominated by ash (*Fraxinus excelsior*) and oak (*Quercus robur* and *Quercus petraea*). Earlier analysis of ash and oak piles from one of the sites, Stare Gmajne, indicates the exploitation of unmanaged wood during 3160-3110 BC (Out et al. 2020). The aim of the present work is to investigate the characteristics of wood exploitation at the other sites that date both to earlier (3700 -3330 BC) and later (ca. 2800-2400 BC) periods. We focus on woodland management at two clusters of sites that were during some periods populated simultaneously.

SASANIAN WOODLAND USE IN TREELESS LANDSCAPES

**Abstract author(s):** Shumilovskikh, Lyudmila (Georg-August-University Göttingen)

**Abstract format:** Oral

Palaeobotanical data from radiocarbon-dated sediments and archaeological excavations represent important source of information for our understanding of human-environment interactions. Compilation of palynological, wood anatomy, charcoal and botanical macroremain analyses provide new insights into woodland management in the treeless landscapes of the Gorgan Plain (NE Iran) during the Sasanian era. Palynological research points to natural origins of the open steppe vegetation in the Gorgan Plain. During the Sasanian period, local sources provided enough firewood for kilns in short-term use, but were insufficient for fortifications which required additional supplies from the Hyrcanian forests. These forests provided the main source of firewood for sites located close to the Alborz Mountains. Cultivation of trees was widespread during the Sasanian Empire for fruits, shadow and possibly moriculture for silk production. The palaeobotanical records are still very rare in the Gorgan Plain. New data are a high desideratum to gain further insights into woodland use before, during and after the Sasanian Empire.

A 19TH CENTURY WHALER IN PATAGONIA, ARGENTINA: DENDROCHRONOLOGICAL ANALYSIS OF THE BAHÍA GALENSES SHIPWRECK

**Abstract author(s):** Mundo, Ignacio (IANIGLA-CONICET) - Murray, Cristian - Grosso, Mónica (PROAS, Instituto Nacional de Antropología y Pensamiento Latinoamericano, Buenos Aires) - Rao, Mukund - Cook, Edward (Tree-Ring Laboratory, Lamont-Doherty Earth Observatory, Columbia University, New York) - Villalba, Ricardo (Laboratorio de Dendrocronología e Historia Ambiental, IANIGLA-CONICET, Mendoza)

**Abstract format:** Oral

Since the late 18th century, the demand for products derived from the exploitation of cetaceans and pinnipeds led North American and European vessels to explore new hunting areas in the southern oceans. Numerous historical sources accounts for these commercial activities involving a great number of vessels. Many of these ships were lost at sea and their precise locations remain unknown.

In 2002 the remains of a wooden shipwreck were discovered on the coast of Golfo Nuevo, northern Patagonia, Argentina. The wreck was named “Bahía Galenses” after the historical name of the cove where it was found. The results of the archaeological research carried out so far indicate that it would be a whaler built in the 19th century employing northern hemisphere timbers.

Some archaeological and written evidence suggest that it could be the Dolphin, a whaler built in Warren, Rhode Island, USA, in 1850 and shipwrecked in 1859 at Golfo Nuevo. To test this hypothesis, using dendroarchaeological provenance methods and a novel approach based on the gridded North American Drought Atlas (NADA), we found highly significant correlations between the wreck’s tree-ring width series and oak and pine chronologies from eastern US. Our findings indicate that the Bahía Galenses shipwreck have the same origin and historical moment of construction of the Dolphin. As far as we know, this research would the first study conducted in South America to date and determine the origin of a shipwrecked whaler through dendrochronological methods.

The results of this study stimulate further interdisciplinary projects to study the large number of unidentified wooden shipwrecks found along the extensive Patagonian coasts of the South Atlantic Ocean, many of which may have been involved in the exploitation of marine resources during the 19th century.

A. **ARCHAEOLOGICAL AND DENDROLOGICAL STUDY OF TWO TYPES OF CHARCOAL KILNS IN THE BIAŁOWIEŻA PRIMEVAL FOREST**

**Abstract author(s):** Wojnar, Joanna (Cardinal Stefan Wyszyński University in Warsaw) - Klisz, Marcin (Forest Research Institute)  
**Abstract format:** Poster

Located on the eastern part of the country the Białowieża Primeval Forest is one of the largest forested areas in Poland. The whole forest complex occupies nearly 1500 square kilometres. Around 42% of it is located in Poland and the rest in Belarus. Archaeological research in Białowieża Forest discovered thousands of features with preserved anthropogenic relief including many remnants of the modern charcoal production. All of them were detected with airborne laser scanning archaeological reconnaissance and verified in the field. Here we present the preliminary results of archaeological and dendrological studies of samples from selected charcoal kilns. The analysed samples were collected from two different types of charcoal kilns located around one kilometre from each other. Features differ in term of morphology – one is rounded with shallow ditch, second is plain mound without ditch. The preserved pieces of wood and charcoal were analysed by dendrological and wood anatomical methods to establish the tree-ring chronology of each charcoal kiln and to determine the tree species of wood samples used in both types of analysed charcoal kilns.

**144 THE EVER CHANGING COAST: INTERACTIONS OF PEOPLE, LANDSCAPES AND ENVIRONMENT ALONG EUROPE'S SEAS IN HIGH-RESOLUTION**

**Theme:** 1. Widening horizons through human-environment interconnections  
**Organisers:** Kristiansen, Søren (Department of Geoscience, Aarhus University; Center of Urban Network Evolution - UrbNet, Aarhus University) - Stamness, Arne (Norwegian University of Science and Technology The NTNU University Museum Department of Archaeology and Cultural History) - Verhegge, Jeroen (Department of Archaeology, Ghent University)  
**Format:** Regular session

Our ability to understand human development along the coastlines of Europe is dramatically improving, both above and below the present sea level. Recent advances are based on improved understanding of past climate change, extreme events, biosphere interactions, and include precise records of sea-level variation since the last glacial period. These fast-developing records of key components of the Earth system have huge potential for improving our understanding of gradual changes, abrupt shifts and resilience in coastal societies from local to continental scales. In this session, we invite contributions focusing on human-environment interactions along the changing shores of Europe's seas and lakes. Archaeological periods can range from Paleolithic to Modern, while scales can range from single site investigations to regional and continent-wide studies. Both marine-based and on-shore studies are welcomed. Of particular interest are studies of coastal landscapes and archaeology using one or a combination of methods to investigate the human-environment interconnections. Examples are high-definition dating (radiocarbon, optically stimulated luminescence (OSL), geo-archaeology (coring, soil science, sedimentology), archaeological databases, geophysical mapping both on-shore and off shore (seismic, GPR, magnetic and electrical methods), and upscaling these using paleo-landscape modelling and remote sensing (lidar, aerial photography, optical and radar satellite data) approaches. Invited archaeological investigations can be both above and below the present sea level as long as they provide new knowledge of relevance for both the environment and humans living along the ever changing coasts of Europe.

**ABSTRACTS:**

**1 LINDISFARNE LANDSCAPES: GEOARCHAEOLOGICAL APPROACHES TO HUMAN-ENVIRONMENT INTERACTIONS ON HOLY ISLAND (NORTHUMBERLAND, UNITED KINGDOM)**

**Abstract author(s):** Kahlenberg, Raphael - Andrieux, Eric - Bailiff, Ian (Department of Archaeology, Durham University) - Lloyd, Jeremy (Department of Geography, Durham University) - Shillito, Lisa-Marie (School of History, Classics and Archaeology, Newcastle University) - Milek, Karen (Department of Archaeology, Durham University)  
**Abstract format:** Oral

The Holy Island of Lindisfarne is a small tidal island in North-East England and is well-known as the scene of one of the first Viking raids on the British Isles in 793 AD. It had an eventful history, both in terms of cultural changes and landscape evolution. During the periods that are best attested in the archaeological and historical records, from the Anglo-Saxon period (5th to 11th centuries AD) onwards, it has seen phases of high religious and economic importance but also temporary abandonment. At the same time, profound changes in vegetation, land use and dune formation took place. While these developments are well-studied in the north of Lindisfarne around the Anglo-Saxon Period settlement of Green Shiel, little paleoenvironmental data is available for the rest of the island, including the parts immediately adjacent to the presumed location of the early medieval priory, the village and the castle. This paper presents the first results of an interdisciplinary study combining geophysical prospection (electrical resistivity tomography and ground-penetrating radar), coring and multi-proxy analysis of palaeosols and sediments, including phytolith and foraminifera

analyses. It is likely that medieval soils are preserved at various locations across the island, sealed by layers of aeolian sand which accumulated during the Little Ice Age (16th-19th centuries AD) and reach a thickness of up to 40 cm. Peaty deposits below these palaeosols suggest a transition from a wetland environment to drier conditions. This observation raises the question of whether parts of coastal wetlands on Lindisfarne have been actively reclaimed under monastic control in (early) medieval times. If this dating and the anthropogenic character of the processes can be confirmed, our study will shed new light on how Lindisfarne's landscapes have been used, transformed and perceived while the island was home to one of England's most influential monasteries.

**2 LUMPS AND BUMPS! RECONSTRUCTING A BURIED LANDSCAPE USING LEGACY DATA AT TRONDHEIM, NORWAY**

**Abstract author(s):** Cadamarteri, Julian (NIKU - Norwegian Institute for Cultural Heritage Research)  
**Abstract format:** Oral

The medieval city of Trondheim, Norway is situated on a river bend promontory in the delta estuary of the river Nid in the middle of Norway. The river and the promontory created an ideal harbour in the Viking and medieval era. Situated in a river delta means that the landscape is shaped by the river, erosion and landslides in the river valley as well as the sea and isostatic sea level change. The medieval city centre is today a seemingly flat level area, today's topography reflects 1000 years of levelling and infilling masking the natural landscape underlying the urban area. Since the early 70s data on the height of the natural subsoil have been regularly documented in connection with archaeological excavations in the city centre. Leading to a database of over 1500 measurements. Converting the data to xyz coordinates makes it possible to build an GIS terrain model of the delta landscape through interpolation. The natural landscape lies underneath up to 5 m of cultural layers and the terrain model makes it possible to understand the original landscape which the earliest human occupation took place in and the landscape the city was founded in during the viking age. The model also enables a new understanding of medieval use of the promontory and the medieval town plan in relation to the landscape, hydrology and vegetation. The model shows that the human occupation up through the iron and medieval age adapted to the landscape in a greater degree than earlier appreciated.

**3 LARGE-SCALE POST-BATTLE TREATMENT OF DEAD IRON AGE WARRIORS IN DENMARK: COASTAL, SETTLE AND LAND-USE CHANGES**

**Abstract author(s):** Hertz, Ejvind (Museum Skanderborg) - Munch Kristiansen, Søren (Geoscience, Aarhus University)  
**Abstract format:** Oral

Coasts along the sea have always attracted people but also the coasts of lakes have been attractive. Just after the birth of Christ a large scale battle took place in East Jutland, Denmark after which thousands of human bones was deposited along the coast of a small lake, present-day Alken Enge, next to larger Lake Mossø as evidence the post war aftermath. Here a sandy coastal spit system evolved in the centuries before the birth of Christ and was around the bone sacrifice at the first half of the first century AD a very prominent in-land shallow, calm water with sandy beaches cut by a small stream with deeper water. These special landscape elements are probably the reason why the sacrifice was performed right here in Alken Enge. The traces on-site are especially indicators to new rituals of sacrifice of minimum 380 individuals, while as example, pollen studied indicates that the post-battle land-use rapidly transformed from grazing and farming into forest after the deposition of the dead warriors. In a regional perspective, conflict related sacrifices continue from 200 to 450 AD in another small lake upstream in the Illerup valley, now with a focus on the weapons and warrior's personal equipment. These rich weapon sacrifices in the small lake, with no clear evidence of white beaches, have their example in the way the Romans treated equipment from conquered armies, but with a special variant with sacrifices in lakes in Southern Scandinavia. Throughout an approximately 500-years period following the sacrifice at Alken Enge the Illerup Valley have in the local communities collective memory hence been perceived as a "Sacred Valley" to which was brought large and significant sacrifice to the gods while, at the same time, the land-use was intensified and the near settlement structure seems to disappear.

**4 NIDA COASTAL SITE IN AEOLIAN ENVIRONMENT. NEW RADIOCARBON AND ANTHRACOLOGICAL DATA FOR CHRONOLOGICAL REINTERPRETATION AND ENVIRONMENTAL RECONSTRUCTION**

**Abstract author(s):** Pilkauskas, Mindaugas (Lithuanian Institute of History) - Peseckas, Kęstutis (Nature Research Center)  
**Abstract format:** Oral

Investigations at Nida Stone Age settlement on southwestern coast of the Baltic Sea counts almost two centuries. During this long research period the knowledge about the site changed with new data available. Extensive radiocarbon dating indicates that it has been inhabited during the period of 3500 – 2500 cal BC. This period can be divided into Subneolithic and Neolithic epochs, represented by shell tempered and mineral/grog tempered pottery respectively. The site is situated at the Curonian Spit a narrow peninsula (0.5 – 5 km width) which separates Baltic Sea from the Curonian Lagoon and is composed mainly from aeolian sand. Currently, Nida Stone Age site is further away from the sea or lagoon shores, but the latest research which included intensive boring, GPR profiling and stratigraphy analysis lets us to draw a conclusion that during Subneolithic and Neolithic the site was on the shore of Curonian Lagoon. Excavations were renewed in 2020. Aims of the latest research at the site were firstly to gather samples from stratified layers for age modelling and secondly to collect direct data on site paleoecology. A large collection of wood charcoals was obtained by hand-

picking during excavations and from soil samples using floatation method. Anthracological analysis was carried out to determine the best samples for radiocarbon dating and to reconstruct past woodland composition.

The results from the latest research lets us cautiously reinterpret the previous notions of chronology and environment. New radiocarbon dates indicate different chronological view and together with freshwater reservoir age correction narrows down the Neolithic period of Nida settlement and distinguishes it from Subneolithic. Analysis of charcoals from cultural layer indicates different environment than previously thought with higher than expected percentage (>50 %) of deciduous broad-leaf trees (Quercus, Alnus, Acer, Corylus).

5 INVESTIGATING HUMAN-ENVIRONMENT INTERACTIONS USING ARCHAEOLOGICAL SHELL PROXIES: THE CASE OF THE FRANCHTHI CAVE AND ITS SUBMERGED NEOLITHIC SETTLEMENT

**Abstract author(s):** Theodoraki, Danai (Römisch Germanisches Zentralmuseum - RGZM)

**Abstract format:** Oral

The molluscan record can provide significant evidence on prehistoric human-environment interactions, as the coastal foraging and early farming communities were closely connected with the immediate marine environment. Broad-scale paleoenvironmental and climate proxies have been widely used when addressing the subject of the liminal phase of the late Mesolithic towards the Early Neolithic period. However, the shell record is able to contribute valuable site-specific evidence when employed as a paleoclimatic and seasonality proxy in order to investigate long-term trends and extreme short-term paleoclimatic events. This presentation is part of a PhD project that intends to examine the ways in which the inhabitants of prehistoric coastal sites in the Mediterranean that bear witness to this transition, such as the site of Franchthi in the Argolid in Greece, were affected by fluctuations in the local paleoenvironmental conditions and sea-level change in terms of subsistence and social practices using the archaeological shell record and inherent high-resolution paleoenvironmental datasets. Thus, environmental variability of the Mesolithic/Neolithic interface will be employed to illuminate important aspects of the coastal communities, while considering different scales of spatial and temporal analysis. Overall, the environmental proxy data of this on-going study have the potential of providing important information on the submerged agricultural landscape of the site.

6 THE MARINE PREHISTORY SAMPLER (MPS), SEARCHING FLINTS IN MOST UNREACHABLE AREA'S

**Abstract author(s):** Muller, Axel - Waldus, Wouter (ADC archeoprojecten) - Smit, Bjørn (Cultural Heritage Agency)

**Abstract format:** Oral

Collecting data about prehistoric occupation from submerged landscapes is common practice in Dutch archaeology. Especially in the west of the country, there are many examples of surveys in drowned landscapes, in areas that are reclaimed (polders). The last decennia, progress has been made in methods and practices for detecting late Pleistocene and early Holocene sites.

Fieldwork in areas that are still open water is very rare. But recent sand and gravel extraction and a commission from the Cultural heritage Agency of the Netherlands gave an opportunity to search for solutions or to improve existing methods and practices. In recent years there have been archaeological surveys of submerged landscapes in one of the large lakes of central Netherlands (Markermeer). In collaboration with important stakeholders, like the Cultural Heritage Agency of the Netherlands, a new sampling technic was developed for sampling areas of a submerged landscapes underwater. Due to this project progression was made in the practical challenge of collecting artefacts from a difficult to reach place (underwater submerged and covered prehistoric landscape), but also in the process of assessment and evaluation of survey data to get a better view of occupation and land use in submerged landscapes. Combined geoarchaeological research and newly developed large sampling methods results in mapping Mesolithic sites in, until recently, unreachable places.

In this presentation we want to show how the MPS was used to detect Mesolithic sites and discuss possibilities and limitations for use in other envionrnments.

7 WASHED AWAY – THE IMPACT OF STORMS DURING THE LATE LITTORINA TRANSGRESSION PHASE ON PALAEO TOPOGRAPHY AND ARCHAEOLOGICAL SITES

**Abstract author(s):** Enzmann, Jonas (Lower Saxony Insitute for Historical Coastal Research)

**Abstract format:** Oral

It is known that storms could have a massive impact on the formation of coastal landscapes. Nevertheless, their remains are not often discussed in the archaeological community so far. Most sites from the Mesolithic period that are described well, show more or less undisturbed or fluvial influenced waste-layers in ancient shallow waters. At the site Strande LA 163 in the Baltic Sea near Kiel, Northern Germany the opportunity arose to study how archaeological material and palaeotopography is impacted by heavy storms. The site was discovered in 2011 nowadays at 6 m water-depth around 1 km in front of the modern coast. A first excavation campaign in 2012 and a survey in 2014 on the site dating to the aceramic phase of the Ertebølle-Culture had very promising results, which led to the current project. Under the title: „Subsistence strategies, settlement structure and communication during the terminal Mesolithic exemplified by a submarine micro-region in the Bay of Kiel” the German Research Foundation (DFG) granted a three years project to the Lower Saxony Institute for Historical Coastal Research (NIhK).

In four diving campaigns excavation, coring and geophysical data could be obtained and merged through a special measurement system that delivered a rarely achieved precision in underwater archaeology. On that basis C-14 dating, pollen analysis, find compositions and the progression of layers through different datasets could be discussed in detail. In the end it was possible to describe a site formation process in which sediments and finds from around 5300-5000 BCE were deposited in a depression around 5000-4800 BCE. Most likely a second eroded settlement phase after the storm event could be verified by few finds in the modern-day sand layer.

8 MAPPING THE CHANGING COASTLINE OF THE SWEDISH VIKING AGE SITE OF BIRKA THROUGH HIGH-RESOLUTION ARCHAEOLOGICAL PROSPECTION

**Abstract author(s):** Trinks, Immo (Vienna Institute for Archaeological Science, University of Vienna; Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology, Vienna) - Wallner, Mario (Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology, Vienna) - Nau, Erich (Norsk institutt for kulturminneforskning, Oslo) - Löcker, Klaus (Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology, Vienna; Zentralanstalt für Meteorologie und Geodynamik, Vienna) - Doneus, Michael (Department of Prehistory and Historical Archaeology, University of Vienna; Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology, Vienna) - Gabler, Manuel (Norsk institutt for kulturminneforskning, Oslo) - Hinterleitner, Alois (Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology, Vienna; Zentralanstalt für Meteorologie und Geodynamik, Vienna) - Verhoeven, Geert - Klimczyk-Lugmayr, Agata (Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology, Vienna) - Neubauer, Wolfgang (Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology, Vienna; Vienna Institute for Archaeological Science, University of Vienna)

**Abstract format:** Oral

Background and Aim:

The UNESCO World Heritage Site Birka and Hovgården is located on the neighbouring islands of Björkö and Adelsö in Lake Mälaren, Sweden. Due to post-glacial rebound, the land has risen by up to six metres over the past 1,200 years, causing substantial changes to the coastline. A comprehensive archaeological prospection case study aims to explore the site to reveal buried settlement remains and Viking Age burials in unprecedented imaging resolution, while at the same time testing and advancing archaeological prospection techniques.

Material and Methods:

Remote sensing in form of aerial photography and airborne laser scanning as well as ground based non-invasive near-surface geophysical prospection methods have been adapted and utilised to collect extensive high-resolution datasets for archaeological prospection. A dedicated LiDAR survey was flown using a Riegl LMS-Q680i full-waveform laser scanner mounted in a Cessna 182 light airplane. The scanner acquired in average 12 points per square metre with up to 20mm ranging accuracy. Efficient motorised, ground-penetrating radar measurements were conducted with a motorised 16-channel 400 MHz MALÅ Imaging Radar Array on the ground. The collected datasets were integrated and analysed in a GIS using a specially developed toolbox.

Results:

A highly detailed digital terrain model has been generated from the LiDAR data after removal of vegetation and modern constructions using the SCOP++ software package (TU Wien). Topographically corrected georadar depth-slices have been computed to map and image the subsurface in-depth. The post-glacial uplift of the land has been reconstructed using both the digital terrain model as well as the subsurface information derived from georadar measurements.

Conclusions:

The large-scale archaeological prospection approach revealed not only numerous buried archaeological remains and permitted the mapping of the topography of the World Heritage Site in unprecedented resolution, but provided detailed information on the changing shoreline and corresponding human-environment interactions.

9 DETECTION, VISUALIZATION AND ANALYSIS OF PALAEO-BEACHES FOR HIGH-RESOLUTION CHRONOLOGICAL AND SPATIAL ARCHAEOLOGICAL INVESTIGATIONS – GEOPHYSICAL CASE STUDIES FROM NORWAY

**Abstract author(s):** Stamnes, Arne (NTNU University Museum, Department of Archaeology and Cultural History) - Kristiansen, Søren (Department of Geoscience, Aarhus University)

**Abstract format:** Oral

A combined landscape- and geoarchaeological approach has great potential for illuminating the interaction between land-water divides and for landscape reconstruction. Such “landscape gradients” where elements meet were often preferred locations for settlement and human activity globally. In addition to the archaeological information, large scale, high-resolution geophysical surveys have tremendous potential as a source of paleoenvironmental information by detecting former beach ridges, palaeochannel systems, palaeotopography and geomorphological processes, as well as providing information on relative chronology of archaeological observations and landscape changes.

The study of beach ridges, in particular, has the potential to provide additional information on relative landscape chronology and be used to create new relative sea-level curves, but often relies on singular ground-penetrating radar (GPR) sections and or visible

beach ridges, sometimes detected by Lidar-analysis. Large scale, high-resolution geophysical survey examples demonstrate how a much more detailed impression of the temporal landscape development is achievable. Such high-resolution in 3D from the combined surface and subsurface investigations have to a large degree not been utilised for paleoenvironmental and -landscape mapping, as the survey parameters are often targeted to much larger scale but at a considerably lower resolution. A GPR approach, combined with terrain models derived from Lidar-data, provides new information on landscape developments. Therefore, it is applicable to study sites from all archaeological time periods and may be especially useful for lake and sea coastal areas next to or below the ice shields of the Last Ice Age.

This paper present examples from several archaeological coastal sites from Norway that demonstrate the archaeological possibilities and technical feasibilities of a high resolution and detailed view of the relative changes in sea level by revealing sub-surface paleo-landforms. This combined information can form the foundation for an integrative high-definition, multi-scalar understanding of human-landscape interactions, resilience-studies and large-scale settlement studies.

**DESTROYED IN 1362 AND CONSERVED UNDER SEDIMENTS: INTERDISCIPLINARY INVESTIGATION OF SUNKEN MEDIEVAL SETTLEMENTS IN THE WADDEN SEA (NORTH FRISIA, GERMANY)**

**Abstract author(s):** Majchczack, Bente (Christian-Albrechts-Universität zu Kiel; ROOTS Cluster of Excellence) - Blankenfeldt, Ruth (Zentrum für Baltische und Skandinavische Archäologie) - Hadler, Hanna (Johannes-Gutenberg-Universität Mainz) - Klooß, Stefanie (Archäologisches Landesamt Schleswig-Holstein) - Wilken, Dennis (Christian-Albrechts-Universität zu Kiel)

**Abstract format:** Oral

The tidal flats, marsh islands and sand barriers of the southern Wadden Sea area of North Frisia (Germany) cover the extended remains of a sunken cultural landscape. From the Early Medieval Period on, settlers have occupied a natural landscape of marshes, river embankments and fenlands. With rising sea-levels and recurrent floodings, a systematic reclamation and cultivation, alongside with construction of extensive coastal protection measures set it from the 12th century and led to a fundamental transformation into a cultural landscape. Large-scale peat quarrying and drainage led to subsidence of the ground-level in many areas, creating an additional vulnerability of settlements and farmland towards flooding. This led to a pattern of destruction and land-losses through major storm surges, notably the extremely destructive flood of 1362, countered by adaptations like reclamation or abandonment. While past research largely depended on random finds, uncovered by tidal erosion, we approach the area with a combined geoarchaeological, geophysical and archaeological methodology to produce a high-resolution reconstruction of the landscape dynamic, the Medieval settlement patterns and land-use in an area, which is difficult to access with traditional methods. Areas with visible remains are mapped with drone photography and surveyed with metal-detecting. Magnetic gradiometry provides a detailed mapping of settlement structures beneath the present tidal flats, marine reflection seismics is added to characterize the underground structures. Vibracoring and geochemical sediment analysis is used for validation of structures and reconstruction of the palaeoland-scape. An integrated GIS-database is used to bundle the results to create a comprehensive visualization of the Medieval settlement landscape. The presentation brings forward the used methodology along with exemplary prospection results from the medieval town of Rungholt, drowned in 1362.

11

**NURAGIC NAVIGATION AND LANDING POINTS: THE COAST OF TERTENIA (CENTRAL EASTERN SARDINIA)**

**Abstract author(s):** Lopez, Giuseppa (freelance archaeologist)

**Abstract format:** Oral

This contribution is the result of the underwater and terrestrial archaeological prospections conducted along the coast of Tertenia (central eastern Sardinia), in the locality named “San Giovanni di Sarrala”.

This site is marked by a historical anthropization. Its coastal landscape has geomorphological and hydrographic characteristics that make it an area of historical and archaeological importance in connection with the sea routes and in particular due to the landing points.

The availability of landing points needs to be referred to the ancient coastal geomorphology, to the technical characteristics of the boats, and to the navigation techniques widespread in the western Mediterranean during the Nuragic time (Bronze Age). This can be achieved through a comparison with the data coming from contemporary wrecks belonging to other civilizations with which the Nuragic one had intense relationships.

This contribution therefore aims to provide new knowledge based on archaeological data resulting from targeted prospections combined with evidence coming from geomorphological and paleo-environmental studies and considering man-environment interactions, particularly how man used the environment and adapted to it.

12

**THE EVER CHANGING OLÉRON (FRANCE): A CHALLENGING PUZZLE FOR COASTAL ARCHAEOLOGISTS**

**Abstract author(s):** Save, Sabrina (Amélie SARL) - Soler, Ludovic (Service archéologique départemental de Charente-Maritime; UMR 6566 PACEA) - Gandois, Henri (UMR 8215 Trajectoires; UMR 6566 CReAAH)

**Abstract format:** Oral

Invaded every summer by tourists, Oléron island, on the French Atlantic coast, is the biggest French island (174 km<sup>2</sup>) after Corsica. Its physiognomy is in perpetual evolution, with today’s Oléron totally different from the Prehistoric one due to rising sea levels, the infilling of its multiple coastal lagoons, the creation of big sand dunes, recent urban development and the exploitation of its salt marshes. Some Prehistoric sites are now exposed on the intertidal zone, while others are stranded in the middle of the island whereas they once had direct ocean access. Trying to understand the human implantation strategy on Oléron disconnected from the island’s geographic history results in non-sense.

Intertidal excavations, pedestrian and geophysical surveys, as well as palaeo-environmental coring in the coastal salt marshes are leading to first integrated archaeological and palaeo-environmental reconstructions of the island. Coastal lagoons on the western coast started infilling around 4900 BP, with the development of peat bogs. Around 3200 BP some erosion processes, likely caused by storms, took place and the bogs became sealed from the ocean by the creation of sand dunes. On the eastern coast, new investigations revealed the coastal lagoons were deeper and never developed peat; they remained open water until sealed from the ocean, probably following the creation of sand dunes at a yet undetermined date, transforming the lagoons into salt marshes later exploited by humans. Nevertheless, some coastal areas remain inaccessible to our investigations. While sand dunes protect the archaeology by sealing it under meters of sand, they are also an obstacle to the detection of archaeological sites, engulfing Medieval villages and Prehistoric megaliths alike. We hope in the near future that new geophysical methods will allow us detect these sand-submerged archaeological sites allowing us to complete our comprehension of human implantation on the coasts.

13

**ENVIRONMENT AND SETTLEMENT IN A LONG TERM PERSPECTIVE: VIK, ØRLAND, CENTRAL NORWAY 600 BC – AD 1250**

**Abstract author(s):** Ystgaard, Ingrid (NTNU University Museum; Department of Historic and Classical Studies, NTNU) - Gran, Magnar (NTNU University Museum)

**Abstract format:** Oral

Postglacial land upheaval combined with the flat landscape profile of the Ørland peninsula, central Norway, have led to profound transformations of the landscape ever since the peninsula rose from the sea c. 600+/-100 BC. An aim of a large-scale excavation project at Vik in 2015 and 2016 was to gain a coherent understanding of the relationship between landscape development, vegetation history, climatic change and settlement at Vik, Ørland, from the Late Bronze Age to the early medieval period. A generalized interpretation of geological, archaeological and botanical data from Vik suggests periods of intensive settlement and agriculture in the Pre-Roman Iron Age and Roman Iron Age, while the Migration Period was a period of decline. Settlement and agriculture nearly disappeared in Vik during the Merovingian and Early Viking periods, coinciding with re-vegetation of the landscape after the global climatic catastrophe of AD 536. A sheltered bay formed a safe harbor during the period from c. 400 BC to c. AD 600, when the bay eventually dried out and left the settlement at Vik in a less strategic position. Vik was re-settled very late, not before c. AD 950, possibly because of the extinction of the harbor. In this paper, land upheaval, vegetation history and settlement development at Vik are combined in a chronological scheme of ten phases.

14

**EUROPE’S COASTS IN HIGH-DEFINITION BY CROSS-BORDER RESIDUAL RELIEF MODELING: THE NORTH SEA AND THE BALTIC SEA AS EXAMPLES**

**Abstract author(s):** Kristiansen, Søren (Department of Geoscience, Aarhus University; Center of Urban Network Evolution - UrbNet, Aarhus University) - Stott, David (Moesgaard Museum, Højbjerg) - Maring, Peter (School of Culture and Society, Aarhus University)

**Abstract format:** Oral

Glacio-isostatic influences on past coastline dynamics and consequences for prehistoric societies have been studied for decades. Remote sensing is increasingly an essential tool for those attempting to identify and characterize features on the surface of Earth. In particular, the rapidly growing spatial coverage of Airborne Laser Scanning (lidar) data has enabled archaeologists to find many hitherto unidentified features. This is often focused on single sites or at local scale as data are difficult to handle. However, in coastal setting lidar data are particular useful as they all allow to examine research questions across regional and national borders.

Here, we show the first examples of the archaeological possibilities of a cross-border, newly developed GIS layer where morphologies are mapped by residual relief modelling and detected on a large scale by looking for both landscape and archaeological features. This first example covers large parts of Northern Europe, namely Belgium, Denmark, Estonia, Finland, Germany (Brandenburg), Holland, Lithuania, Poland, Norway, and Sweden.

We will exemplify the usability of a combined residual relief modelling approach by focusing on a few famous archaeological sites, to highlight what new can be learned at local scales, and will also demonstrate how it works at the borders of national datasets, where cross-border archaeological comparisons have hitherto been difficult.

MAPPING PALAEO-SHORELINE IN THE PREHISTORY OF THE IBERIAN PENINSULA FOR THE ANALYSIS OF SETTLEMENT PATTERNS

**Abstract author(s):** Mejías-García, Juan Carlos - Fraile-Jurado, Pablo (University of Seville)

**Abstract format:** Oral

Due to the climatic conditions of the last Quaternary ice age, it has been recorded that sea level stayed some tens below current sea level in the period between 120,000 BP and 6,000 BP, reaching its minimum value of about -130 meters approximately 18,000 years ago, during the Glacial Maximum.

This drop in sea level and its subsequent rise to recover the current levels, did not occur linearly, taking place numerous periods of changes not only in the rhythm but also in the trend.

An algorithm that allows the calculation of the time that the currently submerged lands remained, emerged during that period, was designed in order to implement it in the coasts of the Iberian Peninsula. It also provides the determination of which palaeo-shoreline would correspond to any specific date within the study period.

From our radiocarbon dating database (integrated in the SIAC project - <http://arqgeogis.us.es/dataciones/>), with more than 10,500 records, have been taked chronological data, georeferenced location and functional tipology of the prehistoric sites found within of the range of distance that facilitates access to marine resources.

This approach has allowed to determine the true and precise position and distance to the marine environment from prehistoric sites linked to the sea and explotation of marine resources, establishing a first analysis of the distribution and relationship of dating sites from peninsular prehistory with respect to its corresponding palaeo-shoreline.

CHANGING MINDS, CHANGING COASTS

**Abstract author(s):** Hutchinson, Oliver - Newman, Danielle - Northall, Lawrence (CITiZAN / MOLA)

**Abstract format:** Oral

Changing Minds, Changing Coast is a community led pilot study mapping 100 years of coastal change as evidenced by the memories and photographs of the residents of Mersea Island, Essex. Funded by the National Environment Research Council (NERC) and developed by CITiZAN (The Coastal and Intertidal Zone Archaeological Network), the project aims to co-create a visual and aural history of the islands changing coastline using data gathered from the community under COVID secure conditions. A network of local contacts within the Mersea community provided over 300 images and documents from their personal archives. These were supplemented by a series of eight oral history recordings recounting the presence of archaeological features, topography and structure of the fore-shore sediments, and the presence and absence of plant and marine life at two locations on the island. These indicators were used to interrogate the image data and investigate, amongst others, the scale and speed of coastal erosion, habitat loss and threats to coastal heritage around the island. Using this data set, covering a century on the island, the CITiZAN team cross-referenced and mapped the myriad changes in 20-year intervals from 1920 to 2020 to create a timeline of change. The combination of oral histories and personal archives brought a unique dimension to the study, shedding light on a range of issues to help better understand the human-environment interactions on the island. The project provides a model for archaeologists to work remotely with communities to document the impacts on coastal archaeology wrought by gradual changes and abrupt shifts in coastal morphology, whilst highlighting the resilience of coastal communities to their changing environment. It was achieved within a framework that puts the community at the forefront of creating a dataset valuable to a range of disciplines including archaeologists, geographers, marine biologists, and social historians.

ASSESSING THE METHOD OF DATING STONE AGE SITES WITH REFERENCE TO RELATIVE SEA-LEVEL CHANGE IN SOUTH-EASTERN NORWAY

**Abstract author(s):** Roalkvam, Isak (University of Oslo)

**Abstract format:** Oral

Reconstructions of the trajectory of relative sea-level change is frequently used to ascribe an approximate date to prehistoric sites and monuments that were situated close to the shoreline during their original use and occupation. The geologist W.C. Brøgger and his son, the archaeologists A.W. Brøgger, noted the close correspondence between Norwegian Stone Age sites and prehistoric shorelines in their respective theses of 1905. Ever since, this fact has been a defining element of Stone Age research in Norway. In south-eastern Norway the isostatic rebound has been more profound than corresponding eustatic sea-level rise, leading to a continuous and relatively rapid regression of the shoreline from as much as 200 m a.s.l down to its present level. Consequently, site activities in the region can be ascribed a fairly precise date-range based on reconstructions of relative sea-level change, provided the sites were in fact located on the shoreline when they were in use. However, despite its importance, there have been surprisingly few rigorous evaluations of the applicability and precision this method. I aim to conduct such an evaluation by investigating the agreement between site dates informed by relative sea-level change and independent dates achieved through radiocarbon dating. The study is based on around 50 sites from an area where we have good knowledge of the trajectory of shoreline displacement.

An assessment of this relationship can have major implications how we approach Stone Age sites where other means of dating are unavailable, and, as a consequence, the temporal framework on which our understanding of the period is based. Furthermore, since the method is only applicable so long as the societies in question have continuously settled on or close to the contemporary shore-

line, adherence or deviations from this pattern also has direct implications for the socio-economic foundations of the societies in question.

IMPACT OF HOLOCENE COASTAL CHANGES ON PAST HUMAN COMMUNITIES: RESULTS FROM AN INTERDISCIPLINARY APPROACH IN THE GIRONDE ESTUARY MOUTH

**Abstract author(s):** Culioli, Camille (Université Bordeaux Montaigne; Laboratoire AUSONIUS; Sorbonne Université Paris) - Stéphan, Pierre (Laboratoire LETG; Université de Bretagne Occidentale) - Verdin, Florence (Laboratoire Ausonius; Université Bordeaux Montaigne) - Bertrand, Frédéric - Arnaud-Fassetta, Gilles (Laboratoire PRODIG; Université de Paris) - Coutelier, Clément (Laboratoire AUSONIUS; Université Bordeaux Montaigne) - Eynaud, Frédérique (Laboratoire EPOC; Université de Bordeaux) - López-Romero, Elias (Universidad Complutense Madrid) - Suanez, Serge (Laboratoire LETG; Université de Bretagne Occidentale)

**Abstract format:** Oral

The current sea level rise induced by climate change may lead to challenges for coastal communities under pressure of intense coastal changes. In North-Médoc, comparable environment variations have been experienced by past human societies. The evidence of human-environment interactions trapped in the Gironde estuary mouth sedimentary archives, can offer comparative systems for the current challenges. Consequently, the diachronic and long-term study of the correlation between human and environmental processes highlights the adjustment and adaptation capacities of coastal populations.

The North-Médoc Peninsula (SW France) is a triangular-shaped coastal area between the Atlantic Ocean and the Gironde estuary. During the last three decades, intense winter storms have uncovered sedimentary deposits containing numerous archaeological remains on the Amélie beach, located on the oceanic side of the North-Médoc. Coastal erosion in this area provides an opportunity to access a whole array of paleoenvironmental and archaeological data for analysis.

Since 2013, through four interdisciplinary projects: LITAQ, FAST-LITAQ, Ecorest and ESTRAN, surveys and analysis have continuously been conducted along the Amélie beach. They combine aerial photography, topography, micropaleontology, radiocarbon dating, sedimentology and archaeology. This interdisciplinary approach has resulted in a high-resolution chronostratigraphic reconstruction of the Amélie beach deposits. Human-environment interactions were analyzed for the past 8 ka years, which correspond to a Holocene sea level slowdown period. Three different scales were considered for this: from the structure to the territory to better constrain paleogeographic changes and settlement patterns. Archaeological and paleoenvironmental results have allowed the characterization of relative sea level variations in the area and the recognition of specific periods of environmental pressures and of human responses from the Neolithic to the Antiquity.

This reconstruction of long-term human-environment interactions makes it possible to sketch the evolution of adaptation strategies of human communities to coastal changes during the Holocene.

NATURE VS. NURTURE: THE SUBMERGED PALEO-LANDSCAPES AND LATE NEOLITHIC PILE-DWELLING IN ZAMBRATIJA BAY (CROATIA)

**Abstract author(s):** Jerbic, Katarina (Flinders University, Adelaide)

**Abstract format:** Oral

In global climate history, the period after the Last Glacial Maximum is known for a sudden increase in temperature, consequently leading to rapid rise of mean sea-levels which inundated low altitude landscapes worldwide. Sea-level rise significantly influenced the climate as well as the natural organisation of landscapes and human populations of the impacted areas. In the Northern Adriatic region, this influence was additionally amplified by the melting of the Alpine Glacier, whose melted ice was flooding the Northern Adriatic Basin slightly longer than the rest of the Mediterranean. Radiocarbon dated archaeological and paleo-environmental evidence from Zambratija Bay (Northern Adriatic) helped recreate a chronological timeline of local sea-level, environmental and social change since the time when the Alpine ice water was still flooding the landscape, until today. This evidence includes three seabed cores whose sediments heavily imply a change from freshwater, to brackish and to a marine environment in only 2500 years. A dendrochronological sequence derived from eleven wooden architectural elements found in situ revealed that around 4,200 BCE, a pile-dwelling was built there in a brackish environment and existed for at least 63 years. Furthermore, the stratigraphy of the seabed cores indicates that the site was abandoned by the time the environment fully changed to marine. These results revealed a new sociological aspect of the coastal societies in the Prehistoric Alpine Adriatic, indicating that they likely had highly developed subsistence economies and a deep understanding of seasonal activities within the environments they were inhabiting. The environments were changing so rapidly and intensely that the state of constant change must have been an incorporated part of everyday life. This paper shows the connections between the changes in natural and cultural history of Zambratija Bay by presenting evidence of resilience and sustainability of the population that occupied the prehistoric pile-dwelling.

A. INTENSIVE SYSTEMATIC SURVEYS OF PALAEOSPITS IN THE NARVA-LUGA KLINT BAY AREA: ANALYSIS OF METHODOLOGY AND RESULTS

**Abstract author(s):** Gerasimov, Dmitriy (Peter the Great Museum of Anthropology and Ethnography, Rus.Acad.Sci.) - Kholkina, Margarita (Saint-Petersburg State University; Russian Geological Research Institute - VSEGEI) - Muravev, Roman (Saint-Petersburg State University) - Danilov, Gleb (Peter the Great Museum of Anthropology and Ethnography, Rus.Acad.Sci.) - Kriiska, Aivar (Tartu University) - Nordqvist, Kerkko (Helsinki University)

**Abstract format:** Poster

In recent decades, palaeogeographical studies in the Narva-Luga Klint Bay area on the Russian-Estonian border have identified several generations of palaeospits, which formed mainly during the Litorina Sea stage (7800–2500 cal. BC).

In the beginning of the 2000s, forest fires destroyed large areas of pinewood on the Russian side of the territory. Forestry authorities cleaned the fire-damaged areas, which were then ploughed for planting new pine trees. The situation caused by the natural disaster presented a unique opportunity for archaeological surveys. During several field seasons, intensive and systematic surveys were fruitfully carried out in the territory of about 200 sq.km, and over fifty new Stone Age archaeological sites (prehistoric settlements and campsites) were discovered. The sites were associated with palaeospit formations and formed clusters.

The presence of large open areas allowed for proper transect surveys in several locations. In 2019, such a survey was conducted on the Galik palaeospit, where five Stone Age sites were already known at the time. About 300 km of transects was walked by a crew of students, investigating an area of 1 sq.km, meter by meter. Altogether 148 find spots with over 2700 artefacts were identified. The three largest concentrations were considered as remains of prehistoric settlements/campsites, but no cultural layer was associated with the rest of finds. These results, as well as those previously obtained in other palaeospits of the territory, make it possible to discuss ways of exploitation of coastal zones by prehistoric people in different phases of the Stone Age.

The study was supported by the Russian Science Foundation project № 17-77-20041 “The impact of global, regional and subregional natural factors on the development of coastal morphosystems of the eastern Gulf of Finland as a human living environment”.

B. THE IMPACT OF SHORELINE CHANGES OVER MESOLITHIC POPULATIONS OF WESTERN IBERIA (11500 TO 7000 CAL BP)

**Abstract author(s):** Araújo, Ana Cristina (DGPC- Archaeosciences Laboratory, Lisboa; Research Centre in Biodiversity and Genetic Resources, CIBIO-InBIO; UNIARQ, Centre for Archaeology, University of Lisbon) - Costa, Ana Maria (DGPC- Archaeosciences Laboratory, Lisboa; Research Centre in Biodiversity and Genetic Resources, CIBIO-InBIO; IDL, Instituto Dom Luiz) - Costas, Susana (Center for Marine and Environmental Research - CIMA, Universidade do Algarve, Faro) - Naughton, Filipa (IPMA: Instituto Português do Mar e da Atmosfera, Lisboa)

**Abstract format:** Poster

Changes in shoreline are nowadays a major concern to populations living in coastal zones, forcing governs to act on climate change worldwide. Notwithstanding, variations in the shape and position of the coastline have occurred continually throughout our millennial history, though at different rates, with people adapting to the new environmental scenarios, creating innovative solutions, and developing new skills.

The Pleistocene-Holocene transition was concomitant to a rapid rise in mean sea-level due to global climate warming and consequent melting of ice caps. It was also a time of change in hunter-gatherer societies that become more dependent on the sea and its resources. These dynamics are well documented in the archaeological and geological records of the littoral areas of SW Iberia. From 11500 to 7000 cal BP, as sea-level rises, changes in human settlement and mobility patterns took place, although post-depositional processes may have contributed to distort traces of that distant past. These changes in the lifestyle of human societies separates the Early (11500-8400 cal BP) from the Late Mesolithic (8400-7000 cal BP). During this time span, people shift from mobile and dispersed groups occupying and exploiting the coastal environments, to more stable and clustered settlement, organised around the margins of estuarine areas formed during marine transgression.

The apparent abandonment of the coastal fringe seems to oversimplify the real distribution patterns of people during the Late Mesolithic, representing only the pattern observed along the northern coast. Indeed, the southwestern coast continues to be visited and exploited regularly during this later phase. According to our interpretations, geomorphological evidence suggests a sand depleted coast to the north that associated with its rapid retreat and inundation would have inhibit people from settling. Conversely, the southern coast was encouraged by a greater abundance of sand that would delay marine transgression, accommodating the Mesolithic groups.

C. PREHISTORIC HUMAN-ENVIRONMENT INTERACTIONS IN THE LINCOLNSHIRE FENLANDS: A GEOARCHAEOLOGICAL INVESTIGATION OF WILLOW TREE FEN

**Abstract author(s):** Derrett, Sally (Department of Archaeology, The University of Sheffield)

**Abstract format:** Poster

Researching the complex sediment sequences of the Fens of Eastern England reveals a dynamic environmental history of fluctuating marine and freshwater inundations throughout the Holocene. Archaeological evidence for long-term human land use and

settlement is widespread on the boundaries of the Fenland basin, with the wetlands providing both challenges and opportunities for fen-edge communities.

Diachronic geoarchaeological analysis at Willow Tree Fen, in the relatively unstudied silt fens of south Lincolnshire, revealed a record of human-environment interactions in the landscape since the Late Mesolithic. The palynology and microcharcoal analyses reconstructed numerous fluctuating ecological zones which altered according to the shifting influences of marine and freshwater inputs. People’s relationships with this dynamic environment were responsive and resilient, including evidence for pastoralism during dry periods and salt-making during periods of brackish marine conditions.

Despite a lack of peat sediments at the study site, the research has demonstrated the preservation capabilities of the roddon deposits in the Fenland, revealing a well preserved, long pollen sequence throughout the stratigraphy. The results demonstrate the potential for extending geoarchaeological analyses across much of the Fenland. Future research can address the bias of peat-land-focused investigations by extending palaeoenvironmental studies into areas which have been subject to extensive marine inundation and peat wastage.

149 BIOARCHAEOLOGY OF HEALTH, LIFESTYLE AND SOCIAL CHANGE IN THE LATER MIDDLE AGES

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Robb, John (University of Cambridge) - Knüsel, Christopher (Université de Bordeaux)

**Format:** Regular session

Skeletal and molecular analysis are providing ever more powerful tools for investigating aspects of medieval society which historical records tell us little about. This symposium displays the range of modern studies, highlighting the productive nature of bringing together different kinds of data interdisciplinarily and the gains to be made by deep social contextualisation of bioarchaeological results.

This session showcases current research at the convergence of social history and bioarchaeology, for the later Middle Ages (from around 900 AD through about 1500) in Europe. The range of topics is great. Contributions may focus upon epidemics such as the Black Death and their social consequences; genetic profiles of medieval populations and their implications for kinship and mobility; diet and its social differentiation; human-pathogen coevolution; the biological correlates of social patterns such as gender, class and religious identity; aspects of daily life such as the organisation of work, social practices of violence, and hidden aspects of religious practice; and the osteobiographical narratives of ordinary people.

ABSTRACTS:

1 MUSLIMS UNDER CHRISTIAN RULE THROUGH THE ISLAMIC POPULATION OF VALL D'UIXÓ (CASTELLÓN, SPAIN)

**Abstract author(s):** Olivé-Busom, Júlia (Autonomous University of Barcelona) - Márquez-Grant, Nicholas (Cranfield Forensic Institute, Cranfield University) - López-Costas, Olalla (Group EcoPast (GI-1553), Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University; Laboratorio de Antropología Física, Facultad de Medicina, Universidad de Granada) - Kirchner, Helena (Autonomous University of Barcelona)

**Abstract format:** Oral

From 711 and until the Christian conquest, a great part of the Iberian Peninsula was under Islamic rule and became known as Al-Andalus. This generated a new political and social order, the appearance of new forms of rural settlement and agricultural practices, and the migration of Arab and North-African populations. Once the Christian kingdoms conquered these lands, they imposed a new social and economic rule, the feudal order. The Andalusí people that remained in the regions under Christian rule became known as mudéjares. Their distribution was uneven in rural areas, and in many cases, their presence was the result of relocations dictated by the feudal power. Their status within the new Christian context is widely debated as several authors propose they were subjected to fiscal depredation and populational concentration and marginalisation.

One of the areas where mudéjares remained is modern-day Vall d'Uixó (Spain). During the Andalusí period, it consisted of a series of hamlets (qurá) that were organized around a fortress (ḥiṣn), the foundational date of which is placed on the AD 9th century. Through fossilized toponomy, it is believed that these hamlets had an Arab or Berber origin. Historical sources indicate that their Islamic population remained long after the Christian conquest (AD 1238) and until the Edict of Expulsion (AD 1609), concentrating most of the Islamic population of its region. Thus, this contribution presents the anthropological data gathered from 99 human skeletal remains from two of these hamlets. Our aim is to evaluate the physiological and occupational stress in the studied sample and its biological distance towards other Al-Andalus collections. Furthermore, samples from 7 skeletons have undergone aDNA analysis currently under study to further assess their possible Arab or North African ancestry.

2 **LIVING AND WORKING IN AL-ANDALUS: AN OSTEOLOGICAL COMPARISON OF RURAL AND URBAN POPULATIONS FROM ISLAMIC SPAIN (11TH -15TH C. AD)**

**Abstract author(s):** Charisi, Drosia (Department of Legal Medicine, Toxicology and Physical Anthropology, Faculty of Medicine, University of Granada) - Laffranchi, Zita (Department of Prehistory and Archaeology, Faculty of Philosophy and Literature, University of Granada; Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Milella, Marco (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Jiménez-Brobeil, Sylvia (Department of Legal Medicine, Toxicology and Physical Anthropology, Faculty of Medicine, University of Granada)

**Abstract format:** Oral

The Islamic occupation of the Iberian Peninsula (“al-Andalus”) from the 8th to the 15th centuries AD brought several changes in the daily life of the populations in this territory. However, it is unclear whether variability in local settings (eg. urban vs. rural contexts) triggered the adoption of different economic strategies, subdivision of gender roles and, therefore, daily activities . This study addresses this question by exploring differences in physical activity and gender subdivision of labor between urban and rural contexts in Southeastern al-Andalus. To this aim we performed an osteometric analysis of 152 adult individuals (n males: 75, n females: 77) from two cemeteries representing two social settings of Islamic Granada: La Torrecilla (rural) and Sahl ben Mālik (urban). Diaphyseal shape and product of diameters -as proxies for the directionality and intensity of bone mechanical loading respectively- were estimated from external measurements of long bones, and percentage absolute asymmetry in the humerus was calculated for both variables. Variables were then compared between the sexes and populations by means of Independent samples t tests, Analysis of Covariance, and Mann-Whitney U tests.

Results show a) greater sexual dimorphism of shape and diameter products in the rural population, b) greater male upper limb asymmetry in both contexts, and c) rounder right humeral diaphyses for the rural males compared to their urban counterparts, pointing to differences in the types of activity and the level of gender subdivision of labor between the two populations.

This work supports the findings of previous bioarchaeological studies that highlight the difference in living conditions and gender status in rural versus urban Medieval Islamic communities, adding new insights into social heterogeneity and gender roles in Al-Andalus.

This study was undertaken under the Research Project “Health and diet in Populations of Southeastern al-Andalus” (PID2019-107654GB-I00/AEI/10.13039/501100011033), funded by the Spanish Government.

3 **INFANT STRESS, MORBIDITY, AND AGE-AT-DEATH IN THREE RURAL AND SEMI-RURAL PORTUGUESE MEDIEVAL NECROPOLISES (COIMBRA, SOURE, AND LEIRIA)**

**Abstract author(s):** de Carvalho, Liliana (Research Center of Anthropology and Health, University of Coimbra) - Wasterlain, Sofia (Research Center of Anthropology and Health, University of Coimbra; Centre for Functional Ecology, University of Coimbra)

**Abstract format:** Oral

Health and disease indicators may reveal important information on cultural, social, and economic aspects of a population. According to the “Developmental Origins of Health and Disease” theory, the physiological stress experienced during childhood is particularly detrimental to the individuals’ health and development, causing health problems in adulthood and leading to increased morbidity, anticipation of age at death, and decreased average life expectancy.

In order to assess the impact that childhood stress may have had on the development of individuals who lived in urban or semi-urban sites, children’s stress indicators will be analysed in adults from three Medieval osteological series (11th and 16th centuries), from Leiria, Coimbra, and Soure. Therefore, the present study aims to estimate the frequency of child stress in urban/semi-urban samples; to investigate if there is any relation between childhood stress and age-at-death; and to understand whether individuals who suffered childhood stress were more likely to present higher degrees of morbidity in adulthood. Non-specific stress markers, namely dental enamel hypoplasia (DEH), were observed in the individuals’ anterior teeth, following the methodology suggested by Hillson (2001). The age at which each defect occurred was estimated according to Reid and Dean (2006). Other stress markers, like porotic hyperostosis (PH) and orbital cribra (OC), were also observed. Stature was assessed using Mendonça (2000) and Santos (2002) formulae.

A gradation of childhood stress levels was found, from the most urban site (Coimbra: 93.9% individuals, and 71.2% teeth with DEH; 38.1% OC; 72.0% PH; Stature ~159cm) to the smaller and more rural (Leiria: 83.9% individuals, and 56.6% teeth with DEH; 14.3% OC; 83.9% PH; Stature ~165cm; Soure: 80% individuals, and 77.6% teeth; 53.3% OC; 50.0% PH; Stature ~163cm). All obtained results suggest that the medieval urban environment was more detrimental to the children’s development and growth than the rural one.

4 **VIOLENCE, REPRODUCTION, AND SOCIAL MAINTENANCE IN THE LA ARRIXACA SUBURB IN THE 11TH-12TH CENTURIES**

**Abstract author(s):** Haber, María (Dpto. Preh., Arq., H. Antigua, H. Medieval y CCyTT Historiograficas. Univ.Murcia) - Marín, Javier (Professional archaeologist)

**Abstract format:** Oral

The archaeological and bioanthropological analyses results of the human remains excavated in San Esteban archaeological site (12th-13th centuries) (<http://sanesteban.um.es/>) are integrated into an interdisciplinary research project that combines paleopathological, genetic, isotopic and anthropological analyses that started in 2018 to the present. In this project, the archaeological procedures necessary for the correct sampling and interpretation of data is primordial. The aim of this analysis is to approach the daily life of this population established through the study of human remains and their spatial distribution.

In total, 38 subjects have been recovered in the maqbara, but just 16 skeletons were found anatomically articulated and buried in the right lateral decubitus position following the Islamic tradition. 75% of the individuals corresponded to adult women. The study of this part of the population provides data on social life maintenance and reproduction. Gender archeology takes on great importance in the site, allowing the comparison of the domestic areas of public and private spaces with the direct data recovered from the activities carried out by women in the diachrony of the suburb. The analysis of the infant remains, all under six years of age and no possibility of sex definition makes it probable to explain the most frequent causes of death, the importance of the weaning age or nutritional deficiencies, which allows a vision of the first years of life in this population. The minority of epigenetic traits leads to a presumably small inbreeding in this population, and the study of activity markers in their upper and lower extremities indicate different activities linked to given sex and/or age. The high percentage of injuries with numerous consolidated fractures is striking, as well as some examples of violence as a direct cause of death in the subjects.

5 **SKELETAL REMAINS AS TRACERS OF MEDIEVAL CHILDHOOD IN NW SPAIN**

**Abstract author(s):** Mangas-Carrasco, Elvira (Group EcoPast - GI-1553, Area of Archaeology, Dpt of History. Universidade de Santiago de Compostela) - López-Costas, Olalla (Group EcoPast - GI-1553, Area of Archaeology, Dpt of History. Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University; Laboratory of Anthropology, Department of Legal Medicine, Toxicology and Physical Anthropology, Faculty of Medicine, University of Granada)

**Abstract format:** Oral

The definition and characterization of childhood in different ancient societies is amongst the most stimulating subjects in archaeological academia, as well as in medieval studies. Its relevance resides on the fact that non-adult (< 20 years) studies allow to obtain a reliable knowledge of the whole medieval community, thus complementing those made on adults. Bioarchaeology provides useful tools to explore non-adult individuals’ lifestyles: non-adult skeletal remains constitute direct evidence of those children who died in first years of life, as well as adult remains are those children who survive until adulthood.

We propose a methodology which combine palaeopathological, dietary and historical aspects to approach narratives of medieval childhood. The subject of our analysis is the necropolis of Pontevedra village (coastal NW Spain). Metabolic stress markers (porosities) are recorded in 51 individuals, as well as the presence of specific pathologies. Grade of severity, degree of healing and coexistence of lesions were recorded. Results were related with isotopic data ( $\delta^{13}C$  and  $\delta^{15}N$ ) and historical and archaeological information.

There is a high frequency of cribra orbitalia (60%) and femoralis (72%) in adult and non-adult remains with a clearly age-pattern in healing. No other signs of metabolic disorders or infectious diseases were observed among non-adults. Demographic profile does not show a major presence of non-adults when it is compared with other sites. Dietary reconstruction shows a high intake of marine resources and C4 plants, which is coherent with the activity of the village. Results suggest the possible existence of harsh life conditions that caused the development of porotic lesions but not death. The high frequency of porotic lesions has been also observed in other communities highly dependent on marine resources. Thus, it could have prevented against stressors agents. Present study contributes to a better understanding of the social contextualisation of children from NW Spain.

6 **DIETARY PATTERNS IN THE LATE MEDIEVAL CHURCH OF SANTA MARÍA DE PONTEVEDRA (NW SPAIN) EXPLORED THROUGH ORAL PATHOLOGY**

**Abstract author(s):** Veiga-Rilo, Clara (EcoPast - GI 1553. Universidade de Santiago de Compostela) - López-Costas, Olalla (Group EcoPast - GI-1553, Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University; Laboratory of Anthropology, Department of Legal Medicine, Toxicology and Physical Anthropology, Faculty of Medicine, University of Granada)

**Abstract format:** Oral

Teeth are the most commonly and best-preserved human remains in archaeological contexts. Therefore, in aggressive soil environments for skeletal preservation, such as those prevailing in Galicia (NW Spain), the study of teeth allows to address additional information about past lifestyles. Oral pathology works have been mainly focused on dietary reconstruction; however, little agreement has been found with stable isotope analyses so far. We present here a necropolis whose isotopic dietary reconstruction has shown

7 a unique consumption of marine resources and C4 plants, possibly one of the highest in Europe for medieval times. Considering this specificity, we wanted to explore if there is a connection between oral pathology and stable isotopes for highly singular diets.

Santa Maria church in Pontevedra village is a well-studied skeletal collection, including general paleopathology and stable isotopes analyses in bone collagen. The burials span a 400-years chronological window (AD 13th to 17th centuries). The present study intends to complement previous research by carrying out an oral pathology analysis on the individuals of this necropolis and compare the results with the information already available. We analysed dental caries, macrowear (attrition), alveolar abscess, antemortem tooth loss (AMTL), periodontal disease, and the presence of dental calculus. The aetiology of these features was explored in connection with historical and archaeological information. Our results showed a moderate prevalence of defects, but the attrition was particularly severe. Males tend to develop more severe lesions. High macrowear has also been observed in other populations with marine dependency related to fish consumption. This novel information will allow us to study health and modifications in the subsistence strategies, as well as to approach the possible relation with environmental changes.

7 **A MULTIDISCIPLINARY APPROACH TO RECONSTRUCTING THE LIVED-EXPERIENCE OF MEDIEVAL ENGLISH SUFFERERS OF HANSEN’S DISEASE AND ‘LEPROSY’**

**Abstract author(s):** Blom, Alette (University of Cambridge) - Inskip, Sarah (University of Leicester)

**Abstract format:** Oral

Hansen’s Disease (HD) - colloquially known as leprosy - is one of the most culturally-laden diseases of human history, largely attributable to dramatic and debilitating physical lesions. The cultural stigma surrounding the condition today can largely be ascribed to 1) the conflation or confusion of true leprosy (Hansen’s disease) with ‘Biblical leprosy’; and 2) 19th- and 20th-century hyperbolic interpretations and translations of medieval texts, and subsequent negative and homogenous portrayal of ‘lepers’ in literature, art and even medicine.

However, historic research in the last two decades - piloted by C. Rawcliffe, E. Brenner and F.O. Touati – has redefined this concept of individuals suffering from HD as one uniform, ostracized group. This revisionist approach has highlighted the amount of variation that may have existed in the lives of sufferers based on status, gender, age, location, severity of lesions, and more significantly, personal choice. This new image has received scant attention in bioarchaeological research, despite its value to reconstruct and tell individual life histories. The analysis of human skeletal remains, our most direct source of evidence on the experiences of past peoples, represents a unique opportunity to reconstruct and narrate individual lives from varying social strata and can highlight variation in how HD impacted someone’s life-course in medieval England.

This paper will discuss the reconstruction of several life-courses of medieval English individuals suffering from HD and ‘leprosy’ by combining osteological, historic, archaeological and biomolecular data. By narrating these reconstructed lives, we can exemplify variation in experiencing the disease and life contingencies.

8 **EARLY MEDIEVAL BUDEČ MASS GRAVE FROM THE BIOARCHAEOLOGICAL PERSPECTIVE**

**Abstract author(s):** Vondrová, Hana - Štefan, Ivo (Department of Archaeology, Faculty of Arts, Charles University in Prague) - Drtikolová Kaupová, Sylva (Department of Anthropology, National Museum, Prague) - Fialová, Dana - Brzobohatá, Kristýna - Drozdová, Eva (Department of Experimental Biology, Faculty of Science, Masaryk University)

**Abstract format:** Oral

Budeč (Zákolany, Czech Republic) mass grave represents one of the most extensive archaeological examples of early medieval large-scale violence in Europe. This massacre dated to the 10th century may be hypothetically connected with the conflicts between members of the ruling family. The mass grave uncovered in the vicinity of Budeč hillfort had consisted of about 60 male individuals with numerous perimortem sharpforce trauma situated mainly on cranial bones. Moreover, a number of men were decapitated. Most of the individuals were robust with strong muscle attachment marks on bones. Men from the Budeč mass grave show different craniofacial values compare with individuals buried at local medieval burial sites. The characteristic patterns of healed injuries may point on the presence of trained warriors. This paper presents new bioarchaeological data that help to reveal the origin and social status of these individuals. Analyses of carbon (δ13C) and nitrogen (δ15N) stable isotope ratios were carried out for diet reconstruction. Individuals of non – local origin were documented by using stable strontium isotopes. The ancient DNA (aDNA) extraction was successful from all analysed human teeth. Subsequently, mitochondrial DNA was confirmed in 10 samples from 12 by PCR amplification and Sanger sequencing of the hypervariable regions I and II (HVRI and HVRII). This analysis showed wide variability in obtained polymorphisms between individuals. Next-generation sequencing (NGS) for the next step will confirm the results and extend data by the whole mitogenome. The multidisciplinary study of the Budeč mass grave offers a unique insight into the composition and lifestyle of military retinues in the early medieval societies.

This study was financial supported by a grant GAUK No. 394119, Social Structures of Early Medieval Populations from the Perspective of Archaeology and Anthropology, Faculty of Arts, Charles University in Prague.

9 **WHO WERE THE FIRST COPENHAGENERS? AN INTERDISCIPLINARY INVESTIGATION OF BURIALS FROM TWO MEDIEVAL CHURCHYARDS FROM COPENHAGEN, DENMARK**

**Abstract author(s):** Dahlström, Hanna (Museum of Copenhagen) - Jørvkov, Marie-Louise (Retsmedicinskt Institut, Copenhagen University) - Newell, Elizabeth (Department of Biological and Environmental Sciences School of Sciences Elizabethtown College) - Schroeder, Hannes (Globe Institute, Copenhagen University)

**Abstract format:** Oral

The paper presents some of the first inhabitants in medieval Copenhagen, Denmark, from the study of their burial customs, bioarcheological data and genetic information.

With starting point in the different burial customs registered in the period 1050-1200 at the two early churchyards in the town; the churchyard belonging to the St. Clemens church and a recently discovered churchyard at Town Hall Square, we investigate who the people were, buried here. Burial practices were clearly different in the two churchyards. The graves at the Town Hall Square are characterized by very few individual ritual traits and a low degree of variation between graves, while the material remains of burials practices at St. Clemens show a considerably larger variation. By comparing demographic and genetic information with evidence retrieved from burial customs, we investigate what social, religious, biographical or biological factors might have influenced the way the people at the two churchyards were buried, and what information this yields about the social organization of the early town.

10 **ADVANCED DEGENERATIVE JOINT DISEASE AS A DISABILITY IN THE 14TH-18TH CENTURY IN ŁEKNO, POLAND**

**Abstract author(s):** Matczak, Magdalena Domicela (University of Liverpool) - Buikstra, Jane (Arizona State University) - Pearson, Jessica (University of Liverpool) - Wyrwa, Andrzej - Krenz-Niedbała, Marta (Adam Mickiewicz University)

**Abstract format:** Oral

Degenerative joint disease is one of the most common bone changes identified in archaeological skeletal samples. Some of the most advanced degenerative changes developed with age may have led to socially-recognized disabilities in the past. Although the role of advanced degenerative joint disease is acknowledged as having an impact on the functioning of an individual, it is rarely elaborated in the context of disability in bioarchaeology. The aim of the paper is a methodological discussion about which of the degenerative changes observed on skeletons can be considered leading to disabilities and their impact on individual lives. This problem is evaluated on the basis of anthropological and medical analyses. The study also aims to discuss the issue based on texts from the Middle Ages. Then, using archaeological and osteological findings, the paper shows how people with significant degenerative changes functioned in the 14th-18th century in Łekno, Poland. Deep socially contextualized analysis of lifeways of people with advanced degenerative joint disease offers the (re)construction of the osteobiographical narratives and unique insights into contemporary culture. The case study is based on the theoretical and methodological framework for disability assessment in historical populations within the social model of disability and the bioarchaeology of disability. This paper adds to the growing body of evidence documenting disability in bioarchaeology. Consideration of age-related joint degeneration thus extends bioarchaeological observations of the late medieval and early modern community.

11 **ORGANIC RESIDUE ANALYSIS AND STABLE ISOTOPE PROXIES AS TOOLS FOR EXAMINING DIETARY PATTERNS AT MEDIEVAL STRONGHOLDS OF EASTERN EUROPE**

**Abstract author(s):** Brown, Sophie (Organic Geochemistry Unit, School of Chemistry, University of Bristol) - Rusteikyte, Aukse (History Faculty, Archaeology Department, Vilnius University) - Tabaka, Arkadiusz (Ostrów Lednicki, Museum of the First Piasts, Lednica) - Klimowicz, Patrycja - Krysztofiak, Teresa - Miciak, Magda (Giecz, Branch of Museum of the First Piasts) - Antowska-Gorączniak, Olga - Danielewski, Marcin (Faculty of Archaeology, Adam Mickiewicz University, Poznań) - Wrzesiński, Jacek (Archaeological Reserve of the Grzybowo, Museum of the First Piasts, Lednica) - Evershed, Richard (Organic Geochemistry Unit, School of Chemistry, University of Bristol)

**Abstract format:** Oral

Owing to the inherent ability of lipids to be preserved in ceramic matrices, organic residue analysis of excavated cooking vessels provides ample opportunity to explore settlement dietary practices and broader food network trends. While this well-established biomolecular approach has been applied across various archaeological contexts, the value for such investigation within historical periods has been somewhat neglected. Here analyses have been conducted for several Medieval hillfort sites of Eastern Europe connected to emerging entities of power: from the Wielkopolska region of Poland, attributed to the early dynasty of the Piasts; and extending to Lithuanian territory, for the later ducal residency of Vilnius Palace and associated hillfort assemblages.

By performing GC-FID, GC-MS, and GC-C-IRMS analyses on sherd sub-samples, lipid biomarkers of various animal origins have been identified. With lipid extracts denoting an abundance of degraded animal fat signatures (i.e. palmitic and stearic acids), compound-specific isotope work has allowed further differentiation regarding fat source. Due to varying metabolic and biosynthetic pathways during fatty acid production, it is possible to distinguish between dairy, ruminant/non-ruminant adipose fats via determination of δ13C values. This stable isotope approach has produced a deeper interpretation of results and, particularly when paired with corresponding zooarchaeological data, can effectively assess animal husbandry and hunting practices.

12

Results indicate a broad range of subsistence strategies, with evidence for heavy meat consumption as a shared theme, and indications of wider natural resource exploitation (e.g. fishing, beeswax use). This work establishes greater understanding of lifestyle and diet for the emerging political powers, and evaluates potential socioeconomic influences and interconnection across regions by investigating subtle trends in organic residue signatures. By cross-referencing with faunal assemblages, historical records, and other key artefacts recovered from excavations, our analytical findings help to further elucidate questions regarding dietary practices during these major socioeconomic turning points in Eastern European history.

**SOCIAL DIETARY PRACTICES WITH BIOMOLECULAR ARCHAEOLOGY: MULTIPROXY ANALYSIS OF CONVERSION PERIOD CEMETERY AT KUKRUSE, NE-ESTONIA**

**Abstract author(s):** Oras, Ester (University of Tartu, Department Of Archaeology; University of Tartu, Chair Of Analytical Chemistry) - Scheib, Christiana (University of Tartu, Institute of Genomics) - Hendy, Jessica (University of York, Department of Archaeology) - Tõrv, Mari - Malve, Martin (University of Tartu, Department Of Archaeology)

**Abstract format:** Oral

The conversion period (12th-13th century AD) cemetery at Kukruse, northeast Estonia, provides a unique dataset of well-preserved human skeletons from different sexes and ages, buried with personalised grave goods. The latter include ceramic vessels, interpreted as individualised food containers aimed at accompanying the deceased to the afterlife. This rich material allows us to target age- and sex-based social dietary habits during a person's lifetime (based on skeletal remains) and in the burial ritual contexts (based on pots as individual grave goods).

Multiproxy analysis of different dietary sources at Kukruse was conducted employing 1) mass-spectrometry based organic residue analysis from pottery (lipids with GC-MS, GC-C-IRMS, EA-IRMS, complemented with novel protein analysis with LC-MS/MS), 2) microfossil analysis from pottery-related food-crusts, and 3) dietary stable isotope analysis ( $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$ ) from human remains.

The results reveal several nuances of gender- and age-specific dietary practices at the dawn of the Middle Ages in the eastern Baltic. Men and older women tend to rely on higher trophic level foods like fish and omnivorous animal meats, whilst younger females seem to eat lower trophic level terrestrial animals, most likely ruminants and dairy. Differences in dietary intake start to emerge in the early teenage years. Interestingly, similar and more detailed age- and gender-specific tendencies are also evident in the burial context pottery food residues.

The case study from Kukruse exemplifies how multiproxy dietary analysis combined with bioarchaeological data can uncover the multifaceted and socio-culturally prescribed nature of past food consumption in both daily and ritual contexts.

13

**FACING THE BLACK DEATH: THE CASE OF THE PLAGUE CEMETERY AT 16, RUE DES TRENTE-SIX PONTS, IN TOULOUSE**

**Abstract author(s):** Gourvennec, Michaël (Archeodunum; Université Toulouse Jean Jaurès UMR 5608 TRACES-TERRAE)

**Abstract format:** Oral

The archaeological rescue operation that took place at 16, rue des Trente-Six Ponts in Toulouse (France) during the year 2014 has uncovered part of the medieval occupation of the Saint-Michel suburb.

The excavation uncovered a funeral space used during the 14th century AD. This cemetery contains 109 graves, 29 of which are multiple graves for a total of 444 individuals, 306 of which are buried in three mass graves. These graves, whether single or multiple, have been attributed to the Black Death (1348-1352) through different methodological approaches (stratigraphic, genomic, isotopic, palaeopathological, numismatic, and ceramic). The excavation also uncovered various artisanal activities (small crafts, bell foundry workshop) that can be attributed to the same time as the crisis cemetery.

During this communication, we will explain how this plague cemetery is organized (burial area, craft area, path etc), what type of graves are there and what we learn about their arrangements for dealing with mass mortality. Then, we will characterize the buried population according to gender and age determination and their health status.

Finally, we will attempt to explain how the populations have dealt with this epidemic. We will explain how the different types of graves, whether single or multiple, tell us about the adaptations of medieval society in times of epidemics. Furthermore, we will see how the management of burial space and mortuary practices inform us about the resilience of medieval communities facing Black Plague.

14

**USING SOCIALLY CONTEXTUALISED ISOTOPE ANALYSIS TO INVESTIGATE THE LIVED EXPERIENCE OF THE RESIDENTS OF MEDIEVAL CAMBRIDGE, UK**

**Abstract author(s):** Rose, Alice (University of Cambridge) - Cessford, Craig (University of Cambridge; Cambridge Archaeological Unit) - Dittmar, Jenna (University of Aberdeen; University of Cambridge) - Hirons, Alex (University of Cambridge) - Hui, Ruoyun (The Alan Turing Institute; University of Cambridge) - Inskip, Sarah (University of Leicester; University of Cambridge) - Mitchell, Piers - O'Connell, Tamsin (University of Cambridge) - Scheib, Christiana (University of Tartu; University of Cambridge) - Robb, John (University of Cambridge)

**Abstract format:** Oral

This paper presents an integration of multi-tissue, multi-isotope analyses with high-resolution contextual data to allow for an exploration of the individual- and population-scale lived experience of the residents of Medieval Cambridge, UK. The methodology used allows for a greater interplay between scientific techniques and social history.

Adult individuals dating from c.10th-16th centuries excavated from six sites located either in the Medieval town of Cambridge, or its rural hinterlands were sampled for carbon, nitrogen, oxygen and strontium isotope analysis. These individuals represent a mixture of social groups, from 'ordinary' parish individuals, to Augustinian Friars, to those who may have received care in the Medieval Hospital of St John the Evangelist. In total, 223 rib samples and 156 bulk dentine samples (from 2nd premolar or 2nd molar) were analysed for  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ . 169 tooth enamel samples were analysed for carbonate  $\delta^{18}\text{O}$  and  $\delta^{13}\text{C}$  and 113 tooth enamel samples were analysed for  $^{87}\text{Sr}/^{86}\text{Sr}$ . 76 individuals produced results for all isotopes. Incremental dentine samples were also analysed for  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values in a subsample of 22 individuals from the town. Sampling multiple isotopes from tissues that represent the isotopic signature from different stages of skeletal development has allowed for an investigation of diet and mobility over individual lifecourses, but also across various social groups. When the isotopic data is considered in its wider context, using osteological and social information generated as part of the 'After the Plague: Health and History in Medieval Cambridge' project, a more nuanced understanding of the lived experience of the residents of Medieval Cambridge can be obtained. Combining the available information allows for characterisation of social groupings and creation of isotope-driven osteobiographies.

**LIFE AFTER THE PLAGUE: EXPLORING HEALTH SURROUNDING THE TIME OF THE BLACK DEATH**

**Abstract author(s):** Dittmar, Jenna (University of Aberdeen) - Mitchell, Piers (University of Cambridge) - Inskip, Sarah (University of Leicester) - Mulder, Bram (University of Cambridge) - Cessford, Craig (University of Cambridge; Cambridge Archaeological Unit) - Rose, Alice (University of Cambridge) - Scheib, Christina (University of Tartu; St. John's College, University of Cambridge) - Hui, Ruoyun (The Alan Turing Institute) - Connell, Tamsin - Robb, John (University of Cambridge)

**Abstract format:** Oral

The 14th-century plague pandemic, also known as the Black Death, was the most devastating pandemic in the history of the world. As a result, much of the research on life during the medieval period focuses on the consequences of this catastrophic event. Taking into consideration that societies are complex and are made up of many different subgroups, this research explores the health of the inhabitants of medieval Cambridge, England surrounding the time of the Black Death. Human skeletal remains (n= 323) from three burial grounds in Cambridge, England dating to c. 950-1538 were macroscopically assessed; the Hospital of St John the Evangelist, the urban parish of All Saints by the Castle and the Augustinian Friary. The results revealed very few differences in the prevalence rates of pathological conditions between those that lived prior to the Plague outbreak in 1348 and those that lived afterwards. No difference was observed in rates of infectious diseases, skeletal trauma, and dental disease. Particularly surprising is the lack of difference in the prevalence rates of respiratory diseases, including tuberculosis which were predicted to have decreased to coincide with the drastic reduction in the population caused by the Black Death. Equally surprising is the increase observed in dietary and vitamin deficiencies that follows after the Black Death. This paper will explore the potential factors that may have contributed to the (dis-) continuity in health status observed in the medieval population of Cambridge.

16

**THE SOCIAL LANDSCAPE OF HEALTH IN MEDIEVAL CAMBRIDGE: A WHOLE-TOWN APPROACH**

**Abstract author(s):** Inskip, Sarah (University of Leicester) - Dittmar, Jenna (University of Aberdeen) - Rose, Alice - Mulder, Bram (University of Cambridge) - Cessford, Craig (University of Cambridge; Cambridge Archaeological Unit) - Scheib, Christiana (University of Tartu; St John's College Cambridge) - Hui, Ruoyun (Turing Institute) - O'Connell, Tamsin - Mitchell, Piers - Robb, John (University of Cambridge)

**Abstract format:** Oral

How much did people in a medieval town differ in their health? This paper summarises bioarchaeological data from three groups from later medieval Cambridge – a group of ordinary townspeople (All Saints by the Castle), a group of Augustinian friars, and recipients of charity (The Hospital of St. John's the Evangelist). In many aspects of life the three groups shared a common lifestyle, but they differed in a number of key ways. The ordinary townspeople tended to have more traumatic injuries; the Hospital inmates had evidence for poorer childhoods, were slightly shorter and died slightly younger; and the friars were taller and appear to be better nourished than the other two groups. After contextualising these results in what we know about medieval society, this paper presents new methods for integrating data from diverse subgroups in order to create a more balanced picture of the health of the town as a whole.

COLLECTIVE OSTEOBIOGRAPHIES: IDENTIFYING SUBGROUPS WITHIN A MEDIEVAL CEMETERY SKELETALLY

**Abstract author(s):** Robb, John - Cessford, Craig (University of Cambridge) - Dittmar, Jenna (University of Aberdeen) - Inskip, Sarah (University of Leicester) - Mitchell, Piers - Mulder, Bram - O’Connell, Tamsin - Rose, Alice (University of Cambridge)

**Abstract format:** Oral

People have different life paths and identities. Bioarchaeologists are used to comparing skeletons grouped by grave goods or site contexts, but can we identify different kinds of people from their skeletons alone? We try to do so here using archaeological samples from the Hospital of St. John, Cambridge. The Hospital held a diverse collection of people, who wound up in the Hospital’s cemetery for quite different reasons. In this paper, we combine morphological, pathological and isotopic data to separate them into subgroups which followed different life paths. The structure of variation within the group is complex and polythetic, and standard statistical methods such as correlation and regression are not much use; instead, we make much use of contextual methods of exploratory data analysis. The results identify at least five subgroups in the cemetery’s population -- ordinary townspeople, the lifelong poor, the aged infirm, people dying out of place, and university scholars. The result is the first skeletal prosopography or collective osteobiography of a complex medieval site.

THE SOCIAL CONSEQUENCES OF THE BLACK DEATH? TRACING HISTORICAL CHANGE BIOARCHAEOLOGICALLY IN MEDIEVAL CAMBRIDGE

**Abstract author(s):** Robb, John - Cessford, Craig (University of Cambridge) - Dittmar, Jenna (University of Aberdeen) - Inskip, Sarah (University of Leicester) - Mitchell, Piers - Mulder, Bram - Rose, Alice (University of Cambridge) - Hui, Ruoyun (Alan Turing Institute) - Kivisild, Toomas (KU Leuven) - Scheib, Christiana Lyn (University of Tartu)

**Abstract format:** Oral

What were the historical consequences of the Black Death epidemic (1347-9)? Historians have discussed this at great length, noting increases in mobility, higher wages, and changes in settlement and productive systems. But there has been little skeletal research to clarify directly how the plague changed the lives of survivors and their descendants. Following this great calamity, did people live differently? Were they healthier or taller? Did they have different genes? In this paper, we first discuss models for how the plague might have affected ordinary life in bioarchaeologically visible ways. We then develop new statistical methods for studying continuous or abrupt change with skeletal data, and test these models with data from 300+ skeletons from Cambridge (England) before and after 1350. These models are tested with skeletal, isotopic and genetic data. The results show surprisingly few changes which happened in the mid-14th century and which can be directly ascribed to the plague. Many things show continuity rather than change; some ongoing, gradual changes began before the epidemic and may have resulted from more general processes in the 14th century rather than the event itself.

BAYESIAN META-ANALYSIS OF HUMAN ISOTOPIC DATA FROM LATE MEDIEVAL EUROPE REVEALS DIETARY AND HISTORICAL LINKS

**Abstract author(s):** Coccozza, Carlo (Ludwig-Maximilians-Universität München, Fakultät für Kulturwissenschaften.; Max Planck Institute for the Science of Human History, Department of Archaeology, Jena) - Cirelli, Enrico (Alma Mater Studiorum Università degli Studi di Bologna, Dipartimento di Storia Culture Civiltà) - Teege, Wolf-Rüdiger (Ludwig-Maximilians-Universität München, Fakultät für Kulturwissenschaften) - Fernandes, Ricardo (Max Planck Institute for the Science of Human History, Department of Archaeology, Jena; University of Oxford, School of Archaeology; Masaryk University, Arne Faculty of Arts)

**Abstract format:** Oral

We investigated the interplay between historical phenomena and diachronic trends in subsistence practices during Late Medieval Europe. We employed a meta-analysis of a large collection of bioarchaeological data to determine to what extent major historical developments, such as the medieval agricultural revolution, the 14th century crisis, and the Black Death impacted subsistence for medieval society. Our main data source was the Compendium Isotoporum Medii Aevi (CIMA) that assembles human stable isotope data for Medieval Europe. CIMA is part of the IsoMemo initiative, based at Max Planck Institute for the Science of Human History, that brings together a network of isotopic databases plus access to self-developed modelling tools. We employed the modelling of human isotopic data to visualise temporal and spatial shifts in diet and to determine the relationship between these and historical processes. We adopted a transdisciplinary approach in which the modelling was combined with other archaeological sources to better characterize dietary shifts and their causes.

Our results show a significant increase in animal protein consumption across much of Europe during the late Middle Ages, albeit at varying regional rates and with an overall steep increase during the 14th-15th centuries. The latter could have been the consequence of either the rising prices of wheat, or due to the demographic decrease following waves of pandemics and wars. However, for Italy, southern France and the northern Balkans consumption of animal protein remained fairly constant during the 10th century.

Overall our results illustrate the research potential of large-scale meta-analysis of bioarchaeological data and obtained preliminary results reveal clear links between historical developments and subsistence practices in Medieval Europe.

REDUCED VIRULENCE OF LATE MEDIEVAL YERSINIA PESTIS STRAINS COULD HAVE CONTRIBUTED TO THE DISAPPEARANCE OF PLAGUE FROM EUROPE

**Abstract author(s):** Bonczarowska, Joanna - Susat, Julian (Institute of Clinical Molecular Biology, Kiel University) - Pēter-sone-Gordina, Elīna (Institute of Latvian History, University of Latvia) - Immel, Alexander - Nebel, Almut (Institute of Clinical Molecular Biology, Kiel University) - Gerhards, Guntis (Institute of Latvian History, University of Latvia) - Krause-Kyora, Ben (Institute of Clinical Molecular Biology, Kiel University)

**Abstract format:** Oral

Yersinia pestis (Y. pestis) is responsible for three major plague pandemics, including the medieval pandemic (14th-18th centuries) which began with the infamous Black Death (1347-1353). Although several Y. pestis genomes from that time period have been analysed, the majority of the findings come from western Europe. Therefore, the diversity and microevolution of this pathogen in the eastern part of the continent remain elusive. In the present study, skeletal remains from two graveyards located in Riga (Latvia) were examined. Historical sources indicate that at least two plague outbreaks took place in the area while the cemeteries were in use (15th-18th centuries). It is thus possible that the sites constituted a burial ground for the victims of plague. DNA was extracted from teeth of 16 individuals and subjected to shotgun sequencing. Four samples exhibited molecular evidence of Y. pestis confirming the plague hypothesis. The analysis of two reconstructed bacterial genomes revealed a depletion in the pla region of the pPCP1 plasmid, suggesting the presence of two plasmid variants (pla+ and pla-). The same phenomenon was discovered for other strains responsible for the post Black Death outbreaks of the disease. As pla is an important virulence factor for Y. pestis – essential for infection and transmission in humans – a decreased number of pla+ plasmids could have possibly contributed to the disappearance of plague from Europe in the 18th century.

THE DUTCH Y-CHROMOSOMAL LANDSCAPE FROM THE EARLY MIDDLE AGES TO PRESENT DAY

**Abstract author(s):** Altena, Eveline - Smeding, Risha (Dept. of Human Genetics, Leiden University Medical Center) - van der Gaag, Kristiaan (Dept. of Human Genetics, Leiden University Medical Center; Netherlands Forensic Institute, The Hague) - de Leeuw, Rick - Vaske, Eileen - Reusink, Paul (Dept. of Human Genetics, Leiden University Medical Center) - Diekmann, Yoan - Thomas, Mark (Dept. of Genetics, Evolution and Environment, University College London) - de Knijff, Peter (Dept. of Human Genetics, Leiden University Medical Center)

**Abstract format:** Oral

DNA is a powerful source of information in reconstructing past population demographic processes. Here we present historical Y-chromosomal data from nearly 350 medieval and Early Modern Period (450-1850 CE) individuals from 13 locations across the Netherlands. With these data, in combination with comparable data from the present-day population of the Netherlands, we are able to test for geo-genetic patterns during different periods and population continuity. This contributes to the reconstruction of the male population history of the Netherlands over the past 1.5k years from a genetic perspective.

Using different methods we observed statistically significant differences in time and space. We could, however, not reject population continuity. The changes in geo-genetic patterns for the Y-chromosome in the Netherlands from the Early Middle Ages to present day indicate that the modern patterns formed only recently. Since we cannot reject population continuity, drift (changes of allele frequency due to chance) needs to be considered as a key factor in these changes. We should therefore be careful to assign frequency changes of genetic markers over time to specific historical events.

We also made an interesting observation on a local level. Only one of the sites from which we collected historical samples, the town of Eindhoven, contained samples attributed to Y-chromosomal haplogroup T and also in relatively high frequencies. This haplogroup, however, is very rare today in the Netherlands and Europe overall, but considered to have been brought along to Europe with the medieval Jewish diaspora. Since Eindhoven was founded around 1200 CE as a market place, and Jews were typically restricted to working in finance and trade during this period in Europe, we may have an indication for a Jewish community in Medieval Eindhoven, something that had not been observed in the archaeological record otherwise.

BIOMECHANICS OF PHYSICALLY IMPAIRED INDIVIDUALS FROM MEDIEVAL IRELAND

**Abstract author(s):** White, Jessica (Queen’s University Belfast)

**Abstract format:** Poster

Disability is not defined by a set of disease conditions; individuals will have different experiences of their condition depending on the nature of their environment, culture, social status, and skills. Thus, the day-to-day quality of life of an individual, and associated limitations in activity or restriction in participation cannot be inferred from macroscopic analysis of bone alone. Bone can adapt according to the mechanical stresses placed on it; it can be strengthened by deposition when needed and reduced by resorption when not needed. In this way, bone form indicates function, therefore, analysis of bone morphology may have the potential to reveal information regarding the daily life of physically impaired individuals. By assessing the amount of cortical bone using radiographs, this study may reveal limb function after disability. Crucial to the understanding of bone morphology is the assumption that the levels and patterns of habitual biomechanical stress is reflected in the quantity and distribution of cortical bone in the diaphysis. It is based on this assumption, that allows comparison of limbs for signs of weight bearing, revealing the level of function after injury/illness. This along with macroscopic analysis will reveal if the individual used walking aids following incapacitation of their lower limbs. Addi-

tionally, by using the cortical bone analyses results and CT scans, 3D musculoskeletal models of the physically impaired individuals will be developed. This will potentially allow visualisation of their gait revealing how they may have functioned on a day-to-day basis. Using this state-of-the-art technology to assess the impact of physical impairment in an archaeological setting will not only reveal information about the past but will also show the development and outcome of diseases and injuries if left untreated medically.

B. **TREPANNED HUMAN SKULL DISCOVERED IN THE NECROPOLIS OF 15TH-19TH CENTURIES AT THE ROMAN CATHOLIC CATHEDRAL FROM IAȘI, ROMANIA**

**Abstract author(s):** Groza, Vasilica-Monica (Romanian Academy – Iași Branch, “Olga Necrasov” Center of Anthropological Research) - Bejenaru, Luminița - Petraru, Ozana-Maria (Romanian Academy – Iași Branch, “Olga Necrasov” Center of Anthropological Research; “Alexandru Ioan Cuza” University of Iași, Faculty of Biology) - Popovici, Mariana (Romanian Academy – Iași Branch, “Olga Necrasov” Center of Anthropological Research)

**Abstract format:** Poster

This study is focused on a case of trepanation, reported in a sample of skeletons discovered at the “Adormirea Maicii Domnului” Roman Catholic Cathedral from Iași (Romania). The sample of 89 skeletons (children, adolescents, adults and elders) is originated from inhumation tombs and reburials, dating from the 15th-19th centuries. Trepanation has been practiced in many ancient cultures dating as far back as the Late Paleolithic to this century, and it has been detected in locations widespread in every part of the world. Being an extremely aggressive intervention on the human body, the trepanation (craniotomy, in medical terms) is made with a purpose: medical, symbolic or magical-religious.

In this case, the trepanation was identified in a male skull of 50-55 years old, on the occipital bone, near the left temporal. The craniotomy was evaluated by macroscopic observation, followed by image analysis (i.e. radiology and computed tomography). The skull opening is roughly circular with a diameter of 25 mm, and it was probably made by the scraping method with a flat implement used in a rotary movement on the bone surface, which was eroded to the formation of a complete hole.

Regarding on the healing of trepanation studies have indicated that little osseous regeneration occurs. It is probable, that the individual survived for a fairly long period of time following the operation, since the margins of the perforation were smooth. In the skeleton with trepanation, there are not identified other pathologies.

C. **A NEW APPROACH TO DETERMINATION OF SEX IN DEMOGRAPHIC EVALUATION OF MEDIEVAL HUMAN POPULATIONS FROM NORTH-EASTERN ROMANIA**

**Abstract author(s):** Popovici, Mariana - Groza, Vasilica-Monica (Romanian Academy – Iasi Branch, “O. Necrasov” Center of Anthropological Research) - Petraru, Ozana-Maria - Bejenaru, Luminița (Romanian Academy – Iasi Branch, “O. Necrasov” Center of Anthropological Research; Faculty of Biology, “Alexandru Ioan Cuza” University of Iași)

**Abstract format:** Poster

The identification of sex is essential for the demographics of the past human populations, and not only. Traditionally, the determination of sex on the archaeological human skeletons uses linear metrical data and non-metrical. Many researchers use different skeletal elements in the estimation of the sex (e.g., long bones, pelvis, ribs, clavicle, calcaneus, etc.). But the accuracy of these sex determinations varies between different skeletal elements and between different human populations.

The present study refers to identify the most reliable variables (or indices) and to propose a discriminant function for the sex determination, as a complementary method of identifying sex on human skeletons. For this aim, we used facial metric data from 125 archaeological skeletons of 16th-19th centuries from north-eastern Romania. The analysis was focused on four facial indices: total facial index-FI, upper facial index-UFI, orbital index-OI and nasal index-OI.

Multivariate analyses in the facial series were performed using MANOVA, regression and discriminant analysis. Results are in 95% confidence range and  $p < 0.05$  was considered significant.

Univariate male/female ratios show significant sexual dimorphism in two indices (FI, OI), indicating that the face express strong sexual dimorphism in this medieval populations. The average OI is 84.33 in females, and 81.16 in males, while the FI is 83.51 in females, and 87.64 in males. Even if these facial indices are found to be statistically highly significant and they showed interpopulation and sex variations, we consider that the function established between the four indices is more reliable.

Discriminant analysis technique has demonstrated a high competence in the sex determination using the OI, in specially. Correct classification rates produced by Cross-validation varied from 56% to 88%. Discriminant function equation derived from the combination of the four indices emphasis the dimorphic role of these in medieval human populations of north-eastern Romania.

152 **ANCIENT WEST ASIA AND EGYPTIAN SOUNDSCAPES IN CONTACT**

**Theme:** 4. Globalisation and archaeology

**Organisers:** Köpp-Junk, Heidi (Universität Trier) - Sánchez Muñoz, Daniel (University of Granada) - Rogers, John (Swansea University)

**Format:** Regular session

The importance of the musical traditions of Ancient Egypt (including here Kush/Meroë and Libyan areas) and West Asia (including Assyria and Babylonia, Anatolia, Iran, the Levant, Arabian Peninsula and southern Caucasus) go far beyond the ‘magnificence’ of their extant instruments (e.g. the Mesopotamian bull-lyres or Tutankhamun’s trumpets). Research demonstrates the importance of these traditions as particularly relevant for understanding cross-cultural influences in the musical traditions of surrounding regions (Franklin 2015; Sánchez Muñoz 2017).

Paradoxically, despite their geographical proximity, this previous research has only begun to explore the possible musical interactions between both areas. Moreover, the few works on the topic (Duchesne-Guillemin 1981; von Lieven 2008) still leave many questions unanswered, such as the influences of cross-cultural contact on musical aspects beyond the instruments themselves (e.g. musicians, repertoires, etc.).

This archaeomusicological session consequently emerges with the purpose of solving this situation by welcoming papers from (Ethno-)Archaeology and Material Culture Studies (besides Egyptian & Ancient West Asian Philologies or (Ethno)musicology) about any aspect of musical interactions between Egypt and West Asia during Antiquity (late-4th mill. BCE until the change of era). Emphasising multi-disciplinary approaches and methodologies, the session will develop cross-cultural archaeomusicological study as a specific contribution to wider narratives of understanding relations between both regions. These lines may guide the direction of proposed papers:

- West Asian influences on Ancient Egyptian music and vice versa.
- The role of regions connecting both continents (e.g. the East Mediterranean) in those contacts.
- Ancient West Asian and Egyptian contexts as common receptors of other Eastern and Western ancient musical traditions.

Studies regarding other Asiatic and African cultures are also welcome if pertaining to the musical interactions of both continents in Antiquity. The organisers are open to discuss such matters in advance and intend to publish the results of this session.

**ABSTRACTS:**

1 **ANCIENT CHEIRONOMY: THE GESTURING MUSICIANS OF ANCIENT EGYPT AND ITS NEIGHBOURS. WHO INFLUENCED WHOM?**

**Abstract author(s):** Megier, Austin (Macquarie University)

**Abstract format:** Oral

The surviving evidence for music in the Old Kingdom of ancient Egypt (c. 2686-2181 BC) is mostly limited to representations of musical ensembles depicted on elite tomb walls. These musical ensembles consisted of harpists, flutists, clarinettists, and the “one who sings with the hand”. This latter ensemble member is represented performing a set repertoire of hand and arm gestures. Since the early 20th century, scholars have argued these gestures are representative of a musical practice known as cheironomy. This kind of conducting is most broadly defined as a system of hand-signs used by a musician to indicate melody and rhythm.

These representations from ancient Egypt are often cited as a precursor to later cheironomic practices. For example, the cheironomy of Coptic liturgical music is often commonly argued to have arisen out of the ancient Egyptian practice, without any established link and despite the large significant gap in time.

In order to uncover the relationship between ancient Egyptian cheironomy with other cheironomic practices, we must first closely analyse what is known about the former. Though little is currently known about their musical significance, the Old Kingdom reliefs provide ample scenes from which a typology of gestures can be established. Do we have evidence of these specific gestures in elsewhere? What traces can be made between preceding and succeeding the practice of the Old Kingdom? This paper will present what is currently known about ancient Egyptian cheironomy and explore the practices in other cultures in the attempt to determine possible influences.

2 **A COMPARATIVE STUDY BETWEEN BES AND THE MIDDLE ELAMITE LUTE PLAYERS IN THE SECOND MILLENNIUM B.C.**

**Abstract author(s):** Khaksar, Sepideh (Free University Berlin)

**Abstract format:** Oral

Ancient Elam (southwestern Iran) developed a very rich musical culture chiefly known nowadays through seal impressions and clay figurine depictions of musicians (in particular lute players), sometimes similar to Mesopotamian figurines from the Old Babylonian Period (early 2nd millennium BCE).

The Elamite depictions of lute players may also speak, however, to connections with cultures further away than Mesopotamia, notably Egypt. The iconography of the god Bes as musician certainly shares features with a particular group of Elamite clay figurines.

How should the apparent cultural contact be contextualized? While West Asian influence on Ancient Egyptian music has been explored in the past, Elam never was considered in this, a function of the relative neglect that this culture has suffered in general. By that as it may, the case of Bes shows the validity of exploring far-range connections. In this context it may be reminded that other musical motives have long been known to inhabit a large ancient space; an example is that of monkeys playing musical instruments, which connects Egypt and West Asia.

This paper will address the matter of Bes as a musician from an archaeological and art historical perspective (Elamite written sources of direct relevance for the topic are still lacking). First, parallels between Elamite figurines with lute players and Egyptian depictions of Bes in a musical attitude will be examined. Secondly, a possible origin for such a parallel/influence will be established considering the context of West Asian influences on ancient Egyptian music.

In that way, the role of ancient Elamite music and its impact in other ancient musical traditions will be highlighted, and possible new approaches on religious contact in antiquity will be pointed out.

3 THE EARLIEST MUSIC IN ANCIENT EGYPT AND WHERE IT CAME FROM

**Abstract author(s):** Köpp-Junk, Heidi (University of Trier; Egyptian Archaeology at the Institute of Mediterranean and Oriental Cultures, Polish Academy of Sciences Warsaw)

**Abstract format:** Oral

The earliest attested instruments in Ancient Egypt are rattles, dating to the 5th millennium BCE. They are followed by clappers and flutes in the 4th millennium. Stringed instruments as well as drums are so far not documented in Predynastic and Early Dynastic times; the first harps and drums date to the beginning of the 4th Dynasty (ca. 2600 BC). Nevertheless, in this very early stage of Egyptian history, music seems to have played a major role during ceremonies and rituals.

The earliest clappers are depicted on vessels, they are slightly bend and of a simple design. In contrary, the oldest clappers attested as instruments are richly decorated with zoomorphic design or parts of the human body. The earliest rattles are made of clay, elongated and polished to a shine, others have the shape of fruits, or carvings that are interpreted as buds of a water-lilly. The earliest flute looks like the later ones, but has a larger diameter.

The lecture discusses from which place of origin the earliest instruments might have come to Egypt, since a high degree of mobility and intensive long-distance trade is documented as early as the 4th millennium BCE, showing connections not only to the Sinai and Palestine, but even to Afghanistan. Previous research has not focused on this very early Asiatic evidence on Egyptian music yet.

The lecture will focus on where the instruments are attested earlier, whether there are similar parallel finds, or whether even the earliest ones attested in Egypt are modified and adapted to the Egyptian conditions and preferences. Furthermore, an attempt is made to reconstruct a possible route that the instruments might have taken, because since all these early instruments are handy, they were easy to transport when travelling. These topics have not been in focus in previous research concerning music.

4 SACRED FEMALE MUSICIANS IN ANCIENT EGYPT AND WEST ASIA: A COMPARATIVE STUDY

**Abstract author(s):** Guegan, Izold (Swansea University)

**Abstract format:** Oral

Both in Ancient Egypt and West Asia, female musicians had an important role towards the gods and the king. On the two continents, specific groups, some of them with an impressive longevity, have been identified by researchers. These sacred musicians officiated in various contexts and constituted groups apart from the society. This paper proposes a comparative study of these Egyptian and West Asian female musicians by exploring their status, activities, and identity. The focus will be on the first half of the second millennium BC which corresponds to the Paleo-Babylonian period in West Asia, and approximately to the Egyptian Middle Kingdom. This period offers a wide range of textual and iconographic sources for the two regions. This investigation will discuss different groups of female musicians in Egypt and West Asia and concentrate mainly on the Egyptian Khenerut on one hand, and the Near-Eastern palace musicians along with the Mesopotamian naditum priestesses on the other hand. The surviving documentation enables us to understand the education, status of these musicians and to ascertain their role and performance within the temple and during religious celebrations. Finally, this research aims to investigate the possible influences between these groups regarding their organization and activities.

5 MUSICAL CONTACTS BETWEEN EGYPT AND ANCIENT WEST ASIA THROUGH THE XVIIIITH DYNASTY BANQUET SCENES

**Abstract author(s):** Bueno Guardia, Miriam (Universidad Nacional de Educación a Distancia)

**Abstract format:** Oral

The Egyptian New Kingdom (1550-1070 BC) is a time of economic prosperity and artistic boom for this ancient civilization. But it is also a time when contacts with other foreign people increase. These contacts will be remarkable in different aspects of life and art.

Within the art of the New Kingdom, it is worth highlighting the decoration of the private Theban tombs, which provides us with a large amount of information about the life, customs, and religious thought of ancient Egypt. One of the most important themes within this decoration during the XVIIIth dynasty (1550-1295 BC) are the banquet scenes (which also appear in the art of Ancient West Asia with some common characteristics), highlighting their great symbolic load and the presence in them of groups of musicians.

This paper aims to analyse the orchestras that appear in the Egyptian banquet scenes to extract from them the influences, sometimes reciprocal, between this Empire and the civilizations of the Ancient West Asia. The different instruments that appear in these Egyptian paintings often have origin or some kind of relationship with the Ancient West Asian cultures. But there are also other similarities related to the symbolic function that these orchestras fulfilled, the role of music on these occasions, or related to the components themselves.

Therefore, through these banquet scenes dating from the XVIIIth dynasty we can witness the growing musical contact between the Ancient West Asia and Egypt in this early part of the New Kingdom.

6 EGYPTIAN INFLUENCES IN ANCIENT MESOPOTAMIAN MUSIC? UPDATES AND NEW INSIGHTS

**Abstract author(s):** Sánchez Muñoz, Daniel (Independent Researcher)

**Abstract format:** Oral

Previous research has normally stressed the presence of Mesopotamian (and Western Asiatic in general) musicians in Ancient Egypt and their influences on Egyptian organology and musical repertoire.

When interacting, two cultures usually influence each other, even if one could exercise a larger influence over the other one. In that way, one might expect, at least, some Egyptian influences on Ancient Western Asiatic, particularly Mesopotamian, music. However, while some modern observations for Asiatic regions such as Canaan and the city-state of Ugarit already exist, nothing exists yet for Mesopotamia beyond the already outdated Hickmann ZDMG 111/1 (1960), 36.

Therefore, the present paper will begin and examination of all the possible Egyptian influences in Ancient Mesopotamian music. Three specific musical aspects will focus the attention of this study: (1) the possible presence of Egyptian musicians in Mesopotamia, (2) influences on organology and (3) playing techniques. Furthermore, a comparison with the Egyptian influences on Canaanite and Ugaritic music will be established. Textual sources (never considered by Hickmann), alongside the currently available archaeological and iconographical material, will be considered for reaching these aims.

Regarding the chronological span covered by this contribution, even if the entire lifespan of Ancient Egypt and Mesopotamian cultures will be equally considered, first millennium evidence will be the main focus of study here. That is the moment when the Egyptian presence in Mesopotamia in general is best documented, and when the largest number of Egyptian possible influences on Mesopotamian music could be sought.

After the reading of this paper, it will be clear that Egypt could, at least, have influenced (Late) Mesopotamian music in some aspects, just as Mesopotamia had done with Egypt before.

7 PLAYING AND LEARNING CYPRIOT MUSIC AT THE URE MUSEUM

**Abstract author(s):** Romero Mayorga, Claudina (Ure Museum of Greek Archaeology)

**Abstract format:** Oral

At the Ure Museum of Greek Archaeology (University of Reading) photogrammetry and 3D printing have enabled visitors to investigate the function and symbolism of a collection of 19 Cypriot terracotta figurines of the “Kamelarga” style, probably from Kition. Most of these figurines, which date to the Cypro-Archaic period (750-480 BC) exemplify a mixed technique of moulded faces and wheel-made bodies. Traditionally, these figurines have been interpreted as ex-votos, each of which represents a worshipper holding a gift for the gods – food, animal, weapon or musical instrument. Accordingly, these figurines were created by a farming society to please gods and ensure prosperity.

Although many of them have not optimally preserved their iconographic attributes, five seem to support a tympanum. By handling and playing with the 3D replicas, our staff and visitors delved into the role of music in the Archaic Cypriot society, especially when it came to its links to music performance - and iconography - in Greece, Levant, and Egypt. This paper aims to understand the function of these statuettes in their context (tombs, sanctuaries) and to offer a glimpse into Cypriot musical practices.

8 FOLLOWING THE BEAT. FRAME DRUM PATHS THROUGH EASTERN MEDITERRANEAN

**Abstract author(s):** Mungari, Pasquale Mirco - Kolotourou, Katerina (Independent researcher)

**Abstract format:** Oral

The aim of this paper is to start the development of a research course on percussive performance practice, with special focus on drumming, and in particular the performance of frame drums, which have a long tradition in ancient West Asian, Egyptian, and East Mediterranean cultures. Despite the perishable nature of the instrument itself (made of animal skin and flexible wood), there is a wealth of iconographic and literary evidence testifying to the consistent employment of frame drums in different ritual as well as secular contexts. However, we still have limited knowledge of the instrument’s performance practices: the acoustic effect, the

	<p>emotive affect, the music that it accompanied, its role as a solo or ensemble instrument, and the different techniques of frame-drum playing involved in these contexts, paired with typological variations of the instrument.</p> <p>Information from iconographic and literary sources regarding these matters can be difficult to interpret, fragmentary, inconclusive, or altogether missing. In the absence of direct musical data for the playing of ancient percussion in general, this paper argues that the reconstruction of these unrecorded elements may be attempted through comparative analysis of current drumming practices in combination with the available archaeological data. It will demonstrate that such comparative musicological and archaeological analysis can provide unexpected clues about possible playing techniques and styles, giving an opportunity to explore potential ways of dissemination and transmission of musical knowledge between Mesopotamia, Egypt, and the Eastern Mediterranean. Notwithstanding the culture-specific character of drumming performances, through such comparative musicological analysis of the rich body of evidence it will also be possible to identify some broad overarching elements in the fundamentals of the performance of frame drums within the different cultures in question.</p>
9	<p><b>THE EGYPTIAN TBN-DRUM AND THE GRAECO-ROMAN TYMPANUM: MUSICAL ALLUSIONS TO CROSS-MEDITERRANEAN CULTURAL INFLUENCES IN THE FIRST-MILLENNIUM BC</b></p> <p><b>Abstract author(s):</b> Rogers, John (Swansea University)</p> <p><b>Abstract format:</b> Oral</p> <p>In 1977, Christiane Ziegler wondered whether the Egyptian tbn-drum, found in texts and iconographic representation in the Graeco-Roman temples of Edfu and Denderah, was a hieroglyphic transcription of the Greek word τυμπανον (tympanon/tympanium; Tambours conserves au Musée du Louvre, Revue d'Égyptologie, 29, 1977: 203). Since then, there has been little sustained study of this particular membranophone beyond referencing Ziegler's remarks (see the entry in Wilson, A Ptolemaic Lexikon, 1997: 1133 for a brief summary of current Egyptological knowledge in a specific setting). Therefore, the purpose of this paper is, firstly, to re-examine the plausibility of Zeigler's equation and, secondly, to begin sketching the avenues of exploration that such a connection opens. To do this, the paper discusses the textual and iconographic representations and contexts of the tbn within these two temples and begins analysis of the parallels and divergences in the manifestations of the tbn in the Egyptian record and the famous tympanum of the West Asian and Graeco-Roman worlds. In doing so, the tbn may further illuminate the musical and wider socio-cultural networks between Egypt, the northern Mediterranean, and West Asia; such tangible connections speak to broader intercultural influences and networks in the experiences of ancient religion, ritual, and rulership.</p>
10	<p><b>PLACES OF MUSICAL EXCHANGE BETWEEN EGYPT AND THE LEVANT</b></p> <p><b>Abstract author(s):</b> Staubli, Thomas (Universität Fribourg)</p> <p><b>Abstract format:</b> Oral</p> <p>Iconographic evidences from different epochs testify for an intercultural exchange between the Levant and Egypt in the field of music over centuries. The current study provides examples from the 18th dynasty in Amarna, from the 19th dynasty in Pi-Ramesse, and from the 3rd-1st c. BC in Koptos. They come from a wide range of media like reliefs, steles and bowls. In Amarna the international exchange was deliberately cultivated and documented. At Pi-Ramesse (19th dyn.), Canaanite music was probably a natural part of the cult. Much later (3rd-2nd century BC) this also applies to Koptos, where the trade routes from the north met the Nile. In addition to iconographic evidence of intercultural musical contacts in Egypt, there is also a few evidence of singers and dancers of Egyptian origin in the Levant. The evidence fits the bigger picture of the Levant and Egypt as two regions with an intensive economic and cultural exchange over centuries.</p>
11	<p><b>CHANGES AND CONTINUITY IN ANCIENT EGYPTIAN AEROPHONES</b></p> <p><b>Abstract author(s):</b> Böckler, Nadja (Egyptian Museum Munich)</p> <p><b>Abstract format:</b> Oral</p> <p>Aerophones are one of four groups of musical instruments that are attested for the ancient Egyptian culture. The first vessel-flutes or peg instruments as well as longitudinal flutes are to be found as early as the predynastic period.</p> <p>While the former do not appear in pictorial reproductions in the Old Kingdom, the flute (mA.t) enjoyed great popularity. Not only the instrument itself but the flautists as well are appreciated by inscriptions or images. In the tomb reliefs of the Old Kingdom, especially in Saqqara, the flute is accompanied by a further instrument: the clarinet.</p> <p>During the New Kingdom, the group of aerophones undergo a remarkable change: The clarinet (mm.t) is gradually replaced by the oboe (wDnj), an originally foreign instrument imported from the Asiatic area. Also, the flute seems to be superseded by this new instrument which is incorporated completely into the assemblage of ancient Egyptian instruments and turns out to be the main aerophone in the New Kingdom. However, neither flute nor clarinet disappear completely from the ancient Egyptian "orchestra" – both of them rather experience a change in meaning provoked by the foreign influence and the advantages of the "new" instrument.</p> <p>Also, the transverse flute and the pan flute – both without an egyptian designation – found their way into ancient Egypt, albeit only during the Graeco-Roman period and never being as important as the oboe.</p> <p>In the forthcoming lecture the two native instruments (flute and clarinet) are to be compared to the imported instrument (oboe). Based on this contrast considerations will be presented concerning questions like: Which advantages of the oboe were the reasons</p>

	<p>for its great popularity? What can we learn about music and sound traditions in ancient Egypt? What was the role of the flutist or the oboist?</p>
12	<p><b>WHO PLAYED THE SISTRUM? A MISSING INSTRUMENT IN THE HEBREW BIBLE</b></p> <p><b>Abstract author(s):</b> Friedmann, Jonathan (Academy for Jewish Religion California)</p> <p><b>Abstract format:</b> Oral</p> <p>The sistrum, an idiophone primarily associated with the Hathor cult, appeared in Canaan in the third millennium BCE and persisted into the Roman period. Some biblical interpreters link the instrument to two ambiguous Hebrew terms, shalishim (I Sam. 18:6) and mena'anim (II Sam. 6:5). However, these translations are doubtful. Unlike other widespread instruments in the region, sistra (pl.) apparently did not outgrow associations with the cult, even as they were likely played in other contexts. Their close ties to Egyptian practice led biblical authors to censor or omit references to them. This paper proposes that three interconnected uses of sistra—cultic, apotropaic, and during women's celebrations—were especially problematic for biblical authors, who cite competing instruments serving these functions in Israelite ritual. From this perspective, the exclusion of sistra was part of a larger agenda of discrediting idolatry and distancing from surrounding cultures. Moreover, by comparing biblical passages to the available archeological evidence, this paper confirms that what is preserved in sacred texts does not always reflect the activities of "ordinary" people, who at times engaged in musico-religious practices, such as playing sistra, that were at odds with official rulings.</p>
153	<p><b>ARCHAEOLOGY IN THE DIGITOCENE AGE: DISCUSSING CRITICAL APPROACHES, ONTO-ETHICS, AND POLICIES OF DIGITAL PRACTICES</b></p> <p><b>Theme:</b> 5. Assembling archaeological theory and the archaeological sciences</p> <p><b>Organisers:</b> Hanus, Kasper Jan (TBD) - Stobiecka, Monika (University of Warsaw) - Johnson, Tyler (University of Michigan)</p> <p><b>Format:</b> Regular session</p> <p>As archaeology experiences an ongoing radical shift from "spade-work" to "screen-work," technical advances continue to outpace the development of robust interpretive frameworks responding to the "digital ecosystems" which now characterize our field. This lack of balance risks perpetuating a trend of "techno-fetishism" whereby researchers prioritize the utilization of the latest methods to collect more and more data at the expense of keeping their interpretive frameworks breast with new technologies. Furthermore, on outsized emphasis on the technical over the theoretical can lead researchers to "aestheticize" archaeological knowledge, focusing their efforts on the production of data visualizations which enchant and impress, but do not necessarily make meaningful contributions to interpretive dialogues about the past.</p> <p>Recently, a growing chorus has amplified concerns regarding these issues. Jeremy Huggett, for instance, argues that the influence of digital technologies on the very nature of archaeological practice is "under-theorised, under-represented, and under-valued," but "is increasingly fundamental to the way in which we arrive at an understanding of the past" (Huggett 2015, 86).</p> <p>During this session, we seek to answer Huggett's call for a "meaningful dialogue" about digital technologies and their influence on research outcomes (Huggett 2015, 87), inviting proposals that handle the theoretical, methodological and practice-based problems of digital archaeology in research contexts. Moreover, the increasingly widespread application of digital methods in the context of heritage practice raises the need for a critical examination of these issues beyond the academic field (i.e. public archaeology, indigenous archaeology, rescue archaeology). Therefore, submissions speaking to the influence of digital on the politics of heritage, social impact and global or local values are also highly encouraged.</p> <p>References:</p> <ul style="list-style-type: none"><li>Huggett, J. 2015. "A Manifesto for an Introspective Digital Archaeology." Open Archaeology 1, 86-95.</li></ul>
1	<p><b>DIGITAL SUSTAINABILITY: WHAT HAPPENS WHEN WE DIGITIZE EVERYTHING?</b></p> <p><b>Abstract author(s):</b> Stobiecka, Monika (University of Warsaw)</p> <p><b>Abstract format:</b> Oral</p> <p>The last few years have shown that in heritage policy all over the world priority has been given to digitization. International, national, and regional authorities and academies generously support researchers and technicians working on digital heritage. Almost everything considered valuable is registered, stored in databases, or presented in museums, and finally, saved for posterity in various digital formats. However, this ubiquitous turn towards the digital that has taken over heritage studies still lacks a proper theoretical and critical framework. Many authors notice this severe theoretical lack, which often leads to techno-fetishism, particularly visible in projects where researchers, following the fast-science track, indiscriminately collect more and more data by applying the latest methods, to create more and more representations, reconstructions, simulations, or even simulacra. All too often, digital heritage is based on a simple problem-solution mechanism, dismissing the ethical implications. It is high time to think about the future of digital heritage and repeat the question posed by Harold Thwaites: what happens when we digitize everything? (Thwaites 2013). Or go further and ask: what are the ethical implications of this mass digitization – will the digital replace the material?</p>

In my presentation I will discuss if digital heritage can be sustainable, and if the practice can be slow and thoughtful, instead of fast and managerial. My questions will embrace aspects of digital heritage related to digital materiality, energy use, and accessibility and public use. My speech will be illustrated with the preliminary results of a study on Polish digital and virtual collections.

Throughout my talk I will investigate the future of digital heritage. Assuming that we are witnessing digital heritagization, I will ask further about the implications of this preference for the digital for sustainable heritage development.

2

## DIGITAL STRATEGIES FOR A MORE ACCESSIBLE ARCHAEOLOGICAL FUTURE: DISCUSSION AND EXAMPLES BETWEEN THEORY AND PRACTICE

**Abstract author(s):** Johnson, Tyler (University of Michigan)

**Abstract format:** Oral

A future that emerges as increasingly technological and virtual places immense pressure on archaeologists to produce significant results and paths forward in the realm of digital work. Currently, most significant advances in digital archaeology have emphasized excavation and laboratory workflows or practical and theoretical research outcomes. While such work is obviously to be lauded and supported, much of it has done a poor job of responding to what should be an essential demand of digital applications in archaeology: the design and creation of plans and platforms for making cultural heritage more accessible and equitable to the global public. In what follows, I will engage the concept of “accessibility” on several levels as it pertains to theory and practice in digital archaeology, with key emphasis on the potential for digital applications to make archaeology more accessible to people with disabilities. In the process, I will argue that digital archaeology has the potential to increase accessibility outcomes in both academic research and public facing contexts (museums and other cultural heritage experiences). On the other hand, digital work can only be one aspect of accessibility plans for archaeological projects and must be carefully coordinated with other efforts which strive toward a common goal (including, among other things, the training of personnel and the construction of infrastructure). As a result, this talk will draw upon a few practical examples of current work seeking to expand accessibility in archaeology using digital tools, including my own experiences with the archaeological site of Poggio del Molino (Populonia, Italy) and the University of Michigan’s Gabii Project (Rome, Italy).

3

## OUT OF THE FETISHISTIC FRAMEWORK: DIGITAL CRITICAL THEORY FOR DIGITAL ARCHAEOLOGY

**Abstract author(s):** Vaquero, Pablo (University of Glasgow; University of Granada)

**Abstract format:** Oral

Digital Archaeology can be conceived as the subfield which uses computational/digital tools for generating and processing data which can, then, answer archaeological enquiries. Oftentimes, these technologies seem to bring a halo of utter objectivity. This hampers discussions about the subtleties and nuances of using them, ultimately backfiring many of the expectations put upon this subfield. Such scenario plays against our interest in developing refined frameworks that can effectively deploy the full potential of Digital Archaeology. For achieving this potential, we first have to transcend a point-zero stage -i.e. explicitly address the theoretical underpinnings of these technologies and their use. Going through this stage is what would also show the subjectivity of the digital. The latter might be perceived as counterproductive, but according to Buccelatti (2017), the most appropriate way of being close to objectivity is by acknowledging our subjectivity. At the end of this process, we will realise that there is a constant need for going backwards and forward into theory for the right development of Digital Archaeology.

In this paper, I aim to discuss the importance of theory by focusing on computational ontologies. The case of The DataARC Project grounds this reflection. The presentation addresses the importance of theory for coherently developing an ontology which fits our goals and detecting implicit theoretical frameworks carried by the data (Huggett, 2015). Through this case, I moreover argue that many ontologies hitherto developed for archaeology limit this cybertool’s potentialities. Finally, I reflect upon how our digital approach might affect our perception of the past. I argue that these reasonings are necessary should we develop an ethical Digital Archaeology.

4

## THE POTENTIAL AND LIMITATIONS OF BIBLIOMETRIC BIG DATA FOR THE ANALYSIS, VISUALISATION AND UNDERSTANDING OF ARCHAEOLOGICAL RESEARCH

**Abstract author(s):** Sinclair, Anthony (University of Liverpool)

**Abstract format:** Oral

Developments in archaeological thinking have usually been based on the close reading and criticism of published documents in the form of theoretical, methodological and analytical studies. However, the quasi-exponential growth in archaeological literature has made it almost impossible for anyone to read but a small percentage of the current literature, let alone the corpus of literature produced within any field over the last 30 years. This factor, perhaps as much as any other, has led to a progressive specialization / narrowing of focus by individuals and teams. In contrast, since the 1960s information scientists have argued that bibliometric data – the meta data of individual documents – held in abundant quantity by the major citation indexes (Web of Science, Scopus, etc.) provide an effective source for identifying the key areas of disciplinary development (the ‘research fronts’) their central conceptual

knowledge (the ‘intellectual base’), areas of potentially important research synergy between disciplines, and, of course, the most productive research areas and personnel. Network analysis linking scholars, documents and concepts, visualised by freely-available, science-mapping software provides an awesome showcase for these claims. Using palaeoanthropology as its example, this paper will examine the current effectiveness of such visualisations for understanding the development of archaeology. Specifically, it will emphasise the importance of understanding the limitations of bibliometric data in terms of (i) indexed documents versus cited; (ii) of citation-index provided subject category labels and document keywords used to generate visualisations of concepts. It will identify the work required to render this data and such visualisations useful for archaeologists. At a time when bibliometric data has become a powerful tool for institutional research managers to evaluate ‘objectively’ the standing and investment potential in individuals and departments, an understanding of this such is vital.

5

## DIGITISATION DRIVEN BY TRADITION – AN ARCHITECTURAL VIEW UPON ARCHAEOLOGY

**Abstract author(s):** Lengyel, Dominik - Toulouse, Catherine (BTU Brandenburg University of Technology Cottbus-Senftenberg)

**Abstract format:** Oral

One of the most significant phenomena of digitalisation in archaeology is the gamification. The film industry and notably the gaming industry have been setting standards that contemporary archaeological mediation, whether in museums or in specialist journals, is reluctant to fall behind. Yet the claim is basically completely different: popular culture is primarily about entertainment if not amusement. Scientificity in theses settings becomes secondary, sometimes even undesirable, as it would not only appeal directly to the little attentive, casual museum visitor or magazine reader. On the contrary – in the spirit of general participation – the presumed audience would to be met where they are. Besides, it is well possible to use even the latest technology in such a way that critical and theoretical reflection is still possible, even aestheticised, whereby visualisations can certainly become meaningful contributions to interpretative dialogues. This approach even avoids the risk that this technological access would be under-theorised mainly by focusing on the two traditions of architectural modelling, i.e. the consistent use of abstract representations, and classical architectural photography, i.e. the focus on a visual perception that is as natural as possible, as if the digital model were our physical reality.

The presentation aims to demonstrate and illustrate this method by several projects developed by the authors in cooperation with archaeological research institutions:

- Cologne Cathedral and its Predecessors (by order of and exhibited in Cologne Cathedral),
- Bern Minster – its first century (by order of and published by Bern Minster Foundation)
- The Metropolis of Pergamon (within the German Research Fund Excellence Cluster TOPOI),
- The Palatine Palaces in Rome (by order of the German Archaeological Institute, both latter exhibited in the Pergamon Museum Berlin),
- The Ideal Church of Julius Echter (by order of the Martin von Wagner Museum in the Würzburg Residence).

6

## INTERPRETING THE PAST – HOW ESTHETICS DESTROY THE PAST

**Abstract author(s):** Tomczak, Sonia (Nicolaus Copernicus University)

**Abstract format:** Oral

I would like to answer the question if esthetics used in creating visualisation destroy the past. Living in the Digitocene Age, we as archaeologists have new responsibilities. By examining the past and reconstricting it based on our findings, we try to present result of our research in a way that convince the public and influence their imagination. By visualisations scientists create vision of the past in peoples’ minds. At the same time, it is a great privilege and responsibility.

Nowadays, the most popular means used by archaeologists for the purpose of creating a vision of the past, are beautiful and esthetic visualisations. The use of technology changes our perception of the past. Dirty parts of a vessel dug up from mud are presented as a clean, detailed vessel. One gets the impresion that it is almost possible to touch the object. The vessel is placed in a hand of a person shown in another visualisation and we move back thousand of years to see how people used vesels and how they lived. One could ask if this is real. Of course, we know that visualisation is not a real artefact, or do we? Why does it influence our senses more than a dirty pot?

7

## ONE DOES NOT SIMPLY LOOK AT SATELLITE IMAGERY. INTERPRETING REMOTE SENSING DATASETS WITH ENHANCED ANALYTICAL TOOLS

**Abstract author(s):** Hanus, Kasper Jan (TBD)

**Abstract format:** Oral

The most crucial, and often overlooked, aspect of remote sensing applications in archaeology is selecting the right analytical methods to bridge datasets with theories describing past societies’ complexity. With this paper, the author will attempt to highlight this issue, focusing on a particular case study of matching the social theory, interpretation methods and remote sensing data.

The presentation will focus on a new method for an assessment of past water–human interactions. The method is based on a tool developed by space syntax pioneers Bill Hillier and Julienne Hanson: a gamma graph analysis representing ‘permeability’ of buildings. It will be discussed how this tool was altered in order to model a water management system. Subsequently, the method’s test on a

case study – an ancient Silk Roads’ oasis-city of Miran in north-western China, will be presented. The positive verification makes the author argue that the introduced method can provide new insight into the relations of power interlinked with water management.

8 **MULTIMODAL APPROACHES TO THE PRESENTATION OF 3D AND SPATIAL DATASETS FOR SCHOLARLY AND PUBLIC INTERPRETATION**

**Abstract author(s):** Naglak, Matthew (Boston College) - Araújo, Nina (Northeastern University) - FitzGibbon, John (Boston College) - Kim, Min Jung (Lynch School of Education & Human Development, Boston College)

**Abstract format:** Oral

Technical advances for archaeological documentation have led to the gathering of vast quantities of 3D and spatial data by archaeological projects, yet for the most part these data are kept siloed apart from other areas interpretive presentation, placed in repositories and left to whither. This fact requires anyone hoping to evaluate the data for themselves to jump through a multitude of hoops in order to simply gather the entire dataset into a useable format, much less actually interpret it.

In an attempt to change this mindset, the Gabii Archaeological Project out of the University of Michigan has made a dedicated effort to design a variety of multimodal, integrated user experiences of their 3D and spatial datasets for users of a variety of experience levels to engage with. Through the use of open source tools such as the Unity gaming engine, Leaflet interactive maps, and, more recently, Apple’s Reality Composer Alternate Reality platform, we have attempted to bring our digital datasets out of the repository and into academic and public presentation, offering a one-stop shop for our data. Here we review these efforts (both the successes and failures) both at Michigan and more recently in collaboration with the Center for Digital Innovation and Learning at Boston College, with an eye to the future of what archaeological presentation in the classroom can be.

9 **BEYOND THE VISIBLE. LANDSCAPE EXPLORATION OF THE DEWIL VALLEY (PHILIPPINES)**

**Abstract author(s):** Kowalczyk, Zuzanna (Adam Mickiewicz University, Poznan)

**Abstract format:** Oral

In contemporary archeology, digital methods are commonly used at all the stages of the research – from the data collection, through analysis, interpretation, visualization, and presentation to the public. However, the overwhelming majority of these techniques are related to visual and optical cognition, such as creating graphic maps and plans, drawings, photographs, 2D and 3D models. The sensory data such as sounds, scents, textures, and tastes are considered less scientifically valuable. Even though phenomenological observations are embedded in indigenous practice and correspond with the ethnographic data.

This paper discusses the case study of specific cave sites in the Dewil Valley (northern Palawan, Philippines) which traditionally were interpreted only on the basis of visual criteria, creating an incomplete and pictorial-deterministic narrative about the past. Analyzing indigenous knowledge, ethnographic and archaeological data, I will argue that landscape cognition is inextricably linked with the physicality, features, properties of the material form, and potential for change. Tactile and smell sensations, sonorous qualities, together with visual perception are primary tools in learning landscape ontologies, therefore archaeological tools should be directed at these impressions. Furthermore, I will discuss the developing potential of scentography and sound recording as the methods on a par with the visual ones in the Digitocene Age.

10 **THINKING THROUGH THE TOOL: ARCHAEOLOGICAL BODY-WORK IN IMMERSIVE VIRTUAL REALITY**

**Abstract author(s):** Morrow, Giles - Wernke, Steven (Vanderbilt University)

**Abstract format:** Oral

With the recent emergence of very high-resolution three-dimensional models via photogrammetric techniques as a primary method of archaeological documentation, the construction of near perfect simulacra is imminently within reach. Such models and methods are still viewed as a vanguard practice, requiring large outlays of expertise and computational expense. The vast majority of research making use of high-fidelity 3D models of artifacts and excavation contexts tend to remain siloed under the curation and use of the research teams that produce them. In efforts to “think beyond the tool”, this paper considers how the scales at which the human body interacts with these digital environments is especially important for understanding the affordances and ergonomics of past things and places. The implications of this isometry between archaeological objects of analysis in past social contexts and emerging capabilities to interact with them through digital surrogates in the present are manifold. By enabling interaction with objects and contexts in immersive virtual space, such observational experiences create in silico engagements that are repeatable and distributable. In particular, it is the collaborative capacity of this technology that is explored in this paper through the use of immersive virtual reality (iVR) systems to reinterpret the digital records of two archaeological sites under excavation in Peru. Through iVR frameworks, the authors reconsider the colonial era reducción site of Mawchu Llacta in the Andean highlands and the pre-Columbian site of Huaca Colorada on the north coast. Synchronous scalar experiences that privilege the affordances of architectural space within digital models create opportunities for an embodied interpretational dialogue beyond academic discourse alone. The capacity to digitally inhabit these places and manipulate materials hold subtle but profound epistemological and hermeneutic implications for archaeological knowledge construction.

11 **ARCHAEOLOGY REDESIGNED AS A PEER-TO-PEER PLATFORM**

**Abstract author(s):** Wilkins, Brendon (DigVentures; University of Leicester)

**Abstract format:** Oral

This paper compares a traditional ‘pipeline’ with a networked ‘platform’ model of field work, assessing the impact of technology enabled participation on archaeology’s disciplinary and professional boundaries. In contrast to the collaborative potential of peer-to-peer systems, the current vogue for intra-site digital tools (such as tablet recording, GIS and 3D technologies) can be seen to augment rather than reinvent pre-digital workflows. This is where new peer-to-peer ‘platform’ technology can assist, potentially creating space for civic participation at the centre of our work. DigVentures have adopted a platform approach to archaeological resource sharing, collaborative knowledge production, and crowdsourced labour, facilitated by a suite of networked digital tools creating an accessible space for micro-volunteering initiatives and experiences. By opening up the archaeological process in this way, the central design challenge becomes how to improve research outputs whilst simultaneously enabling civic participation at every level. The underlying technology of the platform addresses this with a publishing hub, online learning courses, e-commerce crowdfunding payment system, and a read/write recoding system enabling project participants to collaboratively produce archaeological data.

A. **MAPPING THE EVOLUTION OF AN ARCHAEOLOGICAL EXCAVATION IN THE DIGITAL ERA. A CASE STUDY OF SULTANA-MALU ROŞU**

**Abstract author(s):** Frujina, Ovidiu - Covataru, Cristina - Lazar, Catalin (Universitatea din Bucuresti)

**Abstract format:** Poster

Until a few decades ago, aerial survey methods were used in archaeology with the sole purpose of acquiring imagistic data that could be used in identifying new areas of archaeological interest. Due to the aid of compact global and inertial navigation systems (GNSS, INS) that are incorporated in the unmanned aerial vehicles (UAV) flight planning software, the speed and accuracy at which areas with high archaeological interest are mapped, has significantly increased. The evolution of this system facilitates the use of close-range photogrammetry to identify the micro-topographical analysis of already known archaeological sites and record the progress of the excavation and of the archaeological features within a site.

The basis for conducting this type of survey/recording consists in using UAV combined with the use of GCP’s (ground control points) that are measured with the help of a total station or a DGPS (differential global positioning system). Using a combination of these two methods, we should be able to obtain a high precision digital terrain model (DTM) and an orthophoto map with absolute geographic coordinates. Interpreting this type of information, allows us a better understanding of the excavation as well as of the archaeological landscape in the proximity of the sites.

Our study will present the results of using close-range photogrammetry as a useful tool to record an archaeological excavation over long periods of time. Interpreting this kind of analysis will allow us a better understanding of the past recorded in the archaeological contexts.

156 **USERS OF HERITAGE: CRITICAL APPRAISAL OF THE ADOPTION OF CITIZEN SCIENCE IN DIGITAL PROCESSES OF ARCHAEOLOGICAL KNOWLEDGE PRODUCTION**

**Theme:** 6. Material culture studies and societies

**Organisers:** Thomas, Suzie (University of Antwerp) - Oksanen, Eljas (University of Helsinki) - Wessman, Anna (University Museum of Bergen)

**Format:** Session with keynote presentation and discussion

We approach the growing trend of citizen science approaches in the curation and creation of archaeological knowledge. Citizen scientists are not limited to those that upload data about discoveries of archaeological material to established databases, and increasingly engagements in physical interventions with archaeological sites and artefacts are similarly being identified as citizen science activity. However, the digital realm of citizen science provides a focal point for this session.

Contributors to this session are requested to take a broad perspective to citizen science approaches, which may include developing their discussions in the context on particular case studies, or by taking a broader approach to the ethical and disciplinary questions that this form of public participation in archaeological heritage presents.

- We therefore ask the following questions:
- What are the ethical parameters that need to be considered in the development and design of platforms for digital citizen science with regard to archaeological heritage? For example, whose needs are to be prioritised by these platforms, and who has and/or maintains control?
  - Can we be certain (or is it desirable) that there is an interactive flow between academia and citizen scientists, or is it more important that the data is made primarily available for scientific research purposes?
  - Within the European context of the Faro Convention, to what extent does digital archaeological citizen science contribute to the increase and enhancement of public participation with archaeological heritage?

Contributors should keep the above questions in mind while considering different motivations for engaging in citizen science and the roles and goals of different actors such as members of the public, heritage managers and academic researchers, the different

levels of control allowed to these often diverse groups, and the questions who has responsibility for ensuring the sustainability these platforms and initiatives - WHO should manage archaeological citizen science?

TRUSTING THE PUBLIC: RECORDING ARCHAEOLOGICAL FINDS IN A GLOBAL PANDEMIC

**Abstract author(s):** Lewis, Michael (British Museum)

**Abstract format:** Oral

Throughout the recent Covid-19 pandemic, especially during March-April 2020 and December-April 2021, the recording of archaeological finds made by the public in England and Wales (through the British Museum’s Portable Antiquities Scheme) depended more on a citizen science contribution, particularly through digital technology (photography, image manipulation, providing findspot data and weights and measurements etc). This was a significant departure for the Portable Antiquities Scheme (PAS) where most finds are handed over to its team of local Finds Liaison Officers (FLOs) for recording, though interns/volunteers work alongside these professionals in the creation and curation of that dataset. As the Scheme now looks to develop its digital applications for recording finds, this paper will explore the lessons learnt from digital recording and the opportunities it brings for involving more people in the recording of archaeological finds (and archaeology more generally), but (importantly) not at the expense of the archaeological record and the value of public finds for advancing knowledge.
- 2

CURRENT STATE OF CITIZEN SCIENCE IN ARCHAEOLOGY OF THE CZECH REPUBLIC

**Abstract author(s):** Komoróczy, Balázs (Institute of Archaeology of the Academy of Sciences of the Czech Republic, Brno)

**Abstract format:** Oral

For the last three decades, archaeological science and archaeological heritage management in the Czech Republic have been strongly influenced by the extraordinary popularity of metal detecting by members of the public. In the 1990s and at the beginning of this century, archaeology reflected this problem mainly as an academic question of ethics, only isolated emergent calls were made during some accidentally evidenced extraordinary losses or damage to archaeological finds and contexts. Largely as a result of generational change within the archaeological community and also as a natural manifestation of the country’s social transformation from post-totalitarian to still fragile but increasingly developed civic society, tools for moderating metal detecting are currently sought and applied in many major professional institutions. Both traditional and digital tools are established to enable the sharing of benefits within the archaeological community and the public. This process quite naturally and necessarily results in the emergence of citizen science circles around professional institutions. Although this is an ongoing process, yet today it is possible to clearly identify the prevailing ethical parameters and especially the practical forms in which this citizen science is constituted. Their characteristics, as well as the benefits, weaknesses and threats of this process are the main topic of the presentation.
- 3

CO-PRODUCTION OF ARCHAEOLOGICAL FIND DATA: ADVANTAGES AND CHALLENGES OF CITIZEN SCIENCE IN ARCHAEOLOGICAL COLLECTION MANAGEMENT

**Abstract author(s):** Rohiola, Ville (Finnish Heritage Agency)

**Abstract format:** Oral

From the perspective of archaeological collections, citizen science produces valuable and beneficial data, which has great potential to improve and enhance the efficiency of archaeological finds management. However, the challenge lies in finding ways to produce and provide archaeological knowledge that satisfies the needs and motivates different users from the general public to academia. Recreational metal detecting has become a steady part of archaeological citizen science in the countries where metal detecting is legally permitted. In Finland, the metal-detecting finds that are considered antiquities by the Finnish Antiquities Act, need to be reported to the Finnish Heritage Agency. The digitally recorded find information by the citizen scientists is becoming increasingly interesting and valuable because of its research potential. Archaeological collections are in the key position in preserving and providing the archaeological find information and in ensuring the quality of the data and its long-term preservation.

In this paper, the interplay between citizen science and archaeological collections is studied with the example of two public services dealing with archaeological finds, managed by the Finnish Heritage Agency: the find reporting service Ilppari and FindSampo, a linked open database of archaeological finds. The main focus of the presentation is to explore the requirements and standards of object cataloguing from the perspective of citizen science. How can citizen science take part in cataloguing archaeological find data and further advance the democratization of archaeological heritage?

All the actors - public, academic researchers and heritage managers - share the interest in archaeological knowledge, but the perceptions regarding metadata quality and minimum information requirements of qualified data varies between actors. Whose needs should be prioritized in recording citizen science find data?

- 4

WIKIDATA AND THE WIKIMEDIA UNIVERSE AS A PLATFORM FOR CITIZEN ARCHAEOLOGISTS

**Abstract author(s):** Schmidt, Sophie (Free University Berlin)

**Abstract format:** Oral

In Germany, metal detectorists and voluntary archaeologists need to register with the federal state they want to work in and need to receive permissions to survey certain areas. As Heritage Management is federalised in Germany, different laws and regulations are enforced in each state. Data and finds by citizen scientists are recorded by Heritage Management and entered into their archives, where they „disappear“ from the public’s eye. In this talk I will present the project „Zerschlagenes Geschirr - Archäologische Quellen in Wikidata“ („Smashed Dishes – Archaeological Sources in Wikidata“) funded by the Wikimedia Foundation within the Open Science Fellow Program (<http://smasheddishes.squirrel.link>). It aims to enable and empower citizen science by showing volunteer archaeologists how to use the Wikimedia universe to publish their data to the wider public as well as to archaeologists.

The Wikimedia universe provides the image storage Wikimedia Commons and the structured knowledgebase Wikidata. Especially Wikidata can be tricky to use for people which are unfamiliar with data management at all. The project therefore aims at creating easy-to-use workflows and guidance and to train volunteer archaeologists in how to use them. As a first step, a suitable data model in Wikidata needs to be designed. For this aim decisions need to be made which will be mediated between volunteer archaeologists and Heritage Management to specify what kind of data citizen archaeologists are able to and should enter, such as type of classification and precision of geographical information.

FACTORY SMOKESTACKS, AN INTERACTIVE ONLINE MAP, AND IDEAS ON HERITAGE

**Abstract author(s):** Äikäs, Tiina (Archaeology, University of Oulu) - Seitsonen, Oula (University of Oulu) - Koskinen-Koivisto, Eerika (University of Jyväskylä)

**Abstract format:** Oral

Factory smokestacks of abandoned industrial spaces can raise multiple feelings; they can be reminders of industrial past, arenas for urban exploring or legend tripping, or they might be considered as wasteland and unaesthetic safety-hazards. This paper is based on data collected via an online interactive map application where people can share their photos and stories related to factory smokestacks. The application gives people a change to comment each other’s postings and bring together people with different ideas of the value or disvalue of these places. Hence the interactive map not only represents factory smokestacks but through the inclusion of stories and later artwork based on these stories, has the potential to transform participants’ everyday encounters with these sites. In this paper we ask, what is the role of this citizen science project in shaping people’s ideas on smokestack as heritage. How can we make sure that different groups of people are equally given voice in collecting data? What is our role as researchers in the heritagization of the smokestacks?

CONSTRUCTIVE CONSERVATION: MAKING MONUMENTS USEFUL

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Darvill, Timothy (Bournemouth University) - Sutton, Robert (Cotswold Archaeology) - Hüglin, Sophie (University of Basel)

**Format:** Regular session

Following a successful first session at the 2020 Virtual Meeting we continue the debate surrounding the challenging task caring for heritage assets whether as archaeological sites, ancient landscapes, or historic buildings. It is a debate that is even more pressing in a post COVID-19 world where adjustments to a new normality will take many forms. Public authorities do not have the capacity or resources to deal with more than a very small fraction of what we now know exists, and increasingly look for public value in what they support. Private bodies and individuals are under pressure to realize financial value from the places they own during the course of development and redevelopment. Conservation as the sustainable and ethically sound management and maintenance of heritage assets needs new and innovative approaches to match these challenges. One such approach is ‘constructive conservation’ which encourages positive, well-informed, collaborative engagements with heritage assets; a flexible process that helps people understand their historic environment and then use that perspective to manage change. Especially important is recognizing, protecting, drawing out, and enhancing the significance of historic places. Creativity is important too, especially in finding new uses for old places in order to give them a secure future. And including elements of the intangible cultural heritage including tradition skills and beliefs can be relevant too.

This session aims to provide a forum in which to illustrate and discuss constructive conservation as an innovative paradigm in contemporary heritage management. Papers are invited on the emergence and development of the idea of constructive conservation; case studies of successful (or unsuccessful examples); and considerations of the ethical and legal implications of constructive conservation in various jurisdictions. It is hoped that the session will range widely, including contributions on buildings, monuments, and landscapes, or combinations of all three.

- 1

### CONSERVATION IN PERSPECTIVE

**Abstract author(s):** Darvill, Timothy (Bournemouth University)

**Abstract format:** Oral

The idea of conservation as a means of looking after elements of the cultural heritage and protecting them from undesirable changes emerged in the late nineteenth century. Since then there have been many twists and turns in the way conservation is understood and implemented. This paper will look briefly at the philosophical roots of conservationism, and consider the dynamic relationships that have shaped its application over the last century and a half. Special attention is given to the conflicting and evolving ideas inherent to conservation within the broader field of archaeological heritage management: simple site protection; the notion of ‘restoring as found’; the idea of fulsome restoration; and the emerging trend for constructive conservation in which selected elements identified through research and investigation become integrated within broader schemes of development and redevelopment. It is argued that making the past contribute to the present has been a strong theme within conservationism for many years, although what exactly those contributions might be is often contested and negotiated. In a world where emotional connections to place are seen as increasingly important, where the art of place-making is integrated with spatial planning and design, and interests in well-being, sustainability, and prosperity dominate social policy, how might constructive conservation keep up with changing demands?
- 2

### THIS PARK IS YOUR PARK, THIS PARK IS MY PARK, ... THE STORY OF THE LVR-ARCHAEOLOGICAL PARK AT XANTEN (GERMANY)

**Abstract author(s):** Kienzle, Peter (LVR-Archaeological Park at Xanten)

**Abstract format:** Oral

The remains of the former Roman Colonia Ulpia Traiana (Roman province of Germania Inferior) are located immediately north of the medieval and modern city centre of Xanten (Germany). Until the late 1950ies, this area was agricultural land with only a few farm buildings. With the construction of a concrete factory at the site of the Roman Town Baths in 1958 prosperity seemed to come to the rural area of Xanten. The expansion of gravel pits to supply the concrete factory meant the final destruction of large parts of the Roman remains. An industrial estate was planned in other parts of the former Colonia.

With the foundation of the Archaeological Park at Xanten in 1973 the site was protected from further destruction but the archaeologists from the museum in Bonn, some 120 km to the south, were perceived as intruders by the local population. They prevented local jobs and prosperity in favour of some “strange archaeological open air museum”. Slowly and gradually the public opinion changed due to various measures taken by the staff of the archaeological park, most of all by providing employment to a great number of locals.

Today, the park attracts some 350.000 visitors a year and is one of the most visited museums in Germany. Resistance prevailed with some of the elder locals and they claim their correct judgement by indicating negative effects of mass tourism. Other citizens do accept the park to be one of Xanten’s highlights.

The paper explores the relationship between the local residents and “their” archaeological park to date. It shows, that a long period of mutual learning from each other results in a win-win situation.

### CONFLICT NARRATIVES: THE POLITICS OF CULTURAL HERITAGE MANAGEMENT IN POST-WAR SYRIA

**Abstract author(s):** Munawar, Nour A. - Symonds, James (University of Amsterdam - UvA)

**Abstract format:** Oral

The physical traces of war and violence may be likened to a disfiguring scar after an accident. They can be removed or disguised using surgery, for the sake of forgetting. Conversely, such scars can be preserved for the sake of remembering and openly displayed as a badge of honour that shows evidence of the trauma that has been endured.

The Arab Spring movements, which started in 2010 in Tunisia, have been characterised by the destruction of cultural heritage sites, monuments, and facilities. Cultural heritage destruction in the Middle East and North Africa (MENA) region has infuriated and saddened local people as well as Western observers, academics and organizations.

The reconstruction of cultural heritage is a long-term process. The physical reconstruction of material heritage and monuments is just one of the first steps in this process. An ill-conceived reconstruction can be as destructive as an act of destruction, and such reconstructions can have the capacity to divide communities and prolong conflict and violence after wartime hostilities have ended. This paper explores the politics of cultural heritage in colonial and pre-war Syria and examines how Ba’athism has used the narratives and remnants of the past in the present. We argue that the ongoing reconstruction works in the Old City of Aleppo, such as the rebuilding of the Great Umayyad Mosque and its famous minaret, are freighted with cultural meaning and are primarily intended to bolster the power and authority of the ruling regime. In effort to contextualise these reconstructions we investigate how Syrian heritage management has been influenced by political developments in the MENA region since the colonial period, and how the public histories and memories of contemporary Syria have been used by Syria’s government to produce and promote counter-narratives in the aftermath of Syria’s unfinished conflict.

### DE-CONSTRUCTIVE CONVERSATIONS: THE MAKING OF USEFUL MONUMENTS

**Abstract author(s):** Sutton, Robert (Cotswold Archaeology)

**Abstract format:** Oral

We can all agree that an understanding of cultural significance lies at the heart of the sustainable management of heritage assets. However, arguments on what constitutes heritage significance and how much weight this should be given, in decisions affecting its future, are commonplace. In the UK, in recent months, the subject of ‘contested heritage’ (specifically regarding colonial histories) is rightly being given more time in these debates. This paper will not attempt to tackle this specific matter, but will look at something far simpler, more basic. What weight should be given to widely held beliefs regarding heritage significance that are just plainly incorrect? You’d think the answer was simple, it isn’t. Case studies from the UK will be used to explore whether heritage significance can be viewed as ‘cold facts’ or whether there is a place for the ‘inauthentic monument’ and misguided public perception. Have we heard enough from the experts?
- 5

### DEAD MONUMENTS OR LIVING PLACES

**Abstract author(s):** Redfern, Neil (Council for British Archaeology) - Emerick, Keith (Historic England)

**Abstract format:** Oral

What do you see when you look at or visit a monument? Do you ask how old it is? Do you ask about what it is? Are you concerned about how authentic it is? Do you care at all or are you just visiting for a nice day out?

In understanding how we make monuments useful, first we need to understand how monuments were created – how did we come to have these pristine sites, laid out the same and presented in the same way – what do we see when we see a monument?

Drawing from our own experiences of over 30 years managing and caring for Scheduled Monuments in England we will explore the myths behind monuments and how their creation and management in the 20th Century has shaped our perceptions of them – and heritage – today.

We will argue that this formal approach has created the dead monuments we see around us. Understanding this helps us evolve our approaches to the management of monuments and enables us to transform them from dead monuments into living places that serve a multitude of uses and meanings. Our paper will show how by telling different stories we can transform our approach to these sites and places.
- 6

### THE HIGH STREET IS DEAD; LONG LIVE THE HIGH STREET: FINDING NEW USES FOR HISTORIC RETAIL SPACES

**Abstract author(s):** Hunter, Sacha (Cotswold Archaeology)

**Abstract format:** Oral

The outbreak of covid-19 and the temporary closures of non-essential shops, and nearly all cafes, pubs and restaurants, is by no means the sole reason for the ‘death of the high street in the UK’. The increase in on-line shopping is clearly an instrumental factor in its slow demise; however, it seems that covid-19 has just hastened what many commentators had predicted as inevitable. But what does this mean for the tens of thousands of historic retail and hospitality buildings that line our high streets? Clearly, some will survive, but these are likely to be a minority. With housing being in short supply, residential conversions seem to be the most likely outcome. But when heritage significance is inextricably linked to its function, can repurposing a retail space for modern day residential use really conserve an appropriate level of historic fabric and the ‘essence’ of the place? And how do we manage the inevitable conflict between retaining historic shop frontages, an intrinsic feature of the character of historic retail streets, but also live practically within them?

This issue will play out across the UK and in our most treasured historic locations. The management plan for the World Heritage Site of Bath explicitly cites the ‘shops, coffee and ale houses: as a demonstrable quality of the Outstanding Universal Value of the place’. Surely now is the time to develop a fresh toolkit to understand and safeguard these critical components of heritage significance. As a nation of shopkeepers, its time for us to step forward with constructive, innovative ideas to manage the change occurring to historic high streets whilst also sustaining their heritage values.
- 7

### REVIVING THE HEART OF THE CITY. ARCHAEOLOGICAL AND CONSERVATION WORKS AT THE OLD COURT PALACE IN BUCHAREST

**Abstract author(s):** Theodor Aurelian, Ignat - Majuru, Adrian - Clesiu, Sorin - Pirvulescu, Dan - Opris, Vasile (Bucharest Municipality Museum) - Capatana, Mircea (Polarh Design)

**Abstract format:** Oral

The Old Court Palace in Bucharest sits right in the center of the Romanian capital. It is the most important monument of the city and it’s now under reconstruction. Its story begins in the 15th century when Vlad the Impaler (aka Dracula) issues a document from his new stone built fortress called Bucharest. Over the centuries, the fortress was reshaped by fires, earthquakes, and by the will of the following rulers of Wallachia, up until the beginning of the 18th century when it was abandoned and sold. During the 19th century the place was completely transformed as the city grew over the ancient stone and brick walls. During the 1970, by the will of the

communist party, massive demolitions followed by intensive archaeological research unearthed the memory of the lost city, and a new open air museum was born. It told the story agreed by the ruling party.

Today, the Old Court Palace has the opportunity of a new beginning. As the monument is undergoing restauration works, a full-scale archaeological project uncovered new well preserved structures and features, some dating back to the 6th century AD. Conservation procedures were put into place in order to preserve these feature for in situ exposure. The initial restauration project which implies the building of a modern in-door and open-air museum had to be adapted to integrate the latest archaeological findings.

All this time marked by the Covid-19 outbreak, and shortage on funding, we have raised awareness in the community by publishing our latest archaeological discoveries on social media and newspapers, TV and radio shows, but also scientific reunions. Periodical meeting with the stakeholders also helped the progress of the project.

The new museum will unfold a new, more accurate story in an interactive fashion suited for the 21st century.

## THE ROMAN AMPHITHEATER OF BURNUM (CROATIA): DIGITAL SURVEY AND 3D MODELING FOR THE STUDY, KNOWLEDGE AND DISSEMINATION OF CULTURAL HERITAGE

**Abstract author(s):** Campedelli, Alessandro (University of Bologna) - Zaninovic, Josko (National Park Krka)

**Abstract format:** Oral

Virtual archeology has a strong impact on the general public and is progressively gaining ground in museums all over the world, because it is able to make the user relive situations as if they were real and to experience strong emotions through immersive visualization systems given by the increased reality. In the archaeological field, most of the time ancient buildings are reduced to ruins, and therefore thanks to the creation of a virtual model it is possible to reconstruct the volumes of the buildings, the interiors and the passable spaces. Virtual reconstructions applied to architecture constitute the most complex field of application because we will intervene on the geometries, proportions and architectural decorations that were part of the structure in antiquity. The lost architecture of the Roman amphitheater of Burnum required those who carried out the digital reconstruction operation to understand all the elements, to recognize every possible clue and to create a logical connection between the remains of the existing building, the his drawings and traces from all possible clues. The 3D modeling tools made it possible to give strength to ideas and hypotheses and were included in a workflow aimed at rediscovering the choices of architects, builders and clients of the past, following a path backwards with respect to even the slightest traces of what remained. The virtual model of the Roman amphitheater of Burnum, in addition to the dissemination purpose, was used for the restoration and reconstruction project of the ancient building and today it is one of the main tourist destinations of the Krka National Park in Croatia.

## DEVELOPMENT OF THE ARCHAEOLOGICAL LANDSCAPE „OLDENDORFER TOTENSTATT”

**Abstract author(s):** Menne, Julia (University Hamburg, Institute of Pre- and Protohistoric Archaeology)

**Abstract format:** Oral

The present project aims at an integrative and sustainable development of the archaeological landscape ”Oldendorfer Totenstatt”. With this ongoing project, we intend to return the output of a university research project back to the region in order to connect regional museums, volunteers, and the local community.

The Lüneburg Heath with its ”Oldendorfer Totenstatt” contains burial sites in a very small area from almost all prehistoric periods - from the Stone Age to the pre-Roman Iron Age. The ensemble, which has been under protection since the 1850s, is largely undisturbed. It thus offers the rare opportunity to observe the development of a landscape from its beginnings over thousands of years. The site is a year-round destination of numerous regional and national tourists.

The aim is to enhance existing structures, strengthen a disadvantaged region and actively involve the public in order to preserve the heritage of this landscape for furture generations. This involves a combination of research concepts and various administrative departments of State Archaeological Heritage Service.

Main questions are: a) How should a monument conservation concept be structured so that state funds, state archaeological monument preservation, EU funds, University funds and other private foundations interact in a useful way? a) How can cooperation with local decision-makers, public authorities and university research look like?

The initial focus is on the development of strategies for public relations and communication. After all, participation in cultural life can only be possible where places and communication are unrestricted and barrier-free. With this example, we would like to present an idea between scientific mission, nature conservation and sustainable tourism that can stimulate a discussion about community’s commitment to heritage assets.

## PEOPLE POWER? PAST, PRESENT AND FUTURE FOR PUBLIC PARTICIPATION IN ARCHAEOLOGICAL FIELDWORK

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Lewis, Carenza (University of Lincoln) - van Londen, Heleen (University of Amsterdam) - Marciniak, Arcadiusz (University of Poznan) - Vařeka, Pavel (University of West Bohemia)

**Format:** Session with keynote presentation and discussion

This session invites presentations about public participation in archaeological excavation. 2021 marks ten years since the Faro Convention came into force on 1 June 2011, calling for civil society to be more closely involved with heritage. In some countries ‘closer involvement’ has increasingly included public participation in community excavations but other countries, participation in the archaeological investigative process by people other than archaeological professionals or students remains rare, or even forbidden.

This session aims to bring together archaeologists with experience of public participative investigations and those who are interested in their potential. The session includes a keynote presentation on the aims and outcomes to date of the ‘Community Archaeology in Rural Environments’ (CARE) project (<https://archaeologyeurope.blogs.lincoln.ac.uk/>) (2019-23) which by the end of 2020 had involved around 350 residents of ten rural communities in the Netherlands, Czech Republic, Poland and UK in new local archaeological excavations, with the aim of advancing knowledge of the past and exploring the benefits to communities and heritage.

Complementary papers for this session are invited on public ‘citizen science’ participation in archaeological fieldwork, especially (but not limited to) those which have involved excavation. These may include (but are not limited to) presentations on (a) challenges and solutions for setting up and carrying out participative archaeological investigations in different countries; (b) the value of their discoveries for advancing understanding of the past, including from places with little or no previously known archaeology; (c) the impact of participative community archaeology on participants and local communities, and its risks and rewards for archaeology and archaeologists; (d) the future for this sort of archaeological practice, whether viewed idealistically or pragmatically, optimistically or pessimistically, including considerations of the impact of the Faro Convention, or more ‘hyper-localised’ world which may develop in the wake of Covid-19.

### ABSTRACTS:

## FROM EVIDENCE TO ACTION: TOWARDS A STRATEGY FOR INCREASING PUBLIC PARTICIPATION IN LOCAL COMMUNITY ARCHAEOLOGICAL EXCAVATION

**Abstract author(s):** Lewis, Carenza (University of Lincoln) - van Londen, Heleen (University of Amsterdam) - Marciniak, Arkadiusz (Mickiewicz University in Poznań) - Vařeka, Pavel (University of West Bohemia)

**Abstract format:** Oral

This paper reviews the ‘Community Archaeology in Rural Environments Meeting Societal Challenges’ (CARE-MSoC) project (<https://archaeologyeurope.blogs.lincoln.ac.uk/>) in order to stimulate discussion of how opportunities for public participation in community archaeological excavation can become more widely available. The CARE project is involving hundreds of members of the public in excavations within 12 local communities in four countries and evaluating the outcomes for archaeology, people and places. Intended project outcomes include recommendations and toolkits to help European policy-makers and heritage practitioners support and facilitate public participation in local archaeological excavations. CARE’s aims reflect the aspirations of the 2005 Faro Convention and, more recently, the 2020 EU ‘Strategic research and innovation agenda for cultural heritage and global change’ which asserts that “public and community engagement as well as participatory approaches should be at the core of [research and innovation] activities and thought should be given to... the role of communities in identifying, understanding and caring for heritage”.

CARE-MSoC focusses on rural communities with few or no known archaeological remains in order to ensure beneficial access to heritage can be democratised by refocussing attention away from ‘authorised’ sites towards locally centred community archaeologies. The Covid-19 pandemic has made this hyperlocal focus even more relevant as people have been spending so much more time than usual within their home communities. CARE has generated a range of rigorously evaluated data from more than 350 participants in the Czech Republic, Netherlands, Poland and UK, showing that locally based community archaeological excavations can advance archaeological knowledge while also democratising participation and benefitting people, places and heritage. This paper will conclude by inviting session attendees to discuss what needs to be done to strategically encourage policy-makers across Europe to make opportunities for public participation in local community-based archaeological investigations more widely available.

## PARTICIPATIVE ARCHAEOLOGY IN POLAND - CHALLENGES AND ATTITUDES OF ARCHAEOLOGICAL RESEARCH

**Abstract author(s):** Kobialka, Dawid (Institute of Archaeology and Ethnology of the Polish Academy of Sciences) - Kajda, Kornelia (Independent researcher)

**Abstract format:** Oral

Public archaeology in Poland has been practiced for many years. However, not many of these projects are participatory. Most of them, focuses on social outreach of archaeological excavations after conducted investigations. Organizing festivals, meetings,

conferences for the public or lectures and workshops are the main popular ways in which public archaeology is brought to live in Poland.

As part of the international project “Community Archaeology in Rural Environments”, we aimed at conducting archaeological project with direct and close cooperation with local communities. Our goal was to investigate rural areas together with its inhabitants to build or strengthen a relation between them and the past of the places they live in. It was the first project of this kind in Poland. But when we started our work, we did not expect to face so many challenges from the side of state institutions and the communities themselves. In our presentation we want to discuss the main obstacles that have made it difficult for us to work in participatory archeology in Poland. We also want to focus on the attitudes of local communities towards archaeological research in the areas they live in.

### 3 COMMUNITY ARCHAEOLOGY AND CZECH TRAMPING

**Abstract author(s):** Vareka, Pavel (University of West Bohemia) - Gabriel, Frantisek (Department of Archaeology, University of West Bohemia)

**Abstract format:** Oral

Tramping movement based on shared interests in nature, freedom and friendship was established in Czechoslovakia in the early 20th century. During the communist regime which suppressed any ideologically uncontrolled spontaneous activities weekend camping trips allowed tramps to escape from the grey everyday reality of the totalitarian state to the woods. In many cases tramp camps were situated in places of ruined historical monuments and tramp groups started voluntarily care about these sites and endeavoured to restore architectural remains. This paper examines activities of a tramp community which camped in Helfenburg castle (14th – 16th century) in northern Bohemia and was involved in archaeological excavations lead by a local professional archaeologist. Since 1981 hundreds of tramps participated in a systematic research of the castle complex during weekends and summer holidays, learned archaeological field techniques, explored medieval material culture items and discussed interpretation possibilities of their findings. The community members were also extensively involved in restoration and their work resulted in preservation of the historical monument. These activities continued also after Velvet revolution in 1989 which opened possibilities for legalization of civic activities. Newly established Helfenburg society soon welcomed foreign young enthusiasts from many European countries and overseas so that the community archaeology gained an international character. The paper explores types of activities carried out by community members, impact on their perception of historical heritage and memory, social impact and it also analyses structure of the tramp community.

### 4 THE EFFECTS OF A PARTICATORY PROJECT: THE CARE PROJECTS’ SPIN-OFF IN THE NETHERLANDS

**Abstract author(s):** Van Londen, Helee - Verspay, Johan (University of Amsterdam)

**Abstract format:** Oral

After a promising start in 2019 the joint test pitting programme Community Archaeology in Rural Environments (CARE), which for the Netherlands focussed on the origins and development of historical villages in the Groene Woud region, was severely hampered due to covid-19. Nevertheless, even at this stage our efforts already sparked several spin-offs across a range of stakeholders, exceeding expectations:

Within a year, a local history club sought support to realise a revaluation of a deselected archaeological site and eventually its excavation. Some members of the general public came to us with their own archaeological finds for identification and to have the stories associated with the finds validated. Others were keen to have their own questions researched about places in the vicinity or to participate with their specific interests and skills beyond the current scope of research. A school saw the educational potential of conducting research and presenting the results, a provincial heritage body wants to stimulate public engagement with archaeology and the Dutch National Heritage Agency commissioned the University of Amsterdam two assignments explore and facilitate citizen archaeological initiatives.

Regional presence, visibility and accessibility seem key to this spur and suddenly we face the challenge to channel this momentum. Apart from introducing people to the archaeological horizon of their environment and facilitating initiatives, the archaeologist (still) has to moderate these substantially to be successful. To further increase the level of participation, community archaeology initiatives would benefit from a more structural engagement and a learning environment for people to develop their archaeological skills and expertise. In our contribution we’ll discuss how this could work in the Dutch setting.

### 5 ARCHEOHOTSPOTS: HOW TO CREATE CASUAL HERITAGE ENGAGEMENTS THROUGH ARCHAEOLOGY

**Abstract author(s):** Knoop, Riemer (Gordion Cultural Advice) - van Oorsouw, Marie-France (Weleer Heritage Communication and Advice)

**Abstract format:** Oral

Since 2015, a number of 22 ArcheoHotspots have come into being across the Netherlands, and two more abroad. These offer a freely accessible, no threshold (no ticket required) space in or near archaeological museums, storerooms or excavations (pop-up), where members of the public, mostly passers-by, are free to join in working with materials from museum or excavation deposits. Basic is the invitation to engage in interaction, through co-operating with elaborating finds or entering into casual conversations, with

hosts (“volunteers”) that are already active in a workshop / laboratory setting. The interaction is based on trust and mutual interest in each others’ stories. Thus, visitors not only make hands-on acquaintance with material culture of their own living environment, but are also affirmed in their bringing complementary narratives and expertise on a par with traditional ways of knowing and speaking.

The presentation will explore the sources of the initial ideas, the trajectory of its successive development, and its present status and outlook, as well as learning points for professional archaeologists.

### 6 COMMUNITY ARCHAEOLOGY AS AN AIM FOR REACHING OUTSIDE THE MUSEUM WALLS

**Abstract author(s):** Paulsen, Charlotte (Museum Skanderborg)

**Abstract format:** Oral

Touch history and it touches you! During the past three years (2017-2019 as Covid-19 called 2020 out), Museum Skanderborg has invited the public to grab a trowel and participate in a community excavation. The first year, field archaeologists of the museum were nervous to hand over the gear to nonprofessionals, but they found out that with proper guidance from the professionals, there was no damage to history.

Public archaeology is new in Denmark. Museum Skanderborg is one of few museums arranging community excavations. The excavations take place for a week during the schools autumn break for people to have time off to participate. Everyone from the age of nine can participate, as you have to be old enough to understand information and work independently without constant supervision. It is not a school project for kids. When kids participate, they are with parents or grandparents that take responsibility.

The impact of the public excavations has been huge. Both the participants and the by-passers of the site have expressed amazement of the feeling of closeness to archaeological artefacts. How they were touched by history. Surveys among the participants has revealed that people find history more exciting, when they can touch things and investigate by themselves. Attending has given them an idea of where they come from. Archaeology can serve to create social memories and provide a context for the formation of relationships.

Museum Skanderborg sees the public excavation as a tool to reach out to the public and past the walls of the museum building. To take down hidden boundaries that dictates whom culture should be relevant to. One of ways of doing that is cooperation. People meet people and interact with the past together. As an outside activity, the museum will continue to arrange public excavations in a post Covid-19 world.

### 7 MOLEHILLS - A NON-DESTRUCTIVE ARCHAEOLOGICAL PROSPECTION METHOD AS CITIZEN SCIENCE PROJECT

**Abstract author(s):** de Raad, Jesper (Laagland Archeologie; Leiden University)

**Abstract format:** Oral

In the Netherlands many non-destructive methods that have been prove effective before the Valletta Treaty are no longer used. These, effective non-destructive prospection method can be executed by visual inspection above ground. However, the methods are not used in Dutch commercial archaeology due to the (seasonal) presence of the to be inspected phenomena on the specific to be investigated area. Yet, the visual inspection of molehills and ditch sides are (under the VS03) still valid prospection methods under the Dutch archaeological regulation. The archaeological prospection of these phenomena are proven to still be effective.

The inspection of for instance molehills can be executed by (archaeological) volunteers under a citizen science project. Volunteers have been proven effective in the use of collecting archaeological data in the Netherlands and the non-destructive methods are particularly useful on specific protected areas, such as selected archaeological sites, archaeological monuments or castle areas. In these areas it is prohibited to execute destructive archaeological methods. The suggested non-destructive archaeological methods provide additional data on these selected archaeological site.

### 8 CONNECTING COMMUNITIES: 15 YEARS OF PUBLIC ARCHAEOLOGY IN KENT

**Abstract author(s):** Mayfield, Andrew (Kent County Council)

**Abstract format:** Oral

This paper will reflect on the successes and challenges of running a series of community archaeology projects in Kent. What started as a project specific role to deliver community archaeology activities for a country park has developed into a fifteen-year programme. The country park became a hub for heritage activities in the wider landscape. Though training and collaboration we now have a team of volunteers who support and instigate projects undertaken by Kent County Council’s community archaeology team. These projects have included landscape partnerships, University research excavations and heritage site restoration schemes. At our home at Shorne Woods Country Park, this previously poorly understood landscape has been thoroughly researched and investigated. Activities have ranged from LiDAR groundtruthing and tree surveys, to test pitting and full-scale excavations. From 2016 to 2019 we ran the Cobham Landscape Detectives project and engaged with the wider local population. The projects were all great fun, but with the reduction of larger-scale group activities during the Covid pandemic we have had a chance to reflect on the work to date. What have we learnt and how can we move forward, post-Covid? What new ways of working are here to stay and what practices are we looking forward to reviving?

9

PARTICIPATIVE ARCHAEOLOGY, POWER DYNAMICS AND CO-PRODUCTION: A COMPARATIVE APPROACH TO DIGGING HILLFORTS IN THE UK AND GERMANY

**Abstract author(s):** Davis, Oliver (Cardiff University)

**Abstract format:** Oral

In the UK over the last two decades, ‘community’ archaeology has become commonplace. Indeed, it is now rare to find excavations that have no public involvement. The reasons for this are complex, but stem from a tradition of public participation in archaeological discovery which can be traced to the foundation of learned societies in the 18th and 19th centuries. In other parts of Europe, such as Germany, community archaeology is much less common and there is little room for the non-professional to engage in the practice of archaeology. Raimund Karl (2020) has recently argued that this is not due to a lack of interest with members of the public, but that the structure of archaeological discourse in the country is skewed towards the privileged expert, relegating citizens to passive consumers of knowledge. Central to these contrasting approaches in both countries are ethical considerations around power relationships and control, not only between the discipline of archaeology and contemporary socio-political agendas, but also between the archaeological professional and non-professional members of the public.

In this paper I will explore these issues by drawing from my own experiences working in the UK and Germany where I am currently co-directing projects exploring hillforts. The approaches taken contrast markedly. In the UK, I have helped develop ‘CAER Heritage’ which is exploring the hillfort of Caerau, Cardiff, but with a guiding principle of co-production with community members. In Germany, I have been co-directing research excavations at the hillforts of the Grotenburg and Piepenkopf, Westphalia, with colleagues from Cardiff University and the Lippisches Landesmuseum Detmold, but with no public involvement. Both approaches have their merits and drawbacks, but I will argue that the participative approach has the potential to produce more democratic power relationships between experts and citizens, and also enrich our understanding of the past.

DIRTY HERITAGE: TOWARDS AN ARCHAEOLOGY OF CONSUMPTION, WASTE AND ENVIRONMENTAL CHANGE

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Papoli Yazdi, Leila (University of Gothenburg) - Dezhamkhooy, Maryam (Humboldt Stiftung)

**Format:** Regular session

We live in a world where the amount of consumption, more than any other traditional wealth-counting system, indicates socioeco-nomic status. The huge mountains of garbage outside of cities and the unwanted items stored in houses are changing the face of the globe. The rapid rate of manufacturing and consumption produces a massive amount of waste, transforming the environment.

Archaeologically speaking, consumption has added tons of wasted material to all other modern objects studied by archaeologists. Archaeology has objectified the danger of a high-speed rate of consumption by applying some advanced novel methods of archae-ology developed within the last century, such as those described in Garbology by William Rathje and his team. Patterns of waste and consumption have changed rapidly since that time, while in the last century the negative consequences of modern lifestyles have become more clear. Now, manufacturing and consumption determine the political hierarchies of countries. All these processes happen while large swathes of some countries have changed into extended landfills of technological and plastic garbage.

Through our papers and discussions in this session, we aim to update our knowledge about modern consumption and garbage-mak-ing by discussing a series of questions: How do novel archaeology methods help us explore garbage-making patterns? How can gar-bology be used to change environmentally damaging consumption behaviors? How have consumption and garbage-making changed the criteria of social class and shaped our lifestyle and households?

Archaeologists from all over the world who have experience in working on the post-industrial revolution and modern consumption, garbage, waste, manufacturing, and environmental changes are strongly encouraged to share their insights, field work, and method-ological experiences or ideas in this session.

ABSTRACTS:

1

WASTE AND THE (RE)GENERATION OF URBAN LANDSCAPES

**Abstract author(s):** Gardner, Jonathan (School of Art, Edinburgh College of Art, University of Edinburgh)

**Abstract format:** Oral

In this paper I discuss the lives and afterlives of recent and contemporary waste materials that emerged as by-products of city building, industrial processes and post-industrial demolition. Exploring the complicated trajectories of such materials and how their valuation changes throughout their creation, use, reuse and (apparent) discard, I want to think about the generative and creative qualities of waste: what has it ‘allowed’ or facilitated in cities in terms of social and political opportunities, in both the past and present? The transformation of such waste is often dramatic: bombed out ruins create the foundations of football pitches, the liquefied ash of coal power stations is repurposed for nature reserves and the bricks of demolished factories are pushed into the sea to ‘reclaim’ land. Using examples from London and Edinburgh, I will discuss my approach using historical GIS, archival research and archaeological fieldwork in a new research project (‘Reimagining British waste landscapes’). Though acknowledging the often

devastating social and environmental costs of creation and disposal of waste materials, I nonetheless attempt to re-excavate ideas of waste’s apparent ‘wastedness’ and explore how it acts as a raw material for reshaping cities’ and the lives of their inhabitants.

2

TELL ME WHAT YOU THROW AND I WILL TELL YOU WHAT TO DO: APPLIED CONTEMPORARY ARCHAEOLOGY TO INFORM POLICY-MAKERS

**Abstract author(s):** Praet, Estelle (University of York; Université Libre de Bruxelles) - Schofield, John (University of York)

**Abstract format:** Oral

Plastics have become the prevalent material characterising our era, sometimes also referred to as the plasticene. They are forming a stratigraphical layer representative of the garbage produced by people since bakelite’s invention in 1907. This waste, so repre-sentative of the post-industrial world, contains valuable information regarding consumption habits and holds key information for investigating behavioural changes. Through three ongoing case studies, we will demonstrate the extent to which contemporary archaeology contributes to a better understanding of plastic waste.

First, plastic, and more broadly garbage, is archaeological evidence as proposed originally by Rathje. With this material culture perspective, we are studying and characterising the objects comprising the plastic-scape of Galapagos to determine patterns in weathering and deposition of plastic objects. These insights, along with citizen science data, will contribute to the establishment of strategies and policies for a Plastic Pollution Free Galapagos.

Second, humans relate to objects through emotions, and archaeologists are often unable to understand such relationships. Con-temporary archaeology has the unique opportunity to investigate these relationships in real-time. By analysing stories on plastic artefacts produced by children on the East Pacific Coast through qualitative analysis (NVivo), we can determine the most commonly perceived problems arising from pollution and offer tailored alternatives for plastic use accordingly.

Third, the current pandemic is definitely marking a momentum in our archaeological horizons. We argue that statistical insights of material culture from social media can contribute to gain a better understanding of disposed face-masks and gloves and inform policy-making to limit this waste that has already entered our archaeological record. This digital archive of the pandemic holds the potential for an in-depth understanding of patterns in face mask use, disposal and perceptions.

These current projects illustrate how contemporary archaeology can provide new perspectives on policy-making.

3

WASTE, LANDFILLS, AND BURIED CULTURE: A VIEW FROM THE MIKVE ISRAEL RUBBISH PROJECT

**Abstract author(s):** Nativ, Assaf (University of Haifa)

**Abstract format:** Oral

Waste scholarship and garbology seem steeply invested in negative valuations of their research objects, often embroiling them in a highly politicised discourse. This is probably inevitable, given that their conceptual foundations consist of terms like ‘waste,’ ‘pollution,’ and ‘discard’ and are often associated with notions of ‘danger,’ ‘damage,’ ‘inequality,’ and other negatively-charged terms. Undoubtedly, this has the significant advantage of stressing garbology’s relevance and timeliness; it also underscores the field’s positive, constructive, and corrective agenda. However, does this not imply a strongly one-sided line of thinking? Are we not willfully and knowingly pursuing an incomplete research programme? Drawing on the Mikve Israel Rubbish Project (MIRP) that excavated an early 20th-century landfill near Tel Aviv (Israel), I would like to indicate two areas that remain overshadowed and may complement this otherwise negative tenor of waste scholarship. The first is that, notwithstanding their adverse implications, waste production and disposal are also fundamentally creative processes that bring into existence new and distinct beings—landfills. The second area is our inability to think and discuss buried cultural formations: we know to say where they come from, but we are poorly equipped to say what has become of them.

4

RUBBISH EVERYWHERE? A RUBBISH PIT AS A CASE STUDY RELATED TO THE RUIN TRAUTSON AT MATREI AM BRENNER (TIROL/AUSTRIA)

**Abstract author(s):** Waldhart, Elisabeth (Universität Innsbruck, Institut für Archäologien)

**Abstract format:** Oral

Garbage is not only found where it belongs, in places like dustbins and landfills. Bits and pieces of modern rubbish can also be en-counterred “out of place”, as it is at nearly every dig site, ranging from single pieces of throw-away plastic items and crown caps to dumped junk. Mostly the objects found are collected and then binned. Only rarely do they make it further and become “findings”, even though they might hold information on more recent use of places.

The case study presented here is related to castle Trautson, which was destroyed by aerial bombing in 1945. Due to pending con-struction work, archaeological excavations took place in 2020. Besides structures and small finds from the medieval age to the time of destruction, a small pit of modern rubbish was found. As it contained many broken drinking glasses and bottles as well as burned things, an interpretation as remains of a barbecue was considered. As packaging and items necessary for consumption, the material seemed to be thrown away incidentally. On the other hand, these objects tell a story of the area that maybe would not have gotten into the scientific record otherwise. After the house had to be left in the 1980s, the premises lay partly fallow. The rubbish could point to an informal and non-commercial gathering place.

This paper reflects on how “trash” becomes an archaeological “find” and how its materiality impacts this process. This includes both the materials - from glass to plastic - and Bruno Latour’s conception of objects as gatherings. With its persistence the litter has the agency to get into view the unofficial use of the place. Modern waste at archaeological excavated sites helps to understand ephemeral everyday practices that continually produce sites in the present.

5 **SOCIAL DEBITAGE; AN ARCHAEOLOGICAL AND SOCIAL EXPLORATION OF THE PATTERNS OF IMPROPER CIGARETTE BUTT DISPOSAL ON A UNIVERSITY CAMPUS**

**Abstract author(s):** Tottman, Walker (University of Victoria)

**Abstract format:** Oral

Around the globe, trillions of cigarettes are improperly discarded into the environment every year. As the world’s most frequently littered item, and made with non-biodegradable materials and toxic chemicals, cigarette butt litter poses serious environmental concerns. Existing studies suggest both smokers and non-smokers espouse negative attitudes towards cigarette butts, and cigarette smokers are increasingly stigmatized. My research studies cigarette littering on the University of Victoria’s recently designated no-smoking campus, and asks: Are there spatial distribution patterns in cigarette butt littering related to features of the built environment? Furthermore, does the seemingly innocuous activity of cigarette smoking provide deeper insight into social norms and attitudes around garbage and the environment? I collected over 7500 littered cigarette butts from the university campus, recording data on their location and condition. My findings indicate this littering occurs in non-designated smoking areas, predominantly in places that are conveniently located, provide shelter from the elements, have seating, and are well-obscured from outside view. Additionally, I suggest the taphonomic erosion of cigarette butts into the environment is conducive to enable further littering. Drawing from archaeological and social-cultural studies on waste and value, I argue social norms make the creation of trash illicit and stigmatized, and counterintuitively reinforce the improper smoking behaviours that create litter and pollution. Fostering open dialogues about the issue of cigarette butt littering, rather than marginalizing smokers, is a needed shift in mindset.

6 **WASTE AT THE ‘DAWN OF EUROPEAN CIVILISATION’**

**Abstract author(s):** Vindrola Padros, Bruno (Institute of Archaeology, University College London)

**Abstract format:** Oral

In the modern drive towards technological development, one of the most materially evident yet socially obscured aspects of our consumer society has been the increasing accumulation of broken objects considered as ‘waste’ or ‘rubbish’. During the Neolithic period, south-eastern and central Europe were also to witness an unprecedented explosion of material remains, a ‘thing-heavy world’ (Robb, 2013:665). These material remains, mostly pottery fragments, would affect the social lives of local inhabitants. However, because of our modern tendency to write (pre)history in stages of technological development, since the time of Gordon Childe the ‘Neolithic Revolution’ is conventionally characterized as the moment where humans became masters over nature, which is portrayed as the ‘dawn of European civilization’. Through this construct, what is emphasized about the period is the introduction of sedentism, agricultural production, and economic innovations. In contrast, the following paper debunks this concept of Neolithic mastery by looking at the unintended consequences of material accumulation and aims to show in what ways the European Neolithic was different to modern urban settings. In other words, the question “to what degree did waste create the European Neolithic?” leads us to understand a different epistemic relationship between humans and broken objects. Drawing examples from south-eastern and central Europe (i.e. Körös-Criş and Linearbandkeramik sites), it is shown that numerous social mechanisms were in place to cope with the effect of the accumulation of potsherds, which contrasts with how waste is dealt with in modern times.

169 **PERIODICITY AND CYCLICITY IN PREHISTORIC PRACTICE AS SEEN IN WATERLOGGED CONTEXTS**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Ballmer, Ariane (University of Bern, Institute of Archaeological Sciences & Oeschger Centre for Climate Change Research) - Bogaard, Amy (University of Oxford, School of Archaeology) - Hafner, Albert (University of Bern, Institute of Archaeological Sciences & Oeschger Centre for Climate Change Research)

**Format:** Regular session

Due to preservation conditions, waterlogged sites allow an exceptional high-resolution perspective into temporal processes. The records show patterns of human practice with a regular, repetitive character, which may be seasonal, or may include longer term cycles. Specifically the relevant practices concern for instance dwelling relocation, agricultural, herding and foraging activities. While climatic circumstances may be a major driving factor for periodic and cyclical shifts, social factors are also likely to play a role.

The aim of the session is to discuss periodic and cyclical practices that are evident in the archaeological findings as a phenomenon in itself, and to provide an overview of the diversity of the practices and different rhythms. On the other hand, methodical approaches for recognising these temporalities using on- and off-site data should be in the foreground. A broader aim is to assess the significance of periodically and cyclically organized practices within prehistoric reality.

Case studies from international prehistoric wetland archeology, in particular featuring interdisciplinary interfaces with botany, zool-ogy, geology, climatology, ecology, geography and ethnography, are welcome.

**ABSTRACTS:**

1 **PERIODICITY AND CYCLICITY IN PREHISTORIC PRACTICE AS SEEN IN WATERLOGGED CONTEXTS. A TOPIC OUTLINE**

**Abstract author(s):** Ballmer, Ariane (University of Bern, Institute of Archaeological Sciences & Oeschger Centre for Climate Change Research)

**Abstract format:** Oral

Wetland dwellings offer an outstanding quality of archaeological records of periodicity and cyclicity, in many cases in a high chrono-logical resolution. In the sense of an overview and appreciation of the topic’s significance for archaeological research, this paper will first give an overview of the different dimensions of periodicity and cyclicity, and how these are manifesting in the archaeological record of prehistoric wetland settlements. Here, the extraordinary preservation conditions allow exceptionally detailed insights, often in high temporal resolution. The focus is both on seasonal cycles, but also on longer-term periods of several years.

A theoretical-conceptual framework will consequently contribute to an understanding of the awareness of periodicity and cyclicity by the communities and individuals concerned, as well as its significance to them. Not only practical and functional perspectives related to subsistence economy, but also the factor of human biography and life cycles will be discussed, ultimately leading to a multi-layered understanding of time and temporality in prehistory. This original perception and management of time is virtually based on repetition, recurrence, transience and new beginnings.

2 **SCALES OF PERIODICITY AND CYCLICITY IN PREHISTORIC LAKESIDE SETTLEMENTS**

**Abstract author(s):** Hafner, Albert (University of Bern, Institute of Archaeological Sciences; University of Bern, Oeschger Centre for Climate Change Research - OCCR) - Heitz, Caroline (University of Oxford, School of Archaeology; University of Bern, Institute of Archaeological Sciences)

**Abstract format:** Oral

Two things were crucial for the understanding of prehistoric lakeshore settlements in the Alpine region: first, a robust chronology based on absolute data, achieved by the routine use of dendrochronology, and second, the excavation of complete settlements, or at least large parts of them. Both conditions were more and more fulfilled after 1980. The number of dendrochronological data increased dramatically and today we know about two dozen of well investigated settlement sites, which allow conclusions about their construction history and architectural structure. On the one hand, this knowledge allows us to record the major cycles of oc-cupation of the lakeshores, and on the other hand it provides insights into the life cycles of settlements and periodic movements of the respective settlement communities. At both levels, regularly recurring patterns can be identified that indicate environmental influences and social dwelling practices of the individuals involved. Climatically induced changes in lake levels and resulting adapta-tions of settlements can be interpreted as vulnerability and resilience strategies of prehistoric settlement communities.

3 **OAKS FOR THE NEXT GENERATION! HOW THE NEOLITHIC PEOPLE AT LAKE BIEL (CH) SUSTAINABLY MANAGED THEIR FOREST**

**Abstract author(s):** Bolliger, Matthias (Archaeological Servie Canton of Bern, Laboratory for Dendrochronology; University of Bern, Institute of Archaeological Sciences & Oeschger Centre for Climate Change Research)

**Abstract format:** Oral

The shorelines of Lake Biel (Canton of Bern, Switzerland) were popular settlement sites in the Neo-lithic and the Bronze Age. The favorable conditions for preservation of organic material on these waterlogged sites allowed dendrochronological investigations of the construction woods. It proved that some of these places have been repeatedly inhabited over centuries and even millennia. The duration of the settlement phases varied between a few years and several decades. Oak has been the preferred wood for buildings due to its natural resistance against decay. It was available during all periods of lakeshore settlements at Lake Biel.

The exact felling years of thousands of piles enable the reconstruction of settlement dynamics on a yearly basis. By means of a den-drotypological approach that considers the specific growth patterns of all samples, an insight into the timber supply of some settle-ments will be presented. It will show how the repeated human presence required or resulted in a specific management of the forests.

4 **SEASONALITY, SCHEDULING AND WETLAND AGROECOLOGY AT NEOLITHIC TIANLUOSHAN, LOWER YANGTZE RIVER BASIN, CHINA**

**Abstract author(s):** Wu, Rubi - Bogaard, Amy - Charles, Michael (University of Oxford) - Sun, Guoping (Zhejiang Provincial Institute of Cultural Relics and Archaeology)

**Abstract format:** Oral

The Neolithic site of Tianluoshan (Hemudu culture) is located in the Lower Yangtze River basin, China. Owing to waterlogged pres-ervation, numerous organic archaeological remains have been excavated to provide a high-resolution view of human-environment interaction. Previous studies indicate that people here made use of a wide range of wetland plants (such as water chestnut, foxnut and rice) and animals (such as snakehead, crucian carp and common carp). The role of rice cultivation at Tianluoshan is a key question that has been debated for many years. However, recent research focuses on plants other than rice and reveals the diversity and

flexibility of wetland plant utilization. Morphological analysis by the present authors shows that some of the water chestnut fruits were collected unripely while some were collected close to a biologically ripe stage. It is reasonable to infer that the harvest season of water chestnuts last for several months. Considering the huge amount of water chestnut shell remains and the storage pits discovered, people possibly use this species not only as an autumn food resource but also a winter and spring one. This revised seasonality enables us to rethink whether or not there really was a scheduling conflict in the autumn between water chestnut and rice.

5 PATTERNS OF SUBSISTENCE: AN EXAMPLE FROM LATE NEOLITHIC NORTH MACEDONIA

**Abstract author(s):** Holguin, Amy - Bogaard, Amy - Charles, Mike (University of Oxford)

**Abstract format:** Oral

Waterlogged archaeobotanical remains from the site of Ploča at Lake Ohrid in North Macedonia offer a rich record of human subsistence from the middle of the 5th millennium BCE. This site is currently under research as part of the ERC synergy EXPLo project, a collaboration of the universities of Bern, Thessaloniki and Oxford, designed to explore the chronology and ecology of early agricultural settlement on lakeshores in south-east Europe. At the site of Ploča, radiocarbon dates on cereal chaff suggest that the abundant plant material, preserved in a cultural layer in places up to 1.7 metres thick, represent a narrow time frame of at most 150 years. The remains of cultivated crops and foraged fruits and nuts thus offer an exciting opportunity to investigate patterns of human subsistence at high-resolution. Such a detailed record allows us to explore how different cultivated and wild plant foods were exploited continuously or episodically through the occupation. Located in a transitional zone between mediterranean and continental Europe, this site also offers insights into how geographic and cultural factors shaped subsistence practices.

6 MULTISCALAR PERIODICITY IN PREHISTORIC WETLAND SETTLEMENTS: A VIEW FROM SOUTHERN ALBANIA

**Abstract author(s):** Allen, Susan (University of Cincinnati)

**Abstract format:** Oral

Archaeological, palaeoenvironmental, and palaeoethnobotanical research in the vicinity of the former Maliq wetland in southern Albania reveals a long history of wetland settlement and dynamic shifts in lake configuration from ca. 6,500 BC to the present. In this paper, I examine archaeobotanical data for the Early Neolithic site of Vashtëmi and the Neolithic to Early Iron Age lakeside settlement of Sovjan together with regional data concerning vegetation and geomorphic changes in order to consider recurring patterns of ecological variation and cultural behaviors at varied temporal and spatial scales, with a particular focus on subsistence and land-use practices. The site of Vashtëmi, excavated as part of the Southern Albania Neolithic Archaeological Project (SANAP), provides an example of an ephemeral village, while the lakeside settlement of Sovjan, excavated by the Mission Archéologique Franco-Albanais du Bassin du Korça, exemplifies a more stable, long-lived settlement. At both sites, well-preserved plant remains attest to iterative processes of mutual adaptation between the wetland and people living on its margins.

7 DENDROARCHAEOLOGY OF SOVJAN - THE FIRST EARLY BRONZE AGE DENDROCHRONOLOGICAL ANALYSIS FROM THE SOUTHWESTERN BALKANS (ALBANIA)

**Abstract author(s):** Maczkowski, Andrej - Bolliger, Matthias - Ballmer, Ariane (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research OCCR) - Gori, Maja (Institute of Heritage Science, National Research Council of Italy - ISPC-CNR, Rome) - Lera, Petrika (University of Fan Noli, Korçë) - Oberweiler, Cécile (UMR 7041 ArScAn, CNRS, Université Paris I Panthéon Sorbonne, Université Paris Nanterre, Paris) - Szidat, Sönke (Department of Chemistry and Biochemistry, University of Bern; Oeschger Centre for Climate Change Research OCCR) - Touchais, Gilles (UMR 7041 ArScAn, CNRS, Université Paris I Panthéon Sorbonne, Université Paris Nanterre, Paris) - Hafner, Albert (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research OCCR)

**Abstract format:** Oral

The archaeological site of Sovjan is situated on the north-western edge of the Korçë Basin, south-eastern Albania. The stratigraphy of Sovjan spans from the Neolithic till the Bronze Age. The thoroughly investigated stratigraphic sequence of the site makes it one of the most important prehistoric reference-sites in Albania and the surrounding region. During prehistory Sovjan was situated at various distances from the shores of the former Lake Maliq, which once filled the Korçë Basin, but was definitely drained after the 1940s. The waterlogged conditions on the site allowed for a high degree of preservation of wooden remains. From the two uncovered dwellings from layer 8, the Maison du Canal (House on the Canal) represents probably the best-preserved wooden structure from the Bronze Age Balkans. The predominant use of deciduous oak wood (*Quercus* spp.) is confirmed in this phase.

Through a combination of dendrochronological analysis and 14C-dates (wiggle matching), we were able to define a high-precision chronological placement of the layer with an end-date range falling between 2158 and 2142 cal BC (2σ), the second half of the Early Bronze Age. It was confirmed that the two dwellings and the trackway were built in the same construction event, made of both worked and unworked wood. The utilized construction timber falls into various age-classes, suggesting variable exploitation of the woodland resources.

Additionally, through Bayesian modelling of the previously published 14C dates from the transitional layer 7, its chronological placement is narrowed-down to the 22nd – 20th century BC.

These new results suggest the contemporaneity of the processes in the Balkan 'hinterland' with those occurring in the wider Aegean region.

A. VIRTUAL VS. REALITY - CYCLICITY IN SIMULATED AND ARCHAEOLOGICAL DATA OF WESTERN SWISS NEOLITHIC

**Abstract author(s):** Laabs, Julian (Institute of Pre- and Protohistoric Archaeology, Christian-Albrechts-Universität zu Kiel; Department of Geography, Physical Geography, Christian-Albrechts-Universität zu Kiel)

**Abstract format:** Poster

Within the western Swiss Neolithic, lake shore settlements constitute a major archaeological site category, which is above all characterized by periodical and cyclic dynamics in space and time. These settlements offer high resolution chronological and well-preserved bioarchaeological remains, thereby constituting a promising ground for the application of simulation modelling approaches. Those can contribute to an understanding and evaluation of diverse socioecological and subsistence scenarios assumed to represent past human-environmental interactions which ultimately led to the documented archaeological record.

Already existing and extended models about the spatio-temporal behaviour and subsistence strategies of the neolithic lake shore communities, are inferred from the archaeological record and the long-lasting corpus of research. Hypotheses from those models concerning diverse processes, such as the choice of settlement locations, the land use strategies and other, are compiled and formalised to be simulated with the simulation model LUTES (Land Use and Technological Evolution Simulator). The socioecological system which is simulated, creates a data set which shows structurally similar patterns concerning settlement duration and land-use impact known from archaeological and palaeoenvironmental archives.

Within the poster contribution presented, the archaeological data and the simulated data will be compared to broaden insights into the past human-environmental relationships culminating in cyclic patterns.

171 THE EMERGENCE OF SOCIAL INEQUALITY IN EUROPE AND SOUTHWEST ASIA: FROM THE LATER UPPER PALAEOLITHIC TO THE EARLY BRONZE AGE

**Theme:** 6. Material culture studies and societies

**Organisers:** Iversen, Rune - Haddow, Scott - Richter, Tobias (University of Copenhagen) - Kroonen, Guus (Leiden University)

**Format:** Regular session

The emergence of social inequality in the human past is the subject of long-running debates amongst archaeologists and anthropologists. Social evolutionary narratives that posit a unilineal increase in social inequality and complexity from the end of the Palaeolithic to the emergence of early state societies are being increasingly challenged, yet they are difficult to dispel. They are based in large part on the historical context in which archaeology and anthropology emerged as disciplines in the modern West. This legacy has come under sustained critique, leading scholars to question not just the social evolutionary underpinnings, but our definitions of social inequality as well. Recent research has not only problematized the idea that hunter-gatherers were consistently egalitarian during the Palaeolithic, but also whether social inequality was present in Neolithic and subsequent societies and how it manifested itself.

Given these critiques, archaeologists and anthropologists must rethink how social inequality should be identified and approached by considering the specific circumstances and conditions under which fluid and flexible forms of hierarchy may emerge and how they may have become more permanent and lasting. The transition to agriculture in Southwest Asia and its arrival in Europe is still seen as a key moment that may have engendered the establishment of more permanent and strict social hierarchies. There is now increasing evidence, however, that various forms of social difference may have existed well before the emergence of fully sedentary agropastoralist societies.

This session invites papers focusing on a wide spectrum of material correlates associated with social inequality in the archaeological record between the Late Upper Paleolithic and Early Bronze Age such as funerary practices, resource abundance, demography, settlement patterns etc.

ABSTRACTS:

1 THE EMERGENCE OF SOCIAL INEQUALITY IN EUROPE AND SOUTHWEST ASIA: AN INTRODUCTION

**Abstract author(s):** Iversen, Rune - Haddow, Scott - Richter, Tobias (University of Copenhagen) - Kroonen, Guus (Leiden University)

**Abstract format:** Oral

This paper will give a general introduction to the session and present some of the main issues within the field. Did the transition to agriculture in Southwest Asia and its arrival in Europe engender the establishment of more permanent and strict social hierarchies? Or did true social inequality first emerge with metal technologies that permitted the monopolization of raw materials, natural deposits and new forging technologies? An important aspect of the discussion is of course what we mean by social inequality in the past and how we recognize it – what are the material correlates of inequality that can be identified archaeologically and how reliable

- 2

are they? These questions will set the scene for further theoretical, methodical and case based discussions, and they will work as a framework for the session whose participants all address different approaches to, and aspects of, social inequality from the European and Southwest Asian Upper Palaeolithic to the Early Bronze Age.

### COERCION, STRESS OR MUTUALISM: EVALUATING DIFFERENT PATHWAYS TOWARDS SOCIAL INEQUALITY AND HIERARCHY DURING THE TRANSITION TO AGRICULTURE IN WESTERN ASIA

**Abstract author(s):** Richter, Tobias (University of Copenhagen)

**Abstract format:** Oral

In this paper I will examine three broad groups of ideas that have been put forward to explain the emergence of social inequality and hierarchy at some point during the transition from hunting and gathering to agriculture in western Asia. These three groups of ideas are coercion, stress and mutualism. Coercionist models suggest that individuals were forced into hierarchical and unequal structures when aggrandizers, big men or otherwise powerful individuals gained control over key resources and used this to leverage influence over decision making processes. Stress models propose that growing population sizes, settlement aggregation and other external factors necessitated the emergence of leaders, ultimately resulting in inequalities, in order to deal with and mitigate social stress factors (e.g. inter-personal violence, property disputes etc.). Mutualist approaches suggest that there was a voluntary acceptance of certain individuals as leaders. For example, religious specialists may have been ascribed status and elevated above other members of the group due to strong religious and ritual needs and beliefs. All of these approaches are based on a strong conception of progress and unilineal social evolution that ultimately harks back to deeply-rooted assumptions about the development of human societies. Instead, I propose here a more non-linear and anarchist reading of the archaeological evidence.

### SHAMANS AND CHIEFS: THE PATTERNS OF SOCIAL INEQUALITY IN NEOLITHIC NEAR EAST

**Abstract author(s):** Türkcan, Ali Umut (Anadolu Üniversitesi)

**Abstract format:** Oral

The emergence of social inequality in the human past as well as in the Near East Neolithic Studies is the subject of long-running debates amongst archaeologists and anthropologists. Social complexity studies from Childe to Binford until seventies, from Cauvin to Hayden until 2000's have been identified in major decades for almost 100 years. Features of Urbanism, social complexity, complex symbolism of religion that are evidenced in Jericho, Çayönü and especially Çatalhöyük had opened discussion on social inequality with many aspects as the “mega-sites” that are evidently laid-out according to a plan, import of raw material in large quantities, exploitation of metal, lime; it is no more possible to call the sites of Neolithic culture as simple villages.

In the light of new discoveries from 1990's especially with Göbekli Tepe; the presence of monumental buildings, Displays of such a wealth expenditure in these settlements seem to have taken the form of elaborate monumental buildings. They are followed by similar sites and new excavated sites in the same area (Harran, Şanlıurfa) with similar rich array of iconography; some PPNA sites in Upper Tigris area with earlier prototypes of cult buildings as well as exotic and nonfunctional “ritual” objects that require prodigious amounts of human labor within skilled craftsmen. Combined with evidence for an unequal distribution of goods (especially exotic prestige items) within communities, the evidence seems to show that early complex societies might have engaged to some degree in the accumulation of wealth and power through trade.

At the dawn of earliest sedentary hunter gatherer communities so called as “Neolithic” societies with new subsistence strategies at the end of Younger Dryas environmental conditions, the proposal is a discussion how and why setting up these iconography and conspicuous buildings with prestige items seems to be major part of an earliest growing social hierarchy.

### DEATH'S REFLECTION: WHAT DO MORTUARY PRACTICES ACTUALLY REVEAL ABOUT SOCIAL STRUCTURE AND INEQUALITY IN THE NEOLITHIC OF SOUTHWEST ASIA?

**Abstract author(s):** Haddow, Scott (University of Copenhagen)

**Abstract format:** Oral

Mortuary practices are one of the key archaeological indicators through which social relations and social inequalities may be identified in the deep past. However, while the manner in which a society chooses to dispose of its dead may reveal important information about the way it organizes itself, it may also serve to obscure, elide or completely invert the social structures of the living. While evidence from a variety of archaeological data sources, including architecture, material culture, food remains and mortuary practices themselves, has been used to characterize Neolithic societies as dominated by a “fierce egalitarianism”, a closer examination of the variation observed within the realm of mortuary practices reveals indicators of nascent social differentiation, in which individuals received differing post-mortem treatments based on selection criteria that are, at the moment, not well understood. This variation is seen most clearly in the range of secondary burial treatments observed throughout the Neolithic of Southwest Asia, in particular the so-called “skull cult”, although other skeletal elements, and even whole bodies, were manipulated in similar ways as part of extended, multi-stage funerary rites. The location of burials and the presence/absence of grave goods are also highly variable. What remains unclear is the nature of these forms of social differentiation; for example, do they reflect the existence of hierarchical (vertical) or heterarchical (horizontal) social structures? In our quest for interpretation, however, we often ignore the subtle ways in which these practices are expressed both regionally and temporally. This paper will explore the use and abuse of mortuary practices in elucidating Neolithic social structures in Southwest Asia.

### BALANCING DIFFERENCES: PATTERNS OF SOCIAL DIFFERENTIATION AND INTEGRATION WITHIN LARGE NEOLITHIC COMMUNITIES

**Abstract author(s):** Mazzucato, Camilla (Stanford University)

**Abstract format:** Oral

It is widely believed that hierarchical societies originally developed as the inevitable outcome of large-scale, intense social interactions that first took place within the densely populated settlements of the Neolithic period. This view is rooted in the idea that social stratification and inequality developed as a way of resolving the scalar-stress and group conflict that is thought to be associated with the increase of settlement sizes in the Neolithic. This perspective has been challenged by recent archaeological research that has complicated/problematised the linear narrative of the emergence of social differentiation and inequality in prehistory. This paper explores the mechanisms of social integration and differentiation that emerge within large Neolithic settlements when no clear signs of hierarchical arrangement of society or concentrations of power have been observed. What are the processes that integrated and held these communities together? How were group identities balanced within these vast settlements? Additionally, what role do houses play in the formation of social life within these Neolithic sites? This paper focuses on the identification of these processes in the archaeological record and on tracing their changes through time and space using Çatalhöyük as a case study and network science as a methodological approach.

### ŞEREFE! THE BEGINNING OF COMMENSAL DRINKING PRACTICES IN PREHISTORIC ANATOLIA

**Abstract author(s):** Schoop, Ulf-Dietrich (School of History, Classics and Archaeology)

**Abstract format:** Oral

Commensal drinking and the use of specialised drinking equipment are known to have played an important role in elite behaviour and elite display in western and central Anatolia during the 3rd and 2nd millennia BC. This contribution will trace the history of commensal drinking practices further back into time. It will be shown here that commensal drinking was adopted, in a comparatively rapid process, as a fundamental social practice in some (but maybe not all) Anatolian regions during the final centuries of the 5th millennium BC. This contribution will argue that this phenomenon is part of a larger shift towards more competitive socio-economic practices taking place at the same time. Questions asked are how the new practice(s) relate to ideological priorities of preceding periods and, given their context in later times, whether or not they signify the first steps toward the emergence of stable social hierarchies and economic inequality in the region.
- 7

### TRACING SOCIAL INEQUALITY IN THE NEOLITHIC THROUGH TECHNOLOGY

**Abstract author(s):** Vitezovic, Selena - Antonovic, Dragana - Mihailovic, Danica (Institute of Archaeology, Belgrade)

**Abstract format:** Oral

Although prehistoric technologies are sometimes perceived as being purely practical and ergonomic, they reflect multiple aspects of the cultural and social relations of a given community. One of the theoretical frameworks for studying technologies is the notion of practical and prestigious technologies, where practical technologies are used to solve basic needs, such as acquiring food, making of shelter, while prestigious technologies are used to solve a social problem, to negotiate and display power and prestige, etc. In this paper, we will analyse some of the aspects of the lithic and osseous technologies in the Late Neolithic Vinča culture in the central Balkan area, with particular focus on rare, exotic, luxurious raw materials: marine shells and lithic raw materials such as marble, obsidian, etc. Beside their exotic origin, their technological traits and life biographies (intensity and duration of use, instances or repair, modes of discard, etc.) suggest these were valued raw materials. The distribution, diversity and frequency of these items vary considerably from site to site, showing that only limited number of settlements and individuals had access to them. The site of Vinča-Belo Brdo particularly stands out among other Vinča culture settlements by diversity and frequency of items made from luxurious raw materials, but there are also some other sites that yielded interesting artefacts, such as the site of Pločnik, where several ornaments made from marine shells were discovered, along with some other less frequently encountered lithic raw materials. This shows that there were differences in economy between different settlements, but also in their importance and wealth, and presumably status. However, at present state it is difficult to assess whether prestigious status was held by individuals, smaller (perhaps family) group or larger groups.

### PRISTINE EGALITARIAN CITIES? EVALUATING THE ARCHAEOLOGICAL EVIDENCE FROM TRYPILLIA ‘MEGA-SITES’

**Abstract author(s):** Ohlrau, René (Institut fuer Ur- und Fruehgeschichte Kiel; ROOTS) - Arponen, V.P.J. (ROOTS)

**Abstract format:** Oral

Recently, the Chalcolithic Trypillia ‘mega-sites’ of the Northern Pontic forest steppe have been characterized as low-density egalitarian cities. The question whether the ‘mega-sites’ provide an example for the integration of larger groups without hierarchical or state organization is an essential part of the counter narrative against traditional models of social evolution.

The currently proposed seasonal, minimalist, and low-density models clearly argue against Trypillia sites as examples for large and integrated populations. In the current conceptualization it appears that only if Trypillia societies were allowed to seasonally fission,

	<p>it would have been possible to integrate a modest population by egalitarian institutions for some time during the summer. Can this hold true?</p> <p>This paper investigates the archaeological evidence for both egalitarian mechanisms and social inequalities from larger and smaller settlements following a diachronic perspective. Social inequalities will be evaluated within the framework of the capability approach to reach beyond wealth and towards differential opportunities and perspectives.</p> <p>While previously the uniformity of the settlement and building layout was emphasized, the research of the last decade produced a variety of features, among them buildings of exceptional size, form, and position within the settlements. The taphonomy, inventory, and relations of the various building classes will be discussed. Other features such as enclosures, plazas, and the distribution of specialized crafts provide further context for the evaluation.</p> <p>As a result, the framing of these settlements provides a building brick for understanding the trajectory of European social prehistory.</p>
9	<p><b>EGALITARIAN PRACTICES AMONG NEOLITHIC FARMERS IN THE SOUTH OF EASTERN EUROPE</b></p> <p><b>Abstract author(s):</b> Kiosak, Dmytro (Ca’ Foscari University of Venice)</p> <p><b>Abstract format:</b> Oral</p> <p>Neolithic societies to the east of Carpathians can be characterized with a paradox. There are many cases of collective construction efforts well known to specialists in the field. Their results sometimes are exceptional like regular layouts of Trypillian mega-sites. However, there is an evident lack of traditional archaeological arguments for social hierarchies in these societies. Houses usually yield very standardized sets of finds; there are no outstanding burials etc. (Contra: see recent discoveries of “assembly houses” on some Trypillian sites). It seems that we often see the impressive results of collective effort of Neolithic farmers but we lack evidence for specialized managers to organize these efforts. Several solutions were proposed to solve this problem: self-organization mechanisms (J. Chapman and co-authors), particular forms of leadership (C. Renfrew), “hidden” hierarchies, which began to be revealed with enlarged archaeological research (J. Mueller, R. Hoffmann and co-authors).</p> <p>Here we suggest that Neolithic societies to the east of Carpathians shared some egalitarian ethos and certain “leveling” social mechanisms, “social practices designed to assertively maintain the operation of egalitarian social systems through the strict enforcement of egalitarian ethics” (G. McCall) despite emerging social inequality. The intentional egalitarization could be responsible for the “hidden” nature of early farmers’ hierarchies. Namely, we suggest that the deliberate burning of houses (very common in Trypillia and known in the adjacent societies) was an egalitarian practice, structurally similar to potlach of North American Indians.</p>
10	<p><b>DISTRIBUTION FITTING AND FRACTAL ANALYSIS FOR CHARACTERISING STRUCTURES OF SOCIAL INEQUALITY</b></p> <p><b>Abstract author(s):</b> Bruvoll, Hallvard (University of Oslo, Department of Archaeology, Conservation and History)</p> <p><b>Abstract format:</b> Oral</p> <p>A discussion on the emergence of social inequality will necessitate tackling the question of what we actually mean by inequality. We can always agree that it entails some measure of difference between individuals in a group. But do all such differences qualify as signs of inequality, or can they be better understood as functional difference, or random fluctuations? Are you wealthy, if most of the people you are compared to are just as wealthy as you?</p> <p>It is argued here that unequally distributed wealth and power is present where very few are highly favoured over many others. In statistical terms, such a situation can often be described as a power law distribution. In economics and finance, the connection between power law distributions and inequality has been known for a long time. Yet, this has received little attention in the archaeological debate on the origins of social inequality.</p> <p>While the Gini coefficient is useful for comparing the overall level of inequality through time and space, it provides little detail on how inequality is structured. Determining the best fit distribution model of an archaeological wealth-related variable, can provide valuable insights to the underlying processes and mechanisms that generated the distribution. Power law distributions exhibit the special property of scale-free fractal behaviour, and the associated parameters – namely the scaling exponent and the fractal dimension – can work as powerful quantitative supplements to the Gini coefficient for explaining the distribution of wealth in a society.</p> <p>An example of this form of analysis is given through the comparison of house-size distributions from the Linear Pottery and Trypillia cultures of the temperate European Neolithic.</p>
11	<p><b>NEOLITHIC HIERARCHY ON DIFFERENT LEVELS IN THE GREAT HUNGARIAN PLAIN THROUGH THE ANALYSIS OF DISTANT STONE RAW MATERIALS</b></p> <p><b>Abstract author(s):</b> Farago, Norbert (Eötvös Loránd University, Institute of Archaeological Sciences)</p> <p><b>Abstract format:</b> Oral</p> <p>The late Neolithic of the Great Hungarian Plain (5000/4900-4600/4500 cal BC) is thought to be the first period in this region when unambiguous signs of inequality emerged. One of the key factors behind this statement is the growing body of so-called Trans-Carpathian raw materials (e.g. Jurassic Cracow flint, chocolate flint, Prut/Dniester flint) found on the tell sites of the Plain. Together with other spectacular phenomena appearing first during this period, like rich and diversified grave furnishing, the first occurrence</p>

	<p>of copper objects, or the development of a complex settlement hierarchy from small farmsteads to large site complexes with tell monuments, social inequality seems to be confirmed. Although such material manifestations of social differentiations can be really convincing, it might be argued that prehistoric relationships were as simple as we think. The case study of chipped stones coming from two, contemporaneous late Neolithic settlements teaches us to take into consideration the many aspects of the prehistoric worldview. Investigating either the level of individuals by their grave goods or the level of households by their waste, the observed differences suggest hierarchy in some form, but not the way we could have possibly imagined.</p>
12	<p><b>IDENTIFYING PAST SOCIAL ORGANIZATIONS THROUGH FOODWAYS – THE IMPORTANCE OF A MULTI-PROXY APPROACH</b></p> <p><b>Abstract author(s):</b> Cheung, Christina (EA – Eco-anthropologie - UMR 7206, Muséum National d’Histoire Naturelle, CNRS, Université Paris Diderot; UMR 7269, LAMPEA, Aix-Marseille Université, CNRS, Minist Culture, Aix-en-Provence) - Syrikova, Polina (Université de Bordeaux, CNRS, UMR 5199 PACEA – Bordeaux; EA – Eco-anthropologie - UMR 7206, Muséum National d’Histoire Naturelle, CNRS, Université Paris Diderot) - Le Luyer, Mona (Université de Bordeaux, CNRS, UMR 5199 PACEA – Bordeaux; School of Anthropology and Conservation, University of Kent, Canterbury) - Herrsher, Estelle (UMR 7269, LAMPEA, Aix-Marseille Université, CNRS, Minist Culture, Aix-en-Provence) - Thomas, Aline (EA – Eco-anthropologie - UMR 7206, Muséum National d’Histoire Naturelle, CNRS, Université Paris Diderot)</p> <p><b>Abstract format:</b> Oral</p> <p>In complex societies, power and resources inequalities are often expressed in the ways people lived (i.e., dietary practices) and died (i.e., funerary practices). Thus, archaeologists have long recognized that palaeodietary and mortuary practices are powerful gateways to understand past social divisions and organisations. This study focuses on examining the social organizations of Cerny communities in the Paris Basin region through a comparison of their dietary and mortuary practices. The Cerny culture is well known for constructing some of the earliest monumental cemeteries in western Europe during the middle Neolithic period (ca. 4700 – 3500 BC). These cemeteries are highly organized and stratified, where only selected individuals were buried within/associated with the monuments, in very specific manners. Despite the highly stratified funerary arrangements, a recent stable isotopic study has revealed that there was little intra-group variability among the Cerny communities. This is in stark contrast to the neighbouring and contemporaneous non-Cerny groups, where highly homogeneous mortuary patterns and strong intra-group isotopic variations were observed. Thus, based on the isotopic results, it was initially assumed that Cerny social stratifications were more “symbolic” in nature (i.e., expressed strongly post-mortem) and that living individuals received similar sustenance across the community. However, new dental micro- and macro-wear analyses reveal that intra-group dietary variabilities indeed existed among the Cerny groups. While stable isotope analysis evaluates the total consumption of macronutrients (especially protein), dental wear analysis mostly concerns the texture of the food consumed. Our results have shown that among the Cerny communities, social stratifications were expressed not in terms of nutritional intake but in the format of the food being consumed. In addition, this multi-proxy approach has highlighted some limits to the current approach in palaeodietary reconstruction, which focused primarily on macronutrients intake and pay little attention to other factors such as food processing methods.</p>
13	<p><b>COMPARING PROXY-MEASURES OF INEQUALITY FROM GRAVES - THE CASE OF THE MORAVIAN CORDED WARE</b></p> <p><b>Abstract author(s):</b> Nørtoft, Mikkel (University of Copenhagen)</p> <p><b>Abstract format:</b> Oral</p> <p>Measuring inequality has long been a problem in archaeology. Some studies measure by the number of object types in each grave. Other studies use the Gini coefficient which is a statistic of income distribution summarised in one number between 0 (100% equal) and 1 (100% unequal).</p> <p>In the absence of a direct income unit used in Gini measures on modern societies, archaeology uses various proxies as measure units. These include house floor area, household artefacts, storage size, or an accumulation of value points defined for different grave goods.</p> <p>Gini measures on grave goods often use different point systems and although naming sensible criteria to decide on the value of objects they often do not report how the individual value points are calculated. This may introduce problems when comparing Gini coefficients across time and space. This paper compares different proxy-measures of inequality in graves and attempts a more broadly applicable and flexible point system for trans-regional comparison in the European Neolithic-Bronze Age. Both the “total object types”-measure and a point system based on labour hours may also be used in tandem as holistic measures to study wealth differences across age and gender instead of focusing only on “prestige” objects. Corded Ware culture (3rd millennium BCE) graves in Moravia, Czech Republic serve as a pilot study.</p>

IDENTIFYING LABOR DIFFERENTIATION THROUGH ANALYSES OF ENTHESEAL CHANGES IN BELL BEAKER EUROPE

**Abstract author(s):** Ryan-Despraz, Jessica - Desideri, Jocelyne (University of Geneva) - Villotte, Sébastien (University of Bordeaux) - Besse, Marie (University of Geneva)

**Abstract format:** Oral

The Bell Beaker period of the third millennium BCE acts as a transition between the end of the Neolithic period and the early Bronze Age in Europe. Studying this period therefore has the potential to shed light on Neolithic practices as well as some of the drivers that led to certain Bronze Age innovations. An anthropological study of 134 skeletons from individual inhumations of this culture’s Eastern complex (Central Europe) examined measurements, enthesal changes, and additional observations. The overall goal of this research was to understand how muscle development can influence bone morphology, and then apply this theory to the identification of specialized activity, mainly archery. Archery provides a unique reference point due to its links to warfare and hunting, though for the Bell Beaker period there remains significantly more evidence for the former. The results of these analyses revealed two important findings. First, an individual perspective exhibited no link between burial context and a likely specialized archer occupation. Second, a population perspective revealed a correlation between enthesal development and burial context; less physical development corresponded to skeletons interred with archery-related grave goods, items that were also likely more socially prestigious. Specifically, these grave goods included stone wristguards, arrowheads, and bow-shaped pendants. This finding indicates a possible labor differentiation within a socially stratified Bell Beaker society. A greater implication of this study discusses a possible link between socially prominent individuals, perhaps community leaders, and a warfare ideology.

GROWTH WITHOUT INEQUALITY? UNDERSTANDING THE RANGE OF VARIABILITY IN BRONZE AGE ECONOMIES

**Abstract author(s):** Green, Adam (University of Cambridge)

**Abstract format:** Oral

Economic growth has been a principal feature of human economies since at least the Bronze Age, however it is rarely fully recognized in archaeological studies of inequality. While there has been a resurgence of archaeological research on inequality, many studies tend to focus on disparities within particular categories of wealth. However, Thomas Piketty highlighted the relevance of multiple parameters to the study of inequality, namely economic growth (g) and returns (r). Drawing on historical data, Piketty argued that in capitalist economies  $r > g$ , an arrangement that increases inequality by driving the accumulation of wealth. Because it has often been argued that economic growth, the rate at which the total amount of material goods and resources per capita within a society increases over a period of time, is restricted to capitalist economies, many archaeological analyses effectively ignore growth, hindering our understanding of how inequality emerges in deep history. However, it has become clear that growth was a key variable in Bronze Age economies. In the Mediterranean, Leppard argued that ‘low-growth’ settings contributed to unexpected spikes in inequality. By extension, I argue that lower levels of inequality prevailed in ‘high-growth’ settings, such as those that contributed to alluvial urbanism in Mesopotamia and South Asia. The growth associated with early urbanisation drives explosive upticks in wealth that can suppress the emergence of inequality. This dynamic was pronounced in the Indus civilisation, where a massive urban economy with numerous rural settlements distributed wealth to everyday people, resulting in an egalitarian urban society. Mesopotamia’s Bronze Age growth was also initially marked by lower levels of social inequality, but its cities were longer-lived, fostering the consolidation of exclusive temple and palace institutions over an exceptionally long period of time. These early cities co-emerged with massive upticks in economic growth that did not inexorably produce a ruling class.

A QUANTITATIVE STUDY OF NEOLITHIC TO EARLY MEDIEVAL BURIAL GROUNDS IN SOUTHWEST GERMANY

**Abstract author(s):** Großmann, Ralph (Kiel University; Cluster of Excellence ROOTS)

**Abstract format:** Oral

Social inequality is a subject of contemporary concerns. Life capabilities and the access to resources vary significantly in rich and poor countries, between elites and others. Furthermore, inequalities based on bio-anthropological and non-bio-anthropological causes are almost universal. Accordingly, inequality was also inherent in past societies and archaeologists have continually examined and interpreted social inequalities in sources such as burial grounds and settlements.

This paper continues cemetery analyses with a new multi-proxy approach. It reveals social inequalities in selected past burial grounds from Southwestern Germany. The burial grounds date to the Early Neolithic (Schwetzingen), the Late Neolithic (Lauda-Königshofen), the Early Bronze Age (Singen), the Early Iron Age (Magdalenenbergle), and the Early Medieval period (Horb-Altheim). The challenge was to identify hierarchical and heterarchical differences within the burial grounds based on a multitude of different proxies.

The examination encompasses variations in the distribution of grave goods, burial pit sizes, bio-anthropological and isotope data. Furthermore, spatial analyses of burial grounds and, in particular, on the distances between the graves play an essential role in this examination. The results reveal hierarchical differences but also heterarchical relationships among and within genders and age cohorts that are differently pronounced in the respective cemeteries.

ENAMEL HYPOPLASIA IN THE CHALCOLITHIC SITE OF LA CARADA (SE SPAIN) AS A PROXY TO CHILDHOOD LIFE CONDITIONS

**Abstract author(s):** Veiga-Rilo, Clara (Group EcoPast - GI-1553, Universidade de Santiago de Compostela) - Jiménez Brobeil, Sylvia (Laboratory of Anthropology, Department of Legal Medicine, Toxicology and Physical Anthropology, Faculty of Medicine, University of Granada) - López-Costas, Olalla (Group EcoPast - GI-1553, Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University; Laboratory of Anthropology, Department of Legal Medicine, Toxicology and Physical Anthropology, Faculty of Medicine, University of Granada)

**Abstract format:** Poster

Hypoplastic dental enamel defects (HED) are non-reformable disruptions in the secretion of the enamel matrix caused by an episode of metabolic stress. In fact, HED can provide insights into stress periods that happen during development, including weaning. La Carada (Huéscar, High Andalusia, Spain) is a megalithic site (Chalcolithic), which was excavated by A. Molina in 1980. The recovered archaeological assemblage comprises a minimum of 164 skeletons and grave goods. The relative high number of non-adults recovered (n=68; 41%) enables to explore the presence of stress markers in childhood. Remains were comingled and fragmented, but teeth were well preserved; although most teeth were recovered in avulsion, hampering to obtain information at population-level.

A descriptive analysis was carried out on a sample of 382 canines (81 deciduous, 301 permanent) from La Carada. We focused our study on the prevalence, susceptibility and severity of the lesions according to dentition (deciduous/permanent), tooth type, affected surface, probable sex, age-at-death and age of formation of the defect.

HED was present in 54% of the pieces, being linear hypoplasia the most common. HED was more prevalent in the permanent dentition. Probable females displayed significant higher number and severity of defects than probable males. Deciduous teeth showed metabolic disruptions, preferentially between 3.5-4 months postnatal age, while permanent teeth showed them at the 4-4.5 years. These lesions do not seem to fit with the usual age of weaning, which might have occurred at later age. The high prevalence of HED in permanent teeth, in contrast to deciduous ones, is interpreted as a consequence of several metabolic disruptions in childhood, but not in the pre- and perinatal stage. Finally, the highest HED rate in females could be related with higher fragility, perhaps due to the differential use of resources in parenting.

SACRIFICE & VALUE: SEEKING AN ANTHROPOLOGICAL ARCHAEOLOGY OF SACRIFICE

**Theme:** 6. Material culture studies and societies

**Organisers:** Walsh, Matthew (Museum of Cultural History, UiO; National Museum of Denmark) - Moen, Marianne (Museum of Cultural History, UiO)

**Format:** Regular session

Archaeologists are often in a unique position to encounter evidence of ritual and sacrificial offerings in the past. However, such evidence varies wildly, both materially and contextually, and how we interpret such findings when they are encountered may also vary considerably. Indeed, sacrifices in some form or another are ubiquitous across societies around the world, and sacrificial practices and traditions have emerged, persisted and evolved in diverse contexts for millennia. Yet, archaeological interpretations of sacrifice, especially of the human variety, are often met with not just a healthy skepticism (as they should be), but they also often lead to controversy and even outright denial of the possibilities.

This session will explore archaeological interpretations of evidence of sacrificial offerings, whether they be of animals, objects or people, in whatever regions around the world they are encountered. Research that seeks to understand the archaeological evidence of such phenomena from cosmological, socio-cultural, ecological, economic and judicial perspectives are all welcome. We especially seek papers which attempt to engage with and untangle the myriad values possibly at play in sacrificial logics in the past and which explore the vicissitudes, vagaries and paradoxes of sacrificial practices in both relative and comparative contexts. A concern with perceived values furthermore means we seek to contextualize divides between objects/persons and thereby encourage papers which explore questions of personhood, identity and value in relation to sacrifice. We hope to investigate this fascinating subject with an eye towards better understanding the why behind acts of ritualized violence as offering, beyond the what and how so often necessarily the focus on the material record.

ABSTRACTS:

FROM OBLIGATION AND OBLATION TO SUBLIMATED VIOLENCE? TRANSFORMATION OF HUMAN SACRIFICE IN THE PREHISTORY OF NORTHERNMOST EUROPE

**Abstract author(s):** Walsh, Matthew (National Museum of Denmark; Museum of Cultural History, UiO)

**Abstract format:** Oral

This research investigates evidence for human sacrifice in Northern Europe from the Late Neolithic period through to the Early Iron Age, with a special focus on cases involving wet site archaeology. Firstly, a brief review of key forensic cases of possibly sacrificial executions of varying degrees of violence (concerning bog bodies) is provided. Secondly, an attempt to compare and contrast known cases through time is made, with preparation for new quantitative approaches -- presenting an original database which syn-

thesizes comparative characteristics for many known cases. Thirdly and finally, a phylogenetic neighbor-joining network analysis is brought to bear on this data to explore whether it is possible to apprehend new emerging patterns of cultural transmission related to ritual violence across time in this region. Findings suggest that not only is it possible to trace hitherto unknown networks of cultural contact in pre-historic Northern Europe, but they can also inform new hypotheses for explaining a long temporal gap in the continuity of human sacrificial practices, suggesting major shifts in human values along the way.

## 2 BODY PARTS IN THE BOG: PERCEPTIONS OF PERSONHOOD, VALUE AND SACRIFICE

**Abstract author(s):** Moen, Marianne (Museum of Cultural History University of Oslo)

**Abstract format:** Oral

This paper positions a relatively small and hitherto not very well known corpus of human remains from wetlands from Iron Age Norway into a wider theoretical framework of sacrifice and personhood. By juxtaposing these remains with the better-known bog body tradition evidenced from Northern Europe, I activate the similarities and differences between these to query constructions and perceptions of personhood,

Situating the discussion into contextual constructions and relational underpinnings of ways of being, I here seek to demonstrate how the material at hand, in the main comprised of fragmentary skeletal remains in votive contexts, offer a novel base from which to consider social relations. Furthermore, these perspectives are used to query the efficacy of the implicit tendency to draw interpretative lines between human remains and predefined personhood. Overall, the paper seeks to ask whether or not the assumption that personhood rests in a human body can be implicitly inferred when confronted with ancient human remains, and in turn what this may imply for interpretations of human bodies in votive settings. This brings the perspective round to a discussion of sacrifice and value, wherein the universality of an assigned value based on status as human is brought into question on the strength of relative constructions of personhood.

## 3 BANDS BETWEEN THE LIVING AND THE DEAD: THOR’S HAMMER RINGS IN RELATIONAL AND RECIPROCAL PERSPECTIVE

**Abstract author(s):** McGinnis, Meghan (Stockholm University)

**Abstract format:** Oral

Within the field of Viking Age archaeology, ‘Thor’s hammer rings’ are by now well-known as a class of finds especially characteristic of cremation grave contexts in certain parts of eastern Scandinavia, such as the Mälär valley in Sweden and the Baltic Åland islands. Yet although these objects are highly recognizable elements of mortuary practice, attempting to explain their overall distribution, and also their presence in particular burials, in terms of gender, age groups, social strata, or other facets of identity often associated with ‘grave goods’ has proved largely unsuccessful. Why is this? Perhaps because Thor’s hammer rings in the main had no link to individual identity, and rather everything to do with establishing and managing connections between different persons, not all of whom were human in nature.

Analyzing examples of assemblages that include Thor’s hammer rings from grave field RAÄ 28 Söderby in Sweden, and building on my own and other scholars’ recent work that ties the broader category of ‘amulet rings’ to the swearing of oaths and making of votive offerings at cult sites, this paper explores how rather than passively reflecting already existing personal attributes and affiliations, Thor’s hammer rings used in mortuary contexts instead functioned as active agents facilitating transformations of states of being, and the production and maintenance of relationships between both living and deceased participants in ritual acts. And did so both in rites that were part of the drama of burials themselves, and those that comprised continued interactions with gravesites during various post-funerary moments. By investigating practices involving these objects from this more relational perspective, we open another window onto the lived experience of a reciprocal logic of sacralized exchange which underpinned the whole religious world of the late Iron Age of Fenno-Scandinavia.

## 4 RITUALS AND SACRIFICES IN ANCIENT ARCADIAN CULTS

**Abstract author(s):** Dimopoulou, Sotiria (University of Münster, Classical Archaeology)

**Abstract format:** Oral

Ancient Arcadia is a region in Peloponnese, whose various cults have been accompanied by sacrifice rituals and religious regulations. Some of them had a purifying character e.g., for those who participated on ritual ceremonies or were connected to the cult of a specific god or goddess.

Despite the fact that literary and archaeological sources about sacrifices are meager, our knowledge about them allows us to study and evaluate these phenomena also as a part of the human behavior with social background. Foremost sacrifices can be seen as a medium of a direct communication with the divine element or as an expression of a deep religiosity of a community. Diverse kind of sacrifices before or during cult practices, such as animals, fruits, pomegranates, animal skins, terracotta statuettes on animal masks, clothes, textiles, even human sacrifices etc., indicate that the type of sacrifice depended on the art and purpose of the cult.

This paper re-examines the significance of sacrifices, trying to give new aspects about beliefs and thoughts connected to specific regulations, mystery cults or matters of social prestige. The study evaluates also a possible relationship between sacrifices and offerings, as well as between sacrifices and initiations, pilgrims, women or important persons. In what way the art of sacrifice was

related to specific category of people and how can we interpret it? As a human need, as a deep religiosity or as a long religious tradition? In any way, sacrifices belong to the material culture of an ancient society, a very important factor to understand ideologies and aspects about this custom.

## 5 MIMETIC RITUALS AND THE SOCIAL

**Abstract author(s):** Hohle, Isabel (RGK - Romano-Germanic Commission DAI)

**Abstract format:** Oral

Studies from Social Anthropology indicate that non-hierarchical or less hierarchical societies practice certain rituals which are intended to strengthen or restore cohesion in the community and, could act as coping practices, e.g. in exceptional environmental conditions or to reduce tensions within or between communities in order to avoid conflicts. In addition, there are certain practices and rituals that are only carried out in “crisis situations” and are characterized by violence and destruction (both in a direct and figurative sense). The concept of “désir mimétique” developed by René Girard - the desire for violence compensated for by imitation (GIRARD 1992) could be extended to any form of mimetic violence: the destruction, smashing, overkilling of objects or animals as well as ritual slaughtering, butchering and smashing the remains of the dead. These mechanisms serve to avert violence against one’s own group (be it from outside or inside) in order to protect the community. There seems to be a connection between the performance of complex, painful (also figuratively) and violent rituals and times of crisis.

Girard’s theory has been widely discussed and criticized and should not be presented here without reflection. Basically, it should rather be about the underlying idea of imitation and representation - concepts that could help to understand practices of sacrifice in prehistoric societies.

## 6 THE QUESTION OF A POTLATCH IN ARCHAEOLOGY

**Abstract author(s):** Gralak, Tomasz (University of Wrocław)

**Abstract format:** Oral

In case of many archaeologically discovered remains of sacrifices, it is clearly visible that various types of goods were withdrawn from circulation. In the most spectacular way it is possible to observe through the discoveries of hoard finds. This phenomenon is particularly distinctive for Central and Northern Europe during the Bronze Age and the Early Iron Age. It seems to be directly connected with the autarkic and non-commercial type of the economy at the time. It was possible to generate a surplus, but it was almost impossible to invest. So there was a capital within a very shallow market. Moreover, among traditional societies the dignity and honor of groups and individuals are the highest and most precious values. It was the relationships with other members of the community that determined the quality of life, and were necessary for survival in difficult conditions. Hence, the accumulated goods were invested in interpersonal relations (status) – by sacrifices and probably through gift giving also. Therefore, such actions resemble the nature of a potlatch. It is not a waste of goods, but ritually conditioned building of social bonds. In this context, trade in metals is also important, because bronze, silver or gold mostly could not be obtained by the autarkic economy of central and northern Europe. Not everyone could participate in the import of these materials, which resulted in a progressive differentiation of status. Hence the need to show it – also through the potlatch.

## 7 FIBULAE LEFT BEHIND: SACRIFICES AT FIRST SIGHT? A PRELIMINARY REPORT OF THE SACRIFICIAL SITE AT OBERLEIBNIG (TIROL/AUSTRIA)

**Abstract author(s):** Waldhart, Elisabeth (Universität Innsbruck, Institut für Archäologien) - Schmölzer, Astrid (Otto-Friedrich-Universität Bamberg, Institut für Archäologische Wissenschaften, Denkmalwissenschaften und Kunstgeschichte - IADK)

**Abstract format:** Oral

Located at a hillside at the Alpine Isel valley 180 objects dating from Iron Age to Roman Times were found. The topographic setting and the object selection includes coins and fibulae as well as artefacts related to feasting and craft. Usually, depositions like these are summarised as “Brandopferplätze”. There are a lot of sites known in this region with identical findings, ranging from larger sacred sites to small locations in the high mountain environment, all together forming a religious landscape.

Within these assemblages of offerings, differences and parallels are raising questions on different social roles and status of the people visiting. The various rituals and composition of objects – especially the occurrence of provincial Roman fibulae – contrast with the continuous use of places known. This allows us to investigate processes of Romanisation in the region. The sacrifices can be seen as constitutive for group and subjective identity as well as the sacrificial site as a place where identity is negotiated.

Especially fibulae are a common object at sites within this sacrificial tradition. Alongside coins and small votive figurines, they can be discussed as individual offerings. Furthermore, fibulae can be seen as commodities, sacrifices of small value as well as an expression of identity. They could be laid down as single votives or were part of a bigger sacrifice – a fibula could also hint to a whole costume (pars pro toto). As a part of the sacrificial site, they can be seen within a network of objects where value is changed or remade through the act of offering. Some objects change from commodities to sacred objects, others from personal things to sacrifices.

The term “Brandopferplatz” is regionally well established. Thus, it is important to re-evaluate and consider theoretical approaches on object agency, applied to our fibulae case study.

8

SACRIFICE, VALUES AND MONETARY SYMBOLS

**Abstract author(s):** Gullbekk, Svein H (Museum of Cultural History, University of Oslo)

**Abstract format:** Oral

In this paper I will argue that there exists a close relationship between sacrifice and money from the introduction of coinage in the late 7th century BCE onwards. The sacralization of monetary symbols and values was vital for its success. Monetary expressions of value became symbols of importance in sacrificial rituals, taking on a plethora of meanings and significances in Greek and Roman mythology as well as in Christian theology.

In Christianity, the concept of ‘Economy of salvation’ where the activity of the creator God in the world to redeem a fallen and sinful humanity was expressed by economic means, especially from the 11th century CE onwards. The sacralization of value expressed in monetary terms and through monetary symbols was viewed as a direct designator of faith as well as authority through the force of various traditions in the hands of the elites, profane as well as religious. In many forms, money was sacred.

The value of sacrifice was transformed and sublimated through performative rituals and narratives, and has often been expressed in the universal language of monetary standards. The relations between money and sacrifice will be discussed through the cases of sacrifice at the temple of Asclepius on Kos (Classical Greece), the rituals of the Eucharist as undertaken in medieval churches, and from foundation offerings in late medieval Siena (Italy).

9

EARLY MEDIEVAL WEAPON DEPOSITIONS IN WATERY CONTEXTS: CONTINENTAL EUROPEAN PERSPECTIVE

**Abstract author(s):** Maczek, Dušan (Department of Archaeology and Museology, Masaryk University, Brno; Faculty of Archaeology, Leiden University)

**Abstract format:** Oral

In continental Western Europe, the practice of weapon burials is slowly abandoned throughout the 8th century AD. This shift is, among others, attributed to the Christian doctrine that gradually seems to obstruct the custom of burying grave goods with the deceased. In the archaeological record, what is striking is that depositions of weaponry in watery contexts take over at this point and continue well into the high medieval period. The medieval arms found in mainland Europe’s rivers and wetlands have traditionally been interpreted as traces of violent conflict. These interpretations have nevertheless rarely considered the chronological and distributional patterns of this evidence, mainly due to the pagan nature of this phenomenon in the previous periods, which has always been put in contrast with the Christian nature of the Carolingian kingdom and its successors. It seems that the people of historical periods of Western Europe have been considered too ‘rational’ and too ‘Christian’ to be depositing valuable personal arms such as swords or lances in such an intangible context as water. This, however, seems to be our construct of the past since the evidence tends to point the other direction. Contextual reconsideration of continental European water-finds of weaponry from the medieval period questions the interpretation of mere battle remains. Whether this archaeological evidence is a result of a convergent value-systems in the light of Scandinavian incursions of the time, conversion of and boundary making in the landscape, coping with the abandonment of weapon burial, conflict resolution or needs to be understood from a perspective of Christian appropriation of past beliefs, the evidence at hand allows us to look at this material from a new perspective.

BETWEEN AUTOCHTHONISM, MARXISM AND TURBOSLAVISM: CONCEPTS OF SLAVS AND SLAVIC ORIGINS THROUGH SPACE AND TIME

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Reichenbach, Karin (Leibniz-Institute for the History and Culture of Eastern Europe - GWZO) - Milosavljević, Monika (Departement of Archaeology, University of Belgrade) - Broka-Lāce, Zenta (Institute of Latvian History at the University of Latvia)

**Format:** Regular session

“The Slavs” of the past are associated with a national idea that may relate to ethnicity, an individual state or Pan-Slavism. Academic conceptualizations of the Slavic people(s) and their origins spanned into a wide range of disciplines from early on, including archaeology, linguistics, historiography and physical anthropology. Even now a whole variety of approaches and results are negotiated in academic discourse, while neo-romantic concepts of Slavic identity and ancestry undergo a growing revival in different public fields, be it populist propaganda or popular culture. Often they seek to ground national identity in ancient ethnic origins, like turboslavist creations of a Slavic past that interlocks scholarly knowledge production with identity and memory politics, old and new nationalisms, neo-pagan spiritualization as well as references to DNA data in order to locate ethnic origins. Where there is a growing idea to “make Slavs great again”, it seems largely based on outdated academic concepts and often lapses into pseudoscience.

Approaching and reflecting different understandings of “the Slavs” as well as the changing ideas tracing their origins and continuity, can disclose similarities and differences in scientific conceptualizations and constructions as well as public narrations and visualizations of Slavic identity. The organizers would like to form a dialogue with scholars within scientific and public discourse to explore the representation of Slavs and Slavic origins in academia and beyond approaching complex questions of collective identity. The session aims to enable a reflexive discussion on the entanglements of scholarly perspectives, public representations and political use of the Slavic issue, from autochthonist-allochthonist dichotomies, Nazi counter narratives, to communist rule and Marxist in-

terpretations up to current megalomaniac phantasmata built on pseudoscientific and nationalistic notions. All contributions related to the topic are welcome, referring to diverse regions, historical periods and the present, to different political systems and social contexts.

ABSTRACTS:

1

SLAVIC FACTOR IN THE HISTORY OF LATVIAN ARCHAEOLOGICAL THOUGHT

**Abstract author(s):** Broka-Lace, Zenta (Institute of Latvian History, University of Latvia)

**Abstract format:** Oral

Latvian archaeology from the theoretical standpoint until this day is strongly influenced by culture-historical tradition. Thus, the study of Latvian ethnogenesis occupies an important place in a large part of research. Due to lack of written sources the synthesis of archaeological, bioarchaeological, ethnographical and linguistic data plays an important role in the search for origins of the various ethnolinguistic groups that inhabited the territory. Most of the hypotheses so far are based on the retrospective method, the significant disadvantages of which are the problems of interpretation and data synchronization.

The relationship between Latvian predecessors - Balts and their neighbouring ethnolinguistic entity - Slavs and the nature of their influences to one-another during prehistory are still debatable from both a linguistic and archaeological point of view. The question of Balto-Slavic linguistic and ethnic unity in prehistory remains debatable whereas there are several conflicting hypotheses, which inevitably have a political context as well.

Through the history there have been different attitudes towards the meaning of Slavic factor in development of Latvian culture, but during the Soviet occupation the Slavic question became predominant. Soviet science considered Slavic people to have special virtues and a historical role in the development of their neighbouring groups. The theory of cultural superiority of the Slavs was mandatory in Soviet archaeology as a political tool to legitimize the ongoing process of Russification and assimilation of non-Russian peoples in The Soviet Union. In archaeological thought it was manifested as an unsubstantiated exaggerating of the Slavic factor in the development of local culture. The desire to unite Slavic world with the help of archaeology and history emerges over and over again. This report tries to search for the roots of different ideas about Slavs in Latvian archaeology, comparing the scientific consensus before, during and after the Soviet occupation.

2

RESEARCH ON THE PERIPHERY OF THE SLAVIC WORLD. ABOUT THE SO-CALLED SLAVIC ARCHAEOLOGY AFTER WORLD WAR II IN GERMANY

**Abstract author(s):** Grunwald, Susanne (RGK/JGUniversity Mainz)

**Abstract format:** Oral

The northwest border of Slavic settlements in the Middle Ages lies in today Germany, but so-called Slavic Archaeology was a peripheral topic on the periphery of the Slavic world for a long time. The growing interest on that topic in East Germany was understood as an effect of the political twist in Eastern Germany after the war. Slavic archaeology seemed as one kind of political supported and willed research and an example for the internationalization of archaeology in the socialist states. Archive sources like letters and unpublished research programs allow another interpretation of the development in the 1950s and 1960s in Germany: Especially investigations on so-called Slavic hillforts in the north of both parts of Germany can see as resumption of elder studies about the ethnogenesis in the southern Baltikum in the middle ages and the search to proof the unbroken dominance of German cultures in that region. Before 1945 German archaeologists and historians tried to describe Slavic cultures just as episodes in a German-dominated region. After 1945 a network of archaeologists and regional historians (Landeshistoriker) just switched officially the protagonists of their research from Germans to Slavs but asked the same questions. That helped to continue research traditions and generate new contacts and cooperation with colleagues in the eastern socialist states.

3

WHY THE ‘SLAVS’? – LEGITIMATIONS OF SLAVIC ARCHAEOLOGY IN COMMUNIST EAST GERMANY. A CASE STUDY

**Abstract author(s):** Kluger, Anne (Leibniz-Institute for the History and Culture of Eastern Europe - GWZO; University of Münster)

**Abstract format:** Oral

In communist East Germany, research on the early ‘Slavs’ from prehistoric and medieval times was one of the main branches of archaeology and prehistory. Unlike in other states of the Eastern Bloc, this may not be obvious at first – not least regarding the traditions of German research before 1945. Based on this observation, I will analyze how the focus on the early ‘Slavs’ was explained and justified in East German archaeology and prehistory and how the ‘Slavs’ were defined in this context. Therefore, Joachim Herrmann, director of the archaeological and prehistorical institute at the East German Academy of Sciences and one of the protagonists of Slavic archaeology in the GDR, will serve as a case study, as his interpretations of the ‘Slavs’ and their connection with the past and present of the GDR represented the dominant narratives in East German Slavic archaeology. In his publications and talks, Herrmann did not only emphasize the GDR’s obligation to compensate for the pejorative evaluation of the ‘Slavs’ in the German ‘Ostforschung’ before 1945 but also assumed an outstanding importance of the ‘Slavs’ for the exploitation and development of the territories that meanwhile belonged to the GDR. Furthermore, Herrmann included ethnic interpretations, for example when he referred to the Sorbs

as a living proof of ‘Slavic’ continuities in East Germany since prehistory. I will discuss Herrmann’s arguments for Slavic archaeology concerning their connections with identity politics and the legitimization of the GDR’s membership in the Eastern Bloc. Besides, the impact of Soviet guidelines and interactions within the communist scientific community will be addressed as part of the analysis. Therefore, the case study enables further insights into the interpenetration of scholarship, political goals, and ideological premises in communist East Germany and the role of conceptualizations of the ‘Slavs’ in this context.

4 THE LONG SHADOW OF AUTOCHTHONISM IN CONCEPTS OF SLAVIC ORIGINS IN 20TH AND 21ST CENTURY POLAND

**Abstract author(s):** Reichenbach, Karin (Leibniz-Institute for the History and Culture of Eastern Europe - GWZO)

**Abstract format:** Oral

The paper addresses autochthonism as a concept localizing the origins of the historic Slavs on the territory of central Europe and especially of modern Poland and tracing them back far into prehistoric times. Fully developed by the end of the 19th century it gained recognition first among Czech prehistorians, while later spreading widely into Polish archaeology where it was mainly advocated by Józef Kostrzewski and the Poznań school of archaeology. It remained the basis for reconstructions of Slavic-Polish history during the post-war decades, losing its significance only from the late 1960s onward. Though thoroughly criticized since then, the concept still has supporters in Polish Slavic studies and archaeology. Its most successful revival, however, it receives as a key element in the pseudoscientific “turboslavic” theory of “Wielka Lechia” claiming the existence of a glorious ancient “Lechitic” empire.

Tracing its progress through changing paradigms within Polish archaeology from positivist national history to Marxist approaches and beyond, the concept of autochthonism has apart from academic discussions always seemed to fulfill a specific function in memory politics, too. It provided arguments in inter-war German-Polish geopolitical disputes, but also played a significant role in the legitimization of the territories shifted from Germany to Poland after 1945 and therefore was inextricably linked to the establishment of communist rule. Even now, the alternative history theory of “Wielka Lechia” is regarded as a pretext for clear political ambitions. Since the political exploitation of a Slavic history based on autochthonist presumptions derived from ethnic interpretations of the archaeological record, the presented insight from the history of archaeology can contribute to a central issue in the methodological discussion, illuminating controversial approaches to material culture as a foundation for far-reaching historical narratives.

5 A LONG, LONG TIME AGO IN A GALAXY FAR AWAY ... - SLAVS AND HIDDEN POLISH HISTORY

**Abstract author(s):** Blaszczyk, Dariusz (Faculty of Archaeology, University of Warsaw)

**Abstract format:** Oral

“The beginnings of Great Lechia date back to around 1800 BCE, when the migration of Elamites from the lands of today’s Iran to Central Europe gradually began. The chronicles state that Sarmata was elected the first Lech, i.e. king at the Slavic rally...”

Around the year 2014 on the Polish internet appeared a new trend. A group of people started to write about the Great Lechia, a mythical empire inhabited by “Aryo-Slavs”, allegedly stretching from the Rhine to Novgorod. A year later, a well-known and respected publishing house in Poland, Bellona, published a book with an intriguing title The Slavic Kings of Lechia by Janusz Bieszk. The following years brought more books by various authors and more websites. This is how the idea of the Great Lechia was initiated. Its followers, called Turboslavs (that is, people striving to show an improved past), proclaimed the existence of an alternative version of history, in which Poland before its baptism was a superpower state, whose story has been falsified. Over time, this pseudoscientific approach has gained some popularity and its representatives began to claim that it was they who discovered the true history of the Slavs and their origin, long hidden by official, academic science.

In my presentation, I will discuss the main ideas of the supporters of the Great Lechia, present selected profiles of its main representatives, and above all, I will consider the reasons for the emergence, spread and popularity of this type of ideas.

6 THE “GREAT LECHIA” HISTORICAL NARRATIVES AS A REFLECTION OF A PRESENT-DAY POLISH SOCIETY

**Abstract author(s):** Pawleta, Michal (Adam Mickiewicz University)

**Abstract format:** Oral

This presentation seeks to analyse the popularity and significance of the so called “Great Lechia” or “TurboSlavs” phenomenon. It is a spread-out of the academia historical narrative of an alleged ancient empire of Slavs that used to occupy the area of almost whole Europe. Its greatness was supposed to manifest itself in the territorial conquests and successful wars against such dangerous enemies as the Roman Empire, as well as superior standard of living and level of cultural and social progress.

The Great Lechia narratives are widespread not only in the Internet, but also in books than can be found in the leading bookstores in Poland. The most influential author is Janusz Bieszk, who wrote four extensive monographs in order to prove the Lechites empire existence. What is characteristic of Bieszk’s and his followers’ narratives is that they stand against findings of academic research.

In my presentation I will characterise main motives and pivotal elements of contemporary socio-cultural context that are present in ‘pseudoslavic’ narratives. I will base my observations on two kinds of sources. On the one hand, it will be an analysis of the leading “Great Lechia” authors and their publication as well as the internet sources (webpages, blogs, etc.). On the other side, I will be referring to critical publications and discussions related to this phenomenon. As I argue, motives that lay behind the The Great Lechia

popularity refer not only to a growing distrust of science and academic research conclusions but are also a reflection of broader issues connected with condition of contemporary Polish society.

7 ARCHAEOLOGY OF SLAVS OR THE DEVELOPMENT OF MEDIEVAL ARCHAEOLOGY? MEDIEVAL ARCHAEOLOGY IN THE WORK OF THE ARCHAEOLOGICAL SOCIETY OF YUGOSLAVIA

**Abstract author(s):** Lorber, Crtomir (University of Ljubljana)

**Abstract format:** Oral

Yugoslavia partially built its legitimacy on an idea of being the “natural” state of southern Slavs. To construct this idea it relied on archaeology and history. One of the most important archaeological “institutions” in Yugoslavia was the Archaeological Society of Yugoslavia (1953–1991), formed after the 1st Meeting of Yugoslav Archaeologists in Niška Banja (1950), where the study of the ethno-genesis of Yugoslav nations was defined as one of the primary goals of Yugoslav archaeology after WW2. This had an impact on the development of the society, primarily on its’ Medieval Section, its’ publishing activity and its’ international work.

The paper discusses the development of the archaeology of the “Slavs” in the Yugoslav archaeological society by highlighting three key topics.

- The definition of the archaeology of the “Slavs”, formed during the meeting in Niška Banja, and the work of the Medieval Section of the Archaeological Society of Yugoslavia, emphasizing that the society conceptualized medieval archaeology in the context of post WW2 nation building and as a tool of international cooperation.
- Looking at the international work of the society we highlight the formation and cooperation with the UIAS (Union Internationale Archeologiche Slave), modelled after UISPP, and cooperation of Yugoslavia with the countries of Eastern Europe. In the field of publishing the paper focuses on the journal Balcanoslavica, a journal of the Medieval Section.
- In conclusion we define the relationship between the society and other relevant Yugoslav institutions (such as Centar za balkanološka ispitivanja ANUBiH) and its’ view of ideas such as Ilirism and autochthonism, which were popular in certain professional and political circles in Yugoslavia.

8 THE DANGEROUS ENTANGLEMENT OF SERBIAN ARCHAEOLOGY - ARCHAEOLOGICAL EVIDENCE AND INTERDISCIPLINARITY UNDER THE SHADOW OF POLITICAL PRESSURE

**Abstract author(s):** Milosavljevic, Monika (University of Belgrade)

**Abstract format:** Oral

The medieval past has been appropriated and misused in support of or to fuel collective identity and answer questions of national origin. In this dangerous entanglement, it is interesting to examine what mechanisms have led to the use of archaeological evidence for such nefarious purposes. Questioning the process of change in archaeological interpretations of the early-medieval Slavic past in Serbian archaeology may act as a prism through which light may be cast on such practices used to prove autochthonous continuity.

Once part of former Yugoslavia, Serbian archaeology shares its general trajectory with its close neighbours’. Serbia’s history of medieval archaeology has not yet been the focus of any critical research. Among other phenomena, relations between archaeological excavations and extremist right-wing interpretations of ethnic origins in 1990’s ethnic wars within the former Yugoslavia fall under a shadow of trauma and silence in Serbian contemporary society. The conceptual foundations of early-medieval archaeology in Serbia were formulated as a cultural-historical paradigm in the shadow of political pressure for constructing identity. The aim of this presentation is therefore to demonstrate the development of a conceptual approach framing of the same evidence that had once been interpreted for a unitary mixed South-Slavic past but then applied to a fragmentary, pure-ethnic past of the Serbs. The backbone for this research is to analyze the scaffolding of archaeological interpretation as it changed through physical anthropology and ethnology to support political misappropriation of evidence to flame ethno-nationalism.

The data samples analysed for this presentation are the main archaeological publications on Slavic and early-medieval Serbian archaeology through discourse and content analysis. The timeframe for this contextualisation of the history of Serbia’s early medieval archaeology focuses from 1945 to 2000, a politically dynamic time (from communist rule, nationalistic uprising, the wars in the former Yugoslavia and its transition).

9 WHERE DID ALL THE SLAVS GO? FROM COLLECTIVE SOUTH SLAVS TO FOREFATHERS OF THE SERBIAN STATE

**Abstract author(s):** Cvjeticanin, Tatjana (National Museum in Belgrade; Faculty of Philosophy, University of Belgrade)

**Abstract format:** Oral

The past is always modeled and invented in the present; certain perceptions are accentuated, other neglected. As in other countries, current Serbian memory politics is partly a response to the tensions of the modern world, but mainly it is the answer to the novel political reality emerging after the 1990s. In the aftermath of the end of the Yugoslavia and the dissolution of its symbolic capital of supra-nation the establishment of a new cultural identity and new collective memory was necessary. Chosen was a narrative of the ‘(heavenly) people with (glorious) past’, living on a territory with a special spiritual axis. The nation became the only true community.

THE ROLE OF ARCHAEOBOTANICAL RESEARCH IN SLAVIC DISCOURSE

Abstract author(s): Smuk, Ana (Department of Archaeology, University of Belgrade)

Abstract format: Oral

Slavs as an ethnic category are being investigated for decades, having culture-historical paradigm rooted in many of the archaeological interpretations across the Balkans and the Pannonian Basin. One way to develop the research on this topic is by including a set of disciplines dealing with the questions of human economy – among others archaeobotany. It shall be discussed if the archaeobotanical results are showing Slavs as a specific group of people with certain habits and diet preferences, or they, no matter how much we try to single them out from the wide set of ‘others’, are representing ordinary life of those who were interacting with each other without making the differences in the way as we do today. Could the agricultural practices, procession and plant consummation of the Slavs have differed from the other ethnic groups? Shall we look at the Slavs as one phenomenon existing independently of others, or we should look at the broader picture taking into consideration their cohabitation with ‘others’? Published set of archaeobotanical material coming from the medieval Slavic sites and some of the authors work on the sites in the Pannonian Basin/Balkan region will be taken into consideration and compared with the neighbouring countries in order to see to what extent the habits and ideas were fluctuating through the continent, regardless of nation, considering that geography sometimes had more important role than ethnicity. We will try to see if the archaeobotanical interpretations were determined by certain paradigms, or archaeobotanists, dealing with the relatively ‘young’ kind of discipline in the Slavic discourse are rather staying away from the interpretations related to the ethnicity. Therefore, a question if archaeobotanists should deal with the topic of ethnicity at all is something to be considered and debated about.

COLLECTIVE ACTION THEORY: THE NEW APPROACH TO EXPLORE THE SLAVIC ORIGINS AND IDENTITY IN CENTRAL EUROPE

Abstract author(s): Machacek, Jiri (Masaryk University, Brno) - Hofmanova, Zuzana (Masaryk University, Brno; Max Planck Institute for Evolutionary Anthropology, Leipzig)

Abstract format: Oral

Previous research into early medieval society in Central Europe was based on a traditional approach to archaeology focusing on the historical explanation of archaeological and anthropological evidence. Within this paradigm most of the social changes were explained either by migration or with the help of top-down models positing hierarchical control by elites. The Slav predecessors of the Central European nations were thought to have migrated en masse to Central Europe from the east in the 6th century (from the Slavs’ homeland in the central and upper Dnieper region). The multi-ethnic character of the society was rarely taken into consideration, because the traditional and national “ethnic paradigm” had dominated “Slavic archaeology” for decades as stressed by e.g. Sebastian Brather.

To pursue this line of thought, we are introducing a new project. The main objective of the project is to investigate the formation and dynamics of the early medieval Moravian polity and population over an extended period (from the 6th to 10th centuries). Our research is focused on social and ethnic group building, variation in the nature of leadership and on the collective–autocratic variability of governance. Collective action theory seems to be a very effective approach for investigating the past of complex and multiethnic societies. As a key study we will present the new discovery, which is the rune-inscribed bone found in the Early Slavic context (see Journal of Archaeological Science, March 2021, Vol. 127). It should be the first archaeological find indisputably attesting to direct interaction between the people of Germanic a Slavic habitus and perhaps origins in Central Europe.

THE GEOARCHAEOLOGY AND SUSTAINABILITY OF CULTIVATION TERRACES AND LYNCHETS IN EUROPE

Theme: 1. Widening horizons through human-environment interconnections

Organisers: Fallu, Daniel (Arctic University Museum of Norway) - Walsh, Kevin (University of York) - Klinkenberg, Victor (Leiden University)

Format: Regular session

Cultivation, or agricultural terraces (and lynchets), are seen as characteristic land-forming elements in many parts of Europe and worthy of protection under both Global and European Heritage Protection schemes (e.g. UN Sustainability Goals and FAO-GIAHS). This is partly because they are under threat from the refashioning of agriculture on slopes, forestry and rural depopulation. There is a real danger that many will disappear before they have been recorded let alone investigated. Even where they are protected, and being maintained or rebuilt, we rarely know their full use-history, origins and relationship to settlements. This is largely because cultivation terraces have rarely been the focus of archaeological excavation per se – due to problems of dating, a typical lack of finds, and problems of deciphering their past cultivation history from aerobic and biologically active soils. However, there is a suite of new techniques which can overcome some of these problems ranging from Lidar to optically stimulated luminescence (OSL) dating. This session will examine a range of aspects of terrace archaeology from the identification and mapping of terraces, through excavation and geochemical methods, to soil micromorphology and direct-sediment dating techniques (such as OSL). Progress has also been made in the use of phytoliths and, most recently, biomolecular methods, including sedaDNA have been attempted. Knowing the original crops or vegetation on terraces as well as their date of construction can both inform landscape archaeology and the range of possible land uses that they could be restored to.

This session will present papers using these techniques on terrace systems in Europe and also the Heritage and sustainability aspects of terraces in the light of the refocussing of agricultural incentive schemes and support from both the EU and European governments.

ABSTRACTS:

AGRICULTURAL TERRACES: INTENSIFICATION, DIVERSIFICATION AND NUTRITION

Abstract author(s): Brown, Antony (University of Southampton; Arctic University of Norway, Tromsø) - Walsh, Kevin (University of York) - Fallu, Dan (Arctic University of Norway, Tromsø)

Abstract format: Oral

Theoretical debates around the adoption and development of agricultural terracing have generally privileged intensification as the dominant explanatory model. However, terraces, although undoubtedly representing an intensification of pre-existing land use, also represent a process of diversification. This may take the form of multiple crops, inter-cropping and rotational cropping. It can also include multiple crop life-forms, so in addition to graminoids (e.g. grain crops) and forbs (pulses, beans etc.) terraces can also support tree crops (olives, hazelnuts, apples..) and epyphytes (vines, hops, figs) which can maximize not only the created fertilized tread-space but also other niches offered by the walls, water channels and structures. The principal result of this diversification is an increase in multi-nutritional yield (i.e. over the range of nutrients required to maintain a healthy population) including some limiting nutrients (e.g. vitamin C). An additional component is the production of prestige goods, secondary products (e.g. honey) and even craft production. This also implies a close connection with population growth and urbanism. Diversification, not intensification, is also the principal way in which terraces confer sustainability in the face of drought reducing the likelihood of population reduction through famine. This paper argues that we need to reframe the terrace debate in terms of the origins and cultural drivers of diversification and localization which inevitably brings in questions of migration, domestication and the organization of society.

EXTENSIVE MEDIEVAL FIELD PATTERNS PRESERVED UNDER WOODLAND CANOPIES IN BOHEMIA: DETECTION, PRESERVATION, VERIFICATION, AND DATING

Abstract author(s): Holata, Lukáš (University of South Bohemia) - Malina, Ondřej (NPÚ and Heritage Conservation) - Plzák, Jindřich - Budilová, Kistýna (University of South Bohemia)

Abstract format: Oral

Considerable afforestation of Bohemian landscape has allowed preserving various remains of past human activities in relief. However, agricultural terraces and lynchets were documented only sporadically and fragmentarily for a long time as they are very hardly discernible by the surface survey in the forest environment. ALS data, used in recent years, has completely changed state of the art – extensive field patterns are indicated under woodland canopies, even the total extent of original ploughlands of some deserted medieval settlements. The paper will discuss the four aspects crucial for the valid interpretation of these types of earthworks: detection, preservation, verification, and dating.

Thanks to a long tradition of research into medieval rural settlements, we focus exclusively on previously discovered sites. For them, a specific method of ALS data elaboration and visualization has been adopted, which ensures the recognition and correct morphological classification of all earthworks indicating medieval land-use, including terraces, lynchets, and even ridge and furrow.

3 Areas of deserted medieval villages are not significantly overlaid by later human activity. Recent disturbances and forest management are thus the greatest threat – they cause significant erasure or destruction of large areas. Therefore, the preservation of field systems is very unbalanced – somewhere we see uniquely preserved field patterns, elsewhere only their fragments. An extensive ground-truthing campaign consisting of surface survey and historical maps analysis is implemented to eliminate a significant number of recent or false objects depicted in ALS outputs. Additionally, the presence of very indistinct/doubtful terraces has been tested using close-range photogrammetry (SfM), which allowed the creation of ‘enhanced 3D models’ of selected transects. Pollen, phytolith, and geochemical analyses confirm the previous cereal cultivation of these areas. Dating represents the most serious issue, but for most cases, the correlation of field patterns with medieval settlements is proven.

3 **CHARACTERISING TERRACE SYSTEMS: USING REMOTE SENSING DATA TO HELP UNDERSTAND THE ROLE OF TERRACES IN LANDSCAPE DEVELOPMENT**

**Abstract author(s):** Sevara, Christopher (Newcastle University) - Salazar Ortiz, Natalia (University of Lleida)

**Abstract format:** Oral

Terrace systems are striking manifestations of the choices people have made in the past as they confronted social and environmental issues and sought short- and long-term agricultural solutions to improve their own lives and/or those of their communities. However, due to a lack of sufficient understanding about the origins, construction, maintenance, and use of terrace systems the reasons for their development largely remain presumptive. A better understanding of terrace development and use is a key to understanding their role within the framework of wider landscape development, and the goal of the project Terraces as Sustainable Agricultural Environments (TerraSagE). TerraSagE focuses on improving knowledge about terraced landscapes through a combination of luminescence analysis, integrated geoarchaeological investigation, and landscape analysis and modelling. This paper concentrates on the contributions that over 80 years of remote sensing data, including historic aerial and spaceborne imagery, LiDAR and Synthetic Aperture Radar (SAR) data provide for understanding such events. This information forms the basis of TerraSagE’s Historic Landscape Characterisation (HLC), a geospatial dataset created from a variety of historic and modern information to document the historical transformation of the landscape. We present ongoing research in Catalonia, Spain, discussing how HLC approaches, geospatial analysis and modelling can be used to produce broad-scale narratives of terrace development, document and analyse the impact of modern mechanization on terraced environments, assess the impact of terracing on soil loss, and understand how terraces may contribute to ecosystem sustainability on local and regional levels. Together with data from detailed geoarchaeological and environmental analyses being carried out in other components of the project, this information will be used to better understand the origins and development of terraced landscapes as well as to inform development of sustainable strategies for management, monitoring and their future use.

4 **CHARACTERIZING AGRICULTURAL TERRACES - NEW QUANTITATIVE GEOMORPHOMETRIC APPROACHES TO ESTIMATE SOIL VOLUMES STORED**

**Abstract author(s):** Cucchiaro, Sara (Department of Agricultural, Food, Environmental and Animal Sciences, University of Udine; Department of Land, Environment, Agriculture and Forestry, University of Padova) - Paliaga, Guido (Research Institute for Geo-Hydrological Protection, National Research Council) - Pears, Ben (Department of Geography and Environmental Science, University of Southampton) - Walsh, Kevin (Department of Archaeology, University of York) - Zhao, Pengzhi - Van Oost, Kristof (Georges Lemaître Centre for Earth and Climate Research, Earth and Life Institute, UCLouvain) - Snape, Lisa - Lang, Andreas (Department of Geography and Geology, University of Salzburg) - Brown, Antony (Natural Sciences, Tromso University Museum, Arctic University of Tromsø; Department of Geography and Environmental Science, University of Southampton) - Tarolli, Paolo (Department of Land, Environment, Agriculture and Forestry, University of Padova)

**Abstract format:** Oral

Agricultural terraces are the most extensive and common landforms that humans have ever produced. Geomorphometric information can be exploited to study and ultimately assist in the future preservation of such landforms in a world increasingly affected by anthropogenic activities. High-resolution topographic (HRT) techniques allow the mapping and characterization of geomorphological features with wide-ranging perspectives at multiple scales through high-resolution Digital Terrain Models (DTMs). By using riser bases as well as terrace edges (riser tops) and through the computation of geomorphometric parameters as the minimum curvature, it is possible to obtain environmentally useful information on these agricultural systems such as terrace soil thickness and volumes. This work aims to realize and test an innovative and rapid methodological workflow to estimate the minimum anthropogenic reworked and moved soil of terrace systems in three different terrace sites in central Europe (Italy and Belgium). We start with remote terrace mapping at a large scale and then utilize more detailed HRT surveys to extract geomorphological features, from which the original theoretical slope-surface of terrace systems were derived. The utilization of ground-truthing through field excavation and sampling has confirmed the reliability of the methodology used. Differences between actual and theoretical terraces from DTM and excavation evidence have been used to estimate the minimum soil volumes and masses used to remould slopes. Moreover, geomorphometric analysis through indices such as sediment connectivity permitted also to quantify the volume of sediment transported downstream, with the associated and mobilized C, after a collapsed terrace. The quantification of terrace volumes can provide extremely useful standards for further multi-disciplinary analysis on the terrace sediments themselves, new benchmarks for soil erosion models, new perspectives for land and stakeholders for terrace management in terms of natural hazard and offer a measure of the effect of these agricultural systems on soil organic carbon (SOC) sequestration.

5 **NEW INSIGHTS INTO AGRICULTURAL TERRACE SYSTEMS. THE USE OF BIOLOGICAL MICRO-REMAINS FOR TERRACE USE**

**Abstract author(s):** Alonso-Eguiluz, Mónica (ERAAUB Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona) - Albert, Rosa María (ICREA; ERAAUB Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona) - Brown, Antony (Tromso University Museum, UiT The Arctic University of Norway; Geography and Environmental Science, University of Southampton)

**Abstract format:** Oral

Agricultural terraces are a significant modification of the landscape that provide sediments and nutrients on slopes. On the other hand, and in an archaeological context, they have a social and demographic impact. Biological micro-remains such as phytoliths have proven to be an excellent source of information for understanding agricultural processes, particularly when analyzed in combination with other biological micro-remains such as calcium oxalates (transformed into ash pseudomorphs after combustion), fecal spherulites, starches, diatoms, and sponge spicules. However, and despite the fact that these studies have been applied in a generalized way in urban contexts, and that terraces are a generalized phenomenon throughout the world, there are still few studies that have applied a microbiological multiproxy approach that allows us to understand the formation and uses of agricultural terraces. Here we present the first results of a combined study of phytoliths, ash pseudomorphs, and fecal spherulites applied to three agricultural terrace deposits from various locations in Europe (Italy, Belgium, and the United Kingdom). All of them correspond to different chronological periods ranging from Prehistory to the Middle Ages. The objective of this study is twofold, on the one hand, to evaluate the potential of the methodology for the understanding formation and post-depositional processes that may have affected the conservation of these remains, and, on the other hand, to shed new light on the crops used on the terraces under study. The results have shown differences for each one of the terraces, both in terms of preservation of the different micro-remains and plant identification. We will analyze these results to further understand the observed differences and their relationship with the formation of the deposits and the possible post-depositional processes that may have affected the preservation of the different micro-remains, and evaluate their feasibility from an archaeological perspective for the identification of crops.

6 **TEMPERATURE SENSITIVITY OF SOIL ORGANIC CARBON IN TERRACE SOILS**

**Abstract author(s):** Zhao, Pengzhi (Georges Lemaître Centre for Earth and Climate Research, Earth and Life Institute, Université catholique de Louvain) - Fallu, Daniel (Tromso University Museum, UiT The Arctic University of Norway) - Cucchiaro, Sara (Department of Agricultural, Food, Environmental and Animal Sciences, University of Udine; Department of Land, Environment, Agriculture and Forestry, University of Padova) - Tarolli, Paolo (Department of Land, Environment, Agriculture and Forestry, University of Padova) - Snape, Lisa - Lang, Andreas (Department of Geography and Geology, University of Salzburg) - Brown, Antony (Tromso University Museum, UiT The Arctic University of Norway; Geography and Environmental Science, University of Southampton) - Van Oost, Kristof (Georges Lemaître Centre for Earth and Climate Research, Earth and Life Institute, Université catholique de Louvain)

**Abstract format:** Oral

Being the most widespread man-made landform, terrace construction has resulted in an extensive perturbation of the land surface. This perturbation has induced changes in soil organic carbon (SOC) stocks, as well as the temperature sensitivity of SOC to decomposers (Q10) in terraced soils, but both are poorly constrained. Understanding the fundamental drivers and basic patterns of Q10 in terraced soils, however, is critical for predicting the future status of SOC stocks in the context of climate change. Here we explored the factors controlling Q10 of heterotrophic soil respiration of abandoned agricultural terrace soils, using soil fractionation and temperature sensitive incubation experiments in combination with measurements of terrace soil burial age and soil pedogenic oxides. Our preliminary results indicate that Q10 was closely related to the terrace soil age. In the relatively younger terraced soils, a decrease of Q10 with soil burial age was observed. This pattern is related to the fact that stronger SOC protection mechanisms, such as soil aggregation and organo-mineral interaction, limit the substrate availability, leading to a decrease in Q10 with soil burial age. However, in the relatively older terraced soils, an increase in Q10 was observed in the oldest soil horizons. On one hand, SOC becomes more chemically recalcitrant due to the preferential decomposition of more labile fractions (i.e., coarse particulate SOC), and this result in a low quality but high-temperature sensitivity of SOC stock in old buried soil horizons; but on the other hand, constraints of SOC protection mechanisms (through mineral associations) gradually weakens with soil aging. This may allow the previously chemically recalcitrant SOC to become accessible again to decomposers and increases sensitivity to warming. These results suggest that the buried SOC stock in the old terrace landscape could be more sensitive to climate change under the scenario of global warming.

7 **INVESTIGATING RURAL CHANGES: TERRACES AS ARCHAEOLOGICAL EVIDENCES AND HERITAGE MONUMENTS. CASE STUDIES FROM LIGURIAN APENNINES**

**Abstract author(s):** Stagno, Anna Maria - Panetta, Alessandro (University of Genova - Laboratory of Environmental Archaeology and History - DAFIST-DISTAV)

**Abstract format:** Oral

Starting on the results of a series of systematic archaeological surveys and excavation carried out in Western Ligurian Apennines by the Laboratory of Environmental Archaeology and History at the University of Genova, this paper proposes a reflection on the multiple dimensions of environmental resource management practices, interpreting them as actions (facts) characterized by the stratifica-

tion of social, juridical and technical practices. The research made it possible to analyse a high number of historical terraces dated at least since the 16th c.

From a methodological point of view, the aim of the paper is to discuss if it is possible to build chrono-typologies of terraces, detecting their chronologies from the different typologies of their dry-stones walls. From a theoretical point of view, the idea is that to keep together the different dimensions of the actions permits the implementation of new perspectives on the processes that bind social change with landscape transformation, focusing on the process of marginalisation of the European rural societies as a parallel process of the one of the heritagisation of their historical rural landscapes.

8 THE TERRACES OF KYTHERA: INTERDISCIPLINARY BIOGRAPHIES OF A 4000 YEAR-OLD MEDITERRANEAN LANDSCAPE

**Abstract author(s):** Trimmis, Konstantinos (University of Bristol) - Tzortzopoulou-Gregory, Lita - Paspalas, Stavros (Australian Archaeological Institute at Athens)

**Abstract format:** Oral

Terraced landscapes across the Mediterranean are well studied in their historical and geographical context and their functional role for agriculture and water management is well documented. In the context of the Greek islands, studies on the terraces have taken place, among other places, on the islands of Crete, Andros, Kephallonia, and Kythera. Most of these studies have focused on the geoarchaeology of the terraced landscapes and their role in local communities. In the context of the Australian Paliochora-Kythera Archaeological Survey (APKAS), a project that aims to record the prehistoric and historical landscapes of the northern part of the island of Kythera, a small study was undertaken with the aim to preliminary record the date using OSL dating, architecture, and the geoarchaeological development of the terraces in this part of the island. The results of this study point to a landscape almost 4000 years-old with the first terraces emerging at some point in the early centuries of the 3rd millennium. The terraces have been constructed with similar complex architectural elements and have been cultivated and maintained diachronically following similar patterns. This paper will present the research conducted on the terraces in northern Kythera and how they relate to terracing techniques across the Aegean, while putting forward some ideas for further research in the area.

9 MANAGING A MARGINAL LANDSCAPE IN BRONZE AGE CRETE: THE AGRICULTURAL TERRACES AND DAMS AT CHOIROMANDRES, ZAKROS

**Abstract author(s):** Vokotopoulos, Leonidas (“Minoan Roads” Research Project)

**Abstract format:** Oral

Recent investigations on the island of Crete, Greece, have documented the presence of agricultural terraces and dams dating from the first half of the second millennium BC – the heyday of Minoan civilisation. Most of these structures represent isolated finds, yet in a few exceptionally well-preserved cases a better understanding of their arrangement and extent has been possible, the whole picture substantiating an intensive exploitation of the hinterland and a pressing need to ensure the productivity of the marginal parts of the landscape.

One such site is Choiromandres, situated at the east end of the island. Surface survey and excavation have resulted in the detection of terraces, enclosures, dams and check-dams that cover a significant part of this small valley. Most of these structures were apparently constructed all at once – they represent, that is, a single large undertaking. Interestingly, this dates to the aftermath of the Bronze Age eruption of the volcano on the island of Thera – an event that had a profound impact on the palatial polities of Crete.

This paper will provide an overview of the land and water management project at Choiromandres, discussing its planning, function, and dating in respect to erosional and depositional events, with the aim of placing this undertaking in its wider historical context.

10 SITE TAPHONOMY IN MEDITERRANEAN TERRACED LANDSCAPES: THE CASE OF SITE RB228 (CERCHIARA DI CALABRIA, IT)

**Abstract author(s):** van Leusen, Martijn (Groningen Institute of Archaeology)

**Abstract format:** Oral

Human tillage has long been among the most powerful geomorphological forces affecting archaeological landscapes. As is demonstrated by the results of the intensive and systematic fieldwalking surveys conducted between 2000 and 2013 by the Groningen Institute of Archaeology in the Raganello watershed basin in northern Calabria (Italy), cultivation terraces and lynchets play an important role in preserving/obscuring archaeological remains in situ, but the concomitant plough erosion plays an equally significant role in destroying/uncovering such remains. The current paper focuses on archaeological sites that appear to be partially preserved beneath a terrace or lynchet, and partially damaged or destroyed in the field immediately downslope of it; in recent years we examined four such sites with test trenches and excavated one in order to understand how taphonomic processes result in the pottery scatters observed at the surface. We review the results of these investigations and discuss the implications for site preservation and the interpretation of geophysical survey data.

11 THE TERRACES OF CASTRONOVO AND THE CONSTRUCTION OF LANDSCAPE IN ISLAMIC SICILY

**Abstract author(s):** Molinari, Alessandra - Ciccone, Gabriele - Giovannini, Fabio (University of Rome Tor Vergata) - Fiorentino, Girolamo (University of Salento)

**Abstract format:** Oral

The research carried out in the town of Castronovo di Sicilia as part of the ERC SicTransit project (directed by M.O.H. Carver and Alessandra Molinari) has allowed us to study the system of irrigated terraces within the town through different types of sources. On the basis of various clues it is possible to hypothesize that the original design of the system, which up to the present day has guaranteed prosperity to this Sicilian community, was born in the Islamic age. In 2019 it was possible to carry out a stratigraphic excavation in a specific terrace and collect various information on its construction history. The overall study of the irrigated system through the drone made it also possible to hypothesize the main phases of its topographical development. The contribution will place this particular study in the more general transformations of the territory of Castronovo between the seventh and fourteenth centuries AD.

12 SOME THOUGHTS ON THE AGE AND ORIGIN OF AGRICULTURAL VALLEY TERRACES IN ETHIOPIA AND TUNISIA

**Abstract author(s):** Blond, Ninon (Université Lumière Lyon 2, Archéorient - UMR 5133; École Normale Supérieure de Lyon - ENSL, EVS - UMR 5600) - Benoist, Anne (CNRS, Archéorient - UMR 5133) - Callot, Yann (Université Lumière Lyon 2, Archéorient - UMR 5133) - Gajda, Iwona (CNRS, Orient & Méditerranée - UMR 8167) - Jacob-Rousseau, Nicolas (Université Lumière Lyon 2, Archéorient - UMR 5133) - Schiettecatte, Jérémie (CNRS, Orient & Méditerranée - UMR 8167)

**Abstract format:** Oral

Nowadays, many parts of the world are cultivated on terraces. These include Eastern Tigray (Ethiopia) and Southern Tunisia, where such terraces allow rain-fed agriculture without irrigation. The terraces of these two regions, however, have the particularity of being erected not on the slopes but in the valleys, which they cross perpendicularly to form flat cultivation areas and conserve water and soil on the plots.

In Eastern Tigray, pre-Aksumite, Aksumite and post-Aksumite archaeological remains have been unearthed on the high points overlooking the terraced valleys. The cultural exchanges between these populations and the Sabea populations of South Arabia, renowned for their hydro-agricultural works, are well documented today and lead to the hypothesis that terraces were ancient. Similarly, in Tunisia, the attested existence of hydro-agricultural developments from the Roman period in the region raises questions about the age and origin of the actually visible structures.

A methodology combining geoarchaeology, geohistory and ethnogeomorphology allows apprehending these issues and estimating the period of installation of water and soil protection structures in the two studied areas, in a comparative perspective.

Moreover, the contemporary evolution of these structures raises the question of their sustainability. In Eastern Tigray, agricultural terraces represent the main, if not the only means of subsistence for the populations. They are now subject to erosion. In Southern Tunisia, the recent rural exodus has exposed the structures to rapid evolution: destruction of low walls, loss of agricultural land by suffosion. Southern Tunisia thus allows a prospective reflection on the future of Tigray in the light of the ongoing rural exodus and questions the factors of regressive erosion in these two areas. More broadly, these two case studies can serve as analogues for reflection on other terraced areas, at different periods and in different regions.

13 ON THE TIMING OF AGRICULTURAL TERRACES: OPTICALLY STIMULATED LUMINESCENCE DATING APPLIED TO TERRACED LANDSCAPES IN THE UK, BELGIUM AND ITALY

**Abstract author(s):** Snape, Lisa - Lang, Andreas (Department of Geography and Geology, University of Salzburg) - Brown, Tony (Tromsø Museum, UiT; Palaeoenvironmental Laboratory, University of Southampton) - Fallu, Daniel (Tromsø Museum, UiT) - Pears, Ben (Palaeoenvironmental Laboratory, University of Southampton) - Walsh, Kevin (Department of Archaeology, University of York) - Cucchiario, Sarah (Department of Agricultural, Food, Environmental and Animal Sciences, University of Udine; Department of Land, Environment, Agriculture and Forestry, University of Padova) - Zhao, Pengzhi (Georges Lemaître Centre for Earth and Climate Research, Earth and Life Institute, UCLouvain)

**Abstract format:** Oral

Ancient terrace and lynchets are abundant across various environmental settings; commonly within mountainous, hilly zones, and other undulating landforms. Our understanding of their origins, timing of use and abandonment has been hampered by the lack of reliable dating evidence. This has made it difficult to draw comparisons across different time periods and understand landscape transformation in response to cultural transitions, climate and other environmental changes. The ERC project ‘TerrACE’ offers the opportunity to study terraces and lynchets systematically from different locations across Europe and to understand how different factors - topography, geology, soil types and agricultural practices - influence the mineralogical characteristics that are important for applying optically stimulated luminescence (OSL). Here we present the OSL dating results from three distinctly different terrace and lynchet systems in Italy, Belgium and the UK. OSL ages show that some terraces were established in Prehistory and were utilised over millennia into the Medieval period, whilst some terraces were used only over a very short period of time (a few hundred years or less). We suggest that OSL dating techniques can routinely be employed in the study of terrace landscapes in conjunction with

14

other geoarchaeological techniques. This paper will also discuss some of the remaining problems of OSL dating terraces and some possible solutions.

**ORIGINS AND HISTORIES OF (AGRICULTURAL) TERRACING AT PETRA, JORDAN**

**Abstract author(s):** Plekhov, Daniel - Rojas, Felipe (Brown University) - Newman, Sarah (University of Chicago) - Nicosia, Cristiano (Università di Padova)

**Abstract format:** Oral

Studies of agricultural terraces have long recognized their recurrent use or re-use through time, in some cases after centuries of abandonment and disuse. The capacity for these structures to be repaired, modified, and transformed underscores their enduring function as landesque capital, continuing to influence land-use practices well after their initial construction. Less acknowledged are the various kinds of landscape modifications that precede terrace construction, which nevertheless also have enduring effects on the landscape and may in fact influence where terraces are built. This paper presents the preliminary results of the Petra Terraces Archaeological Project, which in 2019 investigated a dense concentration of terraces in the hinterlands immediately north of Petra, Jordan. Although most of these walls were initially thought to have been built in the first centuries CE, the results of our radiocarbon and optically stimulated dating indicate that some may in fact date several thousand years earlier. Their use as terrace walls by local communities today, and perhaps at various points in the recent past, is thus only one of their functions of through time. PTAP’s findings caution us to be explicit about the time scales over which we evaluate the sustainability of terrace systems and also underscores the need for even greater time depth in studying their development and long-term history of use.

15

**ON NOT OVERLOOKING LOOKING CLOSELY: THE BENEFITS OF MACROSCOPIC ANALYSIS AND ATTRIBUTE-BASED TERRACE DOCUMENTATION**

**Abstract author(s):** Kvapil, Lynne (Butler University)

**Abstract format:** Oral

For many years, the study of agricultural terraces was hampered by doubts about dating dry stone architecture – doubts that were aggravated by archaeological approaches privileging the search for sites over elucidating the longue durée of the landscape. Off- and non-site approaches to archaeological exploration along with a bevy of technologies able to establish secure chronologies for terrace use and constructions have ushered in a renaissance of scholarship on agricultural terraces and a renewed focus on land use and farming. This paper, while acknowledging these advances, outlines the benefits of incorporating macroscopic analysis for the localized study and architectural documentation of terrace construction as a complement to the range of new techniques.

The methodology described here was developed and implemented for the study of agricultural terraces in the Korpos region in the Corinthia of southern Greece as part of the Saronic Harbors Archaeological Research Project (SHARP). Documentation consisted of multiple phases of macroscopic analysis and hand mapping that led to the assemblage of a suite of terrace attributes distinct to this region. Attributes were used to establish a relative sequence of terrace construction; but, perhaps more importantly, micro-histories of long-term land use centered on terraced farming were able to be determined on a slope-by-slope basis. The approach revealed that the relationship between successive terracing phases and the preservation of terrace walls in the landscape was often surprisingly complex. Past attempts at terrace removal, indications of reuse and rebuilding, and complicated architectural positioning – discovered through systematic documentation and repeated close observation – illustrate cycles of change and continuity in local approaches to the landscape, including the types of farming technologies used and the possible range of crops cultivated from the Bronze Age to the Modern period.

16

**OSL AND PROXY DATING OF LATER PREHISTORIC CULTIVATION TERRACES ON ARTHUR’S SEAT, CENTRAL EDINBURGH, SCOTLAND**

**Abstract author(s):** Srivastava, Aayush - Kinnaird, Tim (School of Earth & Environmental Sciences, University of St. Andrews) - Johnson, Melanie (CFA Archaeology Ltd) - Tipping, Richard - Wilson, Clare - Ferreira, Carla - Tisdall, Eileen - McCulloch, Robert (School of Biological & Environmental Sciences, University of Stirling) - Pickering, Rachel (Historic Environment Scotland, Edinburgh)

**Abstract format:** Oral

Arthur’s Seat, a prominent volcanic plug in central Edinburgh, supports the most extensive cultivation terraces in northern Britain. At least 20 terraces extend some 9.6ha, broadening downslope to widths of around 370m. Excavation of a few terraces in 2019 is the only modern-standard analysis. In support of this, OSL profiling, OSL dating, and portable XRF analyses were used to decipher the stratigraphy. Three OSL assays from basal sediment give pre-Holocene ages. The oldest dated Holocene sediment, in Trench 4 has an age of 1640 ± 490 BC, within the Bronze Age. These contexts appear to drape the remains of a stone bank. Other OSL assays, in Trench 4 and others, are much younger, of early to mid-Iron Age (650 ± 380 BC; 150 ± 250 BC), and broadly Medieval. It is difficult without further analysis to understand fully the chronology of soil/sediment formation from excavation, but this can be compared with securely 14C dated pollen and sedimentological analyses from Dunsapie Loch, at the base of the slope. At 1833-1242 BC there was the first major increase in eroded sediment, in a treeless, fully agrarian landscape. After 1111-928 BC, lithogenic elements, from bedrock, became far more abundant than more mobile, pedogenic elements, until 377-93 BC. One explanation for this imbalance is the preferential loss after c. 1000 BC of pedogenic elements in soils stored in cultivation terraces. Thus, two lines of

17

evidence make us suggest the Arthur’s Seat cultivation terraces began to be constructed in the Bronze Age. The social and organisational implications of such activity is exceptional in this period in this region.

**CONSTRUCTION OF MEDITERRANEAN TERRACES INTENSIFIED IN THE LATER MIDDLE AGES: EVIDENCE FROM LANDSCAPE ANALYSIS USING OSL-PD**

**Abstract author(s):** Turner, Sam (Newcastle University) - Kinnaird, Tim (University of St Andrews)

**Abstract format:** Oral

Dating the construction and use of earth features including terraces has been a long-standing problem for archaeologists. The history of agricultural terraces consequently remains poorly understood and this has impacted research on their significance more widely, limiting knowledge of past agricultural practices and the long-term landscape management strategies used by rural communities. In a series of five widely-separated case-studies from Turkey, Greece and Spain, optically-stimulated luminescence profiling and dating (OSL-PD) was applied to to date the construction and use sediments associated with agricultural terraces. Through GIS-based landscape characterisation the results were linked into the wider context in order to shed light on the evolution of these terraced landscapes more broadly. Results from across the Mediterranean show that the most intensive episodes of terrace construction took place during the later Middle Ages (c. AD 1100-1600); these major episodes of landscape reorganisation were rarely evident in other archaeological or historical sources. The five pilot studies have informed the methodology used in ongoing multi-proxy analyses for the TerraSAgE project.

18

**TERRACES AND LYNCHETS IN PYRENEAN PASTURES: METHODOLOGICAL APPROACHES AND SOCIAL CONTEXTS (BRONZE AGE TO THE PRESENT)**

**Abstract author(s):** Rendu, Christine (CNRS UMR 5136 Framespa) - Bal, Marie-Claude (CNRS UMR 5602 Géode) - Calastrenc, Carine (CNRS UMR 5136 Framespa) - Passarrius, Olivier (Pôle archéologique des Pyrénées-Orientales) - Bousquet, Delphine (UMR 5608 Traces) - Guerre, Josselyne (Inrap) - Lallemand, Véronique (Ministère de la Culture - SRA Occitanie) - Bille, Elisabeth (UMR 5136 Framespa) - Conesa, Marc (Université Montpellier 3 Laboratoire Crises) - Campmajo, Pierre (UMR 5608 Traces)

**Abstract format:** Oral

Ten years ago, the archaeological exploration of terraced systems on the Pyrenean slope of Enveig, between 1650 and 1950 m asl, gave rise to a debate on the cross-use of pedoanthracology, archaeological stratigraphy and radiocarbon dating of coals to understand the chronology and succession of the terraces. In the light of the results, a Bronze Age chronology was proposed for the first generation of terraces observed, and finally admitted. As charcoals in the soils can always be discussed in a chronostratigraphic point of view, we will first return to the main arguments that supported our reading of the profiles.

Other archaeological experiments were subsequently carried out in the same micro-region, using different methods. These fieldwork focused on: 1. the creation and transformation processes of the terraced landscape of a medieval village (Vilalta, 1700 m asl), which we sought to study before, during and after the existence of the settlement; 2. the spatial organisation of terraced plots built around medieval and modern seasonal barns (1800 - 2000 m asl), scattered in the communal heathland; 3. a set of small lynchets created by regular practices of land redistribution in a communal pasture at a lower altitude (1600 m asl).

The aim of this communication is, first, to compare these fieldworks from a methodological point of view (contributions of GPS mapping and mechanical trenches to the spatial understanding of the phenomena, use of radiocarbon measurements and sedimentary approaches). The social and environmental contexts and dynamics of these terraced systems, which oscillate between common land and private plots, will then be discussed, using, together with archaeological sources, written and ethnographic documentation. The final questions will focus on the different trajectories illustrated by these case studies, on what they say about the sustainability of these socio-environmental configurations, and on ways to improve this research.

19

**THE PLUZINA FIELD SYSTEMS – THE NEGLECTED MEDIEVAL LANDSCAPE PHENOMENON IN THE CZECH REPUBLIC**

**Abstract author(s):** Šitnerová, Ivana - Beneš, Jaromír - Majerovičová, Tereza - Bumerl, Jiří (Laboratory of Archaeobotany and Palaeoecology, Faculty of Science, University of South Bohemia, České Budějovice; Institute of Archaeology, Faculty of Arts, University of South Bohemia, České Budějovice) - Janečková, Kristina (Department of Land Use and Improvement, Faculty of Environmental Sciences, Czech University of Life Sciences, Praha)

**Abstract format:** Oral

The pluzina landscape in the Czech Republic is a very significant feature of former arable agriculture. These field systems were neglected by archaeologists for a long time despite their important role in making of landscape character. Today more attention is afforded them in connection with study of agrarian villages background due to new methods of remote sensing and environmental archaeology. The research project „Identification and protection of preserved remnants of the historical pluzina system“ supported by the Ministry of Culture Foundation of the Czech Republic is taking place from 2018 with duration to 2022. Aim of this project is to provide knowledge about important role of these past agrarian field remains and to provide a basis for qualified protection of the pluzina itself, which is missing in the Czech Republic. The specific goal of this project is to date particular chosen systems of pluzina field remains and to collect other data for detailed description and reconstruction of the past vegetation. With this data, researchers can describe the development of these field systems and their original function as arable fields and later as pastures.

20 We compare archaeological data (technological elements of agricultural terraces; ceramics in the past and present arable soils), environmental data (pollen, botanical macroremains, AMS 14C, isotopes of 210Pb and 137Cs) and historical dating (written sources) of pluzina archaeological remains. Five sites with the different pluzina field systems were chosen across the Czech Republic. This contribution is more focused on one of them to demonstrate the first completed result of this project.

21 **LIVING ON THE EDGE PATTERNS OF SETTLEMENT AND CULTIVATION IN THE INNER FJORDS OF SUNNMØRE, NW-NORWAY**

**Abstract author(s):** Dahle, Kristoffer (Møre & Romsdal County Council) - Fallu, Daniel (UiT The Arctic University of Norway)

**Abstract format:** Oral

In 2005 the Geiranger fjord entered the UNESCO World Heritage List, as a central part of the Western Norwegian Fjord landscape. It represents a marginal agrarian landscape, with small iconic farms situated on ledges and steep mountainsides along the fjord, and a contrast both to central agricultural areas along the coast and the hunting grounds further inland. Yet, our knowledge on the origin and development of these small agrarian farms is still quite limited, as modern development-led archaeology has not yet encroached into these sparsely populated areas.

In 2018 Møre & Romsdal County Council initiated a project to enhance our knowledge on the settlement and land-use in this area, based on archaeological and palynological investigations of lynchets and field tillage at the fjord farms. These investigations were viewed in relation to more central farm settlements, on the basis of written sources, grave-finds and development-led excavations and surveys, as well as to the numerous traces of hunting and trapping in the mountains beyond. This project was followed up by new investigations along the fjords in 2020, as part of the TerrACE-project. By widening the toolkit (e.g. pOSL, XRF, aDNA), what can these investigations tell us about former land use and management, continuity and change, and how this affected the soil properties in a long term perspective.

22 **ANTHROPOGENIC SOILS ON JÆREN - RESULTS FROM MICROMORPHOLOGY, XRF-ANALYSIS, AND RADIOCARBON DATING**

**Abstract author(s):** Lechterbeck, Jutta - Gebremariam, Kidane Fanta (Arkeologisk Museum, Universitetet i Stavanger)

**Abstract format:** Oral

In the course of development led excavations the Museum of Archaeology in Stavanger often encounters so called “cultivation layers” – most of them turned out to be actually anthropogenic soils or even fulfil the criteria for plaggen soils. Most of these soils are found on Jæren, which is an ancient cultural landscape, settled since the Mesolithic. Though many soil profiles have been sampled for pollen, botanical macroremains, micromorphology and radiocarbon dates very little research has been done on the soils themselves.

In the last years we were able to analyse profiles from the ancient farms Tjora and Hogstad, who shared a common infield. The anthropogenic soils of the infield are built up on the remnants of the original podzol. Micromorphological analyses revealed the actual anthropogenic character of the soils featuring microcharcoal, wood charcoal, fuel debris and heated or burnt mineral grains. Furthermore, all profiles featured a very high organic content. XRF analyses showed also very high values for phosphorous and carbon.

A survey of the excavation reports from the last 20 years showed that these soils are very widespread in Rogaland. These excavation reports provided a large dataset of radiocarbon dates (over one hundred) which were group calibrated. The large number of the dates outlevels to some extend the fact that older material is mixed into younger soils. The radiocarbon dates revealed that the practise leading to plaggen soils started in Rogaland at least in the pre-roman Iron Age, maybe as early as in the Bronze Age.

Additional analyses are currently under way such as analysis of organic components. Further research questions include quantitative element analysis, quantification of soils and climatic relevance as carbon sinks as well as the archaeological implications of this major land use shift which still coins the appearance of the landscape today.

23 **ANALYSIS OF LOESSIC ORIGINATED TERRACE AND LYNCHET SEDIMENT SYSTEMS IN CHALKLAND LANDSCAPES OF THE UK AND CENTRAL EUROPE**

**Abstract author(s):** Pears, Ben (University of Southampton) - Brown, Antony (Tromsø Museum, UiT; University of Southampton) - Roberts, Mark (University College London) - Lang, Andreas - Snape, Lisa (University of Salzburg) - Fallu, Dan (Tromsø Museum, UiT) - Walsh, Kevin (University of York)

**Abstract format:** Oral

Loess deposits cover large areas of central mainland Europe but are far rarer in the UK. In many cases windblown sediments have been mapped across chalkland landscapes and due to their particular textural characteristics have been intensively cultivated which has led to major colluviation and sediment storage within terrace and lynchet features. This paper presents geoarchaeological results from a substantial chalkland terrace system on the South Downs at Charlton Forest, Sussex identified by Lidar and archaeological excavation and compares it to a large lynchet and terrace system from Belgium.

Both sites demonstrate distinctive horizonated sediment stratigraphies dominated by loessic reworking alongside distinctive anthropogenic input and processional alteration through the cultivation practice over time.

Optically Stimulated Luminescence (OSL) dating of the Charlton Forest site has demonstrated in-situ loess dating to the Late Pleistocene and preserved beneath a Mesolithic burnt mound at the top of the hill, whereas in the terrace system itself repeated cycles of reworked loess and stony sediments have been accreted since the Early Bronze Age and the agricultural system appears to have been extensively exploited from the Romano-British to mid-7th century AD and probably until the development of beech (fagus) woodland in the medieval period.

Comparisons between Charlton and the Belgian site show similar thicknesses of in-situ loess at the hilltop location (30-50cm) with clear downslope variation within lynchets and terrace structures. Additional analysis of the valley bottom at Belgium also demonstrates the extent of colluviation over an extended period as a result of extensive, prolonged cultivation throughout the Holocene.

180 **PROTECTING ARCHAEOLOGICAL HERITAGE IN THE GLOBALISATION ERA: TRENDS, CHALLENGES, SOLUTIONS ILLICIT TRADE**

**Theme:** 4. Globalisation and archaeology

**Organisers:** Mödlinger, Marianne (University of Genoa) - Kairiss, Andris (Riga Technical University) - Bernard, Elisa (IMT School for Advanced Studies Lucca) - Olevska, Irina (ArtLaw.club)

**Format:** Regular session

The increase of trafficking in cultural goods through globalisation constitutes a fast-growing threat to the protection of cultural heritage and its role as an important resource of socio-economic development. Online trade and social media significantly ease the organisation of looting and selling of artifacts from conflict areas, Europe and other regions.

This raises questions concerning the effectiveness and accountability of the UNESCO 1970 and UNIDROIT 1995 Conventions and other international legal instruments. Bilateral accords (e.g. Met-Italy 2006 “Euphronios” Accord), Codes of Ethics and Conduct (e.g. AIAD/IADAA/CINOA/AIC/ICOM), best practices and guidelines underline a global, but toothless will of protection.

Nowadays, especially during the Covid-19 pandemic, museums are increasing Open Access policies: virtual tours, online databases and catalogues ease international fruition of cultural heritage. On the contrary, there are numerous private collections that remain unavailable to research and public.

IT sets out both opportunities for, and challenges to countering of looting and illicit trade. Searchable databases allow users to check the objects’ provenance and register lost/stolen properties (e.g. Carabinieri T.P.C.’s Leonardo, Art Loss Register), whilst projects that create repositories of artefacts currently in circulation aim at counteracting looting and illicit trade (e.g. Circulating Artefacts, Palmyra Portrait Project).

The (continuing) entry of artefacts with doubtful provenance in museums calls for a discussion about whether and how such artefacts should be published. Several institutions (e.g. AIA/DAI/IAA) provide indications. We aim to develop basic principles/guidelines for EAA members concerning the publication of illicit artefacts.

- Papers for this session may include but are not limited to:
- Impact of globalization on, and strategies against illicit trafficking in cultural material;
  - Changes and challenges in looting and illicit trafficking during Covid-19;
  - How to increase public accessibility to private collections;
  - (Inter)national (online) activities against looting and trafficking;
  - Ethics of publishing illicit antiquities;
  - Scientific value and narrative of looted objects.

**ABSTRACTS:**

1 **THE REPATRIATION OF ARCHAEOLOGICAL PROPERTY AND ITS DILEMMAS**

**Abstract author(s):** Bernard, Elisa (IMT School for Advanced Studies Lucca)

**Abstract format:** Oral

Since the late nineteenth century, the protection of Italy’s archaeological property has raised a number of dilemmas, including the tensions between cultural property nationalism and internationalism and the degree of museums’ decentralisation on the Italian territory (polycentrism versus “oligo-centrism”). In recent years, another dilemma has emerged that reflects the friction between the function that public powers should deliver in this field: protection and valorisation. This paper explores these dilemmas with a twofold aim. The first section reconstructs the main points of the debate that raged in Parliament and academia after the Unification of Italy over how to control the loss of archaeological objects: both State retention and context-based conservation were believed to foster universal culture. The second section uses the case of Morgantina’s Hellenistic Silver to investigate whether and how the pillage and later repatriation of Italian archaeological objects from foreign “universal museums” compromise the Italian narrative surrounding them and where and how they best serve the interests of protection and valorisation. It argues that museums can play a significant role and become reception contexts (also) for looted and repatriated archaeological objects when they leverage both those objects’ lost origin context and (illicit) provenance as well as the museum’s own meta-history.

2

THE ICOM RED LIST FOR SOUTHEAST EUROPE EXPERIENCE

**Abstract author(s):** Cosic, Natalija (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

**Abstract format:** Oral

The aim of this paper is to present working experience on the development of the Red List of Cultural Objects at Risk in South-Eastern Europe (SEE) that occurred during 2020 and 2021. The ICOM Red Lists of Cultural Objects at Risk became a worldwide initiative in order to illustrate the most vulnerable cultural assets and objects that are subjected to looting and trafficking. During its twenty years of existence, the Red List has covered the territory of different countries in Asia, Latin America, West Africa, as well as North Africa, and the Middle East. The initiative to create the ICOM Red List SEE is the first publication of its kind for the European countries.

The ICOM initiative for the Red List for SEE included the following countries: Albania, Bosnia and Herzegovina, Bulgaria, Montenegro, Croatia, Romania, Moldova, Northern Macedonia, Slovenia, and Serbia. The drafting phases were defined by the ICOM Red list general guidelines, but the decision on a methodology for determining and collecting information was left to each working group of the ICOM National Committees. Based on the participatory model and open consultations with professionals from museums, institutions of protection, and culture, the working group of the NC ICOM Serbia worked on developing a list of objects at risk of theft and illicit trade. During this process, the working group faced a number of challenges in researching and compiling the list of endangered cultural assets.

Although the Red List SEE will be finalized during 2021, the overall experience has brought many questions, but also some fruitful solutions and insights in this topic.

3

COMMUNAL AND NON-PUBLIC ARCHAEOLOGICAL COLLECTIONS OF LOWER AUSTRIA

**Abstract author(s):** Kerbler, Lukas (ARMET Archäologie & Archäometallurgie e.U.) - Pieler, Franz (State Collections of Lower Austria) - Maurer, Jakob (Danube University Krems)

**Abstract format:** Oral

Archaeology aims at understanding life of the past. As the material culture is the main source, it is vitally important to Archaeological heritage management, scientific research and for the engagement of the public with local history, to know as many sites and finds in a region as possible in order to get an idea of the context and the greater picture.

In Lower Austria, much of our archaeological heritage is not in the hands of state institutions, but in small communal or private collections. These rarely have their collections registered or published in any form, so we have no information on them.

To improve the situation, in 2013 the State Collections of Lower Austria and the Federal Monuments Authority of Austria started a cooperation project with the aim of establishing a systematic record of small communal and private collections.

Since private archaeological collections are as diverse as their individual owners are, the creation of comparable general metadata, using a standardised questionnaire, is vital. This includes basic information about the collection (e.g. contact data, owner/s, focus ...) and its archaeological quality (site allocation/documentation; inventory and storage situation). An important question is about plans for the collection´s long-term preservation. Of collections with uncertain prospects and those in private ownership, a standardised catalogue and photo documentary of the most relevant finds is beeing established.

The paper will present

a) The general background of the historical development of the role of small and non-public-collections in Lower Austria and of challenges one is confronted with when needing data from them e.g. for research projects.

b) The project started in 2013 upon this background.

c) An appraisal of how this project connects to the sessions keywords, esp. “accessibility”, “provenance”, “scientific value” and trade/trafficking.

4

OWNERSHIP OF ARCHAEOLOGICAL HERITAGE OBJECTS: ADVANTAGE OR ENCUMBRANCE?

**Abstract author(s):** Kairiss, Andris (Riga Technical University) - Olevska, Irina (ArtLaw.club)

**Abstract format:** Oral

Cultural-historical and, inter alia, archaeological sites provide opportunities to meet different needs and interests, such as aesthetic, symbolic, educational, research and others. No less important are the economic opportunities offered by the development of the potential of cultural heritage sites. Socio-economic interests and thus the opportunities provided by heritage sites, depending on the quality and significance thereof, affect many stakeholders - their owners (individuals, companies and other organizations, municipalities, state), local community, researchers, tourists, businesses, mass media, heritage institutions, etc., as well as society as a whole.

However, it is widely acknowledged that investment in cultural heritage sites (including conservation, restoration, maintenance, marketing, etc.) tends to outweigh their direct economic benefits (direct revenue). The financial and informational aspect of state aid is important, as ownership of an object with the status of a cultural monument not only increases socio-economic opportunities, but also imposes certain obligations and business activity restrictions. Thus, questions arise: does the immovable cultural object

represent opportunities or burden to its owner? What does the effective use of the cultural object owner’s opportunities depend on?

The presentation, analyzing the situation in Latvia and making international comparisons, uses the integration of socio-economic and legal approaches to the researched issue. It provides both theoretical and practical insight into the problems of cultural-historical (especially - archaeological) heritage objects development potential and possible solutions thereto. The presentation is based on the authors’ research made in 2020 -2021.

5

FROM BONE ROOMS TO INSTAGRAM FEED. TRAFFICKING AND RETURNING HUMAN REMAINS FROM THE 19TH CENTURY TO DATE

**Abstract author(s):** Crescenzi, Nicole (IMT School for Advanced Studies Lucca)

**Abstract format:** Oral

In 1862 the finding of a young Dakota man, maybe belonging to the Sioux tribe, was the kickoff that started the gathering of human skeletal remains with social, cultural, and intellectual purposes.

Museums began a real competition, in order to achieve the largest and best-stocked “bone room”, in which human remains were kept and exhibited in an effort to understand races’ hierarchy, to show comparative anatomy, and also to safeguard a culture that was going to disappear (Native Americans). As an answer to the strong request of museums for human remains a looting process started, with collectors, professionals and amateurs, and scholars digging cemeteries to send the collected bones to museums or to exhibit them in their collections. At the same time exchanges of bones were undertaken with foreign museums, in Europe (where something similar was taking place with colonized countries) and in Asia (Redman 2016).

As a consequence of the looting and exhibiting their ancestor remains, in 1970s indigenous people began to make requests for the restitution of their sacred objects and of human remains, thus opening a debate that has not yet ended. The outcome of these requests was a long process of restitution, of new laws (NAGPRA 1990), and of what is known as “collaborative museology” (Pinna 2011).

But the story of trafficking human remains is not yet over. Nowadays it is even possible to purchase human remains online, through Instagram, Facebook, Etsy, and other very much used platforms. “The ‘fetishization’ of the ‘exotic’ dead that underpins this trade by its very nature transforms pieces of the body into material culture: curios, commodities or objets d’art” (The Bonetrade Project).

The present study will give an overview of this long process and of its main key-points, showing how the discussion is still very far from its conclusion.

6

TO BUY, OR NOT TO BUY... AN EXPERIMENTAL SURVEY ON SOCIAL MEDIA TO BETTER UNDERSTAND THE MARKET FOR CONFLICT ANTIQUITIES

**Abstract author(s):** De Bernardin, Michela (Ca’ Foscari University of Venice; The Journal of Cultural Heritage Crime) - Giovannelli, Riccardo (Ca’ Foscari University of Venice)

**Abstract format:** Oral

In the last few years, we have witnessed terrible losses concerning cultural heritage in the Middle East. Many archaeological sites in Iraq, Syria, and North Africa were heavily affected by extensive looting and destruction. So far, most of the research on cultural heritage “in conflict” has focused on the international legislation related to war damaging, import/export and restitution policies, and art market regulations. These are relevant issues, as well as customs enforcement and investigations on art dealers or auction houses. However, besides such law-concerned measures, in-depth knowledge of the market - from both the sellers’ and the buyers’ point of view - is necessary to decrease the flow of illegal goods drastically. Apart from ICOM’s and UNESCO’s efforts to raise awareness of heritage in danger, accurate analysis of general buyers has not yet been undertaken. People buy antiquities for several reasons, but mostly as a symbol of power and prestige. So, what about conflict antiquities? How is this kind of artefacts generally perceived? Are they recognized as illicit trade? Our research aims to answer these questions by looking at the psychology underlying the collecting of antiquities. We plan to develop a focused anonymous survey to be launched online on a range of social media accounts, notably those of the specialized journal “The Journal of Cultural Heritage Crime” (www.journalchc.com). We thus envisage being able to identify different buyers’ “profiles” and offering the EAA Conference attendants an experimental study on this pivotal matter. Our ultimate purpose is to allow academics and institutions to strategically disseminate knowledge about looting and heritage in danger by addressing specific target-audiences as potential buyers.

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Grimm, Oliver (Centre for Baltic and Scandinavian Archaeology - ZBSA) - Kashina, Ekaterina (State Historical Museum, Moscow) - Kirkinen, Tuija (University of Helsinki) - Piličiauskienė, Giedrė (University of Vilnius) - O'Regan, Hannah (University of Nottingham)

**Format:** Regular session

Human relations to wild animals have gone through multiple transformations in Northern Europe (understood in wide geographic terms). From the Bronze Age onwards, wild animals played only a minor, if any, role for human subsistence. How did this influence the perception of wild animals? And if not for food, for what reasons were they hunted? Are there any patterns in the bones of wild animals found in settlements, burials or offering sites? Did farmers (peasants) hunt differently to the upper classes, and were there other populations to whom the hunt remained important in a mixed economy? Is there a meaning in the low representation or absence of significant species? What kinds of wild animals had a prominent place in human life and religion?

The session is open to different kinds of contributions: diachronic or related to certain periods, in a regional or wider sense, archaeological or interdisciplinary (including modern insights into practical hunting). Recent challenges may be worth considering, too, such as the return of wolves or the co-existence of, for example, bears and humans.

ABSTRACTS:

- 1

**ON THE SCARCITY OF WOLF REMAINS IN THE ROMAN AND MIGRATION PERIODS NORTHERN GERMANY. INSIGHTS FROM BIOMETRICS**

**Abstract author(s):** Patalan, Krzysztof (LVR-Archaeological Park Xanten)

**Abstract format:** Oral

According to common conception it is assumed that wolves kept their distance from human settlements. Premises for that claim are grounded in the ethology of the wolf who sees humans as a potential danger and in the active persecution of wolves documented since the early historic period. The active persecution of wolves led also to the rise of dog breeds specialized in protection against and for the hunting of wolves, such as the Irish Wolfhound. Taking into consideration the similar size of such dog breeds and wolves as well as the close genetic relationship of both subspecies, the question arises: is it possible that some wolves were overlooked in the previously studied osteological material?

In the presentation I will provide an overview of the common cranial morphometric techniques that have been proposed to distinguish between wolves and dogs. I will discuss them in the context of a case study of the settlement Feddersen Wierde in order to evaluate the possibility of hybridization between wolves and dogs. The potential implications of this phenomenon on the trifold relation human – wolf – dog will be elucidated. In conclusion I will provide a brief overview of possible future avenues for study of this topic such as the incorporation of geometric morphometrics with genetic and isotope analyses.

**HUNTING DOGS AND HUNTING WITH DOGS IN THE GRAND DUCHY OF LITHUANIA DURING THE 13TH TO 17TH CENTURIES**

**Abstract author(s):** Piliciauskiene, Giedre - Blaževičius, Povilas - Skipitytė, Raminta - Micelicaitė, Viktorija - Zarankaitė Margienė, Toma (Vilnius University, Department of Archaeology)

**Abstract format:** Oral

According to historical records and iconography, hunting dogs were animals of extraordinary importance in the life of the elite in the Grand Duchy of Lithuania. Written sources report that in the 14th c. Grand Dukes of Lithuania were still cremated together with birds of prey, horses and dozens of dogs. Hundreds of dogs were kept in the kennels of the Grand Dukes' in the Late Middle Ages. Statutes of Lithuania in the 16th c. mention 15 dog "breeds", their functions and also prices of these animals: the main purpose of the elite dogs was hunting.

An impressive collection of dog remains was collected during the intense archaeological excavation of the Vilnius Lower Castle complex, Lithuania. During the 13th-17th centuries, it was the royal residency of the Grand Duchy of Lithuania. Among 100 000 animal bones, remains of a minimum of 63 dogs (NISP 654) were collected and analysed. At least five gracile individuals of 70-80 cm height were morphologically very close to the modern greyhound type dogs. A few robust individuals were very similar to Molossian-type dogs that are found in iconographical sources depicting medieval and Early Modern Period hunting. Carbon and nitrogen stable isotopic analysis of 40 individuals were performed in order to determine the diet of different types of dogs. The aim of this presentation is to discuss elite hunting practices, morphology, types, the health status and diet of the 13th-17th c. dogs from Vilnius Lower Castle according to the zooarchaeological, historical and stable isotopic data.

- 3

**RARE BUT IMPORTANT: WILD BIRDS IN LITHUANIA DURING THE 13TH-17TH C. ACCORDING TO ZOOARCHAEOLOGICAL AND HISTORICAL DATA**

**Abstract author(s):** Zagurskyte, Aurelija (Vilnius University Department of Archaeology) - Rumbutis, Saulius (Kaunas Tadas Ivanauskas Museum of Zoology) - Blaževičius, Povilas (National Museum of Lithuania) - Piličiauskienė, Giedrė (Vilnius University Department of Archaeology)

**Abstract format:** Oral

In general, bird bones contain a small part of Medieval – Early Modern period zooarchaeological material in Lithuania, usually up to 1-3 % of all faunal bones. Moreover, these are mostly domesticated bird remains while wild birds are exceptionally rare. Exclusive archaeological sites where wild birds are more abundant are castles and palaces, i.e. residences of elite. Kernavė (East Lithuania) medieval trade and political center is represented by 14 bird species. Furthermore, at least 27 species of birds were identified at Vilnius Lower castle (East Lithuania) - residency of the Grand Dukes of Lithuania. At least five species of the birds of prey were found in both royal sites and some of these birds were directly linked to falconry. Falconry in general was an important part of elite life and birds of prey were a luxury item and a gift. Also, birds were frequent companions to the afterlife until the Christianisation of Lithuania in the late 14th c. Written sources report that in the 14th c. Grand Dukes of Lithuania were cremated together with dozens of birds of prey, horses and also dogs.

Despite the fact that meat of the game birds made up a very little part of the nobles’ meat menu, wild birds were an important part of Medieval - Early Modern Period elite cuisine. Various species of wild birds were hunted to be served on the daily and festal table of the king and other nobles. In this presentation we'll provide zooarchaeological and historical data about the falconry and consumption of wild birds in Lithuanian during the 13th-17th c.
- 4

**OF BEARS AND HUMANS. THE VISIBILITY OF ANIMAL AGENCY IN ARCHAEOLOGY**

**Abstract author(s):** Kipke, Natascha (Kiel University; Institute of Pre- and Protohistoric Archaeology)

**Abstract format:** Oral

The Human-Animal Studies emerged as an interdisciplinary research discipline to investigate the relationships and interactions between humans and animals. The basis is to see the animal as an influential player within human worlds with its own agency. Currently the role of archaeology within this new research field is barely noted. In order to examine the value of archaeology for the Human-Animal Studies and to get a closer look into the nature of the human-bear relationship from different points of view, a change of perspective shall be attempted. The bear as one of the greatest mammals in Northern Europe acted in manifold ways and affected human cultural and social worlds. Depictions and illustrations of bears are spread over the Scandinavian countries and show in combination with other bear-related archaeological finds a picture of a relation that is still in progress and embedded in multispecies systems. While using ethnological and archaeological theories and methods complementary to investigate the human-bear relation from Mesolithic times until the Viking Age with an emphasis on the younger periods, it is important to keep in mind that Animal Agency can only be detected where the lives of humans and animals have intersected and were visibly manifested.
- 5

**BEARS, BEARSKINS, BEAR-WARMTH AND BEAR-NESS IN THE VIKING AGE: INTERSECTIONS BETWEEN ARCHAEOLOGY, SAGAS AND FOLKLORE**

**Abstract author(s):** Evans Tang, Harriet - Milek, Karen (Durham University)

**Abstract format:** Oral

Relationships between humans and bears are well attested in the archaeological record of Viking-age northern Europe. Viewed as a whole, the physical evidence for the hunting of brown bear, long-distance trade in bear pelts, the use of bearskins (sometimes with claws attached) in burials, and bear sacrifice – including bear graves in the Saami lands of northern Scandinavia – are testaments to the importance of this species to pre-Viking-age and Viking-age economies and beliefs. But our understanding of the complex roles of bears in Viking-age mentalities is vastly expanded by the poetry and prose written down in a country that has never actually been inhabited by bears: Iceland. Although penned in the thirteenth and fourteenth centuries CE by an agro-pastoral society that hunted only modest numbers of Arctic fox, birds, marine mammals and fish, the Icelandic sagas carry a cultural memory of bears and human-bear relations that is likely to stretch back centuries. In these stories, bears appear as adversaries against which heroes test themselves, polar bears are prestigious gifts for foreign kings, and both kinds of bear appear in dream sequences in which they are the supernatural double, or ‘fetch’ (ON fylgja), of living people. Alongside the dominant association of bears with warriors and hunters is another cultural memory that has so far been overlooked: the warmth imparted by bearskins, and the so-called bear-warmth (ON bjarnylr) attributed to people who do not feel the cold. This paper pulls together both archaeological and textual sources to explore the multi-faceted relationship between bears, their skins, and humans in Viking-age and Medieval societies in Scandinavia and the North Atlantic region, and considers the wide range of bear-like qualities that might have been valued and deliberately appropriated through contact with bearskin.

6

DIACHRONIC AND MULTIDISCIPLINARY APPROACH TO UNDERSTAND TRANSFORMATIONS OF HUMAN-BEAR-RELATION IN NORTHERN GERMANY –AN EXAMPLE FOR HUMAN-ANIMAL STUDIES AT THE ZBSA

**Abstract author(s):** Schmölcke, Ulrich (Zentrum für Baltische und Skandinavische Archäologie - ZBSA)

**Abstract format:** Oral

One species group is particularly suitable for studies of relationships between humans and wild animals that go beyond the profane and trivial: large carnivores. Due to their versatile behavioural repertoire and their potential danger, they naturally attracted the attention and interest of humans. In northern Europe this is particularly true for brown bear. By combining ecology, distribution history, settlement and burial archaeology, written sources etc., it is possible to create a continuous scenario covering the entire Holocene, which uncovers several transformations of the reception of the species.

In northern Germany, model region for this presentation, brown bears were distributed from 15,000 years ago and disappeared from west to east over a period spanning several thousand years; the last individuals were killed in the 18th century. It is evident that the meaning and relevance of this animal changed several times in this region. In the Stone Age, bone assemblages indicate no human interest in bear hunting-reasons for this could be spiritual or profane. But during Iron Age and medieval times (the main chronological focus of the presentation), bears for a start began to play a role in human funeral practices, and in the first centuries AD, bear claws were quite regularly used in burial contexts. The new role had not only a cultural, spiritual or religious level, but also an ecological dimension: the demand for bear products must have caused an increased pressure on hunting. In medieval times at the latest, bears occurred only east of the Elbe. There bears were still a constant hunting prey, but a spiritual connotation is not archaeologically visible. Later, the growing human population density, large-scale habitat loss, massive direct persecution (after Christianization bears became deuced) and finally, the capture of bears for public entertainment, led to an extirpation of the last populations.

7

WHO GETS BURIED WITH A BEAR? AN EXAMINATION OF WILD ANIMALS IN THE EARLY MEDIEVAL CREMATION CEMETERIES OF EASTERN ENGLAND

**Abstract author(s):** O'Regan, Hannah (University of Nottingham) - Squires, Kirsty (Staffordshire University)

**Abstract format:** Oral

In early medieval England (5th – 7th centuries AD), cremation was one of the dominant mortuary rites. Cremation cemeteries span a large region in eastern England from the East Riding of Yorkshire through to East Anglia. One of the most distinctive practices amongst cremation practicing groups was the provision of both domesticated and wild animal offerings at the funeral. Bear phalanges are found in a number of cremation burials in early medieval cemeteries in England. To date, of the cremation assemblages analysed, bear remains have been found at four sites; namely, Sancton, Elsham, Cleatham and Spong Hill. In this talk we examine the role of bear remains in the cremation rite. The association between the bear bones and the age and sex of the deceased, as well as relationships with pyre- and grave-goods will be explored on a site and inter-site level. We also examine the other wild animals that have been identified from cremation burials, such as fox and osprey, and discuss why these species were selected. Finally, we consider the origin of this burial rite, and the sources of the animals. Bears were probably extinct in England at this time, so this raises the question as to where the bones and/or pelts were being obtained from, and what this can tell us about identity and affiliation. This presentation aims to further our understanding of the provision of wild animals, particularly bears, in early medieval cremation burials.

8

BEAR CLAW FINDS IN 6TH CENTURY SAMBIAN WEAPON GRAVES AS INDICATION OF THE GERMANIC WARRIOR CULTS

**Abstract author(s):** Prassolow, Jaroslaw Aleksei (Centre for Baltic and Scandinavian Archaeology - ZBSA; Institute of Archaeology of Russian Academy of Sciences - IA RAN) - Skvortsov, Konstantin - Dobrovol'skaja, Maria - Kleshchenko, Ekaterina (Institute of Archaeology of Russian Academy of Sciences - IA RAN)

**Abstract format:** Oral

This report is devoted to the study of interregional cultural relations of the Sambian-Natangian culture on the Kaliningrad (formerly Sambian) peninsula in the south of the Baltic Sea basin. The end of the 5th century was marked by a disappearance of weapons from the male burials of the inhabitants of Sambia, Aestii, in spite of their presence in the majority of the earlier male graves. At the beginning of the late phase of the Great Migration period (early 6th century), a transition from military democracy to stratified society took place in the societies of Western Balts, and armed retinue and unarmed farming classes emerge. In the light of this hypothesis, analysis of male (warrior) burials with weapons, which reflect the higher social status of the buried person, is of special importance. The results demonstrate the influence of the European warrior culture, which was characterized by the presence of cultural elements of both nomadic and Germanic origin. In this context, two recently discovered 6th century burials with weapons and horses are of particular interest: burial X22 of the Aleyka-7 burial ground and burial 25 at the Mitino burial ground. In spite of the differences in the richness of their grave inventories, which allow them to be interpreted as a so-called “chief” burial and that of a retinue warrior; both graves contain objects typical of the Germanic cultural circle. Especially interesting are the first documented finds in Sambia of burned bear claws in the cremations, which are interpreted as elements of clothing (fur cloaks), which probably had a cult character. Use of bearskins was practiced by the elite of Germanic warriors throughout the Early Middle Ages, as is recorded in a number of sources. These finds most probably demonstrate the influence of Germanic traditions on the upper strata of the Aestii society.

9

THE SNAKE AND THE DUCK OF THE BELARUSIAN LAKE LAND

**Abstract author(s):** Charnianski, Maxim (Department of the prehistory archaeology, Institute of history, NAS of Belarus)

**Abstract format:** Oral

The settlements of the Kryvina peat bog (Northern Belarus) from the Late Neolithic and Early Bronze Age provide us with a large amount of material evidence that is connected with the beliefs of the population of the region. Among them, special attention is drawn to sculptural images of ducks (bone and clay) and snakes (bone), found in the Northernbelarusian culture (mid-3rd – mid-2nd millennium BC). In the previous, genetically related, Usviaty culture of the Middle Neolithic (end of 4th – 1st half of the 3rd millennium BC), these creatures were also present, but only as ceramic vessel decoration. Interestingly, images of ducks and snakes in this area continue to occur later on, for example, pendant-ducks (8–11 centuries AD) and bronze bracelets with zoomorphic ends in the form of stylized snake heads (10–13 centuries AD) from the territory of the Kryvichy population, ceramic whistles in the shape of a duck dated 12–13 centuries AD from Polack city. Legends about the King Snake (Grass snake), as well as the custom of feeding grass snakes near the houses were recorded in ethnographic materials in the 19th and beginning of the 20th centuries. All this may indicate the birth in the Late Neolithic/ Early Bronze Age of a powerful ideological impulse associated with these two creatures, the echoes of which reached even modern times.

10

FROM A DRAGON TO A HARE – SELECTION OF ANIMALS FOR SYMBOLIC PURPOSES DURING THE LATE IRON AGE IN ESTONIA

**Abstract author(s):** Jonuks, Tõnno (Estonian Literary Museum; Tallinn University)

**Abstract format:** Oral

The Late Iron Age (ca 800-1250 AD) witnessed a situation, where a large variety of animals, or references to animals were used for symbolic purposes. This corpus of material includes animal teeth and bones, as well as animal figurines used for pendants and decorations. Animal images were also combined with other objects, enlarging the subject of animal representation. In this lecture I will give an overview of animal representation in Estonia, discussing the animal species that are portrayed, their semantic details and contextual distribution. Among the animal species we can identify a variety of predatory animals and birds, mythological beasts, but also more “peaceful” examples like the hare and chicken. At the same time major economic species, like sheep, cattle, or horse, are used less for symbolic purposes, or not at all. This study will analyse the ideology, religion and moral values of the human culture expressed by animal symbolism in the Late Iron Age Estonia.

192

LANDSCAPES AND THE AUGUSTAN REVOLUTION: EXPLORING THE TRANSFORMATION OF THE WESTERN PROVINCES BETWEEN THE REPUBLIC AND THE EARLY EMPIRE

**Theme:** 4. Globalisation and archaeology

**Organisers:** Espana-Chamorro, Sergio (Institut Ausonius - UMR 5607, Bordeaux) - Moreno Escobar, María del Carmen (Durham University)

**Format:** Regular session

The Western provinces of the Roman Empire experienced different processes and temporalities of Roman conquest that created diverging ways of understanding these provincial landscapes. In particular, the hodological vision of the republican period has generated perceptions of provincial spaces from the Romano-centric point of view which have defined how the provinces of Sardinia, Sicilia, Gallia, Hispania and Africa are understood. During the Imperialism development, the emergence of new requirements and aims motivated a complete renovation of Roman domains at the end of the Republic started (but not completed) by Caesar. These transformations have been analysed from the perspective of epigraphy, literature, history, and material culture, but has left out the agency of local communities and their impact on the provincial landscapes they inhabited and lived in. In this sense, the potential contributions of landscape archaeology are clear, due to its capacity to identify, analyse and understand changes and continuities on these provincial landscapes, which were intimately linked to the processes of social and political change occurring in the Empire.

This session will focus on the contributions that both landscape studies and landscape archaeology have on the understanding of wider processes developing in the western provinces of the Roman Empire, aiming at generating new insights into how these developed (e.g. their differences and similarities). As such, we welcome submissions exploring the transitions to the Empire in the provincial landscapes of the western Roman Empire (Hispania, Italia, Gallia, North Africa) from both theoretical (e.g. the transformation from hodological point of view to the cartographical vision) and practical perspectives (e.g. settlement patterns, mobility and communication, spatial analysis, remote sensing and GIS).

### EUROPA ASIA AFRICA IN LATIN LITERATURE FROM THE REPUBLICAN TO THE AUGUSTAN AGE

**Abstract author(s):** Paladini, Mariantonietta (Università di Napoli)

**Abstract format:** Oral

‘Europe’, ‘Asia’ and ‘Africa’ are words very common and frequent in our languages, due to the general knowledge that Earth is divided into (five) continents. In ancient times, and especially in the Roman and Latin world, the situation was very different. Even if the Oikoumene’s division in three parts is a concept that emerged very early in Western culture within Greek scientific works, the Roman world did not react to it in the way we could expect: Roman geography became an independent discipline with Pomponius Mela, who wrote a book entirely devoted to this subject, which he divided into three parts describing each of these geographical regions. However, how this situation was before him remains unclear, since there aren’t many sources that could help us define it. An important question in this regard is: What was the attitude of Roman poets, orators, and historians in the Republican times and even in the Augustan Age? This contribution will address this topic by discussing the recognition of the words ‘Europe’, ‘Asia’ and ‘Africa’, their presence in texts (e.g. in sequence or not), and the existence of the variation ‘Libya’, as terms that were used by non-geographer writers during the Republican and Augustan times.

### AUGUSTUS AND THE TRANSFORMATION OF THE ROMAN ROAD NETWORK IN THE WESTERN PROVINCES (GAUL, HISPANIA AND AFRICA). AN EPIGRAPHICAL PERSPECTIVE

**Abstract author(s):** Espana-Chamorro, Sergio (Universidad Complutense de Madrid; Institut Ausonius - UMR 5607, Bordeaux)

**Abstract format:** Oral

Roman road policy has been considered as one of the best strategies for opening and developing conquered territories. Roman transport was a fundamental tool for the consolidation of the newly annexed spaces and for the dissemination of the territorial administration and the Roman lifestyle. It was also one of the best ways to incorporate these spaces into the economic coherence of the Roman Empire. Another aspect to consider in terms of the Roman road policy is the crucial role that the development of infrastructures had for extending the real political aegis of Rome to regional and local levels through the introduction of the Roman provincial administration.

A specific aspect of Roman roads was the use of milestones. During the Republic, milestones were erected mainly in Italy and only few evidence have been found in the provinces (Eastern Hispania, Southern Gaul and Greece). Augustus was the first ruler who promoted an expansion of this landmark in the new reorganised Empire. From the Augustan age the use of milestones started in some regions as North Lusitania, Baetica or Africa. This paper will provide the transformations of Roman roads in the age of Augustus by analysing mainly epigraphic evidence. A comparison between Gaul, Hispania and Africa will provide a new vision in the panorama of Roman roads.
- 3

### ROADS AND LANDSCAPE TRANSFORMATION IN SOUTH-EASTERN HISPANIA: A CASE STUDY

**Abstract author(s):** Lopez Garcia, Antonio (University of Helsinki)

**Abstract format:** Oral

Between the end of the Roman Republic and the beginnings of the imperial era, the administrative boundaries of the Hispanic provinces changed significantly. The re-adjustment of the blurred liminal area between Hispania Baetica and Hispania Tarraconensis in the south-eastern sector left some inconclusive footprints on the archaeological record. Decades of investigation have revealed the prominence of the trade routes that linked the resources of the Baetica with the eastern Mediterranean coast. Acci, a minor Iberian settlement at the foothills of the Mons Solorius —the current Sierra Nevada— became in Augustan times the dominant node that interconnected the mines of Castulo and the Baetis basin in the western with the seaport of Carthago Nova in the southern Tarraconensis. Other significant roads converged in Acci, connecting the colony with the southern coast and with the municipium of Florentia Iliberritana. The landscape transformation caused by the Romans in this area is visible through the lens of archaeology. In this presentation, I analyze the historical development and the environmental adaptation of the area.

### THE IBAÑETA/RONCESVALLES PASS AND ITS TERRITORY: AN EXAMPLE OF LANDSCAPE ORGANISATION IN THE EARLY EMPIRE PERIOD IN THE WESTERN PYRENEES

**Abstract author(s):** Mendizabal Sandonís, Oihane (UPV/EHU, Department of Classic Studies; Aranzadi Science Society)

**Abstract format:** Oral

The territory of the Ibañeta-Roncesvalles pass (nowadays in Navarre, on the border between Spain and France) was one of the last regions starting the Romanisation in the all Pyrenean mountain range. According to the data currently available, these processes should be dated to the Augustan period, linked to the development of the Imperialism. It was quickly integrated into the dynamics and the administrative and economic organisation of the empire, due to its privileged strategic position and the abundance of raw materials in the area.

All this territory was articulated around the iter XXXVIII, which linked the northwest province of Hispania Citerior with Aquitania in Gaul. Stable urban settlements were created around the route of the road, in the north side of the Pyrenees. There, we know the

### PARAMETRISING THE ROMAN ARMY’S BEHAVIOUR IN NORTHERN IBERIA: THE EXPEDITIO PROJECT

**Abstract author(s):** Costa-García, José (Universidade de Santiago de Compostela)

**Abstract format:** Oral

Over the centuries, the Roman Empire expanded across Europe, spurring dramatic political, social, economic and cultural changes and forever transforming the diverse landscapes it encountered. In the last decade, the appearance of new conceptual and technical tools (GIS, remote sensing, UAVs) has led to gathering an enormous amount of archaeological data that can be related to the Roman army’s activities in Iberia. The situation in the northernmost territories -the last to be conquered between 138 BC and 19 BC- has been particularly thriving.

Within the Expeditio project (funded by The Galician Autonomous Government, Spain), a considerable effort has been made to systematise and catalogue the archaeological information related to the Roman army in northern Iberia. This action aims to make it easier to parametrise variables and behaviours reflecting different military actions and operations by using morphological, locational and mobility analyses.

So far, archaeological data points to diversity. It is possible to document scenarios of fossilised violence (sieges, assaults, battles), while the primary concern in other areas seems to have been to keep logistical supply routes active. Similarly, some activity clusters appear to respond to warfare episodes that involved the deployment of large armies. The distribution of several posts occupying key geographic positions across the territory could be better understood in terms of occupation and control logic. By reconstructing these lost scenarios, aspire to recreate the sequence of events that will support innovative perspectives and archaeological narratives on the asymmetric interaction between the Late Iron age indigenous peoples and external imperial power in this area.
- 6

### TIMES OF CHANGE: THE TRANSFORMATION OF SETTLEMENT LANDSCAPES IN EASTERN GAUL DURING THE AUGUSTAN PERIOD

**Abstract author(s):** Fernández-Götz, Manuel (University of Edinburgh, School of History, Classics and Archaeology)

**Abstract format:** Oral

In many parts of eastern Gaul, the main changes in settlement patterns and lifestyles did not take place during or immediately after the Caesarian conquest, but rather in the Augustan period. This paper will focus particularly on the civitas of the Treveri. In this area, a fundamental change occurred towards the end of the 1st century BC and the beginning of the 1st century AD. Most Late Iron Age oppida were abandoned or suffered a drastic decline, whereas new centres of power such as the Roman capital of the civitas, Augusta Treverorum, were founded. However, some of the old centres retained a role as religious centres, despite the decline in population and economic activities. The transformations can also be observed in the funerary record associated with settlement centres. The paper will explore the possible reasons and main drivers behind the changes, while at the same time exemplifying the complexity and diversity of existing situations in relation to factors such as geography and social status.
- 7

### AGGREGATION AND LOCAL AGENCY IN THE LANDSCAPE OF EASTERN Languedoc (1ST C. BCE - 1ST C. CE)

**Abstract author(s):** Borowski, Pawel (University of St Andrews; University of Tuebingen)

**Abstract format:** Oral

One of the key features of the provincial landscape in the early Roman empire was the phenomenon of aggregation, which created relations of dependence between conquered communities. Typically, scholars discuss subordinated communities in terms of the administrative categories adtributio and contributio which emphasise Roman conceptual perspectives and marginalise local agency. To recover the role played by communities themselves in transforming the provincial landscape, this paper examines the relations of dependence between Nemausus and 24 subordinated communities in eastern Languedoc in the 1st c. BCE – 1st c. CE. The case of Nemausus is attested primarily by literary sources (Pliny the Elder, Historia Naturalis 3.4.37 and Strabo, Geographica 4.1.12) which are usually interpreted as evidence for Nemausus functioning as a passive regional centre organised by Rome. By reconstructing the complexity of the socio-political landscape in eastern Languedoc on the basis of archaeological, numismatic and epigraphic (CIL 12.3362) records, I argue that Nemausus was not just a subject of Rome’s actions but an active agent: it fostered its communal interests and changed the regional landscape at the expense of the subordinated communities. To support my claim, I will complement the literary sources with the results of rescue archaeology in Nemausus and its peripheries, and archaeological work at various eastern Languedocian sites which have been identified with the subordinated oppida.

8 By examining the case study of Nemausus in light of the present archaeological knowledge of eastern Languedoc, this paper will illustrate the role played by local agency within the phenomenon of aggregation. Ultimately, I will offer a new understanding of the processes which transformed provincial landscapes.

8 LANDSCAPE TRANSITIONS IN TARRACO: EXTENDING THE UNDERSTANDING OF PROVINCIAL COMMUNITIES AND THEIR INTEGRATION INTO THE ROMAN EMPIRE

**Abstract author(s):** Moreno Escobar, Maria del Carmen (Durham University; University of Lund)  
**Abstract format:** Oral

The Iberian Peninsula has been repeatedly characterised by its wide diversity of landscapes and of communities inhabiting them in Antiquity. This circumstance has hindered the possibility of developing holistic interpretations of cultural change experienced by these communities. However, recent research (e.g. Moreno Escobar, Ojeda Rivera and García Sanjuán 2020) has highlighted how the analysis of landscapes can not only unveil dynamics of transformation but (most interestingly) can also generate a holistic interpretative model that integrates both archaeological analysis and historical contextualisation. This particular model successfully explored and interpreted the changes in local communities from very different regions in Baetica in connexion with their inclusion and integration within the political, economic and social structures of the Roman Empire. However, despite its success for these particular -Baetican regions, its suitability to interpret the integration of other regions of the Roman Empire remains unexplored. This contribution will focus on testing this model's application to other areas of Hispania, taking the Roman city of Tarraco and its hinterland as case study. This region has been subject to a long tradition of research in the area, mainly on its rural occupation, territorial organisation, and more recently on its Roman port system. This previous work has resulted in the generation of a vast amount of archaeological data susceptible of re-analysis, which makes this region an optimal case study. By applying techniques of spatial analysis and statistical analysis, this work seeks to contribute towards the definition of a holistic interpretation of Tarraco's development between Republican and early Imperial times and of this community's integration into the Roman Empire.

9 TRANSFORMATION OF THE PRODUCTIVE LANDSCAPE IN SW IBERIAN PENINSULA: ECONOMIC ORIENTATION AND INFRASTRUCTURE BEFORE AND AFTER THE “AUGUSTAN REVOLUTION”

**Abstract author(s):** Moreno Megias, Violeta (Instituto del Patrimonio Cultural de España; Universidad de Sevilla)  
**Abstract format:** Oral

The distribution of the elements that shape the productive landscape in the SW Iberian Peninsula contributes to the understanding of the provincial landscape of Hispania. The moment of change represented by the beginning of the Augustan period coincides with the provincial reorganisation. It marked a change in the economic orientation of the region - it began to organise itself as an area of exploitation for large parts of the Empire, while at the same time hosting increasingly powerful markets. The location and characteristics of agricultural and fish farming structures, pottery workshops, storage buildings and port infrastructures began to follow very different guidelines to the previous phase. During the republican period, the spaces of persistence of pre-Roman traditions had merged with new imposed realities for a heterogeneous population, impregnated with a multitude of cross-influences. This contribution focuses on the transformations of the productive space and the infrastructures related to the commercial organisation before and after the provincial reorganisation promoted by Augustus. It will be done from a diachronic approach and a local perspective, with special regard to the western area of the Guadalquivir valley.

10 HYDRAULIC TECHNOLOGIES, THE PRODUCTIVE LANDSCAPE OF WESTERN PROVINCES AND THE DEVELOPMENT OF ROMAN LAW

**Abstract author(s):** Ronin, Marguerite (CNRS)  
**Abstract format:** Oral

The proposed contribution builds upon a reconstruction of the agricultural landscape of Roman Central Italy where, from the 2nd c. and increasingly in the course of the 1st c. BC, 1) peri-urban areas are developed into small, intensively cultivated and irrigated plots devoted to market gardening and to the supply of urban markets; 2) hill slopes, naturally exposed to waterlogging and erosion, are relatively newly terraced lands, adapted to winegrowing and tree crops. Based on archaeological and literary evidence, this reconstruction emphasizes the role of hydraulic technologies for increasing the food production. It is also consistent with the legal texts and, arguably, it helps contextualize two legal mechanisms notably developed at the same period: the servitude to draw water (servitus aquae ducendae) and the action to ward off rainwater (actio aquae pluviae arcendae).

Jurisconsults and public authorities controlling legal changes were responsive to the needs of those engaged in the farming business. Exploring the legal documentation is consequently key to understanding how these activities developed, what were the opportunities and risks faced by the landowners and the farmers in regard to water resources and hydraulic risks. However, while this reconstruction of the productive landscape, with its economic and legal implications, is credible enough for Central Italy, where the legal solutions were enforced in the first place, we may wonder if it is sensible to extrapolate from these results to reconstruct the

productive landscape of the provinces. This paper will take some case studies in Gaul, Africa and the Iberian Peninsula to test and explore this question, crucial for both our understanding of the agricultural production and of the diffusion of the Roman law.

202 ANCIENT CULTURAL ROUTES: PAST TRANSPORTATION AS A TWO-WAY INTERACTION BETWEEN SOCIETY AND ENVIRONMENT

**Theme:** 1. Widening horizons through human-environment interconnections  
**Organisers:** Mazzilli, Francesca - Glomb, Tomáš (University of Bergen) - Fulminante, Francesca (University of Bristol; University Roma Tre) - Faupel, Franziska (University of Kiel)  
**Format:** Session with keynote presentation and discussion

Ancient regional routes were vital for interactions between settlements and deeply influenced the development of past societies and their “complexification” (e.g. “urbanization”, Roman expansion). For example, terrestrial routes required resources and inter-settlement cooperation to be established and maintained, and can be regarded as an epiphenomenon of social interactions. Similarly, navigable rivers provided a complementary inter-settlement connectivity, which conditioned the development of roads and pathways. In this sense, fluvial and terrestrial connections can be seen as the two layers of an integrated regional transportation system, which was the product of social relations and of the interplay between past societies and environment. Sea transportation is also relevant as it expands the scale of these relations and interplays.

When we consider past societies, we implicitly or explicitly take into account interlinked aspects, such as their culture, traditions, politics, economy and religion. Under the umbrella of environment, we include topography, terrain, visibility, water management and sustainability,

In view of numerous conference sessions and publications on transport networks in past societies, this session specifically focuses on how the transportation networks and their modes, from terrestrial to riverine, sea routes or a combination of them, were a crucial part of the dialogue between past societies and the environment and how the dynamic processes related to human culture were developed by this dialogue. Following this rationale, we welcome methodological papers and case studies that focus on:

- How the constraints of the physical environment impacted on dynamic processes of human societies in the past, such as cultural transmission, trade, migration, and war, or in the opposite direction;
- How the activities and motivations of human agents shaped and structured the environment with respect to mobility.

ABSTRACTS:

1 TRANSPORT, INTERACTION, AND CONNECTIVITY  
**Abstract author(s):** Nakoinz, Oliver (Johanna Mestorf Academy)  
**Abstract format:** Oral

Transport is an aspect of greatest relevance for the development of culture, society, and economy because it was the only means of spatial interaction in pre- and protohistory. Transport is the actual movement of people and commodities towards a spatial target. The routes form the spatial outlay and are part of the infrastructure for these movements. These routes are mainly determined by interaction which refers to the interaction between environment and society on the one hand and inter-human interactions. The transportation network adapts to the actual interaction canalises the interactions. Interaction allows the balance of interests, the exchange of ideas, and the development of complex social organisations. Furthermore, it enables the collaborative work on innovations, the division of labour, and urban and centralised settlements. But interaction also can be a root of conflicts. The analysis of interaction mainly focuses on one of the three dimensions of interaction research: Groups and cultures, networks, and interaction-intensities. Transport and interaction research already are able to reveal a substantial amount of knowledge but these research topics are still rather concrete. For more general results we need to turn to a more abstract keyword: Connectivity. Connectivity can have two meanings, both important. Connectivity can refer to the actual degree of interaction or to the potential degree of interaction. Which interactions do we actually have and which interactions are possible? Both parameters are connected in different ways to general developments of culture, society and economy enable us to contribute to general questions and macro-history.

2 REGIONAL RELIGIOUS NETWORKS AND THE ROAD NETWORK IN THE ROMAN EMPIRE  
**Abstract author(s):** Mazzilli, Francesca (University of Bergen)  
**Abstract format:** Oral

Cult sites were meeting public places for village communities and worshippers coming from neighbouring and farther afield areas. They were monumental displays of elite's wealth and of local communities' religious beliefs visible by anyone passing by. Cult sites were not isolated centres, but they were part of the wider social network affected by neighbouring and farther afield communities and cultures. For these reasons, it is even more important to contextualize a cult site in its landscape and in relation to other sites. Anna Collar undertook proximal point analysis (PPA) to calculate and discuss the spread of cults based on the proximity of sites. However, people and religious ideas were facilitated to move from one site to another by infrastructure into place (roads, riverine and maritime routes).

- 3
- This paper will consider regional case studies at the edge of the Roman Empire (Lusitania, roughly Portugal, and the Hauran in the southern Syria):

  - to discuss methods to understand the relationship between cult sites and the road network (through spatial distribution of cult sites in relation to roads, location of a site within a 5 km radius from the road, identification of differences between PPA and PPA based on road networks);
  - to understand the role of Roman roads in the spread of cults which might have varied depending on the gods worshipped in cult sites, their benefactors, worshippers, and possibly subject to the complexity of cult sites.

4

### THE WORSHIP OF ROMAN DEITIES ALONG THE ROADS: A GIS NETWORK APPROACH

**Abstract author(s):** Glomb, Tomas (University of Bergen)

**Abstract format:** Oral

In recent years, the amount of available data for exploring quantitatively the Roman culture and mobility has increased significantly. With respect to mobility in the Roman period, researchers can now work with the Stanford geospatial network model of the Roman world (ORBIS) that allows calculating the fastest, shortest, or cheapest connections between selected cities based on the distance, mode of transport used, and seasonality. Another suitable option is a dense network of geocoded Roman roads based on Richard Talbert’s Barrington Atlas of the Greek and Roman World. Considering the evidence on Roman culture, online databases of geocoded inscriptions, Roman coinage, and corpora of ancient texts in Greek or Latin represent a suitable data pool for approximating quantitatively many cultural aspects. The paper follows this development in the historiography of the ancient Mediterranean and discusses how can epigraphic databases and geocoded ancient roads help examine the relationships between the worship of Roman deities and mobility in the Roman Empire. Specifically, the paper presents a case study focusing on the spatial patterns of worship of Apollo, Minerva, and Asclepius and their ties to the transportation network and Roman military infrastructure in the border provinces between Britannia and Moesia Inferior. Besides presenting the preliminary results of the intra-regional and extra-regional dynamics with respect to the spread of these cults across the transportation network, the paper discusses both the advantages and the pitfalls of the available geocoded data for spatial network analysis.

5

### DATA AND HYPOTHESIS ABOUT ROAD SYSTEM IN WESTERN SICILY FROM THE ROMAN PERIOD TO THE NORMAN AGE

**Abstract author(s):** Canale, Alessandra - Burgio, Aurelio (Dipartimento Culture e Società, Università di Palermo)

**Abstract format:** Oral

The paper aims some hypotheses about the system of ancient path routes in Western Sicily. The focal point is continuity and discontinuity of use from the Roman period to the early Middle Ages, when the main streets become pilgrimage roads and, along these, borns resting places such as xenodochia and hospitalia or small rural churches usually located near the most important crossroads.

This historic fase of the landscape is evidenced by the dissemination of place names, often associated with byzantine cults, as well as by the persistence of rural cults in the modern sanctuaries linked with the ancient road system, some of which are living a modern revival of longstanding votive practices of pilgrimage.

The historical-topographical analysis is focused on the areas around Castronovo di Sicilia and Vicari, along the basin of the North Imera river and in the Madonie mountains. Moreover, these places are connected with the historical events Teutonic Knights of the Magione di Palermo and with their politics of control territory to defence Christianity, thanks to which they had accumulated huge wealth and many estates in the Palermo province and in other areas of Sicily.

6

### SALT PRODUCTION IN CENTRAL ITALY AND SOCIAL NETWORK ANALYSIS CENTRALITY MEASURES: AN EXPLORATORY APPROACH

**Abstract author(s):** Alessandri, Luca (University of Groningen) - Fulminante, Francesca (University of Bristol)

**Abstract format:** Oral

Since the first pioneering application of network principles to identify and analyse the ‘centrality’ of a place and the dynamics of settlement and/or trade patterns such as for example the dynamic of hunters-gatherers populations in the Fjorland Archipelago (Mackie 2001), or the brick trade in the Tiber valley during the Roman time (Graham 2006) many advances have been made especially thanks to the application of different cost-allocation spatial models, gravity models, stochastic models and more recently models that combine spatial and cultural variables.

In this exploratory paper we partially go back one step and apply traditional Social Network Centrality measures to fluvial and terrestrial transportation networks in central Italy with a focus on a particular type of site: the Bronze Age and Iron Age coastal sea-salt production centres, about which many questions remain still unanswered. We experiment normalized degree centrality, betweenness centrality and closeness centrality and obtain varied results that partially bring to interesting new hypotheses, which deserve further investigation with more sophisticated models.

In particular, the closeness centrality is probably the less interesting: all sites have more or less equal values, as it is probably foreseeable in a relatively small and compact region such as Latium and Etruria. The normalized degree centrality indicates some centres

- 7
- with a higher number of neighbours, which often seems to coincide to important centres also according archaeological or historical evidence. However, the more interesting results comes from the betweenness centrality.

The routes indicated by the centres with highest betweenness centrality are the potentially most used routes both fluvial and terrestrial. This analysis shows some patterns that shed new light on the potential dating of both the briquetage and the more efficient saltpan salt-production techniques and the more frequent use of the famous salt roads, later identified with the Salaria.

8

### TRANSPORT COSTS AND ECONOMIC DEVELOPMENT IN ROMAN BRITAIN

**Abstract author(s):** Ortman, Scott (University of Colorado) - Wiseman, Rob (University of Cambridge) - Lodwick, Lisa (University of Oxford) - Lobo, Jose (Arizona State University)

**Abstract format:** Oral

Archaeological studies of relationships between settlement population and material output have uncovered consistent increasing returns, whereby output increases proportionally faster than population, at rates that are mirrored in contemporary urban systems. This suggest a common underlying process is responsible for extensive (agglomeration-driven) growth in all societies. However, an important difference between ancient and contemporary societies pertains to the baseline productivity of workers, which was relatively static prior to the industrial revolution but has increased steadily since then. A possible exception to this pattern may be the Roman Empire, and especially Roman Britain, where analyses of data compiled by the Rural Settlement of Roman Britain project and the Portable Antiquities Scheme suggest an increase in baseline productivity over time, and relative to the pre- and post-Roman periods. Settlement scaling theory proposes that this type of intensive (i.e., individual productivity) growth is driven in part by improvements in transport technology. In this paper we ask whether intensive growth in Roman Britain coincides with reductions in transport costs over time. We adapt ideas of spatial equilibrium from urban economics to interpret the fall-off curves of pottery wares, distinguishing water vs. land transport, to infer any changes in basic transport costs that may have occurred due to technological changes in shipping, vehicles, and roads. Previous studies suggest that the slopes of these curves capture differences in transport costs related to product weight and mode of transport. We extend this work here by comparing slopes for coarse ware pottery made during different time periods. Our results suggest the Roman economy exhibited growth dynamics common to economies throughout history, not so much in the magnitude of growth or level of output, but in the generative mechanisms behind it.

9

### TERRESTRIAL TRANSPORTATION INFRASTRUCTURE BETWEEN SOCIETY AND ENVIRONMENT: A CASE STUDY FROM BRONZE AND IRON AGE TUSCANY

**Abstract author(s):** Stamerra, Laura (Roma Tre University, Italy) - Fulminante, Francesca (Bristol University; Roma Tre University)

**Abstract format:** Oral

Routes are a vital feature of the ancient anthropic landscape. Through their analysis, scholars can get a better understanding of settlement patterns, landscape exploitation strategies, social interactions, and cultural exchanges. Sometimes, it can also help to clarify the organization of a society, its development and eventual ‘complexification’. In the last decades, thanks to the introduction of GIS (Geographic Information Systems) and spatial analysis tools, new perspectives of research are available. Scholars can more easily attempt to reconstruct and evaluate pathways networks.

In this paper, we present the case study of Central-north Tuscany during the Bronze and Iron Age. Although sparsely populated, the medium and lower Arno basin represents a coherent and complex system. The area was populated by local communities, which were deeply attached to the land but at the same time fully integrated into regional and interregional cultural trends. Interactions and cultural exchanges with the more densely populated surrounding areas – especially the Romagna – continued even during demographic declines. This suggests the presence of highly important communication pathways, connecting north Italy with the Etruscan territories. It also leads us to question the label of “marginal area” that weighs on the region.

Using cost surface and least cost path analysis, regional terrestrial pathways are reconstructed in their diachronic evolution, investigating their influence on settlement development. To test the model validity and recognize main cultural routes, correlation is sought between the paths network, identified topographical routes, and defining materials distribution. Furthermore, we compare sites typology and site function (domestic, funerary, productive) with Social Network Analysis Centrality measure to verify whether specific types of sites are more ‘central’ than others according to different degrees of centrality, and to better understand the role of transportation routes in the shaping of the landscape, as well as its socio-political, economic, and symbolic use.

10

### MODELLING SPATIAL INTERACTION DURING THE EARLY IRON AGE IN SOUTHWEST GERMANY AND THE ALSACE

**Abstract author(s):** Faupel, Franziska (CRC 1266)

**Abstract format:** Oral

This study aims at the investigation of river systems as interaction corridors and infrastructure elements, the reconstruction of terrestrial path systems, research desiderate for the Early Iron Age, and the evaluation of interaction relationships of princely seats in dependency of geographical distance.

The Rhine and Danube serve here as reference areas, as they allow to investigate communicational corridors, different environmental settings and different primary orientations. The Rhine cultural distance diagram profile curves show high deviations in the

9 interaction relation with the north and south located type spectra of the central axis at three places. Therefore, these points are interpreted as points with a high exchange rate. The interaction references on the Danube do not represent such concise structures. Exchange nodes or zones do not establish themselves in the entire material's curves, but rather as latent structures concerning vessels, ring jewellery or garb and often only related to one river bank. Such an exchange zone is recorded in the vicinity of the He-  
uneburg.

Although the significance of transportation for the Iron Age is well-known, the reconstruction remains an open issue. So far, mainly theoretical models based on partial data (import goods) and an emphasis on river systems outline possible connections while neglecting alternative routes, cultural effects, or the path's exact location. The entire working area's local path system is reconstructed from barrows' location. Princely seats are being built in places with good infrastructure. Rural settlements are based on other parameters and are usually further away from the paths. To be able to carry out exchanges, the location was therefore not ideal for agriculture. Exchange nodes at rivers functioning as communication corridors, channels and bundle exchange from far-reaching contacts over 50 km away characterise the image of the EIA distribution system.

9 ON THE ROADS AND RIVERS OF LATE IRON AGE GAUL : CHALLENGES IN CALIBRATING LEAST COST PATH MODELS

**Abstract author(s):** Filet, Clara (UMR 7041 Université Paris 1) - Rossi, Fabrice (Université Paris Dauphine)  
**Abstract format:** Oral

The end of the second Iron Age saw the explosion of trade leading to an extension of medium and long-distance traffic. However, the understanding of these traffic flows is hampered by the lack of knowledge of the road network in use during the last decades of Gallic independence. The objective of this communication is to propose a method for estimating realistic transport costs between settlements, in a context where the road network is unknown.

The classic solution for reconstructing a transport network from the sole location of archaeological sites consists in approximating the transport network by the set of least cost paths (LCP) between sites based on the constraints of geographical space (relief, wetlands, etc.).

Our work extends the state-of-the-art in three directions:

1. Our method is based on the articulation of partial historical data with multiple simulations to estimate unknown values (transshipment costs, river crossing costs, etc.). These simulations are compared using systematic sensitivity analyses, including the use of novel aggregated metrics that characterise a LCP collection and emphasize global effects of some parameters.
2. Few studies have attempted to take into account the multimodal nature of old transport (land and river), and the many scientific and technical problems posed by modelling changes in means of transport. In this context, this work proposes a new explicit implementation of the bimodal (terrestrial and fluvial) nature of these old transports.
3. The last challenge is the application of these methods to extremely voluminous data, using a high-resolution numerical terrain model at the scale of central-eastern Gaul (260 000 km²). The numerous simulations needed to assess the sensitivity of LCP calculations to the cost parameters are associated with a large consumption of computational resources. A dedicated implementation is needed to complement the classic tools, such as R packages traditionally used for LCP.

10 AN EXAMPLE OF GEOGRAPHIC NETWORK ANALYSIS: THE CASE STUDY OF THE FORTORE VALLEY (MOLISE AND PUGLIA, ITALY)

**Abstract author(s):** De Simone, Claudio (University of Naples Federico II-Specialization School of Archaeology)  
**Abstract format:** Oral

Today, the Fortore river is the geographic and administrative limit between the regions of Molise and Puglia but was it the same in the past? In the last decade, scholars have debated about the Fortore's role during pre-Roman and roman periods, specifically focusing on how this physical boundary may have influenced the interaction and connectivity between the Samnium (modern-day Molise) and Daunia (modern-day northern Puglia).

Both ancient literary sources and archaeological finds demonstrate that the situation is more complex than it may seem and that it is not easy to locate the geographical and cultural borders, especially in the pre-Roman period. In this poster is suggested a model that can help to understand the interaction between the two modern-day settlements that are opposite only in appearance, i.e. Macchia Valfortore (Molise) and Carlantino (Puglia). These sites were in the proximity of the Fortore river, and, in both centres, a specific investigation of material culture brought to light a complex and diversified society, between the Iron age and Samnitic period (respectively, 9th-8th cent. BC and 6th-3rd cent. BC). The small-scale geographic network (constructed) helps to explain the interchange dynamics between the two sites and, furthermore, the interaction with transhumance routes, i.e. tratturi. These are associated with the collective seasonal migration of animals and shepherds between the highlands of Central Apennine and the pastures's South Italy, but not only that. Since the Iron Age, the transhumance, in the study area, has had a strong impact on many economic activities and on different aspects of society.

So, the proposed case study points out the successful choice of using an innovative model to identify interaction areas through a historic interpretation; and moreover, it demonstrates the key-rule of the fluvial connections in the area to the development of human society.

11 WATER, COMMUNICATION, SIGHT AND THE LOCATION OF FORTIFICATIONS ON THE STRATA DIOCLETIANA (SYRIA) IN LATE ANTIQUITY

**Abstract author(s):** Seland, Eivind - Meyer, Jørgen Christian (University of Bergen)  
**Abstract format:** Oral

Strata Diocletiana was a military road constructed along the Syrian Desert-frontier of the Roman Empire in the late third century AD. New military outposts were established at regular intervals after the Roman sack of Palmyra, probably reflecting a situation when Roman soldiers had to directly control a route that had earlier been the responsibility of their former Palmyrene allies.

The new road seems not to have been constructed along the easiest and fastest route through the desert. What considerations came into play when reorganizing communication along the Syrian Desert-frontier? Using GIS approaches we compare the situation of archaeologically attested Roman forts and outposts with the distribution of (modern era) water sources, the distance between military installations, the least-cost path between permanent settlements and the viewshed from the military outposts. We argue that access to water and considerations of viewshed and defense were more important than speed and ease of travel.

12 MARGINS. REFRAMING THE POTENTIAL OF MOUNTAINOUS AND INSULAR AREAS FOR MOBILITY AND INTERACTION IN NEOLITHIC SICILY

**Abstract author(s):** Dawson, Helen (Dipartimento di Storia Culture Civiltà, Università di Bologna; Institut für Prähistorische Archäologie, Freie Universität Berlin) - Speciale, Claudia (Istituto Nazionale di Geofisica e Vulcanologia - Osservatorio Vesuviano) - Forgia, Vincenza (Dipartimento Culture e Società, Università di Palermo)  
**Abstract format:** Oral

This paper discusses the role of two “marginal” areas of Sicily, the Madonie mountains and the island of Ustica, in the ancient organisation of a mobility system evidenced by the spread of obsidian during the middle Neolithic (end of 6th-middle 5th millennium BC). The Madonie mountain range is located in the northern part of Sicily some 40 Km from the coast, ranging in altitude from approximately 200 m a.s.l. at the bottom of the Imera River Valley, to 1,979 m a.s.l. at Pizzo Carbonara. Ustica is a small volcanic island (ca. 9 sq Km) located some 70 Km north of the coast from Palermo and 110 Km west of the Aeolian islands. Both areas had access to obsidian, despite their distance from the two main sources on the islands of Pantelleria and Lipari.

Taking as case studies these two very different areas, we evaluate key aspects linked to insularity and marginality, such as geographic accessibility, resource availability, evidence for networks and their role in the development of prehistoric cultural routes. Our work highlights potential reasons that attracted Neolithic communities to occupy such extreme environments, in particular communication and exchange routes. We interpret the occupation of small islands such as Ustica and of mountainous landscapes within Sicily to represent choices by early communities. The evidence for lithic raw material networks highlights the role of such marginal or “in-between” areas in the exchange of obsidian resources within and throughout Sicily.

13 THE ROLE OF THE ROAD IN SETTLING A MOUNTAINOUS REGION

**Abstract author(s):** Mino, Martin (Monument Board of Slovak Republic)  
**Abstract format:** Oral

In the heart of Europe in the area of traditional threshold between cultural areas lies a mountainous area in Northern Carpathians in today's Central Slovakia. Though this area isn't abundant of fertile soils it has been a repository of raw material resources since the Palaeolithic. In spite high demand on the resources the current state of research indicates an incapability of prehistoric and early historic populations to maintain a self-sustaining continuous settlement area. Even up to modern days the local communities exploiting the raw materials depended on long distance trade for subsistence. To maintain the trade a reliable network of safe routes across the mountainous landscape had to be established. Many fragments of old roads connecting this mining area with locations in all directions are still preserved. Especially the south – north route connecting these resources with the Carpathian Basin in the south and the Vistula River Basin in the North seems to come to the most importance as a possible bypass to the well known Amber Road. In combination of the walkthrough survey and high resolution LIDAr data course of single roads can be reconstructed. Analysing them in smaller scale plans the main routes can be defined. By applying GIS and adding settlements, fortifications, farmable land, exploitation sites, environmental features such as geo-relief, hydrology or seasonal heavy snow cover and cultural features such as hostility of cultures analyses could be performed on whether the route passing through a certain area is a cause of establishing settlements or in contrary the route is built as a consequence to connect an established site with the rest of the surrounding world and ancient route planning strategies could be defined. Attempt to answer the question how the main routes facilitate the settlement pattern and cultural evolution could be made too.

14 COUNTRY ROADS TAKE ME HOME TO THE PLACE I BELONG. REGIONAL ROUTES ON NORTHERN APENNINE AS RESOURCES FOR IDENTITY NEGOTIATIONS

**Abstract author(s):** Da Vela, Raffaella (SFB1070 RessourcenKulturen University of Tübingen)  
**Abstract format:** Oral

Between the 7th century BCE and the 4th century BCE, the Northern Apennines can be considered as a complex system of natural and cultural resources, rich of water, quarries and forests and populated by people whose cultural references and religious identities

were expressed in hybrid languages. Quickly mentioned in the ancient literary sources as a barrier to overcome, aiming to reach reach the fertile fluvial plains, the Apennines has been longer considered as a geographic and cultural boundary also in the archaeological research. Recent surveys and excavations demonstrate indeed, as the connections across the mountains has been always an opportunity for commercial contacts and cultural exchange. The mobility of persons and supplies across the Apennine, attested by several archaeological finds and epigraphic data, constituted a channel for these cultural contacts and for the exchange of knowledge and ideas. Focussing on the roads in the mountain and in the foothills and on the relationships with the material culture attested in settlements and cult places, the present contribution points out as environmental and cultural factors shaped not only the mountainous landscape, but also the identities of local communities. These regional routes, rather than commercial and colonial infrastructures, are thus approached as resources for the negotiation of the social identities of the ancient inhabitants of the region.

## 204 ARE WE REALLY STRATEGIC? DEVISING AND IMPLEMENTING ARCHAEOLOGICAL STRATEGIES

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Doyle, Ian (The Heritage Council of Ireland) - Robinson, Rhonda (Historic Environment Division, Northern Ireland Department for Communities) - Grant, Kevin (Historic Environment Scotland)

**Format:** Regular session

Archaeologists are no strangers to devising strategies. Research frameworks, historic environment plans, organisational documents and planning for heritage areas all include elements of strategy. Yet, as a discipline we rarely discuss what has worked.

In devising sectoral plans there are a number of common approaches including stakeholder mapping and consultation, a reflection of the benefits of greater participation and access to heritage, the economic opportunities provided by archaeology, as well as emphases on skills and learning. Research Frameworks ensure that important questions are addressed and that we look to the bigger picture. Such approaches are underpinned by surveys demonstrating how the public relates to archaeology as well as by forecasting exercises and horizon scanning practices. Yet are there other equally valid approaches to devising strategy for the archaeological heritage sector?

An additional key ingredient of strategy is how do we deliver it successfully and sustainably. What has worked to ensure that the efforts that have gone into strategy formation are matched by successful implementation? Traditional approaches to delivering on strategy include leadership, lobbying, quick wins, and the continued involvement of stakeholders through suitable structures. Equally how good are we as a profession in monitoring and evaluating progress or otherwise in a plan of strategy?

This session builds upon ongoing collaboration on the island of Ireland and Scotland in the devising and delivery of strategies for archaeology. We would like to broaden the frame of reference to other countries and organisations at various stages in the strategy cycle. These issues are of growing importance as typically the historic environment sector faces low levels of resources, regular fluctuations in economic conditions and, even more so, the challenges of climate change and a global pandemic mean we need to share learning on strategic practice.

## ABSTRACTS:

### 1 ARCHAEOLOGICAL STRATEGIES FOR THE DANUBE REGION – THE IRON-AGE-DANUBE EXPERIENCE

**Abstract author(s):** Mele, Marko (Universalmuseum Joanneum)

**Abstract format:** Oral

We love EU-projects! They are a great opportunity for transnational co-operations in research, monument protection and tourism. For at least three to five years they provide us funds for nice products (outputs), which sometimes even survive and continue to thrive beyond the project duration. One of the most loved outputs of the Interreg projects are Strategies and Action and Implementation plans. They are even so greatly needed, that they are a mandatory part of many international EU-programmes. But, they often are not among the most sustainable outputs, which create a major impact in the targeted stakeholder group.

Twenty partner from four countries, Austria, Croatia, Hungary and Slovenia, concluded in 2019 the Interreg Danube Transnational project called Iron-Age-Danube. In the project working groups were established, which developed joint strategies for the research, protection, promotion and touristic use of archaeological landscapes in the Danube region. The focus was mostly on the regions with well known and preserved Iron Age heritage, mostly represented by hilltop settlements and tumulus cemeteries. The international strategies were flanked by national action and regional revitalisation plans, with concrete steps for their implementation.

In my paper I would like to discuss the process of the development of strategies and the challenges which the partners have to overcome, once the strategies are developed. In addition, in 2020 a new Interreg project called Danube's Archaeological eLandscapes was launched, which also aims to add new strategic approaches to the digitisation of the archaeological heritage. Therefore, I would also like to present, what lessons were or were not learned and transmitted to the new project with over 20 partners from 10 countries of the Danube region.

### 2 'PLAN OR BE PLANNED FOR': REFLECTIONS ON ARCHAEOLOGICAL HERITAGE STRATEGY IN IRELAND

**Abstract author(s):** Doyle, Ian (The Heritage Council of Ireland)

**Abstract format:** Oral

Recent years have seen a number of over arching documents on archaeology and heritage policy for the Republic of Ireland. These cover areas such as the development of the wider profession, the implementation of standards, involving communities, better communication and advocacy, maximising the knowledge dividend from field practice, and winning support from decision makers. Organisational strategies and location specific conservation and management plans are also important elements of ongoing practice. Research frameworks, policy documents on issues like climate change and sectoral plans have been the key outputs from all of this activity – yet have they delivered beyond their launches or is the drafting of a plan enough in its own right? This paper will outline some of the key strategy documents set out in Ireland in recent years and examine how they were compiled, where is the ownership, how has their delivery been structured, and have they been evaluated so as to determine success or otherwise. This, it is argued, will suggest that we have a lot of plans with a mix of achievements and that this in turn provides lessons for future practice.

### 3 IMPLEMENTING THE HISTORIC ENVIRONMENT RESEARCH AND DELIVERY STRATEGY: HIGH SPEED RAIL 2-UK

**Abstract author(s):** Halsted, John (Atkins; HS2 Ltd) - Court, Michael (HS2 Ltd) - Hopla, Emma (HS2 Ltd; Atkins)

**Abstract format:** Oral

The large scale of the HS2 rail project in the UK, extending 200km from London to north of Birmingham gave rise to the development of a strategy which aimed to focus investigations and approaches in key areas. The strategy was developed around key headline objectives and specific objectives relating to knowledge creation, community and skills. For archaeological and historic environment investigations the strategy focussed on knowledge creation objectives, drawn from existing research frameworks and agreed through a process of consultation with stakeholders. The implementation and delivery of those methods was underpinned by a series of technical standards, echoing industry standard best practices in, for example, fieldwork survey and excavation practice, GIS standards and data delivery. The strategy as a whole was designed to support over-arching commitments for the historic environment through a published Heritage Memorandum, ultimately supporting an Act of Parliament.

Key themes have arisen during the course of works including how to address less visible archaeological remains, selection for further investigation, the potential for bias and the consideration of scales of analysis. This paper will discuss how the strategy has been implemented, the decision-making processes involved, and the methodologies used to date in addressing the specific research objectives.

### 4 MAKING ARCHAEOLOGY MATTER: FIVE YEARS OF SCOTLAND'S ARCHAEOLOGY STRATEGY

**Abstract author(s):** Grant, Kevin (HES Historic Environment Scotland)

**Abstract format:** Oral

Scotland's Archaeology Strategy was launched at the EAA in Glasgow in 2015 with a vision to make Archaeology Matter – imagining a Scotland where archaeology is for everyone. It articulated an ambitious agenda for archaeology, meeting the challenges of the future, enhancing the value archaeology brings to wider society, and fitting into a wider strategic landscape within Scotland.

IN 2021, a five year review of Scotland's Archaeology Strategy was published, and is therefore a good time to take stock of what has been achieved and what issues remain to be addressed. This presentation will review the experience of delivering the strategy so far, focusing on key areas where there is ongoing work and discussion. It will also share examples of best practice and an honest assessment of the challenges we face working across the Historic Environment Sector to deliver an ambitious strategy to make archaeology central to Scottish life, whilst sited in a global context.

### 5 ARCHAEOLOGY 2030: CREATING A STRATEGIC APPROACH FOR NORTHERN IRELAND

**Abstract author(s):** Robinson, Rhonda (DfC Historic Environment Division)

**Abstract format:** Oral

The past twenty years has seen considerable changes in Northern Ireland. With land use change, increased development and the introduction of new planning policies, has come a significant increase in the number of archaeological excavations being conducted. With archaeological legislation which was introduced in 1995, related planning policies in 1999, and more public interest in archaeology than ever before, it seems timely now in 2021 to stand back and consider where we are at as a sector, and where we want to go within the next ten years.

There are some substantial questions which those who participate in the whole range of archaeological activities have identified that we need to answer. Key issues include reviewing our legislation, policies, systems and procedures to ensure that they facilitate and enable us to deliver archaeology and maintain and protect our heritage assets in today's working environment. How do we implement best practice standards, and could a research framework help us to collaborate, and synthesise data to produce knowledge, which can be shared and made accessible? How do we look after our records, archives and artefacts? What are the skills and new

technologies that are essential for the future? Perhaps most crucially in a time a limited finances, how do we mainstream archaeology and encourage to public to engage with it, and to understand the wide range of benefits it can produce?

These are big questions for a small sector! If all archaeological work aims to broaden and deepen our understanding of the past – what is our strategy to achieve this by 2030 in Northern Ireland?

6 CREATING A SUSTAINABLE ARCHAEOLOGICAL RESEARCH STRATEGY FOR THE ENGLISH EAST MIDLANDS

**Abstract author(s):** Knight, David (York Archaeological Trust) - Miles, Dan (Historic England) - Owen, Vicky (York Archaeological Trust)

**Abstract format:** Oral

The East Midlands Historic Environment Research Framework is one of a suite of English regional frameworks developed from the mid 1990s to provide a more strategic and research-led culture, primarily for development-led investigations. Recent work to transform the original document-based framework into an interactive digital resource is a significant step towards developing a sustainable research strategy for the East Midlands. The focus has been on three areas: creation of an online wiki framework that can be kept up to date, maintained and developed; an implementation plan that will embed it into practice and deliver impact; and the establishment of a research community that is responsible for managing, implementing and sustaining the framework. The development of the online framework has in many ways been the easy part, as both websites and wikis are now mainstream in terms of innovation. The most daunting task has been to drive the framework forward and to encourage implementation of the recommended strategies. Extensive consultations with community groups, contracting units, planning offices, universities, museums and other organisations have succeeded in engaging stakeholders from across the East Midlands. In addition, we have developed a sustainable management structure, underpinned by a steering group comprising members from across the historic environment spectrum with shared interests and agendas and a common strategic vision of the future. We will reflect upon the methods used to encourage stakeholder engagement during compilation of the framework; the strategies for involving stakeholders in maintaining and updating the new wiki; the contribution of this process to the delivery of public benefit and impact; and the potential of the framework to serve as a template for national and international research strategies.

A. URBAN ARCHAEOLOGY IN PANDEMIC TIMES

**Abstract author(s):** Luciano, Vanda Bela (UAL)

**Abstract format:** Poster

Preventive archaeology in Portugal continues to surprise us, even in pandemic times. We have had to adapt to promote the protection for our heritage but to protect us too. Yet despite these disturbing times, archaeology never stopped in Portugal. Due to the pandemic construction on urban sites has been challenging because we had to work more safely and also we had the challenge of working in the uncertainty caused by the pandemic.

The recording and analysis of walls uncovered in urban archaeology in Portugal is sometimes forgotten. This poster argues that as we focus on stratigraphy and the excavation of deposits we are in danger of overlooking important evidence for the materials used and re-used in the actual wall fabric. In order to change this situation, this poster will suggest the need to raise awareness of the vulnerability of this resource. If we lose this information, we have lost it for ever. The poster will argue that if surveys and excavation are important in a urban project, why is the survey of walls not given more attention?

205 LITHIC RAW MATERIALS IN PREHISTORY: METHODS, PRACTICE AND THEORY. PART 1

**Theme:** 6. Material culture studies and societies

**Organisers:** Brandl, Michael (Austrian Academy of Sciences, OREA-Institute) - Martinez, Maria (Smithsonian Institution, National Museum of the American Indian) - Gurova, Maria (National Institute of Archaeology and Museum, Bulgarian Academy of Sciences)

**Format:** Regular session

Lithic materials are the oldest provable culture bearing resources in human history, demonstrated by the wide array of their use in the profane and sacred spheres of life. Due to their abundance, versatility and longevity, lithic artefacts are ideally suited for approaching and interpreting past human behaviour through the reconstruction of resource management, i.e. the procurement either directly or through distribution networks, the processing, use and eventual discarding, which represents the complete chaîne opératoire of lithic production and artefact biographies . From a diachronic perspective, such studies can reveal dynamic processes relating to the development of economic behaviour, production strategies and traditions, landscape use, contact spheres, routes of migration, and distribution networks. Successfully reconstructing these processes however crucially depends on the ability to trace these materials back to their original sources. Despite the obvious importance of provenance studies in archaeology, attempts to generate characteristic “fingerprints” of particular raw materials are still not widely available and remain challenging endeavours. Consequently, this session focuses on analytical techniques applied to various lithic raw materials from all geographical regions , and their potential for tracing lithic resource management. This topical issue can be tackled from a multitude of perspectives, which hold the promise for significantly enhancing our insights into past economic behaviours on a large international and multidisciplinary scale.

We cordially invite researchers from diverse backgrounds to contribute to this undertaking.

ABSTRACTS:

- 1 LITHIC RAW MATERIAL PROVENANCE STUDIES IN THE SIWALIK HILLS OF NORTH-WESTERN INDIA: A REASSESSMENT AND FUTURE SCOPE

**Abstract author(s):** Kaur, Anubhav (Indian Institute of Science Education and Research, Mohali)

**Abstract format:** Oral

Palaeolithic evidences have been known from the Siwalik Hills of north-western India since the early 20th century. These assemblages are characterised by the exploitation of fluvially rolled quartzite clasts using simple core-and-flake technology. The entire Siwalik Frontal Range is abundant in good quality quartzite clasts with an uneven spatial distribution. However, the problems of raw material provenance, acquisition, transport and site-selection are poorly understood. Previous geoarchaeological studies in north-western India, have identified potential raw material sources in the Boulder Conglomerate Formation (Middle Pleistocene) and the post-Siwalik deposits (Late Pleistocene), due to the abundant presence of knappable quartzite clasts and spatial overlap with identified Palaeolithic sites and findspots. Geological data points towards a presence of probable raw material sources in the Early Pleistocene Siwalik deposits as well. However, no targeted, site-specific, scientific inquiry has yet been undertaken to ascertain any of these sources and their relationship with the Palaeolithic sites with conviction. Chauhan (2007) is the only study that initiates a site-specific, theoretical inquiry into the problem. The main issue that remains here is that to date no surveys have yet, been undertaken to ascertain local raw material sources and their macroscopic and microscopic relationship with the lithic assemblages. Such studies in the region are necessary to understand the hominin land-use pattern, site-selection, raw material exploitation and transport. This study particularly highlights the lack of provenance studies in the Siwalik Hills of north-western India, thereby, focusing on the need, analytical methodologies to be used and the future scope of the same in the region.
- 2 KNAPPED RAW MATERIALS OF THE SOUTH INDIAN NEOLITHIC: A COMPARISON OF TECHNOLOGY AND USE FROM THREE INDIAN ASHMOUND SITES

**Abstract author(s):** Rajala, Ulla (Stockholm University) - Madella, Marco (ICREA - CaSEs, Department of Humanities, Universitat Pompeu Fabra) - Korisettar, Ravi (Karnatak University, Dharwad)

**Abstract format:** Oral

The lithic assemblages of Neolithic South India have normally been described according to typological divisions without entering the topic of raw material exploitation and stone technology. Indeed, flint and chert were only a part of a more complex array of raw materials utilised by the Southern Neolithic people. Even if this situation has improved (cf. Rajala et al. 2009; Shipton et al. 2012), the wider questions related to different Neolithic chaîne opératoire –sequences still require further work.

This study is based on the lithic materials from The Herders’ Monuments: Ashmounds of Southern Deccan Neolithic project. The summary outline of the surface survey and its lithic material (Rajala et al. 2009) established that the assemblage reflects Late Neolithic-type chaîne opératoire and the quartz assemblage from Palavoy is relatable to the quartz industries in northern Europe. The further study of surface assemblages from three different ashmound sites, in the collections of Karnatak University, has revealed differing patterns of raw material use depending on local natural and social environment. The analysis will concentrate on presenting different modes of quartz exploitation in comparison with other raw materials exploring different technological diagnostic features and typological makeup in the assemblage. Furthermore, the procurement and use strategies are compared to those from other quartz using areas in Eurasia and beyond.

## Serpentine procurement and personal ornament production in the Early Upper Palaeolithic assemblages of Altai

**Abstract author(s):** Fedorchenko, Alexander - Belousova, Natalia - Kulik, Natalia (Institute of Archaeology and Ethnography SB RAS)

**Abstract format:** Oral

A comprehensive study of utilitarian and symbolic artefacts made of exotic stone raw material contributes to obtaining unique information about mobility, cultural and technological innovations of their makers. While the main aspects of the transportation and processing of jade or obsidian in Siberian prehistoric cultures are well known, other specific lithic material’s role is still poorly studied. Here we present new data from detailed analyses of the serpentine personal ornaments (n = 15) from Early Upper Palaeolithic assemblages of Ust-Karakol, Anuy-2 and Denisova cave sites (Russian Altai). Our research focused on the production sequences and functions of artefacts following technological, use-wear and experimental, petrographic, refitting and raw material unit analysis.

The petrographic study of magmatic rocks of the Bashchelak and Anuy mountain ranges showed that serpentine for ornaments could have been local. We consider gabbroid deposits related to Devonian and Permian magmatism of the region as potential sources. For blanks, Palaeolithic inhabitants of Anuy river valley used small angular laminar fragments. Items’ perforation preceded the abrasive treatment of their surfaces owing to the serpentine’s fragility in use. Such a sequence reduced the risk of breaking an ornament. The experimental and functional analyses show that most serpentine ornaments have evidence from contact with threads, straps, clothes or human skin. Reconstructed manufacturing techniques belong to the technological repertoire of the Ust-Karakolian tradition in the Altai. Lithic assemblages of this tradition demonstrate perfect knowledge of the local raw material resource base and early humans’ high mobility. Thus, they could afford to select lithic materials for manufacturing tools and personal ornaments of various types.

This research was funded by the Russian Science Foundation project No 20-78-10125 «The dynamics of cultural development and human colonization of Altai at the onset of the Upper Paleolithic: life support strategies, paleotechnologies, mobility».

5

## Prehistoric stone axes in the Sahara – some thoughts on raw material

**Abstract author(s):** Jesse, Friederike (University of Cologne, Institute for Prehistoric Archaeology, African Archaeology)

**Abstract format:** Oral

Prehistoric stone axes in the Sahara can be considered a neglected find category. They are numerous and various in shape but not much attention has been paid to them in recent research. Since 2019 a research project focuses on a special form of stone axes, the so-called “necked axes”, “hache à gorge”, “Darfurbeile”. This rather peculiar type is widely spread throughout the Sahara and can there be linked with the different pastoral groups of the 5th to 3rd millennium BCE. Seen the wide distribution between the Nile Valley and Mali questions of trade and transport of these axes are an important research question. The raw material used for the manufacture of the axes is of great interest in this regard. Especially, since already in first descriptions a peculiar greenish rock is mentioned, especially for pieces found in the eastern part of the Sahara. To get a better understanding of the raw materials used pXRF analysis were made on a sample of about 60 axes from the eastern Sahara, mainly the Wadi Howar and Laqiya region in northern Sudan. The results will be presented and discussed.

6

## Prehistoric flint provenance and distribution in Bulgaria: Petrographic and geochemical analyses of raw materials and prehistoric artefacts

**Abstract author(s):** Gurova, Maria (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences) - Stefanova, Elitsa - Andreeva, Polina (Geological Institute, Bulgarian Academy of Sciences)

**Abstract format:** Oral

Bulgaria is a country with many primary and secondary outcrops of flint raw materials that were or could be sources for flint toolmaking in prehistory. A provenance study, as well as long distance raw material transfers across Bulgaria and other forms of prehistoric cultural messaging and interactions have previously and mostly been inferred by visual and/or petrographic observations of flints.

Our innovative (for 2011 – the year of starting) and efficient analytical approach, combining micropetrography and LA-ICP-MS analyses of raw material samples and prehistoric artefacts has proven its reliability and potential. So far, a significant number of flint raw material outcrops (more than 40) and archaeological sites (more than 10) have been identified and documented and more than 100 raw materials and artefacts were characterized in detail by microscopic petrography and LA-ICP-MS analyses.

Petrographic microscopy can contribute to a better understanding of the origin of the flint and help to identify source areas. Therefore, identification of possible sources requires additional methods to be employed. The LA-ICP-MS technique is a highly appropriate method for studying archaeological artefacts because it is virtually non-destructive and does not require any specific sample preparation. Our results suggest that geochemical data are very efficient for better characterization of individual flint types and allow us to differentiate different subtypes.

Our results show that both methods have advantages and can yield valuable information about flint raw materials and prehistoric artefacts.

This paper summarizes the results of our work in order to evaluate the potential of both methods to answer different archaeological questions concerning raw material sourcing and mobility patterns during prehistory. The paper illustrates the advantages (and limitations) of both methods for the study of flint materials.

7

## Virtual lithic reduction with neural networks: A proof of concept for a novel raw material research tool

**Abstract author(s):** Orellana Figueroa, Jordy (Department of Early Prehistory and Quaternary Ecology, University of Tübingen) - Reeves, Jonathan (Technological Primates Research Group, Max Planck Institute for Evolutionary Anthropology) - McPherron, Shannon (Department of Human Evolution, Max Planck Institute of Evolutionary Anthropology) - Tennie, Claudio (Department of Early Prehistory and Quaternary Ecology, University of Tübingen)

**Abstract format:** Oral

The experimental replication of prehistoric stone tools is an important tool for raw material studies. Methods such as the calculation of core reduction intensity and cortical index are commonly based on studies performed on experimental lithic replication (e.g. Clarkson and Hiscock, 2011; Shipton and Clarkson, 2015; Braun et al., 2008). However, such experiments can require large amounts of time and raw materials, limiting the amount of research that can be carried out, as well as the size of the resulting experimental datasets.

A program for virtual stone knapping that uses a fraction of the time and resources required for actual knapping—and whose results were validated with archaeological and experimental data—could be an important tool for raw material research. Such a tool would allow for simpler data sharing, easier replication of lithic studies, and more robust insights into the effects of raw material in core reduction.

With a fully digital dataset, the creation of the desired core shapes and sizes could be done easily in a computer. In addition, the virtual knapper program would allow for extensive digital core and flake assemblages that could be used to compare with experimental and archaeological data.

We present here the initial results of a proof of concept for a virtual knapping framework based on a conditional generative neural network (CGAN). For this proof of concept, we generated a dataset (n = 2010) of 3D cores and flakes based on core shapes from an experimental study (Dibble and Režek, 2009), and used them to train and test the neural network model. The model obtained highly accurate results in predicting flake width, volume, length, and overall shape.

These results from our proof of concept suggest that our framework, when trained and validated with an experimental dataset, could be a powerful tool in lithic research.

8

## Volhynian long blades’ distribution in 4th millennium BCE

**Abstract author(s):** Sliesariev, Yevhenii (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

Volhynian” flint raw material is well known for its high quality throughout history. Exploitation of this resource started during the occupation of the Pre-Carpathian region of nowadays Ukraine by LBK communities in 6th millennium BCE. In 4th millennium BCE the intensification of large-scale contacts took place in Central – Eastern Europe. This phenomenon occurred not least because of Trypillian communities’ movement toward North-West to Volhynia which is rich with high-quality siliceous raw material. One of the

9 clearest markers of long-distance contacts during the 4th millennium BCE is long blade hoards which were discovered in different areas of Trypilian oikumene and beyond. Tracing the distribution of long blades over the long distance together with use of other markers of material culture could help us to understand the exchange system, inequality rise, and to reconstruct prehistoric routes of exchange in Central – Eastern Europe. It is also clear that Volhynian flint served as a raw material for specific needs. Among Trypil-  
lian communities it was used for elaborate tools and weaponry crafting, at the same time using “local” lower quality raw materials for crafting more simple tools. Understanding what is “Volhynian flint” and tracing its distribution could give us necessary information about raw material management, trade relations and local economies’ organization in Chalcolithic Central – Eastern Europe.

## 9 CHARACTERIZATION AND IDENTIFICATION OF SILICEOUS ROCKS AS POTENTIAL RAW MATERIALS

**Abstract author(s):** Kochman, Alicja (AGH University of Science and Technology; Faculty of Geology, Geophysics and Environ-  
mental Protection)

**Abstract format:** Oral

The Upper Jurassic sediments from the southern part of the Kraków-Częstochowa Upland (KCU) are developed as carbonates and host a variety of siliceous rocks (chert concretions, bedded cherts and epigenetic siliceous rocks). In the Middle Palaeolithic, this region was settled by humans. Among the reasons were: availability and high quality of local siliceous raw materials. In archaeolog-  
ical research, the siliceous raw materials used in this production are categorized mostly according to the macroscopic features. Moreover, such raw materials are linked with particular regions or even with particular outcrops. The mineralogical and petrographic  
characterization of siliceous rocks is closely related to the development of primary depositional structures of their limestone hosts.

The identification of different types of siliceous rocks used for tools manufacturing should base upon the microscopic observa-  
tions of thin sections, which reveal primary microfacies of limestones subjected to silicification, and the X-ray diffraction analyses including the determination of crystallinity index of SiO<sub>2</sub>. This research enabled to relate the distinguished types of siliceous rocks to particular stratigraphic intervals of Upper Jurassic succession from the southern KCU. Moreover, it was possible to evaluate the  
credibility of provenance determination of siliceous raw materials from which tools were manufactured, based upon the mac-  
roscopic feature. Unfortunately, the available research methods do not allow to identify the varieties of chert concretions, which might have been even roughly connected with particular outcrops or, at least, with particular regions of the occurrence of siliceous  
raw-materials, also on Pan-European scale. Macroscopic criteria recently used in archaeological classifications, aimed to evaluation of the origin of stone tools together with resultant conclusions indicating the source outcrops or regions are, regretfully, groundless  
from the geological point of view.

This researches was supported by The National Science Centre, Poland, contract no. UMO-2017/27/B/ST10/00594.

## 10 CHOCOLATE FLINT. WHAT DO WE KNOW AND WHAT DO WE WANT TO KNOW? HISTORY OF RESEARCH AND RESEARCH PERSPECTIVES

**Abstract author(s):** Sudol-Procyk, Magdalena (Institute of Archaeology, Nicolaus Copernicus University, Torun) - Werra, Dagmara  
(Institute of Archaeology and Ethnology, Polish Academy of Sciences, Warsaw) - Brandl, Michael (Austrian Academy of Sciences, OREA-Institute, Vienna) - Krajcarz, Maciej (Institute of Geological Sciences, Polish Academy of Sciences, Research Centre in War-  
saw) - Siuda, Rafał (Faculty of Geology, University of Warsaw) - Malak, Magdalena (Institute of Archaeology, Nicolaus Copernicus University, Torun)

**Abstract format:** Oral

Chocolate flint is one of the most renowned types of silicite raw materials used in prehistory, which occur in the territory of Poland, as well as in Central-East Europe. The materials were known and utilized since the Middle Paleolithic to the Late Bronze Age/ the be-  
ginning of the Iron Age. Research on chocolate flint has been going on for 100 years. The best known and studied zone of its deposits is the north-eastern edge of the Holy Cross Mountains and for many years this area was considered the only region where this raw  
material occurs. The current state of knowledge has been changed by the recent discovery of deposits of this raw material located about 200 km to the west, in the Kraków-Częstochowa Upland area. The discovery of chocolate flint outcrops in the central part of  
the Upland and – in the context thereof – mines along the open-air and cave sites with workshops, sheds new light on the current state of knowledge in the field of extraction, production, and, above all, distribution of this raw material.

All that puts our knowledge, especially about the uses and distribution of this raw material by prehistoric communities, in a new perspective and creates new questions. Such as those about the occurrence of chocolate flint outcrops in other parts of the  
Kraków-Częstochowa Upland; petrological features that can be used to distinguish the chocolate flint from the Kraków-Często-  
chowa Upland from the chocolate flint from the Holy Cross Mountains; or the importance of the Kraków-Częstochowa Upland raw material for the prehistoric economy.

Looking for answers, we would like to present the state of knowledge about chocolate flint, mostly based on the results of various instrumental methods.

Research on chocolate flint is carried out thanks to funding from the National Science Center, Poland, grant No 2018/30/E/  
HS3/00567.

## 11 FLINT TECHNOLOGY AND SOCIAL BEHAVIOUR AT THE TBK POGANICE SITE

**Abstract author(s):** Pyzewicz, Katarzyna (Faculty of Archaeology, University of Warsaw) - Gruzdz, Witold - Migal, Witold (State  
Archaeological Museum in Warsaw)

**Abstract format:** Oral

The site in Poganice is located in the part of Pomerania (Poland) that lacks good quality raw material outcrops. The societies TBK of culture that inhabited this region applied methods of flint production in quite a different manner than their counterparts in the  
inland territory. Our presentation focused on the analyses of chaîne opératoire of different tool type that were made from two kinds of erratic flint at the Poganice site. The most common raw material in the assemblage is the so-called Pomeranian flint that occurs  
in small pebbles. The dimensions and shape of this nodules influenced the reduction method. The second group of flint consist of cretaceous flint of different varieties that are assigned in polish literature to so-called Baltic flint. In our studies, we applied exper-  
imental and use-wear methods to investigate how the products from both kinds of raw material were made and used. We wanted to investigate if these two groups of tools were used in the same manner or different and if it is possible to state any connotations  
between them and inland production and usage of flint tools.

## 12 ALFÖLD LINEAR POTTERY CULTURE COMMUNITIES IN EASTERN SLOVAKIA (THE NORTH-EASTERN CARPATHIAN BASIN) IN THE LIGHT OF OBSIDIAN SOURCE USE

**Abstract author(s):** Werra, Dagmara H. (The Institute of Archaeology and Ethnology Polish Academy of Sciences, Warsaw) - Hughes, Richard E. (Geochemical Research Laboratory, Portola Valley) - Nowak, Marek (Institute of Archaeology, Jagiellonian  
University, Cracow) - Vizdal, Marián (Institute of History, Prešov University, Prešov) - Gačková, Lýdia (Zemplínske múzeum, Mich-  
alovce)

**Abstract format:** Oral

Obsidian due to its particular physical properties, as well as its aesthetic qualities, was widely used by prehistoric communities, and still attracted attention in modern times. This natural volcanic glass is present on archaeological sites in Eastern Slovakia dated  
from the Middle Palaeolithic, through the Upper Palaeolithic, Mesolithic, up to the Neolithic, up to the Early Bronze Age. The incidence of obsidian use increased with the appearance of the Early Neolithic communities. Archaeologically they are reflected by the Alföld  
Linear Pottery Culture (ALPC) dated to c. 5600–4900 calBC. The ALPC chipped lithic inventories are almost entirely composed of obsidian items. Over the last few decades since the first description of Carpathian obsidians, numerous modern analytical methods  
have been applied to determine the provenance of obsidian artefacts. However very little instrumental analysis has been undertak-  
en on obsidian from ALPC sites in Eastern Slovakia.

In the presentation, we will demonstrate the results of the non-destructive energy dispersive x-ray fluorescence (EDXRF) analysis of obsidian artifacts from eight archaeological sites attributable to the Eastern Slovak ALPC. This is the largest instrument-based  
study yet conducted and reported for obsidian artifacts connected with the activity of the ALPC communities in this territory.

Obsidian artefacts, next to the pottery finds, are used to delineate prehistoric conveyance networks in the Carpathian Basin, but also outside of it (e.g. in the Vistula river basin). The obtained results make it possible to have a look for signs of actual, cultural and  
territorial differentiations. They also enable to evaluate the role of far-reaching communication networks in the functioning of the ‘Eastern Linear’ communities.

Acknowledgements: Investigations were financed by the National Science Centre, Poland (OPUS 15 2018/29/B/HS3/01540).

## A. RAW MATERIAL UNIT ANALYSIS IN THE THEORY AND PRACTICE OF ARCHAEOLOGICAL RESEARCH: AN EXAMPLE FROM PALAEOLITHIC SITES OF RUSSIAN ALTAI

**Abstract author(s):** Belousova, Natalia E. - Fedorchenko, Alexander (Institute of Archaeology and Ethnography SB RAS)

**Abstract format:** Poster

In this paper, we discuss the methodological and practical aspects of applying the raw material unit analysis (RMU) to study the Ini-  
tial and Early Upper Palaeolithic assemblages from the Russian Altai (45,0–30,0 kyr uncal BP). This method is also called transforma-  
tion analysis (TA) or minimum analytical nodule analysis (MANA) in the archaeological literature. This approach aims to identify from a broad technological context of assemblage groups of lithics produced from the same raw material blocks. As the main criteria, we  
used colour, texture and another macro- and microscopically seen petrographic attributes of artefacts.

Based on the collections of the Ust-Karakol-1 multilayered site we integrate data from the raw material unit analysis and refitting studies of lithic assemblages, experimental modelling of operational sequences, the results of the use-wear investigations to re-  
construct the structure of stone processing production activities, its spatial and temporal aspects, as well as the raw materials strategies of Upper Palaeolithic human. The implementation of complex geological-mineralogical and exploratory studies, the inte-  
gration of natural science and archaeological data allow us to establish the nature and localization of the primary sources of stone raw materials of different cultural complexes, to assess the influence of stone raw material on the life-support processes and  
mobility structure of the first Upper Palaeolithic inhabitants of Altai, the functional specificity of the sites and cultural appearance of assemblages.

The research was supported by the Russian Science Foundation project No 20-78-10125 «The dynamics of cultural development and human colonization of Altai at the onset of the Upper Palaeolithic: life support strategies, paleotechnologies, mobility».

LITHIC RAW MATERIALS IN PREHISTORY: METHODS, PRACTICE AND THEORY. PART 2

Theme: 6. Material culture studies and societies

Organisers: Brandl, Michael (Austrian Academy of Sciences, OREA-Institute) - Martinez, Maria (Smithsonian Institution, National Museum of the American Indian) - Gurova, Maria (National Institute of Archaeology and Museum, Bulgarian Academy of Sciences)

Format: Regular session

Lithic materials are the oldest provable culture bearing resources in human history, demonstrated by the wide array of their use in the profane and sacred spheres of life. Due to their abundance, versatility and longevity, lithic artefacts are ideally suited for approaching and interpreting past human behaviour through the reconstruction of resource management, i.e. the procurement either directly or through distribution networks, the processing, use and eventual discarding, which represents the complete chaîne opératoire of lithic production and artefact biographies . From a diachronic perspective, such studies can reveal dynamic processes relating to the development of economic behaviour, production strategies and traditions, landscape use, contact spheres, routes of migration, and distribution networks. Successfully reconstructing these processes however crucially depends on the ability to trace these materials back to their original sources. Despite the obvious importance of provenance studies in archaeology, attempts to generate characteristic “fingerprints” of particular raw materials are still not widely available and remain challenging endeavours. Consequently, this session focuses on analytical techniques applied to various lithic raw materials from all geographical regions , and their potential for tracing lithic resource management. This topical issue can be tackled from a multitude of perspectives, which hold the promise for significantly enhancing our insights into past economic behaviours on a large international and multidisciplinary scale.

We cordially invite researchers from diverse backgrounds to contribute to this undertaking.

ABSTRACTS:

1

MINING AND USE OF VIENNA RADIOLARITE – AN INTEGRATED STUDY OF LITHIC RESOURCE MANAGEMENT

**Abstract author(s):** Brandl, Michael - Schmitsberger, Oliver (Austrian Academy of Sciences, Austrian Archaeological Institute) - Penz, Martin (Museen der Stadt Wien – Stadtarchäologie) - Trnka, Gerhard (University of Vienna, Dept. of Prehistoric and Historical Archaeology)

**Abstract format:** Oral

In the course of the ongoing project “BergbauLandschaftWien” (Mining Landscape Vienna, MLV) previously unknown radiolarite mining and processing sites have been recovered and documented in the context of the radiolarite bearing St. Veit Klippen Belt south-west of present day Vienna, Austria.

The MLV-project combines geo-archaeological surveys, archival research, techno-morphological studies of old collections and newly discovered lithic assemblages, and raw material analyses according to the Multi Layered Chert Sourcing Approach (MLA).

Until recently, the only known radiolarite mine in this area was located at the Antonshöhe in Vienna-Mauer, dating to the Lengyel Culture. Since 2016, almost 30 new radiolarite quarrying- and workshop areas have been identified based on extensive remains of prehistoric quarrying, including debris from extraction activities, decortification flakes, discarded precores, and hammer stones. First results of raw material analyses aiming at the characterisation of the quarried material, which we term “Vienna radiolarite”, offer promising future perspectives for a differentiation from North Alpine and Carpathian radiolarites, and also on a more local scale between various types found within the St. Veit Klippen Belt.

Currently, the project is concerned with incorporating the mining landscape into the surrounding prehistoric settlement infrastructure to understand the socio-economic dimensions of these mining activities. Our study of selected lithic assemblages from throughout eastern Austria and adjacent areas demonstrate that Vienna radiolarite was used from the Palaeolithic to the Bronze Age, however, the peak of mining seems to have occurred during the Neolithic period. The preliminary results of this research program show that the dimensions of Neolithic radiolarite mining in Vienna were dramatically underestimated, and revealed a prehistoric mining landscape of international rank and significant extent providing unprecedented research potential.

2

CHERT OF CHOICE. RAW MATERIAL PROCUREMENT STRATEGIES IN NORTH-EASTERN VORARLBERG (AUSTRIA) DURING THE BOREAL AND ATLANTIC – A CASE STUDY

**Abstract author(s):** Posch, Caroline (Department of Archaeologies, University of Innsbruck)

**Abstract format:** Oral

Northern Alpine radiolarite and chert constitute two of the standard raw material varieties within various archaeological sites of Western Austria from at least the Late Palaeolithic onwards. Although the presence of these raw materials has been recorded time and again in the archaeological record, only few studies have looked into the respective procurement strategies and the decision-making processes behind the utilisation of these ubiquitous lithic resources. Therefore, it is the aim of this paper to explore their usage more in depth, using the area of north-eastern Vorarlberg as case study. Here, in the regions of Großes Walsertal and Kleinwalsertal, several outcrops of the Ruhpolding Formation and thus primary deposits of high-quality radiolarian rocks and chert

are present. Concerning the archaeological record, numerous – mainly Early Holocene – sites have been recorded in the area since the 1980s. The Kleinwalsertal in particular features more than 90 archaeological sites, dating from the middle of the Boreal and to the end of the Atlantic period and containing large numbers of lithic artefacts predominately made from locally available chert varieties. Thus, the research area provides an opportune possibility to examine the different procurement modes of local varieties as a resource for the production of blanks and tools. To understand these strategies, the lithic artefacts were studied in more detail via an analysis of their morpho-technological and taxonomic characteristics as well as their respective position within the chaîne opératoire. This revealed striking differences and similarities between sites from various chronological and topographic contexts, including the choice of raw material sources (primary vs. secondary deposit), colour and the extent of preliminary core curation strategies.

3

ZURICH ALWAYS “INTERNATIONAL”? NEW PROVENIENCE ANALYSES BY OF THE PILE DWELLING SETTLEMENT ZÜRICH-INSURANCE

**Abstract author(s):** Wehren, Helena (ArchGeo Biel/Bienne) - Affolter, Jehanne (Ar-Geo-Lab Neuchâtel; University of Berne)

**Abstract format:** Oral

In prehistory, human contacts can be sketched by tracing the geographical origin of the raw material of silica artefacts. Knowledge about the distribution of artefacts and about their source of raw materials makes it possible to gain insights into prehistoric contacts and the area of movement.

We present in this presentation the results of a provenience study of silicite raw materials of/from artefacts found in a multiphase pile dwelling settlement excavated in 2018 in the agglomeration of Zurich (Switzerland). We use the sedimentary microfacies analysis which corresponds to the analysis of the fossils, sedimentary features, and their relation to each other. This enables investigation of the depositional conditions of the parent rock and thus its geological affiliation and its geographical origin.

The raw materials show typical contact networks observed in the Zurich area. The local and regional materials lie on possible routes for the few long-distance contacts correspond to possible routes seen in the nearer material. However, there are some new types in the raw materials record in the Zurich area.

4

ACHEULEAN INDUSTRIES AND ITS RELATION WITH AVAILABLE RAW MATERIAL IN T4 TERRACE: THE MALHADINHAS CASE STUDY (TEJO RIVER, CENTRAL PORTUGAL)

**Abstract author(s):** Pirata, Vânia (Universidade Autónoma de Lisboa; Novarqueologia, Lda.) - Pereira, Telmo (Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar; UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Cunha, Pedro (University of Coimbra, MARE – Marine and Environmental Sciences Centre, Department of Earth Sciences) - Martins, António (Universidade de Évora, Departamento de Geociências; ICT – Instituto de Ciências da Terra) - Pereira, José (Novarqueologia, Lda.)

**Abstract format:** Oral

The basal sequence of the T4 terrace of the Tejo River is characterized by the presence of Acheulean and can be divided in two units: the Lower Gravels below and the Upper Sands above. In the Lower Gravels (ca. 340 to 325 ka), the debitage is mostly on chopper-like cores, flakes have informal retouched and the LCTs are rude and little elaborated. In the Upper Sands (ca. 325 and 220 ka), there is high number of discoidal-like cores, flakes have formal retouched and the LCTs are more elaborated. Above the basal sequence, the middle and upper sequences of the T4 already have Mousterian, that also occur through the younger T5 and T6 terraces. In the older T3 terrace there were never been found lithic artefacts.

Malhadinhas is an Acheulean site located in the T4 terrace at the right bank of the Lower Tejo. The site is known for almost one century but was only briefly surveyed and sampled. In 2019, the construction of a Solar Photovoltaic Plant allowed producing the first extensive surface collection, combined with mechanical test pits and manual excavations that allowed a detailed description of the context and to collect more than 1300 stone tools. Geomorphologically, this Acheulean occupation is at 45 m a.s.l., on the top of the Lower Gravels, which doesn't have artefacts in the 3 m below the occupation. Archaeologically, the assemblage is very well delimited in space at the elevation of 45 m a.s.l. and it is composed by almost only large artefacts, which is congruent with other assemblages found in the Lower Gravels across the Lower Tejo. Together, this data suggests that the presence of this dense gravel of quartzite boulders was determinat for the Acheulean occupation in order to produce LCTs.

5

RAW MATERIAL USE AND SETTLEMENT PATTERNS DURING THE END OF PLEISTOCENE AT CENTRAL PORTUGAL

**Abstract author(s):** Gameiro, Cristina (UNIARQ - Lisbon University) - Aubry, Thierry (Fundação Côa Parque) - Manzano, Carmen (Arqueologia&Património) - Gomes, Sérgio (CEAACP - Coimbra University) - Matias, Henrique (UNIARQ - Lisbon University)

**Abstract format:** Oral

In Portugal, the chrono-cultural sequence of the Upper Palaeolithic was tardily defined, when compared to the rest of Southwestern Europe. Until 1995, when the Côa Valley engravings and occupation sites were discovered, most of the known sites were in Estremadura.

The recent identification of two Upper Palaeolithic occupation sites in the Vouga River valley (central Portugal) is yet another valuable contribution to this knowledge. This paper will present a synthetic analysis of raw material procurement modalities, blank production, transformation and use of the lithic tools recovered at the Rôdo and Vau. The results will be compared with data from anal-

- 6

ogous sites of Estremadura and the Côa Valley, in order to understand the exploitation modalities of the territory located between these regions. Apart from Vau’s Middle Gravettian occupations (SU005) and Olga Grande 14 (SU3) the remaining Upper Palaeolithic assemblages are mostly composed of various types of quartz, both in the Côa Valley and the Vouga Valley. The available data seem to indicate a decrease in the percentage of flint, silcrete and hydrothermal silicifications from Final Magdalenian/Azilian onwards, in both regions.

In the Côa Valley, the use of the same types of flint, silcrete and hydrothermal silicifications available in the Spanish Meseta and Portuguese Estremadura is documented between Gravettian and Tardiglacial. Most of these raw materials have also been identified at the Palaeolithic sites of the Vouga Valley, a region situated halfway between the Côa Valley and the flint sources of Estremadura. By interpreting the Palaeolithic rock art sites of the Côa Valley as a place of aggregation, one can envisage the mobility of human groups between these two regions, more than 150km apart, enabling the exchange of lithic raw materials from various sources and the diffusion of know-how concerning the production of lithic artefacts.

In addition, the study of the site location, spatial organization of the structures and artefacts enables a functional interpretation of these hunter-gatherer camp sites.
- 7

**IT’S JUST LOCAL! FOLLOWING THE SOCIAL NETWORKS OF A LOCAL FLINT IN PREHISTORY**

**Abstract author(s):** Monforte-Barberan, Andreu (Grup de recerca Arqueològica al Mediterrani i al Pròxim Orient, Universitat Autònoma de Barcelona) - Pardo-Gordó, Salvador (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Molist, Miquel (Grup de recerca Arqueològica al Mediterrani i al Pròxim Orient, Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The circulation of lithic resources, either as raw materials or as manufactured products, constitutes a key factor for the analysis of the production, reproduction and consumption of prehistoric societies. Due to the difficulty of identifying and differentiating siliceous rocks in archaeological contexts, the implication of most of these materials in the change and exchange networks had been excluded. Although, there are some siliceous varieties with specific geochemical identifiable remarks such as the Montjuïc’s jasper. This flint has been detected in different sites in the northeastern Iberian Peninsula as a significant raw material used by prehistoric societies between the 6th and 3rd millennium cal ane.

Circulation patterns of this raw material, a priori with a local scale distribution, could be explained by dynamics networks, especially by structural (measured as the betweenness centrality) and geographical position of some nodes. Using graph models and a statistical approach, the aims of this communication is to present the reconstitution of the circulation networks of a local flint to reconstruct the connectivity degree of these prehistoric societies.

**NON-INVASIVE GEOCHEMICAL DISCRIMINATION OF CORDED WARE CULTURE BATTLE-AXES FROM THE NE BALTIC SEA COASTS – TESTING PXRF PROTOCOLS**

**Abstract author(s):** Holmqvist-Sipilä, Elisabeth - Nordqvist, Kerkko (University of Helsinki)

**Abstract format:** Oral

The Battle Axe / Corded Ware Culture (CWC) spread around the Baltic Sea c. 2900–2200 BCE, its northern-most adaptation emerging in the modern-day Finland. An astonishingly rich collection of ground stone battle-axes that lend the name to the cultural phase, c. 1400 specimens, has been found in the country. The abundance of battle-axe discoveries is explained by a century-old, yet never thoroughly scientifically proven postulate of the existence of a domestic battle-axe production centre in SW Finland, which exploited the olivine-diabase deposits of the Satakunta County and distributed battle-axes across southern Finland and beyond. We aimed to challenge the prevailing Satakunta-provenance paradigm by analysing stylistically related CWC battle-axes from Finland and comparative material from Estonia and Latvia via portable X-ray fluorescence spectrometry (pXRF). We also acquired a substantial comparative data set by analysing lithic samples from Satakunta and other diabase deposits in Finland. The majority of the battle-axes in the museum collections are intact, which challenged us to seek analytical protocols for non-invasive surface-analysis of lithic artefacts. Our aim was to establish protocols that generate adequate analytical power for geochemical discrimination and source determination of the axes. The identification of regional battle-axe economies and distribution patterns of the axes can inform us about the organisation of prehistoric labour and resources, and the formulation and maintenance of inter-regional contact networks by prehistoric communities – these questions are of particular interest when interpreting material evidence of a migration or expansion associated with the CWC phase.
- 9

**SOURCING OBSIDIAN FROM THE EARLY BRONZE AGE MARITIME SANCTUARY OF KEROS (CYCLADES, GREECE): AN INTEGRATED APPROACH**

**Abstract author(s):** Carter, Tristan - Moir, Rose (McMaster University)

**Abstract format:** Oral

Until 2019 there had never been a sourcing study undertaken on an obsidian assemblage from the prehistoric Cyclades, the received wisdom being that it would all be from the ‘local’ source of Melos. Ultimately this may well be the case, however this is to ignore the fact that there are two spatially and geo-chemically distinct sources on Melos – Sta Nychia (Adhamas) and Dhemenegaki – whose exploitation through time and space we cannot assume to have been the same. This paper details the elemental characterization

- 10

of 198 obsidian artefacts from the well-known Early Bronze Age [EBA] (3rd millennium cal. BC) site of Keros, of which 99 came from the maritime sanctuary at Kavos, while 99 derived from the neighboring settlement of Dhaskalio, representing c. 13% of the total assemblage from the 2006-08 excavations. Portable x-ray fluorescence spectroscopy [pXRF] was the best-suited technique for the study as it (a) can discriminate the products of the main obsidian sources of the Aegean and surrounding region, (b) is non-destructive, and (c) can be undertaken where the material is stored. The artefacts selected for analysis included all of those illustrated in the original publication, i.e. our study was underpinned by a detailed techno-typological analysis of the assemblages, and also represented the different phases of occupation at Dhaskalio to gain a diachronic perspective on traditions of obsidian consumption. The results of this work suggest a striking preference for one of the Melian sources over the other, plus handfuls of other source products, a assemblage variability not usually associated with EBA assemblages in the southern Aegean, but very much in keeping with the well-connected character of the site.
- 11

**LONG-DISTANCE OBSIDIAN TRADE TO NORTHERN ITALY DURING THE NEOLITHIC**

**Abstract author(s):** Tykot, Robert - Vianello, Andrea (University of South Florida)

**Abstract format:** Oral

Obsidian from four islands in the central Mediterranean was acquired starting in the Early Neolithic (ca. 6000 BCE) and distributed long-distance to sites in northern Italy. The nearest is the islet of Palmarola, several hundred km to the south, while Lipari, Monte Arci (Sardinia), and Pantelleria are even further away. Previous studies demonstrated that obsidian from all four reached this far north, raising questions about quantity and frequency from each and how they may have changed over three millenia. Our study used a non-destructive portable X-ray fluorescence spectrometer to analyze >1000 artifacts from several sites in northern Italy. This research significantly increased the number of archaeological sites and artifacts tested in this region, allowing statistical comparisons between time periods and sites and provides some interpretations for the socioeconomic factors involved in this variation.

The sites tested in this study include Pescale, southwest of Modena, excavated by an early archaeologist and dating to the Middle-Late Neolithic. The majority of the 926 artifacts tested are small blades. The sites of Case Catena (56 artifacts), Pontetaro (66), and Guidorossi (47) are all near Parma, and date to the Early-to-Middle Neolithic. Along with mostly small blades, obsidian cores have been found at the first two of these sites, confirming the local production of the final tools used. About 35 obsidian artifacts from several sites in northeastern-most Italy were also analyzed.

The results obtained in this study show striking differences between the sites in the distribution patterns of obsidian from each source, as well as changes over time which may be related to increasingly complex socioeconomic patterns over the course of the Neolithic. The obsidian distribution patterns are used to propose potential transportation routes while assessment of the typo-technology of the artifacts addresses the involvement of lithic specialists in various stages of the chaîne opératoire.
- 12

**VARIATIONS IN USE OF LANDSCAPE RESOURCES THROUGH TIME AT A MIDDLE PALAEOLITHIC SITE, THE BAU DE L'AUBESIER, VAUCLUSE, FRANCE**

**Abstract author(s):** Wilson, Lucy (University of New Brunswick In Saint John)

**Abstract format:** Oral

The Bau de l'Aubesian is a multi-level rock shelter site with Middle Palaeolithic layers dating from the later Middle Pleistocene into the Late Pleistocene. A long-term project aimed at identifying raw material sources for the lithic assemblages has made it possible to delineate the territories exploited for each assemblage, and to evaluate the extent of use of different parts of those territories. This presentation combines the lithic data from several layers with information on the season of death of fauna, and environmental data from micromorphological analyses, sediments, and fauna, to look for potential relationships between season of use and climate on the lithic territories of each layer. The older layers formed during spring to fall times of year, in cold periods. They contain a predominance of faunal remains from large mammals, and have lithic assemblages where ease of access to sources of raw materials seems to have been emphasised, more than the raw material characteristics such as nodule size or quality for knapping. In the middle part of the site stratigraphy, a layer deposited mainly during winter in a warm period has a lithic territory that is concentrated in an area with easier terrain, and the proportion of faunal types that could have been obtained nearby, in the gorge where the site is located, increases. In the upper layers, climate was again cold, and fauna and lithics are both diverse, but the choice of sources of raw material was more influenced by raw material characteristics, and less by terrain considerations. The youngest layer provides evidence of the passage of highly mobile hominins with a toolkit made of flint from a variety of sources, some relatively distant, but also reflects a period of intense use of local resources, both lithic and faunal.

- 12

both chert formation types and individual deposits. Other benefits include it’s accuracy, speed, low cost, portability, and non-destructiveness. Regardless of the benefits of reflectance spectroscopy, a continued emphasis on survey, source identification, sampling, lithic database construction, and statistical methods should be maintained in conjunction with technique development. The limitations and areas needing further testing are also crucial components when evaluating reflectance spectroscopy or for that matter any technique applied to chert source research. Therefore, a portion of a large private collection, the Sim’s collection, was non-destructively analyzed using reflectance spectroscopy to study mobility patterns of Late Pleistocene hunter-gatherers in the Southeastern United States. The results of the chert source study highlight both the reflectance spectroscopy technique and it’s application in understanding past human behavior.

**UTILIZATION AND PROVENANCE OF STONE ARTEFACTS AND RAW MATERIALS FROM IGALIKU (Ø47) AND TATSIP ATAA KILLEQ (Ø172) IN SOUTHWEST GREENLAND**

**Abstract author(s):** Beck, Sólveig (University of Iceland)

**Abstract format:** Oral

The aim of this paper is to share preliminary findings of an on-going classification study of stone assemblages from two Norse midden formations uncovered at the episcopal manor in Igaliku (Garðar Ø47) and farm site Tatsip Ataa Killeq (Ø172) in Vatnahverfi in the Eastern Settlement in South Greenland. Combined, the two sites yielded over 1700 stone finds, artefacts, debitage and raw materials, the majority of which are comprised of steatite, red sandstone and chert. The ultimate objectives are to pinpoint commonalities and differences between the assemblages of the two farm economies, and map raw material variabilities and their potential sources with the aid of typological, petrological and chemical analyses (XRF and LA-ICP-MS), whether they be from within or beyond the shores of Greenland. This study is part of a larger research project, Sticks and stones: Raw material use in Norse Greenland, a collaborative effort between the National Museums of Greenland and Denmark, the University of Iceland, and the Geological Survey of Norway (NGU), Denmark and Greenland (GEUS). The project aim is to shape a more detailed view of the nature of raw material utilization and material procurement strategies for wood and stone between the 11th and 15th centuries and add important insight into the structure and extent of Norse socio-economic networks in Greenland, at the very margin of Northwestern Europe.
- 13

**PROCUREMENT, PRODUCTION, AND DISTRIBUTION IN THE UCAREO/TULA OBSIDIAN EXPLOITATION SYSTEM IN POSTCLASSIC HIGHLAND MEXICO**

**Abstract author(s):** Healan, Dan (Tulane University)

**Abstract format:** Oral

Over the past four decades, geochemical studies have identified Ucareo, Michoacan as a major source of obsidian for artifacts found at prehispanic sites in many parts of Mesoamerica, beginning in the Early Formative period. During the Epiclassic and Early Postclassic periods, Ucareo obsidian appears to have been a particularly important commodity associated specifically with prismatic core/blade technology, and comprised the principal source of prismatic blades at a number of major centers, including Xochicalco, Tula, and Chichén Itzá. Over the past several decades, archaeological investigations of prismatic core/blade workshops at Tula and obsidian quarries and related sites at the Ucareo source itself have examined the principal nodes of a network of exploitation encompassing extraction and initial processing of raw obsidian at one extreme and prismatic core/blade production and consumption at the other. Collectively, these investigations provide critical insights into quarry and core/blade production technology, and shed light upon the sociocultural milieu in which production took place.
- 14

**BEYOND THE MIRROR: REFLECTIONS OF INDIGENOUS CONTINUITY IN OBSIDIAN LAPIDARY IN CENTRAL MEXICO**

**Abstract author(s):** Martinez, Maria (Smithsonian Institution, National Museum of the American Indian) - Brandl, Michael (Austrian Academy of Sciences, Austrian Archaeological Institute) - Vicenzi, Edward (Smithsonian Institution, Museum Conservation Institute) - Sharps, Meredith (Rochester Institute for Technology, Image Permanence Institute) - Lam, Thomas (Smithsonian Institution, Museum Conservation Institute)

**Abstract format:** Oral

Over the last couple of decades researchers have increasingly used museum collections as primary sources for gaining a deeper understanding of socio-economic processes of the past, both independently and in comparison, to newly excavated archaeological material. For this study, we apply collections-based research with an ethno-historical approach that interweaves museum collections with obsidian sourcing and historical as well as archaeological evidence to explore the potential function, chronology and cultural assignment of six rectangular obsidian tablets typically identified as pre-Columbian “mirrors” housed at the Smithsonian Institution (SI)-National Museum of the American Indian (NMAI).

We employed a novel analytical procedure for non-destructive obsidian sourcing combining pXRF with SEM based micro-XRF. The latter achieved more refined chemical signatures not observable through pXRF and revealed a previously unknown local of obsidian procurement in the Los Azufres volcanic complex used for the manufacture of one of the investigated items.

The results of combined techno-morphological analysis, provenance studies and the study of historical sources enable us to show that these items are of Colonial origin, discuss the role and autonomy of obsidian lapidarians from Central Mexico after the European invasion of 1521, and the impact of the conquest on craft production. The outcomes of this study highlight the importance of

- 15

integrated collections-based research utilizing non-destructive analytical techniques and the full breadth of historical sciences to answer complex socio-economic questions, which resulted in the definition of an analytical protocol for collections-based research involving rectangular polished obsidian tablets from Mesoamerica on a larger scale.

**THE LONG JOURNEY: CHEMICAL SOURCING AND DISTRIBUTIONAL ANALYSIS OF JADE IN MESOAMERICA**

**Abstract author(s):** Kovacevich, Brigitte (University of Central Florida)

**Abstract format:** Oral

Chemical compositional analysis and sourcing of jadeite and greenstones in Mesoamerica has been a process fraught with difficulties due to the heterogeneity of the material. Numerous techniques have been implemented, including X-Ray Fluorescence (XRF), Instrumental Neutron Activation Analysis (INAA) Inductively-Coupled Plasma Mass Spectrometry with Laser Ablation Introduction System (LA-ICP-MS), stable isotope analysis and others. Headway has been made, but there are still more questions than answers. Despite the challenges presented by compositional analysis, if complemented by the study of production techniques and distribution patterns, these processes can together be used to infer mechanisms of movement and organization of production of Mesoamerican greenstones. Jadeite and other greenstones can no longer be considered to be the exclusive property of the elite and they may have been produced and exchanged in a variety of contexts. Archaeological, chemical sourcing, iconographic, and ethnohistoric evidence will be reviewed in order to investigate the use and meaning of jade for the Maya.

**COMBUSTION FEATURES IN MEDITERRANEAN LATE PREHISTORY: MULTIDISCIPLINARY APPROACHES TO THEIR USES AND FUNCTIONS**

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Belarte, Maria Carme (ICREA - Catalan Institution for Research and Advanced Studies; ICAC - Catalan Institute of Classical Archaeology) - Beylier, Alexandre (UMR5140, CNRS - Centre National de la Recherche Scientifique; Université Montpellier 3; Service archéologie Sète agglomère méditerranée) - Mateu, Marta (Instituto de Investigaciones Antropológicas, Universidad Nacional Autónoma de México) - Molist, Miquel (Departament de Prehistòria, Universitat Autònoma de Barcelona) - Portillo, Marta (Institutió Milà i Fontanals, CSIC - Spanish National Research Council)

**Format:** Regular session

Firing installations, such as hearths and ovens, are among the most frequent structures documented in settlements of any period. They are mainly associated with cooking but also had other functions such as heating, lighting or transforming raw materials. Their location determines the circulation and use of space, as well as the organisation of daily activities, both individual and collective, and, ultimately, the organisation of the households. Their study can be approached from very different perspectives in order to obtain information on aspects such as fuels, technological level of the societies that built and used them, food, management of natural resources, craft activities or certain ritual practices, among others.

The aim of this session is to share the results of studies carried out or underway on combustion structures from different methodological approaches, such as geo-archaeology, bio-archaeology, experimental archaeology or ethno-archaeology, including interdisciplinary analyses. It includes the presentation of both case studies and regional syntheses of the different areas of the Mediterranean arc in recent prehistory (from the Neolithic to the Iron Age).

**PYROTECHNOLOGICAL PROCESSES BEHIND FIRE TRACES: EXPERIMENTAL ARCHAEOLOGY FOR THE INTERPRETATION OF ARCHAEOLOGICAL RECORD**

**Abstract author(s):** Costa, Annalisa (LaBAAF, Laboratorio Bagolini Archeologia Archeometria Fotografia, Università degli Studi di Trento) - Cavulli, Fabio (Università degli Studi di Napoli Federico II, Dipartimento di Studi Umanistici) - Pedrotti, Annaluisa (LaBAAF, Laboratorio Bagolini Archeologia Archeometria Fotografia, Università degli Studi di Trento)

**Abstract format:** Oral

In the early Neolithic site of Lugo di Grezzana (VR), dated between 5500 to 4900 cal BC, several pits have been dug: morphometrically similar, circular or squared in plan, with dimensions of the opening that vary from a minimum diameter of m 0,85 to a maximum one of m 2,10, they are all clearly characterized by charcoal and ash remains, strong rubefaction of the walls, oxidized sediments, artefacts and ecofacts modified by fire such as burnt clay, and burnt beams at the bottom. Rubefaction is always more pronounced on the pit walls than on the base surface, and traces of a cover are not recorded at all. It is difficult to define which processes led to the formation of such traces in the archaeological record and to relate them to a specific function. Dimensions and rubefaction of the walls could reflect several and/or long lasting firings as can be the case for pottery firing. The smallest ones could be used for other purposes. However, we cannot exclude similar structures might have been used in a multifunctional way.

The methodological approach applies an experimental archaeology to test different hypotheses for better understanding of the firing process that led to the formation of the archaeological traces. The several actions involved in the process have been enucle-

ated, slightly changing them many times to see the effects to the records. Experiments aimed to observe the effect of a single or many firings, of reducing conditions and which processes allow the preservation of wooden burnt beams at the base of the pit and to understand.

The experimental work not only allows the comparison with the archaeological features but it gives unexpected information about pyrotechnology.

Using SEM-EDXS and FT-IR analyses on both archaeological and experimental samples of fired sediments allowed to make interesting considerations.

2 **COMBUSTION STRUCTURES AND USE OF SPACE. A MULTIDISCIPLINARY APPROACH TO THE NEOLITHIC OCCUPATION AT COVA DE LES PIXARELLES (TAVERTET, BARCELONA)**

**Abstract author(s):** Sisa-López de Pablo, Joaquim (Universitat Autònoma de Barcelona, Departament de Prehistòria, Grup de Recerca en Arqueologia prehistòrica de la Mediterrània i Pròxim Orient - GRAMPO) - Wattez, Julia (Inrap, Umr 5140 Archéologie des Sociétés Méditerranéennes; Equipe Sol-DMOS, AgroParisTech) - Álvarez, Ramón - Rauret, Anna Maria (Universitat de Barcelona, Departament d’Història i Arqueologia) - Gómez, Anna - Molist, Miquel (Universitat Autònoma de Barcelona, Departament de Prehistòria, Grup de Recerca en Arqueologia prehistòrica de la Mediterrània i Pròxim Orient - GRAMPO)

**Abstract format:** Oral

As is well known, combustion structures are a key element in archaeology for understanding the articulation of the social spaces of past societies since they allow us to approach to domestic activities, given the role they play in daily life production and consumption practices. In the last years, the study of hearths and other combustion features as well have been enriched by the application of a set of new methodologies, which has made it possible to delve deeper into its study and know both the activities involved in its use and the management.

In this communication, we present the results of an interdisciplinary study carried out at the Cova de les Pixarelles site (Tavertet, Barcelona) which aims to contribute to the knowledge of the use of space and rhythms of occupation of the Middle Neolithic societies in the Northeast of the Iberian Peninsula through the study of combustion structures and their management. The exceptional conservation of the remains in strata of highly organic composition due to the formation of travertine layers in the periods when it is not occupied, constitutes this cave as a benchmark for occupations in karst cavities during recent prehistory in the region. More specifically, we will focus on Level XXII, made up of a large accumulation of ashes and faunal remains among other utilitarian elements. Therefore, the ethnographic vision of the use of the cavity in the economic and social cycle is deepened by the first results of the micromorphological analysis along with the rest of the archaeological record.

3 **A MULTIDISCIPLINARY TOOLSET TO STUDY A NEOLITHIC COMBUSTION STRUCTURE FROM THE NORTHEASTERN COAST OF THE IBERIAN PENINSULA**

**Abstract author(s):** Monforte-Barberan, Andreu - Sisa-López de Pablo, Joaquim - Breu, Adrià (GRAMPO, Universitat Autònoma de Barcelona) - Beamud, Elisabet - Maestre, Estefanía (Unitat de PALEOMAGNETISME - CCiTUB-CSIC / Geosciences Barcelona - Geo3Bcn) - Gallego, Jose (Global Geomática SL) - Martínez, Pablo (SERP, Universitat de Barcelona / CIPAG) - Molist, Miquel (GRAMPO, Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The study of combustion structures through multidisciplinary tools inform us about the means of production, reproduction and consumption of prehistoric societies. This communication aims to study the use of space, subsistence behaviours and management of a combustion structure localized in the Carrer Aurora (Barcelona), dated from the 5th millennium cal. This archaeological site was excavated in the framework of a rescue archaeology activity in the Raval quarter. To this end, we apply a multidisciplinary toolset including geological, archaeomagnetic, microspatial, micromorphological and biochemical analyses which will be capable to assess the social life of the structure. This is the first time this type of approach has been applied to hearths from the northeastern coast of the Iberian Peninsula. We expect to combine the study of the original source of the hearth stones with archaeomagnetism, analyses of any surviving organic residues and a comprehensive description of the micromorphological features of the structure.

4 **AN APPROACH TO THE STUDY OF PREHISTORIC FIRE-PITS BASED ON NEOLITHIC EVIDENCE FROM THE BARCELONA PLAIN (SPAIN)**

**Abstract author(s):** Ruiz, Joaquim (Universitat Autònoma de Barcelona. Prehistoria. GRAPPO)

**Abstract format:** Oral

The general aim of this study is to contribute to the analysis of prehistoric hearths in the settlements of the northeastern Iberian Peninsula, specifically in the Neolithic period (5000-3500 BCE). We present the results of a multidisciplinary research project on a specific type of fire installation, the “Fire-Pits”, defined by an excavated structure and a filling consisting essentially of stone blocks and combustion evidence. This type of hearth is abundantly documented and, for our study, we will analyse in detail those discovered in the archaeological sites of the Barcelona Plain (Raval district). The large combustion structure from “Reina Amalia 38 bis” site, dating from the post-Cardial Neolithic period (5310 ±30 BP), has been studied using a methodology based on the analysis of the lithic filling, the spatial distribution of the remains, their reassemblage and the combination with thermal alterations. The

study allows addressing hypotheses about the functioning of the structure (open/closed combustion), as well as identifying the post-depositional processes and the variability of the rubefacted elements. The analysis carried out allows proposing a methodology and analysing a series of variables, which will contribute to the study of similar structures and thermal processes in the recent prehistory of the Western Mediterranean.

5 **KILNS AND BUILDERS: AN EXPERIMENTAL STUDY ON HUMAN FACTOR IN THE CONSTRUCTION AND USE OF POTTERY FIRING INSTALLATIONS IN CHALCOLITHIC**

**Abstract author(s):** Manea, Bogdan (ArchaeoSciences Division, ICUB, University of Bucharest) - Opreș, Vasile - Ignat, Theodor (Bucharest Municipality Museum) - Popescu, Gabriel - Lazăr, Cătălin (ArchaeoSciences Division, ICUB, University of Bucharest)

**Abstract format:** Oral

Experiments on prehistoric pottery firing structures generally focused on testing multiple techniques in order to achieve different combustion atmospheres, analyzing thermal data (maximum temperatures/heating rate/soaking time/cooling rate), recording temporal information about the firing and fueling process as well as the type/quantity of the fuel used. Alongside identifying the potential construction methods, the above-mentioned approaches are very important. However, for a better understanding of the complexity that the building process and use of such structures entailed for the prehistoric communities we need a broader perspective analysis.

The current paper will provide the results of an experimental archaeology program carried out at Sultana-Malu Roșu (Romania), regarding the study of prehistoric pottery firing structures.

We will discuss the whole range of operations performed when building and using some pottery firing structures archaeologically certified for the Chalcolithic period from Southeastern Europe. Information will be included, relative to all the materials used (type/preparation/quantity), the building process (construction/drying process/repairs) and use of the reconstructed structures. Likewise, information relative to the operational sequences will be provided, concerning labor (number of individuals/sex/age) and the physical effort entailed.

The results offered by the experimental study will be correlated with the archaeological record, to help us reveal some of the unknowns concerning people’s interaction with both tasks and the environment, as well as the knowledge and skills required for making and using such structures. Ultimately, our results may lead to a better understanding of the decision making process relative to the overall process of ceramic production, during Chalcolithic.

This work was supported by a grant of the Romanian Ministry of Education and Research, CNCS - UEFISCDI, project number PN-III-P4-ID-PCE-2020-2369, within PNCDI III.

6 **DEFINING RECURRENT HUMAN ACTIVITIES AT A 3RD MILLENNIUM SETTLEMENT THROUGH CONCENTRATIONS OF ARCHAEOBOTANICAL REMAINS: THE CASE OF DHASKALIO, KEROS, GREECE**

**Abstract author(s):** Mavromati, Antigoni (Independent researcher) - Ntinou, Maria (School of History and Archaeology, Department of Archaeology, Aristotle University of Thessaloniki) - Tsartsidou, Georgia (Ephorate of Palaeoanthropology-Speleology, Ministry of Culture, Athens; M. H. Wiener Laboratory for Archaeological Science, ASCSA, Athens) - Margaritis, Evi (The Cyprus Institute, Science and Technology in Archaeology and Culture Research Center - STARC, Nicosia) - Boyd, Michael - Renfrew, Andrew (McDonald Institute for Archaeological Research, University of Cambridge)

**Abstract format:** Oral

The Early Bronze Age settlement of Dhaskalio, Keros, Cyclades, Greece, was systematically excavated between 2007-2008 and 2016-2018. Dhaskalio, at present an islet separated from the main island of Keros by 90 m of water, in the EBA was a rocky promontory covered in constructions. Excavations on Dhaskalio have revealed extensive architectural remains where surfaces and fills can be potentially associated with a broad range of activities, including craftworking (primarily metallurgical), as well as perhaps domestic activities. Systematic recovery of archaeobotanical remains has been conducted at the site and the analysis of charred wood, plant macroremains, and phytolith samples is underway. In this study, we examine the deposition and distribution of all categories of archaeobotanical remains in areas L and H of the settlement that have provided evidence for metallurgical activities and in parts of areas A, C, F of a possible domestic character. The study focuses on single contexts in these areas such as surfaces with ash concentrations and deposits with evidence for metalworking as identified through metallurgical remains and soil chemistry analyses. We set out to explore 1. the preservation of plant remains and how it can help clarify taphonomy issues site-wide and in individual contexts, 2. the type of fuels potentially present in each context, i.e. wood, the remains of crop cleaning for kindling, etc., 3. the taxonomic composition of the charred wood, plant and phytolith assemblages of each context and 4. the possible association of different types of fuel and or taxa with different activities. We suggest that at Dhaskalio the study of plant remains associated with fire installations and their contemporary surfaces may help characterize the use of space and the organization of related activities as well as reveal aspects of fuel management and procurement.

7

**FROM THE NORTH TO THE SOUTH. BRONZE AGE COMBUSTION FEATURES OF VIA ORDIERE-SOLAROLO AND MURSIA(ITALY): ARCHAEOLOGY, GEOARCHAEOLOGY, EXPERIMENTAL DATA**

**Abstract author(s):** Peinetti, Alessandro (Laboratoire Archéologie des Sociétés Méditerranéennes, UMR 5140, CNRS, Univ. Paul Valéry Montpellier 3, MCC; LabEx ARCHIMEDE, programme IA- ANR-11-LABX-0032-01; Università di Bologna) - Debandi, Florencia - Cattani, Maurizio (Università di Bologna)

**Abstract format:** Oral

The aim of this paper is to compare the combustion features of two Bronze Age sites of the Italian peninsula from a typological, technological and functional point of view. The two sites are the Middle Bronze age village of Via Ordieri-Solarolo, located in the alluvial plains of Emilia-Romagna, and the Early-Middle Bronze Age village of Mursia-Pantelleria, settled up on the volcanic island of Pantelleria. The analysis is based on archaeological and geoarchaeological data and completed by experimental observations about technological and functional markers or taphonomy.

At Via Ordieri-Solarolo the combustion residues from dumps furnish relevant data about domestic fire management and practices in the first occupation phase, when the site is built up with pile dwellings. On the contrary, an earth oven and several structured fire-places are preserved in the later occupation phases. Two other fire installations, with a peculiar and elongated morphology, are also attested and probably refer to artisanal activities.

On the other hand, the documentation about fire installations in Mursia is particularly abundant. Each domestic building of the village presents several structures related to the use of fire, with different morphologies: hearth delimited with four stone slabs; fireplaces realized with a horizontal slab or with earthen materials; ovens built with stones; etc. This variability attests of different way to manage the fire and transform consumption goods. The diachronically change of the morphology and of building techniques of some of these installations suggest a change of behaviors through time as well. They show also particular choices and a selection of raw materials for their construction.

The comparison of the two sites, highlight the different behaviors concerning the use of fire and the way to manage it by two different Bronze Age communities, taking into account the different environmental, economical and cultural variables which characterize the two contexts.

8

**A MULTIDISCIPLINARY APPROACH TO FUEL CONSUMPTION: ANALYSIS OF LATE PREHISTORIC COMBUSTION FEATURES IN NE IBERIA AND THE BALEARIC ISLANDS**

**Abstract author(s):** Allué, Ethel (Institut de Paleoeecologia Humana i Evolució Social - IPHES-CERCA) - Burguet-Coca, Aitor (Institut Català de Paleoeecologia Humana i Evolució Social - IPHES-CERCA) - Mas, Bàrbara (Seminari d'Estudis i Recerques Prehistòriques - SERP, Departament d'Història i Arqueologia, Universitat de Barcelona) - Picornell-Gelabert, Llorenç (ArqueoUIB Research Team, Department of Historical Sciences and Theory of Arts. Universitat de les Illes Balears)

**Abstract format:** Oral

Combustion features have been approached from different perspectives, among which fuel residues analysis plays a key role. Fuel remains constitute one of the main components of these features, allowing fire activity identification of and the understanding of combustion features functionality in the archaeological record. Besides, fuel procurement and consumption constitute one of the most enduring social practices since the domestication of fire. Accordingly, the aim of this presentation is: 1) to analyze theoretical and methodological issues related to the study of fuel from combustion features, paying special attention to the ethnoarcheological approach to fuel consumption; and 2) to discuss fuel remains in different type of combustion features. The comprehensive approaches to combustion features require multi-proxy analyses, combining spatial distribution and archeobotany, mainly charcoal, phytoliths, dendro-anthracology, with ethnoarcheology and experimental archeology providing prospective venues of inquiry to discuss methodological and theoretical approaches to fuel. By combining different approaches to fire structures and fuels we will discuss the role of fuel residue analysis in these kind of archaeological features. The examples considered show different contexts, including domestic and funerary hearths located in NE Iberia and the Balearic Islands (e.g., Cova Gran, Son Ferrer, Cova des Pas, Cova de la Font Major). The results provide a dataset on plant evidence including taxa and plant parts used as fuel and evidences of the combustion conditions. The results indicate that the formation process of each type of context and the specific uses have an effect on taxonomic diversity that can be related to the functionality of each structure. Moreover, these analyses allow to address multiple methodological questions, such as the representativeness of dispersed vs. concentrated charcoal assemblages in terms of taxonomy and plant types diversity; or the archaeological analysis of social choices taking part in fuel procurement and consumption (e.g., selection, avoidance, preference, etc.).

9

**IRON AGE COMBUSTION STRUCTURES IN THE EASTERN IBERIAN PENINSULA AND SOUTH OF FRANCE: A TRANSDISCIPLINARY STUDY**

**Abstract author(s):** Belarte, Maria Carme (ICREA - Catalan Institution for Research and Advanced Studies; ICAC - Catalan Institute of Classical Archaeology) - Portillo, Marta (Institució Milà i Fontanals, CSIC - Spanish National Research Council) - Mateu, Marta (Instituto de Investigaciones Antropológicas, Universidad Nacional Autónoma de México) - Pecci, Alessandra - Saorin, Carme (Universitat de Barcelona) - Camañes, Pilar - Cuscó, Oriol - Pastor, María - Canela, Joan (ICAC - Catalan Institute of Classical Archaeology)

**Abstract format:** Oral

Throughout the first millennium BC (and following a tradition that dates back at least to the Neolithic), combustion structures with similar characteristics are widespread across the Mediterranean, from North Africa and the Iberian Peninsula to the Aegean. This is particularly true when it comes to hearths. These commonly display an earth layer as a firing surface, even though there are different formal possibilities and techniques. Beyond these similarities, a certain diversity has been described according to the construction techniques, and have led to typological classifications applicable to different geographical areas over long periods of time.

As for the combustion structures in the eastern Iberian Peninsula and south of France, they have traditionally been analysed through the study of formal aspects as well as the association of these fire installations with archaeological findings. Approaches including microarchaeology as well as the combination of different disciplines are still rare. In this respect, the TRANSCOMB project (Transdisciplinary and experimental study of combustion structures in the western Mediterranean during Protohistory) aims to implement an interdisciplinary methodology that integrates specialties such as thin section micromorphology, archaeobotany (anthracology, phytoliths and other calcitic microfossils), organic residue analysis, as well as experimental archaeology. In this paper, we present the first results of the project.

10

**GEOCHEMICAL TECHNIQUES APPLIED TO THE STUDY OF COMBUSTION STRUCTURES**

**Abstract author(s):** Saorin, Carme (GRAP - Universitat de Barcelona)

**Abstract format:** Oral

In this presentation we will show some results of the techniques of X-ray diffraction (XRD) and Fourier transform infrared spectroscopy (FTIR) applied to the study of combustion structures.

These techniques will be applied to the study of combustion structures from the protohistoric period in the north-eastern part of the Iberian Peninsula and southern France, both in the framework of the TRANSCOMB (Transdisciplinary and experimental study of combustion structures in the western Mediterranean during Protohistory) project and in my doctoral thesis project.

The techniques of XRD and FTIR applied to the study of combustion structures are very useful. These allow us to know the mineral composition of the sediment used to build them and also the cooking temperature reached, which can be inferred from the thermal alteration of these minerals and the presence or absence of other minerals that vary according to the temperature. Knowing this variable will enable us to confirm or discard the use of these structures for cooking food and also to determine the function of the space where they are located.

The application of these techniques, together with micromorphology, archaeobotany, and organic residue analysis, will allow us to have complete knowledge of the use or uses that these structures had in the contexts studied.

11

**FUEL USE IN NORTHEASTERN IBERIA THROUGH MICROMORPHOLOGY AND PLANT MICROFOSSIL EVIDENCE FROM IRON AGE COMBUSTION INSTALLATIONS**

**Abstract author(s):** Mateu, Marta (Instituto de Investigaciones Antropológicas. Universidad Nacional Autónoma de México) - Portillo, Marta (Department of Archaeology and Anthropology, Archaeology of Social Dynamics - 2017SGR 995, Institució Milà i Fontanals - IMF, Spanish National Research Council - CSIC, Barcelona)

**Abstract format:** Oral

In this presentation we focus on micromorphological and microfossil evidence from fuel remains from varied types of combustion structures (e.g. flat, semi-excavated and elevated hearths, hearths with and without a preparation layer, ovens) from Iron Age north-eastern Iberia.

The identification and interpretation of fuel remains through microcontextual thin section micromorphology leads to solid interpretations on key archaeological issues on energy use. Despite in our research area hearth combustion surfaces are found commonly 'clean' and macroscopic remains are scarce or even absent, whereas other fire structures appear filled with dumped remains, micromorphological evidence may provide insights into whether or not these remains were burned in situ. In addition to detect depositional pathways, firing episodes and postdepositional processes, microcontextual approaches are critical to assess the integrity of fuel remains, including phytoliths and other calcitic microfossils such wood ash pseudomorphs and dung spherulites, as installation types (e.g. hearths, ovens or walled structures), location (indoor, outdoor), and burial conditions (fast, slow) may determine microfossil preservation.

12 Further, independently of the type of combustion installations and location, the plant microfossil records suggest a varied range of fuel sources, such as wood and a mix of vegetal matter including the leaves and culms of grasses and palm leaves, likely native Mediterranean dwarf palm (*Chamaerops humilis*) which is common in coastal sites in the research area.

Through this integrated micromorphological and microfossil approach depositional pathways and fuel use are identified and understood more accurately, showing the value of microcontextual studies to traditional macroscopic archaeological studies.

12 EVIDENCE FOR FIRE USE -OR NOT- AT THE TALAYOTIC SITE OF TORRE D’EN GALMÉS

**Abstract author(s):** Perez-Juez, Amalia (Boston University; Institut Menorquí D’estudis) - Goldberg, Paul (University of Tübingen; Boston University)

**Abstract format:** Oral

The archaeological site of Torre d'en Galmés spans from the beginning of 1st millennium BCE to the 13th century CE, encompassing Talayotic, Roman, and Muslim periods. It covers two thousand years of occupation in which different peoples used the space according to their needs and cultural patterns. They also made fire, which is evident throughout the site and during the different time periods just mentioned.

We have documented fires for cooking, keeping warm, lighting a room, cleaning, in addition to industrial uses. Some were produced in situ and others were made somewhere and the remains transported and dumped somewhere else. We have also identified different fuels such as wood or dung. The traces of combustion in the archaeological record are multiple and depend on numerous factors. These traces are not always clear at the site, and using only field observation can lead to misinterpretation of remains and possible activities.

This paper will present the evidence of fire found at Torre d’en Galmés, Menorca, applying micromorphological analysis as a way of identifying and evaluating fire, combustion features, their traces or deposits that turned out not to be associated with fire. We will present examples from the interior and exterior of domestic structures and open spaces that show how micromorphology can contribute to a better understanding of site activities as a whole.

13 INTEGRATING MICROFOSSIL RECORDS FROM LIVESTOCK DUNG BURNED AS FUEL IN MENORCA, BALEARIC ISLANDS: AN EXPERIMENTAL APPROACH

**Abstract author(s):** Portillo, Marta (Department of Archaeology and Anthropology, Archaeology of Social Dynamics - 2017SGR 995, Institució Milà i Fontanals - IMF, Spanish National Research Council - CSIC) - Dudgeon, Kate (Department of Archaeology, University of Reading) - Llergo, Yolanda (Department of Prehistory, Autonomous University of Barcelona) - Anglada, Montserrat - Ramis, Damià (Museu de Menorca, Menorca, Balearic Islands) - Ferrer, Antoni (Institut Menorquí d’Estudis, Menorca, Balearic Islands)

**Abstract format:** Oral

Interdisciplinary microarchaeological approaches including integrated studies of plant and faecal microfossils are fundamental to identify and interpret fuel remains within combustion installations such as hearths and ovens, which are common across the Near East and the Mediterranean. This is particularly critical in cases when other sources of archaeobotanical evidence such as charred macroremains are partially uninformative or absent, in order to assess the nature of burnt fuel, as similar plant records may derive from plant-based fuels and other fuel types including animal dung.

The current research illustrates the contribution of integrated analytical methods in archaeobotany to interdisciplinary approaches on the identification, seasonality, and the impact of fuelling on modern livestock dung. The focus is on phytoliths, pollen, non-pollen palynomorphs and calcitic dung spherulites embedded within cattle, sheep and pig faeces collected in different seasons of the year and farms from UNESCO Biosphere Reserve Menorca, Balearic Islands. Experimental firing reference records provide modern comparative datasets on factors affecting the microfossil content and preservation of animal faeces used as a fuel source, as well as on the range of natural and anthropogenic pathways influencing these which are critical to identify and accurately interpret fuel remains. The results reported here are also compared to laboratory-controlled experimental datasets as well as ethnoarchaeological records including firing measurements (time and temperature) from cooking installations that have followed a similar integrated methodological approach.

Experimental and ethnoarchaeological records provide fundamental information on taphonomic issues that are understudied, such as the variation in the ingestion and digestibility among different animals, as well on seasonality of plant and faecal microfossils that are embedded within the dung, and the impact of fire on these as a result of fuel use, as an important combustion material which is still commonly overlooked.

14 INVESTIGATING COMBUSTION STRUCTURES THROUGH EXPERIMENTAL APPROACHES AT IRON AGE CALAFELL ARCHAEOLOGICAL SITE (TARRAGONA, SPAIN)

**Abstract author(s):** Belarte, Maria Carme (ICREA - Catalan Institution for Research and Advanced Studies; ICAC - Catalan Institute of Classical Archaeology) - Pou, Josep (Ajuntament de Calafell) - Morer, Jordi (Món Iber ROCS SL; Universitat de Barcelona) - Pastor, María (ICAC - Catalan Institute of Classical Archaeology) - Portillo, Marta (Institució Milà i Fontanals, CSIC - Spanish National Research Council) - Mateu, Marta (Instituto de Investigaciones Antropológicas, Universidad Nacional Autónoma de México) - Pecci, Alessandra - Saorin, Carme (Universitat de Barcelona) - Fernández, Joaquim (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The goal of this paper is to present the first phase of experimentation on Iron Age combustion structures in the framework of the TRANSCOMB (Transdisciplinary and experimental study of combustion structures in the western Mediterranean during Protohistory) project. Experimental work is carried out in the “Iberian Citadel of Calafell” (Calafell, Tarragona, Spain), a reconstructed Iron Age site, open to the public since 1995, and also a field of experimental archaeology.

The experiment is performed on present-day replicas of archaeological hearths and ovens, located both indoors and outdoors. The structures correspond to a varied typology, based on archaeological documentation from the excavation of Iron Age sites in the western Mediterranean (flat, semi-excavated and elevated hearths, hearths with and without a preparation layer, ovens). Experimental works include the use of various fuel-types (wood, grasses and animal dung), according to the available archaeobotanical records. Variables such as increased heating and time are measured, in order to determine whether variations occur, depending on the fuels used, the type of structure or its location. Liquid boiling and meat cooking tests are also being performed.

In this paper, the first results obtained will be discussed. In the medium to long term, these will contribute to a better understanding of the functioning of the combustion structures in the analysed area and period. Information on daily activities such as food or natural resource management is expected to increase, which will ultimately help to improve the knowledge of the household organisation.

15 MODULAR OVENS OF THE CAPUT ADRIAE IRON AGE: USE AND FUNCTION

**Abstract author(s):** Tasca, Giovanni (Museo Civico di San Vito al Tagliamento) - Vinazza, Manca (University of Ljubljana) - Groppo, Veronica (University of Venice)

**Abstract format:** Oral

The authors have recently recognized and defined, through a classical typological ceramic analysis and reassembly of large quantities of fired clay fragments, a class of household ovens with mobile modular elements. They are widely distributed in settlements in northeastern Italy and western Slovenia between Final Bronze and the Early Iron Age (XII -V century BC). In the proposed paper, the authors intend to present the results of a research based on different approaches. Due to status of preservation of this kind of archaeological material it is not easy to understand its function and use. Tea main focus is construction techniques, use and function of household ovens. The research is based on experimental archeology, ceramic petrography and residual traces of organic matter. We would like to understand whether the function of these ovens is related to the daily cooking of food or to cooking for preservation purposes (e.g. roasting of cereals).

16 CONSTRUCTION OF SOCIAL HISTORY OF CONTROL AND APPLICATION OF THERMAL ENERGY PROCESS AND ITS TECHNICAL, SOCIAL, SYMBOLIC AND PALAEOENVIRONMENTAL CONSEQUENCES

**Abstract author(s):** March, Ramiro (CNRS)

**Abstract format:** Oral

Reconstruction of fire history since its discovery, control and application to the transformation of matter within the different human societies has followed a theoretical - methodological rather complex history, result of the different theoretical frameworks that given rise to the emergence of the study of fire structures in archaeology. This session focus on methodological approach’s and the use of experimental and analytical methods concerning the study of societies that evolved in the Mediterranean region in late prehistory with having different degrees of complexity. In previous works we trying to explain that, “rebuilding to understand”, is a necessary step for the reconstruction of this process. But this approach is also essential for the reconstruction of the history of every fire structure and for each site studied and must be adapted in relation to the complexity of uses of thermal energy in the different kind of societies under study. In this article we will try to unravel, analyzing examples from these periods, how the fire structure analysis continues to be problematic due to: the complexity of the phenomenon; the incomplete interactions between different analytical methods applied and the consequent hyper-specialization and fragmentation of our object and subject, the lack of a systematic study in a well-established theory framework among specialists and generalists and finally how the practical inherent problems of our disciplinary approach are reinforcing this inductive tradition that frequently neglected a broader theoretical perspective necessary to solving the problem. In our sense this approach needs to incorporate a reflection about different human modes of appropriation, production and uses of thermal energy and the strategies implemented by these different societies to reproduce themselves. Therefore we need to give to these question the necessary relevance of their significance at the different aspects of each society and culture structuration, from infrastructural to ideological levels.

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Mele, Marko (Universalmuseum Joanneum) - Fábián, Szilvia (Hungarian National Museum) - Mihelić, Sanjin (Archaeological Museum in Zagreb)

**Format:** Regular session

Archaeological routes and paths, information boards and monument interpretation tools are considered a great way to present and promote the archaeological heritage. They encourage individual visitors or groups to explore the landscapes and experience the original sites of discovery of the objects displayed in the vitrines of museums. The approaches and challenges may differ widely, depending on the type of heritage, accessibility, possibilities for presentation, touristic potential of regions and so on. Many of these challenges were discussed in the Session “Routed Archaeology – Archaeological Routes and Their Impact on Perception of Archaeological Heritage in the Landscape” at the annual EAA meeting in the year 2020.

The year 2020 and COVID-19 pandemic have created new challenges, but also new opportunities for the archaeological routes. On the one hand, it is becoming increasingly difficult to transmit information on heritage to visitors in a direct manner, but on the other hand the promotion for regional/local/national tourism has raised the interest in the European archaeological heritage. In the recent years new technologies are steadily gaining in importance as indispensable tools in the visualisation and interpretation of archaeological heritage. Digital guides, augmented reality, digital visualisations of monuments are becoming major tools for reaching new younger audiences. They offer new ways to transmit information to the outdoor visitors of archaeological sites.

In our session we are looking for contributions presenting new digital tools for the interpretation of archaeological monuments along trails, routes, sites or open-air facilities. A special focus will be given to new fresh approaches in the digital or virtual archaeology and the combination of digital and analogue interpretation tools.

The session is associated with the EU-Project “Danube’s Archaeological eLandscapes”.

**FROM ARCHAEOLOGICAL DATA TO TOURISTIC PRODUCTS – A CASE STUDY FROM THE IRON AGE SITE SCHWARZENBACH, AUSTRIA**

**Abstract author(s):** Fera, Martin - Doneus, Michael - Lobisser, Wolfgang (University of Vienna) - Neubauer, Wolfgang (Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology)

**Abstract format:** Oral

Developments in archaeological research in the last centuries have brought new methods and new technologies to investigate various sites in their broader environment and revealed data for the reconstruction of entire landscapes for various prehistoric and historic periods. Established remote sensing approaches of aerial archaeology on the landscape scale got enriched by Airborne Laser scanning, that allowed us to investigate remnant archaeological traces that survived in the relief. Effective geophysical systems allow additionally to investigate large areas for archaeological prospection of entire sites in their surroundings. But also classical archaeological approaches, as excavations, benefited from the integration of various sensors and bio- and geoarchaeological practices in the research process.

This paper presents results from research projects from eastern Austria with a focus on Iron Age research on multiple scales. It uses selected examples to demonstrate how long-term multidisciplinary collaboration allowed the collection of data sets from the landscape scale down to Iron Age habitation and production areas. Using the example of the Iron Age site of Schwarzenbach it shows how the data and it’s interpretation were used in the construction of sustainable forms of presentation for the benefit of various stakeholders, for knowledge generation, educational purposes and regional development.

**ARCHAEOLOGICAL ROUTES AS A GAMING EXPERIENCE? THE ROLE OF AR AND VIDEO GAMES IN THE ACTIVE CONSUMPTION OF ARCHAEOLOGICAL HERITAGE**

**Abstract author(s):** Frankovic, Filip - Balen, Jacqueline (Archaeological Museum in Zagreb)

**Abstract format:** Oral

In the recent years, one of the most remarkable outbreaks in the mobile gaming industry was the release of Pokémon Go by Niantic, Inc. The game was released in 2016 and soon became a global phenomenon, reaching 150 million active users by 2018, one billion downloads by 2019 and the profit of 6 billion dollars by 2020. The game became the best known video game for mobile phones which combined both location-based and augmented reality (AR) technologies, at the same time promoting video games as an outdoor activity. While Niantic, Inc. has released or plans to release similar games in the future, it is often forgotten that the company’s first successful title was Ingress. The success in the game strongly relied on the players’ ability to visit as many real life locations designated as portals as possible. Various monuments, statues and historical buildings functioned as portals in the game, motivating visits to historical sites.

This paper examines the potential of similar location-based and AR games in the popularization, promotion and presentation of archaeological heritage. It explores the potential of similar platforms in the presentation of individual sites and the creation of archae-

ological routes (i.e. micro and macro level). The introduction of similar tools in the presentation of sites and routes might increase the possibilities for a more active consumption of archaeological contents, as well as satisfy the demands of the newly emerging audiences.

**VILLA ROMANA BALÁCA – FURTHER STEPS IN HERITAGE PRESENTATION AND PROMOTION**

**Abstract author(s):** Kovacs, Lorand (Hungarian National Museum - Magyar Nemzeti Múzeum) - Látos, Tamás - Fábián, Szilvia - Pálinskás, Adrienn - Czifra, Szabolcs (Hungarian National Museum)

**Abstract format:** Oral

Roman exploitation of the countryside is symbolized by Villa Romana Baláca (in Hungary), the centre of a large estate upon which the rural economy of the Western Empire was based. The villa of total ca. 56 hectares is one of the largest and most luxurious of its kind in Pannonia province. Archaeological excavations uncovered the central building of 2400 m2, to which a number of smaller constructions were attached: e.g. a bath, private granary, wine press-house, other farming buildings and a monumental burial place that originally must have been 12 m high. Based on the results of interdisciplinary works, central buildings of the villa were partly reconstructed and have been open to the public since 1984. A new EU funded project called Danube’s Archaeological eLandscapes open new dimensions in heritage visualization and enables to coin a vivid answer on the question: „What have the Romans ever done for us?”.

Virtual reality and the connecting vectorized archaeological data play an essential role in this process. Favouring VR methods to visualize archaeological heritage, the project’s main output and will virtually connect archaeological artefacts stored in museums and the reconstructed sites.

The project put great emphasis on connectivity and foster the creation of new cultural routes at the border territory of the western and eastern Roman Empire. The ancestor of our idea was, the itinerary called Pannonia Hungarica Antiqua was a real and good endeavour in 1995 to connect Roman sites in Transdanubia, Hungary but unfortunately, it remained just a “play for fanatics”. Concerning the Roman period, authentic tracks of roads can be used to re-connect known remains, such as cities, villas, forts, etc. and hopefully revitalize these sites as cultural and touristic sights.
- 4

**ROUTED IRON AGE - APPROACHES TO THE DIGITISATION OF THE IRON AGE HERITAGE IN GROSSKLEIN (STYRIA, AUSTRIA)**

**Abstract author(s):** Mele, Marko (Universalmuseum Joanneum)

**Abstract format:** Oral

Archaeologists developing apps, databases and digital content is often like kids playing with fire. It is a lot of fun, but they often get burned. Almost 10 years we are playing with such fire and as soon as something, like a database, an app or an elearning tool, gets lit, there is a danger that the fire can’t be maintained and we burned another pile of public finances. The reasons for struggling are many and very diverse, e.g. from creating a highly complex content to being always behind the newest technologies and trends.

In my paper I would like to discuss four major digital products from our past projects, two databases, an interactive tool and a visitors app, which were developed for the archaeological heritage in Großklein (Styria, Austria). All of them have been developed by archaeologists, with the intention of boosting the interest on local heritage and by this to support its protection, research and usability for tourism. The questions which arise are: what impact did each single tool have on the overall comprehension of the Großklein’s heritage on local, regional and international level? Are the tools actually compatible? What do locals think of the work?

In 2020 we started the EU-project Danube’s Archaeological eLandscapes, yet another project dealing with digital technologies, mostly 3D, VR and AR. In the paper I would like to address the question: what did we learn from the past projects? How can we change our approach in developing such tools to achieve a higher impact and sustainability? The archaeological heritage of Großklein is presented in three museums, in a reconstructed village and as an archaeological path. The last will be mostly in the focus of my presentation.

**IN THE FOOTSTEPS OF THE WARRIORS: IRON AGE IN THE GOLDEN VALLEY**

**Abstract author(s):** Rakvin, Marta - Balen, Jacqueline (Archaeological Museum in Zagreb) - Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences) - Lukačević, Marijana (Papuk Nature Park)

**Abstract format:** Oral

Cultural route “In the Footsteps of the Warriors: Iron Age in the Golden Valley” was created based on the notion that cultural routes are one of the best forms in which the cultural heritage sites can be introduced to the public. A walk through the past, while immersed in the landscape and surrounded with cultural heritage sites, allows the visitors to experience the heritage presented.

Furthermore, presenting the sites using new digital tools further engages the visitors and provides a better context for the finds usually accessible only in museums.

In this paper we which to present the case study of the aforementioned local cultural route where a combination of digital and analogue interpretation tools was used in order to bring the EIA closer to the public. Created on the EIA archaeological site Kaptol in Požega Valley (Eastern Croatia), one of the most prominent Early Iron Age sites in continental Croatia, 11 different topics are presented on the thematic boards posted along the route.

The first idea for visualization and reconstruction of the site was created in the scope of the project “Monumental landscapes of the Early Iron Age and the Danube region” (Iron-Age-Danube), which was implemented from 2017 to 2019 and is being enhanced through the implementation of the project “Virtual Archaeological Landscapes of the Danube Region” (Danube´s Archaeological eLandscapes). In 2020 the route became a part of a larger international network the Iron Age Danube Route.

Along with the benefits of cultural route establishment, specific sets of issues will be addressed ranging from preservation and protection of the heritage presented to the responsible sustainable management of the route and the role of the local community.

6

### INTEGRATING IRON AGE ROUTES IN THE SOPRON-FERTŐ REGION (NW-HUNGARY) INTO MODERN TOURISM-RELATED INVESTMENTS

**Abstract author(s):** Jerem, Elizabeth - Wollák, Katalin (Archaeolingua Foundation)

**Abstract format:** Oral

In the past few years, international projects and programmes (IAD, IADR) provided an opportunity to conduct research into Iron Age sites and landscapes in the Sopron-Fertő micro-region, during which a special emphasis was placed on the main routes and the general character of the road network, surveyed by digital and non-invasive methods. The Hallstatt period settlement network became even more dense in the Late Iron Age and a system of connections that has impacted cultural history until today was formed at the foot of the Eastern Alps, around the Leitha Mountains and Lake Fertő.

Tourism-related investments that have been implemented recently and are planned in the future certainly interfere with the one-time road network and settlement hubs. The Amber Road in the Roman period crossed the area of present-day Sopron, and from here it led towards Vindobona and Carnuntum, as well as towards Braunsberg and Bratislava. The main road along Lake Fertő also joined this network of west-east oriented communication and trade routes that ran parallel to the Danube.

Several Hungarian and international programmes target regional developments in north-west Transdanubia which facilitate recreational, sport-related, or educational investments. In this presentation those projects will be discussed that placed a special emphasis on digital applications and have had a considerable outreach. The modernisation project of the Sopron museum quarter, the development of touristic and heritage trails around the town and connected to archaeological sites, the forest schools and camps, the Centre of Eco-Tourism and Culture to be built in Fertőrákos, and the issues concerning world heritage areas will be addressed, as well as the potentials of cooperation with representatives of municipal and forest management authorities and touristic associations.

7

### THE DEVELOPMENT OF CULTURAL ROUTES IN GREECE AND THE USE OF NEW TECHNOLOGIES

**Abstract author(s):** Kosta, Elissavet (Ionian University)

**Abstract format:** Oral

The cultural routes are generally a big challenge and chance for culture, tourism, the economy and the local growth. They include a wide range of possibilities like the evolution of the new touristic strategies as well as the local development of these areas. At the same time, they constitute a unique kind of cultural tourism as they combine culture with tourism as they have the potential to offer the visitors a host of activities.

The aim of the current research is the creation of cultural routes in Greece. The cultural route is defined as a brand name touristic product, that is a product of cultural tourism, which is shaped according to a specific connecting element. We attempt a diachronic approach as we will include places and monuments from the ancient times until the transition in the industrial and post-industrial societies. In order to design the cultural routes, we will put emphasis on the co-existence of the cultural route with the wealth of each peripheral section.

Modern tourists have created a new profile of a traveler who aims at living some new experiences. For this reason, the new technologies will play an important role in this effort so as to facilitate the visitors and to enhance their experience.

8

### XPLORE-SH. LANDSCAPE ARCHAEOLOGY AND LOCATION-BASED EDUCATION

**Abstract author(s):** Hölscher, David (Institut fuer Ur- und Fruehgeschichte Kiel)

**Abstract format:** Oral

Past societies have shaped European landscapes from the Neolithic onwards at the latest and left traces within our everyday environment. Some of these are still visible today. While this is rather obvious to experts, public awareness of “ordinary” archaeological heritage in middle and northern Europe, such as gravemounds and earthen fortifications is low. In Germany communication related to them is often absent or limited to interpretive signage for selected sites. With his PhD-project the author tackled the task of engaging “the” public with this kind of heritage and raising awareness for the long-lasting history of landscapes – and thus human-environment relations. To this end a cycling tour was set up, guided by a mobile application providing information about archaeological sites and landscape development on site. In contrast to the rather intuitive use of (esp. digital) communication tools that seems to be widespread within public outreach in archaeology, this project was set within a framework of educational research. Besides founding on educational theory, it also included an empirical study on learning outcomes connected to the use of the app. Hopefully sharing some of the results will shed light upon possibilities and limitations of digital heritage communication outdoors.

9

### DESIGNING COMMON GROUND AS A BASIS FOR ARCHAEOLOGICAL ROUTES

**Abstract author(s):** Toulouse, Catherine - Lengyel, Dominik (BTU Brandenburg University of Technology Cottbus-Senftenberg)

**Abstract format:** Oral

During the Counterreformation, in the early seventeenth century, the archbishop of Würzburg, Julius Echter von Mespelbrunn, built several hundred village churches, that follow a common principle, that by itself has never been realized due to the varying preconditions. Prof. Dr. Barbara Schock-Werner, the former master builder of Cologne Cathedral, verbally described this hypothetical ideal church in her habilitation treatise. The project demonstrated in this paper describes not only how the ideal church has been translated from the verbal into a virtually modeled state, but also its mediation to the public by an interactive Virtual Reality experience introduced by a narrative film and a physical model. The objects are represented in the common model scale 1:100 at first. When the operator successfully composes a church’s volumes, he is forwarded to an original scale model. It is one of the specific strengths of Virtual Reality to switch between scales.

The ideal church project demonstrates how the combination of digital and analogue interpretation tools can succeed in conveying an identity whose origins are scattered over larger regions. Individual finds in the museum combined with a recontextualisation in virtual reality does not only reach the new younger generation. This form of presenting cultural heritage encourages people to visit original sites. The virtual experience serves as a promotion for an archaeological route connecting the realised churches, which are then put into relation with the ideal church and interpreted accordingly, which also serves the identification of the locals.

Particularly abstraction, if carefully designed, allows to demonstrate, explain, illustrate and understand concepts that otherwise can only be perceived subtly. The project has been realised for the exhibition „Julius Echter. Patron der Künste. Konturen eines Fürsten und Bischofs der Renaissance“, exhibited in the University of Würzburg’s Martin von Wagner Museum in the Würzburg Residence in 2017.

### KINGSHIP IN EARLY MEDIEVAL EUROPE: PLACES OF ROYAL POWER AND RITUAL

**Theme:** 7. From global to local: Baltic-Pontic studies

**Organisers:** Sanmark, Alexandra (University of the Highlands and Islands) - Ljungkvist, John (Uppsala University) - Hall, Mark (Perth Museum & Art Gallery)

**Format:** Regular session

Following on from a series of workshops held in Scotland over 2020/21 exploring early medieval kingship and its attendant ritual, this session will seek to explore the diverse range of evidence for early medieval kingship and ritual across Europe and the Pontus region from Late Antiquity to circa 1000 AD. We welcome contributions from a range of disciplines, including but not limited to, archaeology, art history, history, onomastics and folklore. We hope to further promote the excellent research of recent years in to the dynamics of kingship across Europe and we would welcome contributions that dealt with, for example, the types of royal site that can be identified (including their topographical settings and archaeological signatures), any regional differences (including any detectable influence from Pontus, Roman Byzantium and the Sassanian world); any toponymic identifiers; the nature of ritual and other activities associated with such sites; religious links (notably but not limited to Christianity) and any legacy and folkloric memory the places gave rise to. We are keen to gather as wide a geographic assemblage as possible, not only the Baltic-Pontic axis but from Francia, Spain and the Western Mediterranean.

ABSTRACTS:

1

### A PRE-CHRISTIAN CULT AREA IN FREY’S SHIRE – A PRESENTATION OF TWO SITES NEAR HARREBY, SOUTHERN DENMARK

**Abstract author(s):** Grundvad, Lars (Museet Sønderkov)

**Abstract format:** Oral

The increasing use of metal detectors in Denmark over the last decade has led to the discovery of several new metal-rich sites from the pre-Christian era. A few of these show indications of belonging to the highest social strata and demonstrate intriguing signs of ritual practice.

Two of these sites are situated adjacent to each other in the hinterland of emporium Ribe in southwestern Jutland. Both have been partly excavated and the combined surveys have revealed several hall buildings and metal depositions of varying character dating to the first millennium AD. The earliest of the two sites included the deposition of more than 200 weapons, a ceremonial wagon and a sacrificed gold neck ring, all from the Roman and Early Germanic Iron Ages. This site was eventually abandoned around AD 550 and no later than around AD 600 a new sacred site emerged near Harreby – a historical placename that strongly suggests the presence of a “hørg”; a feature interpreted as a pre-Christian “alter”. Preliminary surveys have revealed a sacred area enclosed by fences, partly hidden behind a 575 meter linear earthwork. Within the fenced area were traces of a large Viking Age hall building and a hørg. Besides these features, the site is known for two Viking Age hoards; one consisting of multiple gold artefacts that are stylistically related to the workshops of King Gorm the Old, and the other, a silver hoard consisting of mostly coins. Both hoards were deposited in pits near the entranceway to the sacred area.

This paper presents these new discoveries and the interpretation that these sites were a part of a sacred complex named after the god Frey. Furthermore, they seem to have been either under kingly control or maybe even owned by the Jelling Dynasty.

2 MEMORIES OF PICTISH ROYAL POWER IN PLACES OF CHRISTIAN RITUAL

**Abstract author(s):** Plumb, Oisín (University of the Highlands and Islands)

**Abstract format:** Oral

The memory of Pictish secular authority remained strong in local church foundation accounts long after the end of the Pictish kingdom. It is notable that in the origin accounts of several churches, the original bestowal of land to the Church comes from an unambiguously Pictish king or noble. This is despite the long-recognised process of ‘depictification’ in medieval hagiography, which led to Pictish men and women in the church coming to be portrayed as Gaels. This discussion will focus on surviving church foundation accounts of establishments in formerly Pictish locations, such as those of St Andrews, Deer, Loch Leven and Abernethy. It will consider why Pictish secular authority is given such a prominent role in these texts and ask if these accounts can tell us anything of the legacy of royal authority in Pictland and its relationship with places of Christian ritual, both in the Pictish period and as perceived in later ages.

3 CARVED STONES AND KINGSHIP IN EARLY MEDIEVAL NORTH-WESTERN EUROPE

**Abstract author(s):** Busset, Anouk (University of Glasgow; University of Lausanne)

**Abstract format:** Oral

During the first centuries of Christianisation, the role of kingship gradually transformed. The modification and manipulation of places of rituals linked to kingship for the purpose of negotiating social relationships were likely inextricably intertwined with the conscious agency involved in erecting, shaping, and utilising stone monuments within their boundaries. Focusing on case studies across north-western Europe, this paper will explore how carved stones participated in the transformation of places linked to royal rituals. The comparative analysis undertaken here allows a novel approach into the twinned processes of Christianisation and institutionalisation of the Church and how these processes drove a shift of power from the secular elites to the Church. Research on this topic has been constrained by analysis often conducted at a local or national level, leading to a strong understanding of local environments, but often forgetting transnational social, religious and political trends. By moving beyond the localised approaches within a framework centred on the creation of spaces, this paper discusses convergence in how stone monuments were employed in the negotiations of power between kings, local elites and the Church.

4 KING-SEATS OR ROYAL RESIDENCES, THAT’S THE QUESTION

**Abstract author(s):** Fallgren, Jan-Henrik (Uppsala Universitet)

**Abstract format:** Oral

In this paper I will discuss so called King-seats and royal residences in connection to Scandinavian Central-places. The paper will discuss the differences between King-seats and royal residences and how these concepts fit in, or not, to these special Scandinavian places. Scandinavian Central-places are usually regarded as either royal residences or some form of estate owned by some king or dynasties. I will instead argue that these so called Central-places neither can be characterized as royal residences nor have constituted any kind of estates. This will be done by comparing a large number of different Scandinavian larger farms and their agrarian economy with the type of economy and find material that characterize the uniqueness of the Central-places. By comparing these Nordic settings with Anglo-Saxon so called “great hall complexes”, Irish “royal places” and Pictish “power centers”, I hope that the argumentation and discussion that will take place will become more interesting and convincing.

5 LOCAL COMMUNITIES AND THE RISE OF POLITIES IN THE TYNE-FORTH REGION

**Abstract author(s):** Orsini, Celia (Durham University)

**Abstract format:** Oral

Early medieval cemeteries have been described as central places where identities are developed, reassessed, and reaffirmed. They have been the focal point of early medieval researchers for the past two decades, notably the large cremation cemeteries thought to have a large site-catchment and to serve multiple communities. However, in areas where the size of cemeteries is much smaller, the existence of small communities is not as easily inferred; Instead, the excavation and analysis methods are questioned. This paper aims to challenge the current framework and revisits the social organization of the communities of the Tyne-Forth region between the 5th-8th centuries. Working with 90 site locations and 2434 burials, this research explores how people signaled their identity and their connection to places through their funerary practices and through the use of their surrounding landscapes. A comparative analysis of the funerary practices calls attention to the existence of highly varied practices, showing no sign of homogeneity throughout the selected timeframe despite the spread of Christianity, and it is here interpreted as a localized expression of identity. Proximity and viewshed analysis complement the landscape study to stress the use of varied features (natural and built) and their visibility in localized area. Finally, the apparition of larger cemeteries around the 7th century is discussed, underlining the high variability in the funerary practices within each site. This paper argues for a social organization in small to very small social

groups through the 5th and the end of the 6th century and highlights a change in the social organization during the 7th century, correlated to the spread of larger political entities in the region.

6 VISIBILITY, MOVEMENT, AND THE ROYAL DYNAMICS OF CONTROL AT YEAVINGER, NORTHUMBERLAND, ENGLAND

**Abstract author(s):** Buchanan, Brian (Eastern Washington University) - Semple, Sarah - Skinner, Tudor (Durham University)

**Abstract format:** Oral

The iconic early medieval royal palace of Yeavering is located on a small, elevated terrace at the base of the Cheviot Hills in the fertile Milfield Basin. The excavations of the site, led by Brian Hope-Taylor, revealed a multi-faceted complex containing timber halls, cemeteries, and evidence of reuse and reinterpretation of prehistoric features. Hope-Taylor identified the site as the royal vill noted by Bede as an assembly site used by King Edwin of Northumbria. Although long considered a type-site of early medieval royal centres in Britain, questions remain on the site’s extent, development, chronology, and landscape context. Since the publication of the Yeavering monograph in 1977, numerous early medieval settlement sites have been identified in the region, placing Yeavering in a landscape of activity, ritual, and power. This presentation examines the topographic position of the palace complex as a function of the subtleties of kingship, control, and ritual. Using GIS-based analyses focused on visual exposure and movement, this presentation demonstrates that the spatial location of Yeavering affords specific types of control over the landscape. Yeavering’s location is vital in understanding both the ritual importance of place and being a strategically important nodal point overseeing social movement in the landscape. This further demonstrates the importance of visibility and movement for the development of early medieval royal centres in Britain.

7 FEEDING KING AND COURT: FOOD RENDERS, HUNTING AND FEASTING AT LLANGORSE CRANNOG, WALES

**Abstract author(s):** Best, Julia (Cardiff University)

**Abstract format:** Oral

Llangorse Crannog is a gem in crown of Welsh archaeology. This royal site, associated with the kings of Brycheiniog, was in use between 890 and 916 AD before being burnt to the ground. Excavation revealed a rich array of artefacts including the largest analysed bone assemblage in Wales of this date. The animal bone assemblage contains a unusually high frequency of wild animals alongside the domestic ones, with some species having distinct sections of the body represented. The animal bone has given an incredible insight into both hunting, and the wider provisioning of the site. When analysed alongside the Welsh lawbooks such as Cyfraith Hywel (the Law of Hywel) this site provides a unique window into hunting, herding, feasting, kingship and social hierarchy. This allows investigation of status, display and sustenance in Early medieval Wales, and can also reveal how different groups used the resources to negotiate power and identity.

8 THE VOCABULARY OF POWER AND BECOMING (NEARLY) ROYAL: THE EARLS OF FLANDERS BETWEEN THE LATE 9TH AND EARLY 11TH CENTURY

**Abstract author(s):** Tys, Dries (Vrije Universiteit Brussel)

**Abstract format:** Oral

The dynasty of the Graven van Vlaanderen , the Earls of Flanders, rose rapidly to power between 880 and 890 in order to reach a nearly royal position. in particular Baldwin the second, who was the grandson of Charles the Bald and the son in law of Alfred The Great, had the ambition of creating a royal position and future for his family and the principedom of Flanders. A combination of historical information, architecture and monuments and landscape archaeology shows how he and his son, Arnulf the Rich, used a diverse set of media and means to create a royal vocabulary of power. In this paper we will present this vocabulary and how it was used to consolidate power, in an attempt to form a new Middle Kingdom. The means that were used included of course Palaces and burghs, burials and collegiate churches, but also genealogies, and even the environment. Most of all an innovative concept of governance, which marked the end of the Early Medieval Period.

9 FROM SITE ON TRADE ROUTE TO KEY ROYAL CITY

**Abstract author(s):** Videiko, Mariia (Kyiv Borys Grinchenko University)

**Abstract format:** Oral

The second half of the Xth century was a time when the “trading cities” moved under the royal power. Profits from trade that went along the Dnieper gradually became a source of power for the rulers of Kyiv. As in the North of Europe in the East, uncontrollable trade factors here become the mainstay of royal power. The city of Tropol, which is located on the Dnieper, was first mentioned in written sources at Xith century as belonging to the Kyivan prince. However, there is reason to believe that it was founded earlier and is known from the runic inscription as Ustaholm. Archaeological research here shows the existence of the city on an area of about 30 hectares. This is the third largest settlement at this time on this section of the Dnieper. It had three lines of fortifications and a special channel with the “Water Gates” around, possibly used as a harbor for ships. There are three types of sites on the Dnieper, which functioned to provide a way across the Dnieper. These are open settlements, fortresses, fortified harbors. The time of their

appearance can be attributed to the Xth century. Some of them were clearly outside the jurisdiction of the princes of Kyiv. However, from the end of the Xth and during the first half of the XIth century. all these points were conquered by them. It was then that cities grew around some fortresses, and in between new fortresses were built, which marked the new borders of Kiev’s royal power, which moved to the South. These boundaries were defined in more detail by a large-scale defense system known as “serpent`s ramparts” - an analogue of Danevirke.

10 THE ORIGINS OF COPENHAGEN AND THE CONSOLIDATION OF ROYAL POWER

**Abstract author(s):** Stafseth, Terje (Copenhagen Museum)

**Abstract format:** Oral

According to the standard version of Danish history, the origins of Copenhagen, and the consolidation of royal power, started with the archbishop and warlord Absalon (1128-1201). Absalon is seen as the first town lord, transforming a fishing village into a town in the mid-12th century. Following new archaeological results, we have good reasons to argue that the town originated earlier, in the 11th century, and royal consolidation of the town took place shortly after.

Based on the new evidence, we believe that Copenhagen grew from a local chieftain’s farm into a regional trading port during the 11th century. This growing town, with an associated church and churchyard, attracted the king’s attention. To counteract the power of the local lord, the king established his presence with a new fortified area / royal court in the center of this developing town, accompanied by his own church of St. Clements.

Around 50 years later, as a gift from the king, Absalon took over lordship of the town as a whole and by the beginning of the 13th century all traces of the older settlement, church and earlier local lords had vanished.

The paper will present the most important archaeological results from the last decade, contributing to our new knowledge concerning the origin of the town. Focus will be on The Metro Cityring excavations 2010-2014 and a later excavation in Rådhuspladsen (Town Hall Square) in 2018, which revealed evidence of urban settlement dating back to the early 11th century. This suggests the presence of an urban settlement larger than a mere fishing village at the start of the 12th century.

11 THE GEOGRAPHY OF POWER IN MEDIEVAL SCOTLAND

**Abstract author(s):** Sanmark, Alexandra (University of the Highlands and Islands)

**Abstract format:** Oral

This paper will examine some key places of power in late medieval Scotland, such as Edinburgh Castle, Dunfermline Abbey and Stirling Castle. These sites played important roles in different types of event, from royal ceremonies, such as coronations, marriages and key assembly meetings over several hundred years. These sites also seem to have been important strongholds in many of the medieval wars that took place in the course of the Middle Ages.

These sites, and other key sites, will be examined in terms of their archaeological remains as well as their location in the landscape. The earliest evidence of fortifications will be traced. Other important issues include identifying any key features that these places share. Emphasis will also be placed on any particular differences between the sites that can be discerned. Through this applying this interdisciplinary approach the underlying patterns of the geography of power in late medieval Scotland will be investigated.

216 HORIZON EUROPE: ADDRESSING THE PRIORITIES

**Theme:** 2. Pandemics and climate change: responses to global challenges

**Organisers:** Carver, Martin (University of York; British Academy) - Bánffy, Eszter (DAI Römisch-Germanische Kommission, Frankfurt am Main; German Archaeological Institute, Budapest Research Unit)

**Format:** Round table

Horizon Europe, which follows Horizon 2020 as the principle vehicle of EU research funding in January 2021, urges us to focus on the urgent matters of the day:

- 1. Health
- 2. Culture, creativity and an inclusive society
- 3. Civil security
- 4. Digital industry and space
- 5. Climate, energy and mobility
- 6. Food, bioeconomy, natural resources, agriculture and environment

These objectives align with the Sustainable Development Goals drawn up by the UN in its 75th anniversary year, so can be justly called global. How will archaeology organise to address these topics? As a subject that professes disciplines of both STEM and SHAPE we are well placed to make effective contributions. While science is seen as the primary instrument for achieving the objectives , there is a good case for the humanities, and archaeology in particular, to illuminate the case and win new support through the advocacy of the past. But some adjustment will be required to the traditional agenda and to the interdisciplinary groupings that will be needed. This round table intends to launch the conversation.

AGENDA

- 1. Introduction: Are we ready to go global? Addressing the UN SDGs: pathways for archaeological research
- 2. Personal, National and Global: at what level should research agendas be prescriptive?
- 3. Archaeology is both a STEM and a SHAPE subject with strong benefits to both communities; can we make the case, to governments for a two-horse category for archaeology?
- 4. If STEM deduces, and SHAPE advocates, how can we strengthen both to strengthen the impact of the whole?
- 5. Interdisciplinarity is necessary to address the SDG’s. How can project design accommodate it in the new goals?
- 6. If its principal agenda is to serve the SDGs, how would project designs be assessed?
- 7. Archaeology has a strong commercial presence and is a million-euro player in the economy; how are its commercial and intellectual contributions to be assessed?
- 8. If any of these ideas attracts support, how would their adoption affect the teaching of archaeology?
- 9. How would these ideas be of benefit to the public?

217 PREHISTORIC LANDSCAPES UNDER THE BOG: TRACING CULTURAL RESPONSES TO ENVIRONMENTAL CHANGE

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Behrens, Anja (Lower Saxony Institute for Historical Coastal Research; German Archaeological Institute) - Smyth, Jessica (School of Archaeology, University College Dublin) - Mennenga, Moritz (Lower Saxony Institute for Historical Coastal Research)

**Format:** Regular session

The reaction of prehistoric societies to the consequences of environmental change is mostly hard to trace for archaeologists. However, when we combine different scientific analyses, field methods and the local palaeogeography, in some regions good insights are possible – and allow wider questions on this theme. In this session we want to focus on bog areas in Northern Europe that developed in the Holocene. Both coastal and inland terrain in several regions changed during this period, affecting how people used the landscape. In some places this change was very rapid, and in others more gradual, as wide areas became covered by bog and/or flooded by the sea.

Investigations on these preserved regions show that a combined evaluation of the changes in landscape and cultural responses are possible. We want to know more about ongoing or already completed research on this topic with a focus on prehistory. How do you trace archaeological features and changes in landscape use within the bog, what are your methods and what are the results? We are interested in all kinds of research approaches; from coring, botanical analysis and remote sensing to the usage of archaeological biomarkers, such as pottery lipids or bog butter analysis. The focus of papers should be your conclusions about the environmental-cultural interaction of prehistoric societies. What role did the developing bog have on choice of settlement areas, ritual practices, economic life, communication structure and networks. We welcome papers from all bog regions of Northern Europe and throughout prehistory to explore these questions.

ABSTRACTS:

1 LIVING IN A DROWNING LANDSCAPE. INTERDISCIPLINARY RECONSTRUCTIONS OF LONG-TERM HUMAN-PEATLAND INTERACTIONS IN THE NORTHERN NETHERLANDS

**Abstract author(s):** Beek, Roy - Quik, Cindy (Wageningen University & Research)

**Abstract format:** Oral

In historical literature and folkloristic sources bogs are frequently described as remote, hostile and dangerous. However, the contrary is true. Archaeological evidence demonstrates that they were exploited, modified, accessed and structured by humans. Furthermore, they influenced patterns of habitation and movement. Gaining insights into long-term landscape developments requires intimate knowledge of the interrelations between habitation trends and environmental change, as well as the pace of these processes. With regard to Dutch peatlands this type of research is rare, due to a lack of high-resolution environmental data. This is mainly caused by the fact that the large majority of these environments have disappeared long ago due to turf-cutting and agricultural reclamation. In this lecture we present the results of ongoing interdisciplinary work in one of the largest remaining bog remnants in the Netherlands: the Fochteloërveen. The results of new coring data on peat stratigraphy are integrated with palaeoecological evidence and a detailed archaeological inventory comprising over 400 sites ranging from the Late Palaeolithic to the High Middle Ages. This allows us to study the lateral expansion of this formerly vast peatland over time, and to reconstruct how humans interacted with this drowning landscape over long time scales and on various spatial levels.

2 **WET FEET OR DRY FINDS? TRACING MESOLITHIC SETTLEMENT IN BOG AREAS OF LOWER SAXONY, GERMANY**

**Abstract author(s):** Mahlstedt, Svea (NIHK)

**Abstract format:** Oral

A recently running project is dealing with a survey for waterlogged mesolithic sites in the Northwestern part of Germany. As Mesolithic remains in this area are mostly known from surface sites on sandy soils, well-preserved finds and structures are missing so far. To get a better understanding of landscape use, material culture and subsistence strategy in Mesolithic Lower Saxony, we are following an intense survey strategy: In a first step we are bringing together the known sites and geological information on raised bogs, kettle bogs and early Holocene coastal peat growth, to select the most interesting places. There, we are expecting that peat growth may have covered and preserved camp sites, as well as primary waterlogged activity and drop zones. In a second step in the field, size and situation of the sites are checked by field walking, raster coring and sampling from mega-drills. Thus, a reconstruction of the sandy relief below the peat can be developed and former surfaces can be recognized. The mega-drills are bringing up larger samples of these drowned landscapes. The samples are sieved and searched for anthropogenic finds and datable material. On the most promising sites small test trenches are opened.

Still, the remaining questions for the project are: Do we only find, what we know already, when we start searching in the vicinity of known sites? And how much landscape reconstruction is needed to find new sites below the bog?

In this paper the preliminary results from the first two years of the project are presented. Successful and less successful surveys in several different micro-regions are discussed.

3 **CHANGING PATTERNS OF INTERPRETATION. NEW PERSPECTIVES ON MESOLITHIC LIFE, EXEMPLIFIED BY NEW RESULTS FROM DUVENSEE WP 10**

**Abstract author(s):** Groß, Daniel (Centre For Baltic And Scandinavian Archaeology - ZBSA; CRC 1266: Scales of transformation: Human-environmental interaction in prehistoric and archaic societies - SFB 1266) - Corradini, Erica (Institute of Geosciences, Applied Geophysics, University of Kiel; CRC 1266: Scales of transformation: Human-environmental interaction in prehistoric and archaic societies - SFB 1266) - Dörfler, Walter (Institute of Pre- and Protohistoric Archaeology, Kiel; CRC 1266: Scales of transformation: Human-environmental interaction in prehistoric and archaic societies - SFB 1266) - Lübke, Harald - Meadows, John - Schmölcke, Ulrich (Centre For Baltic And Scandinavian Archaeology - ZBSA; CRC 1266: Scales of transformation: Human-environmental interaction in prehistoric and archaic societies - SFB 1266) - Wieckowska-Lüth, Magdalena (Institute of Pre- and Protohistoric Archaeology, Kiel; CRC 1266: Scales of transformation: Human-environmental interaction in prehistoric and archaic societies - SFB 1266) - Zanon, Marco (CRC 1266: Scales of transformation: Human-environmental interaction in prehistoric and archaic societies - SFB 1266)

**Abstract format:** Oral

For almost a century, the Duvensee palaeolake has been a centre of attention for Early Mesolithic research in northern Germany and beyond. Having become a large lake and fenland during the early Holocene, the micro region repeatedly attracted several Mesolithic groups, who established short-term camps. While hunter-gatherers exploited the area heavily to harvest hazel nuts, other activities also left archaeological traces in the peat bog.

In this presentation, we will summarise the latest research results from the Duvensee area, with a special focus on the Preboreal/Boreal site Duvensee WP 10. We will give a brief overview of the methods we have applied to investigate the prehistoric landscape, including refined methods of remote sensing and further chronological analysis, and of the new insights obtained by modern re-evaluations of the sites. . The results will be embedded into a wider geographical context and show the place of Duvensee in the Mesolithic socio-economic system.

4 **INVESTIGATING PLANT SIGNALS IN LIPID RESIDUES OF NEOLITHIC POTTERY FROM A BLANKET BOG ENVIRONMENT AT THE CÉIDE FIELDS, IRELAND**

**Abstract author(s):** Olet, Lilly - Casanova, Emmanuelle - Robson Brown, Kate - Evershed, Richard (University of Bristol) - Smyth, Jessica (University College Dublin)

**Abstract format:** Oral

The Céide Fields are an extensive field system of drystone walls in North Mayo, well-preserved under blanket bog. They are traditionally associated with herd management and, to some extent, arable farming. Archaeological and palaeoecological research suggests a high human impact on the landscape during the Early Neolithic, followed by a decrease of farming activity parallel to an increase in peat bog formation during the Middle and Late Neolithic. Analysing lipids entrapped in the ceramic matrix showed that Early and Middle Neolithic vessel use at several of the Céide Field sites (Behy, Glenulra, Ballyglass, Céide Visitor Centre and Belderg Beg) was predominantly linked to dairy production (Caulfield et al. forthcoming). Lipid residue analysis further showed that the majority of the samples not only yielded the typical molecular distribution attributed to animal (dairy or carcass) fat, but also contained compounds that point towards a peat-derived plant source. This effect is especially dominant among the Middle Neolithic Globular bowls. We are currently applying a range of techniques to pottery samples, including imaging techniques such as micro-CT; pyrolysis of root material; lipid residue analysis and radiocarbon dating of single compounds to establish the origin, the inclusion pathway and the time of

deposition of these peat-associated plant lipids. This suite of methods bears potential to study human subsistence parallel to peat bog formation and can help understand the interaction between societies and their changing environment at the Céide Fields as well as at other peat bog sites in the future.

5 **THE NEOLITHIC PRE-BOG LANDSCAPE OF AHLEN-FALKENBERG IN NORTHERN GERMANY**

**Abstract author(s):** Behrens, Anja - Mennenga, Moritz - Karle, Martina - Wolters, Steffen (Lower Saxony Institute of Historical Coastal Research)

**Abstract format:** Oral

Since 2019 the Lower Saxony Institute for Historical Coastal Research carries out investigations on the Neolithic landscape in the dist. of Cuxhaven and Stade, Lower Saxony, covered by bog for the past 5000 years. However, several prehistoric monuments including megalithic graves of the Funnel Beaker Culture (TRB) became visible again during the last 50 years due to intensive drainage measures and dry summers, which caused severe peat shrinking processes in these areas. By this the newly emerged megalithic graves of the Ahlen-Falkenberger Moor show excellent preservation conditions. The project „Preserved in the bog“ aims to investigate the original constructions and history of these monuments. Furthermore we want to estimate the impact of the changing environment on the Neolithic societies on a local and a regional scale. For this a number of field methods are applied to reconstruct the former landscape and how it developed during the Holocene, including coring, geomagnetic surveys, excavations, phosphate analyses, botanical and geological investigations as well as 3D-modelling. First results reveal a gently undulating landscape with already aquatic environments due to sea-level rise like saltmarshes and peat areas next to still dry places, which had been used to establish a burial and settlement landscape. Late Holocene sea-level rise also caused a marine incursion into the Neolithic pre-bog landscape, which followed the course of a fenland channel pre-shaped by the Saalian glaciation and providing the Neolithic community with a direct access to the North Sea. In order to understand the spatial and temporal landscape changes during the last 5000 years further excavations and measurements will be conducted with a focus on the short as well as long term effects of the environmental changes on the Neolithic societies in the Ahlen-Falkenberg region.

6 **WET FEET IN THE STONE AGE? ENVIRONMENTAL-CULTURAL INTERACTIONS OF NEOLITHIC WETLAND DOMESTIC SITES ON THE SOUTHERN CIMBRIAN PENINSULA AND BEYOND**

**Abstract author(s):** Brozio, Jan Piet - Feeser, Ingo (Institute of Pre- and Protohistoric Archaeology CAU Kiel)

**Abstract format:** Oral

Neolithic domestic sites in wetlands are a well-known phenomenon in the Northern German Plain. Good preservation conditions of artefacts and ecofacts are responsible for a long history of research interest of such sites. Comparing the evidence for known sites, a diverse picture emerges. They are located in different landscapes, such as the coastal area of the Baltic sea and inland situations. Thus they were exposed to different environmental challenges but also resources. Settlement sizes and architecture differs, probably reflecting different forms of subsistence practices. In this paper we will present several examples of sites, with a focus on the southern Kimbrian peninsula. Beside archaeological excavations palynological investigations have been carried out at the sites and allow to compare settlement structure and dynamics with evidence for environmental changes. In doing so, we will address the questions of how changes in the wetlands affected settlement activities and vice versa. Furthermore, we aim at exploring if changes in settlement intensities and/or population density can be observed and how they register in the archaeological and palaeoenvironmental records.

7 **PUTTING THINGS IN (UN)USUAL PLACES: ANALYSIS OF THE SITING OF SELECTIVE DEPOSITIONS IN THE BOURTANGER MOOR, THE NETHERLANDS**

**Abstract author(s):** Moree, Jelle (Faculty of Archaeology, Leiden University; Soil Geography and Landscape group, Wageningen University)

**Abstract format:** Oral

The practice of selective deposition – the intentional deposition of particular objects at specific places in the landscape – is a widely studied phenomenon in European archaeology (Bradley, 2017; Fontijn, 2019). The Bourtanger Moor, a former raised bog that stretched from the north-eastern Netherlands into north-western Germany, is renowned for its selective depositions. Although Wentink (2006) and De Vries (2016) studied the siting of Middle Neolithic and Iron Age depositions respectively, the siting of Late Neolithic and Bronze Age depositions had not been investigated yet. Hence, this study concerned an analysis of the physical and cultural landscape context of Late Neolithic and Bronze Age selective depositions in the area that encompasses the Hondsrug (a subglacially-formed ridge) and the adjacent Bourtanger Moor. It was found that objects were preferably deposited in or near (ephemeral) waterways in the Moor. They were deposited in or near brook rivers in the Moor itself and close to stream valleys bordering the Hondsrug. Additionally, selective depositions were often found close to bog trackways. It is hypothesized that an increase in bog surface wetness during the Bronze Age partly motivated the construction of such trackways, as they ensured continued access to hard-to-reach parts of the bog that remained favourable for deposition. As such, the trackways are argued to have connected different ‘deposition zones’ in the study area. The associations of depositions with waterways and/or bog trackways fits within a wider north-western and northern European tradition of deposition in or near bodies of water and/or near tracks (cf. Bradley 2017). However, a preference for deposition near flowing water within a bog has not been identified in other European bogs yet. Further

research in and reassessment of selective depositions in other north-western and northern European bogs will illuminate whether this association was specific for the Bourtanger Moor, or not.

8 **BOG BUTTER IN IRELAND: A STUDY THROUGH TIME AND SPACE**

**Abstract author(s):** O’Toole, Karen (University College Dublin)

**Abstract format:** Oral

Bog butter is among the most common finds recovered from Irish bogs. Recent phases of radiocarbon dating have demonstrated the practice of bog butter deposition was extremely long-lived in Ireland, beginning as early as the Early Bronze Age and persisting as late as the post-medieval period (Smyth et al. 2019; Synnott 2014; Cronin et al. 2007; Downey et al. 2006). As a result, bog butter is uniquely positioned to help archaeologists explore the role of developing bog on the economic life and ritual practices of people in the past. This presentation will focus on a pilot study exploring bog butter distribution across space and time in six counties located in central and western Ireland (Kildare, Laois, Mayo, Meath, Offaly, and Westmeath) that was recently completed as part of my PhD research. The pilot study took a GIS-based approach combining spatial data with radiocarbon measurements, lipid analysis and aDNA results to provide a large-scale picture of the phenomenon and trace the changes that occurred over time. Additionally, this pilot study also incorporated data on other types of artefacts recovered from bogs in the study area in a preliminary exploration of the associations between bog butter and other bog finds. This aimed to begin to integrate bog butter deposition into the wider practice of Irish bog deposition and exploitation. Some patterns are already beginning to emerge as a result of this research, including an apparent chronological divide along the east/west axis of the island and hints as to the role played by bog butter in wider practice of bog deposition in Ireland and beyond.

9 **TRAFFIC JUNCTION THROUGH THE TIMES: THE BOG NARROW NEAR GNARRENBURG, LDKR. ROTENBURG/WÜMME (LOWER SAXONY)**

**Abstract author(s):** Heumueller, Marion (Lower Saxony State Office for Cultural Heritage) - Hesse, Stefan (District Office of Archaeology Rotenburg, Wümme) - Behling, Hermann - Leuschner, Hanns (University of Göttingen, Department of Palynology and Climate Dynamics)

**Abstract format:** Oral

The ‘Teufelsmoor’ is one of northwest Germany’s largest peatlands, stretching over 260 square kilometers. For the last three years, a small narrow between Gnarrenburg and Karlshöfen, known for their trackways and wheel finds, was examined in a joint project by the District Office of Archaeology Rotenburg (Wümme), the bog archaeologist of the Lower Saxony State Office for Cultural Heritage and the Department of Palynology and Climate Dynamics at the University of Göttingen.

Initially, after intensive drainage measures and peat cutting, hopes of finding remnants of trackways in the area, were dampened. Over time, however, the site has exceeded all expectations. At least five trackway constructions from the period between 2500 BC and 100 AD have been newly discovered. Their construction varies greatly, not least depending on climatic conditions. A comparison between path construction phases with stress-induced changes in the postglacial dynamics of dendro-dated peatland forestation phases can reveal such climatic relationships at high temporal resolution.

One particularly spectacular find consists of an unusually wide wooden road of the Neolithic period with a width of more than 4 m and a bridge-like construction of the pre-Roman Iron Age founded on three rows of pillars. The relatively large number of finds from the Iron Age and the Roman Imperial Period is also extremely unusual. Pollen analytical studies indicate activity in the settlement phase and thus embed the archaeological structures in the period of occupation history. This suggests little land use activities near the area of study. Results indicate several changes in drier and wetter conditions of the large peatland area surrounded by oak and alder forests. Several periods of stronger fire events have been identified.

219 **THE HISTORICAL ECOLOGY OF RECLAMATION LANDSCAPES: TOWARDS A CROSS-CULTURAL COMPARATIVE PERSPECTIVE**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Haas, Tymon (Leiden University) - Schepers, Mans (University of Groningen) - Walsh, Kevin (University of York) - Gardner, Tom (Historic Environment Scotland) - Stratigos, Michael (Leverhulme Centre for Anthropocene Biodiversity, University of York)

**Format:** Regular session

Wetlands are extremely rich ecosystems, and have attracted humans throughout (pre)history. Although these areas are often perceived as marginal in urban societies, it was particularly in periods of growing socio-political complexity and population growth, that wetlands provided attractive landscapes to reclaim and exploit in more intensive and systematic ways.

However, the reclamation and exploitation of wetlands could come at a high price: the investments needed to reclaim wetlands could easily approach or exceed the capacities of a society; living and working in these landscapes was often strenuous; and different institutions and groups could have conflicting interests in their exploitation; and drainage measures could radically alter ecosystems and land-use potential.

Recently, de-watered landscapes are experiencing calls for restoration. While necessary to return a range of ecosystem-services, expansive restoration programmes require policymakers to balance wetland’s archaeological/palaeoecological significance with potential ecosystem-service provision. Policymakers need established, comprehensive datasets to understand and mitigate the risks involved and add value to restoration efforts.

Thus, reclaimed wetlands provide excellent contexts to explore the impact of past societies on the long-term development of landscapes, which in turn crucially informs current restoration policies. The framework of historical ecology (and related concepts of sustainability and resilience) have been successfully applied to understand the complex interplay of cultural and environmental processes in the development of such reclaimed landscapes.

Building on such scholarship, this session explores how societies in different geographic and historical contexts faced the challenges involved in exploiting wetlands, and how the reclamation of such landscapes affected, and continues to affect, their development and exploitation. Regional case studies provide new insights into commonalities in the ecological and human responses to, often unforeseen, environmental and land-use change. They integrate historical, archaeological and ecological sources to reconstruct how different processes interact in the long-term, and how to safeguard these landscapes during restoration.

**ABSTRACTS:**

1 **THE IMPACT OF RECLAMATION ACTIVITIES ON LANDSCAPES: A CONCEPTUAL FRAMEWORK**

**Abstract author(s):** Schepers, Mans (Groningen University) - De Haas, Tymon (Leiden University)

**Abstract format:** Oral

The reclamation of various types of wetlands took and takes place across the world. We set out to identify overarching principles potentially associated with these reclamations, but soon came to the conclusion that an essential starting point, following academic standards, should be to explore what actually entails ‘reclamation’ and ‘reclamation landscapes’. This paper addresses our search and findings and the concepts we developed so far, and strives to be a starting point for further discussion.

We argue that, talking about reclamation landscapes, rather than ‘reclamation’ proper, allows us to study reclamation as a process in what we consider to be three major (relative) time moments in a reclamation landscapes history, being (1) the landscape before reclamation, (2), the landscape during reclamation, and (3), the landscape after reclamation.

We will discuss the exact definition(s) (or lack thereof) of a number of terms and concepts associated with reclamation landscapes, which include reclamation itself, but also ‘polders’ and ‘water management’. After having established what, according to us, reclamation actually is, we will present a broad overview, in time and space, of reclamation history. Subsequently, we will discuss the major goals and effects of reclamation projects. These effects can be separated in two major categories: Short-term effects and long-term effects.

We will also relate the former to well-established, yet at the same time heavily debated concepts related to the interaction between people and their environment, most notably resilience, sustainability, adaptation, and landesque capital.

2 **BALANCING HABITAT AND HERITAGE: ISSUES AND OPPORTUNITIES IN WETLAND AND PEATLAND RESTORATION FOR POLICYMAKERS ACROSS THE UK AND IRELAND**

**Abstract author(s):** Gardner, Tom (Historic Environment Scotland; University of Edinburgh) - Davies, Mairi (Historic Environment Scotland) - Ward, Kara (Heritage Advice and Regulation Branch, Department of Communities, Northern Ireland Government) - Hazell, Zoe (Historic England) - Grant, Fiona (CADW)

**Abstract format:** Oral

Wetland and peatland restoration are high on the international agenda, particularly in relation to the climate emergency, and across the UK and Ireland extensive targets for restoration are being set by national and local governments, exceeding 500,000ha by 2030. Overall, this development is positive due to the potential of restoration to safeguard and enhance biodiversity, ecosystem service provision, and carbon storage/sequestration. However, expansive wetland restoration has implications for the preservation and management of the historic environment of wetlands that play a key role in their archaeological and palaeoecological importance.

As a cross-governmental group of cultural heritage policymakers and decisionmakers, we need access to reliable and well-contextualised studies and data around restoration to allow us to make informed decisions on heritage management and land-use on behalf of the public. To this end, we use this paper as a platform to outline issues and identified gaps in available knowledge around the short-, medium-, and long-term impacts of restoration upon historic assets individually, and the historic environment generally.

Our contribution outlines the state of play and current available information relating to wetland and peatland restoration across Britain and Ireland and identifies the following issues, intended to galvanise researchers to generate data/information of a form usable by policymakers. Identified gaps in our knowledge include:

- 1. Lack of widespread understanding of peatland restoration in the heritage sector.
- 2. Few reliable case-studies.
- 3. Widespread poor-quality mapping of restoration sites.

4. Poor identification of ‘unknown’ archaeology or sub-peat landscapes in blanket peat.
5. Poor understanding of the impact of restoration on archaeological/palaeoecological records.
6. A lack of pre-restoration, and medium- to long-term post-restoration monitoring of restoration sites (hydrology, geo-chemistry, vegetation change).
7. Limited engagement with wetland/peatland adjacent communities.
8. Poor understanding of how cultural heritage contributes to climate science.

3

INTEGRATED APPROACHES TO UNDERSTANDING COMPLEX LONG-TERM RECLAMATION PROCESSES IN THE HINTERLAND OF RAVENNA

**Abstract author(s):** Abballe, Michele (Ghent University; University of Verona) - Cavalazzi, Marco (University of Bologna) - Fiorot-to, Celeste (University of Verona; Ghent University)

**Abstract format:** Oral

In this paper, we aim to present the results of an interdisciplinary research project focusing on the hinterland of Ravenna, more specifically in the surrounding of the town of Lugo. The area is known for the extraordinary preservation of the centuriated field system, although its “Roman” origin has been rightly questioned in the last three decades. Our data show how this seemingly homogenous area has instead a very complex history, due to frequent flooding events often connected to river avulsions. Artefact surveys have been useful to study the main trends in the evolution of settlement patterns, which show resilience after the end of the Roman period for at least part of the study area, and archaeological and historical sources have revealed the strong impact that urban Communes and other contemporary powers had in the 12th-13th centuries. This was a moment of generalized population growth, during which these powers were able to change the existing settlement patterns, even modify river courses and build large-scale drainage systems. Only thanks to a multidisciplinary approach it has been possible to clearly understand these processes. Indeed, a geoarchaeological investigation has allowed to better understand the extension of a former wetland and the mechanisms that led to its complete reclamation. Finally, the area has also been ecologically characterized by archaeobotanical analysis (seeds, fruits, charcoal and pollen) to better understand the evolution of this reclaimed landscape also in terms of land use and land cover.

4

WETLAND RECLAMATION STRATEGIES AND LONG-TERM LANDSCAPE DEVELOPMENT: SOME OBSERVATIONS FROM MEDIEVAL AND ROMAN CONTEXTS

**Abstract author(s):** Haas, Tymon (Leiden University) - Schepers, Mans (Rijksuniversiteit Groningen)

**Abstract format:** Oral

Wetland reclamation has occurred under diverse geographic, socio-political and socio-economic conditions, and it seems evident that these conditions affect the strategies (in terms of scale, technology, organisation) used in such reclamations. However, the relation between such strategies and long-term regional landscape changes seems less evident: did reclamations using large technological and labour inputs necessarily lead to more radical and enduring landscape transformations, and if so, in what respects? This paper explores these question through a comparative analysis of two wetlands in different geographic contexts that were reclaimed under different socio-political regimes: the Pontine marshes, reclaimed as part of Rome’s early Imperial expansion, and the coastal salt marshes of the northern Netherlands that were reclaimed by emergent state societies in the medieval period. For both cases we present a diachronic assessment considering pre-reclamation conditions, the phase of reclamation itself and its afterlife combining archaeological, historical and ecological evidence. This comparison suggests that the Pontine case, which drew on more centralised forms of organization and higher levels of technological knowhow, was in the end less successful in sustainably reclaiming this wetland.

5

SHIFTING ECOLOGIES OF A RECLAIMED WETLAND LANDSCAPE IN SOUTHERN ALBANIA

**Abstract author(s):** Allen, Susan (University of Cincinnati)

**Abstract format:** Oral

Radical landscape transformations such as wetland reclamation not only alter the physicality of terrain and ecosystems, but also actively suppress the place-based narratives of human experience that shape public memory over the long term. The 1940’s drainage of the Maliq wetland in southern Albania, a focus of human settlement in the area for more than 7,000 years, provides a compelling example of this coupling. Immediately following World War II, Albanian dictator Enver Hoxha hailed the drainage and eradication of the wetland in southern Albania as one of his great political triumphs over nature. This rhetoric, grounded in the notion reclamation, effectively silenced less empowered narratives of the wetland itself, the people engaged in its drainage, and its cultural ecologies. A longue durée approach that integrates palaeoenvironmental, archaeological (Neolithic, Bronze Age, Iron Age), ethnoecological, and ethnohistorical evidence illuminates the diversity of these hidden ecologies and their grounding in place-based knowledge.

6

WHAT WETLAND ARE WE PROTECTING AND RESTORING? QUANTIFYING THE HUMAN CREATION OF DESIGNATED WETLANDS IN SCOTLAND

**Abstract author(s):** Stratigos, Michael (Leverhulme Centre for Anthropocene Biodiversity)

**Abstract format:** Oral

Wetland environments have been specifically designated and protected globally for their importance to biodiversity since the Ramsar Convention in the 1970s. These protected areas are often proactively managed and restored in order to prevent, halt and reverse human impacts to these environments. However, in many regions around the world, designated wetland environments are not only impacted by human activity in the present and recent past, but are themselves entirely a product of human activity, completely transformed from their pre-altered condition. This is a conceptual and management challenge for designation, legislative frameworks and restoration efforts which often situate their goals with reference to desired states along a ‘natural’ (ie. favourable) to ‘anthropogenic’ (ie. unfavourable) axis. Through exploring a range of case studies in Scotland which exemplify protected and restored wetlands across this axis, this paper will present a framework for quantifying the degree to which a protected area is designated as the result of human activity. The framework will then be used to contextualise different types of designation and restoration goals. This framework will be useful as part of decision-making for future restoration and wetland environment designation which provides a broader evidence base with improved outcomes for archaeology and cultural heritage.

221

CONNECTING PREHISTORIC ANATOLIA AND EUROPE THROUGH FOODWAYS

**Theme:** 6. Material culture studies and societies

**Organisers:** Dietrich, Laura (Deutsches Archäologisches Institut, Berlin) - Galik, Alfred (Österreichisches Archäologisches Institut, Wien) - Çilingiroğlu, Çiler (Ege Üniversitesi, İzmir)

**Format:** Regular session

In this session we want to discuss different aspects of food and diets and encourage contributors to address scientific questions dealing with foodways in prehistoric Anatolia and southeastern Europe, as well as their transmissions westwards. We choose these regions because of their geographic, cultural and economic roles as active zones of transmission between the Southwestern Asia and central Europe. We choose food as an indicator of interconnections or barriers as it constitutes one of the most important drivers in the emergence of cultural, social and economic identities and is at the same time formed, and transformed by them. Therefore, we intend to analyze both aspects of environmental agency of these regions on the formation of culinary traditions, as also local characteristics of prehistoric diets and their further complete or partial transmission or non-transmission throughout Europe. The session will use “foodways” and “foodscapes” as analytical concepts for discussion, including all activities, norms, and symbols enclosing the production, processing, cooking, serving, and consumption of food. The topics should be focused on the emergence of farmer-herder foodways and the process of Neolithisation; the formation of foodscapes, local cuisines and the emergence of traditions both in Anatolia and in Europe; on the identification of adoption or non-adoption, of possible routes of westward transmission, circulation of food and movement of ideas. We encourage contributors to present new research results and discuss novel ways for the identification of foodways with the methods of archaeological science. Theoretical approaches on the agency of food is also welcome.

ABSTRACTS:

1

NEOLITHIC FOOD PRACTICES AT THE SITE OF GÖBEKLI TEPE AND BEYOND FROM THE SURFACE DEFORMATIONS OF THE GRINDING STONES

**Abstract author(s):** Dietrich, Laura (Orient Department of the German Archaeological Institute)

**Abstract format:** Oral

The paper explores the significance of the analyses of grinding and pounding tools (GPT) for the reconstruction of food practices at the Early Neolithic site of Göbekli Tepe and their implication for the Neolithic in Southwestern Asia and Europe. GPT defines pairs of active (handstones or pestles) and passive (netherstones) tools which are used to process different food stuffs, like cereals, legumes, fruits or meat trough crushing. Thus, GPTs can offer information on changes in food processing techniques or the contribution of new food technologies to the Neolithization process. The site of Göbekli Tepe currently has the largest number of GPT of all known Neolithic sites in Anatolia. The functional analysis has revealed that the handstones were standardized tools for the production of fine and coarse flour from cereals. Both food processing techniques can be well recognized by analysing the surface formations of the netherstones. Unlike the handstones, these were not hewn intentionally in shape; instead, big basalt boulders were chosen in the basalt quarry near the site and brought to the site, then deepened through use. Combined macro- and microscopical analyses as well as the establishing of use-sequences („stratigraphies of traces”) on 3d-models provide evidence of multiple, long-term use-ways of the netherstones from Göbekli Tepe. Both fine flour for bread-like products and coarse flour for porridge, but also legumes were processed on them, either with handstones or with pestles. Comparisons with GPT’s assemblages from Central and Western Anatolia and Europe reveal different technological developments probably indicating different food practices.

2

MULTIPLE ISOTOPIC AND ADNA ANALYSES OF NEVALI ÇORI SHED LIGHT ON A SOCIO-SECTION OF ANCIENT SOUTHEAST ANATOLIA

**Abstract author(s):** Wang, Xiaoran (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University Munich) - Skourtanioti, Eirini (Department of Archaeogenetics, Max Planck Institute for the Science of Human History) - Pöllath, Nadja - Peters, Joris (Department of Veterinary Sciences, Institute of Palaeoanatomy, Domestication Research and the History of Veterinary Medicine, Ludwig Maximilian University Munich; Bavarian State Collection of Anthropology and Palaeoanatomy) - Schultz, Michael (Department of Anatomy, University of Göttingen) - Roberts, Patrick (Department of Archaeology, Max Planck Institute for the Science of Human History) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Faculty of Biological Sciences, Friedrich Schiller University) - Stockhammer, Philipp (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University Munich)

**Abstract format:** Oral

Nevali Çori in Southeast Anatolia, the "eastern wing of the Fertile Crescent", is associated with a socio-economic system of Pre-pottery Neolithic B (PPNB) of the 10th–8th millennium BC. Together with other sites in the eastern upper Tigris region, southeast Anatolia became another independent region with one of the earliest Neolithic lifestyles in sedentism and domestication. The site was repeatedly settled also later during the Halaf period, the Early Bronze and the Iron Age.

In my paper, I will first present the results of strontium and oxygen isotopic analyses conducted on human and animal remains recovered from Nevali Çori. The results indicate a decline of mobility already during early PPNB. The carbon and oxygen data also revealed the seasonal hunting times of gazelles in that time. The carbon and nitrogen analysis informs about nutritional practices through time indicating changes in subsistence strategies. This enables a better understanding of the underlying mechanisms and motivations of Neolithization in west Asia. The genetic analyses of the PPNB people in Nevali Cori shed new light on the genomic structure of aceramic southeast Anatolian farmers and their genetic relations to adjacent Anatolian and Levantine regions. The post-PPNB inhabitants of Nevali Cori showed a different genetic makeup compared to the PPNB people related to the admixture event of regional gene pools across Anatolia and the Southern Caucasus during the Late Neolithic.

3

NEOLITHIC CULINARY TRADITIONS AND CUISINE IN ANATOLIA: LATEST RESULTS FROM ÇATALHÖYÜK

**Abstract author(s):** González Carretero, Lara (The British Museum; Museum of London Archaeology - MOLA)

**Abstract format:** Oral

Previous research into food preparation and cooking traditions in Anatolia has mainly focused on the potential ingredients from the archaeobotanical and zooarchaeological data and on the possible technologies used for the preparation of meals such as pottery, ground stone tools, fire installations, clay balls, etc. Very little has been said about the actual choice of ingredients and the different processes behind the preparation of food and meals during the Neolithic period in Anatolia. Çatalhöyük, spanning more than 1000 years and with remarkable preservation, provides an ideal site for the study of Neolithic cooking practices and cuisine as well as the changes in those practices over time. This paper presents the latest results from the study of cooking practices, food preparation and consumption at Çatalhöyük, with focus on the identification of food products and Neolithic recipes. Advances in the application of coherent and cohesive methodological approaches involving different types of microscopy (Digital Microscopy and Scanning Electron Microscopy) have enable the successful identification of a variety of archaeological food remains, shedding light on Neolithic cuisine in Anatolia and wider Southwest Asia.

4

ANIMAL FOODWAYS IN LATE NEOLITHIC ÇATALHÖYÜK: INTEGRATING SPATIAL, POTTERY, AND FAUNAL DATA

**Abstract author(s):** Pyzel, Joanna (University of Gdansk) - Pawłowska, Kamilla (Adam Mickiewicz University in Poznań) - Barański, Marek (Academy of Fine Arts in Gdańsk)

**Abstract format:** Oral

Excavations in the TP Area (Team Poznań) of the East Mound at Çatalhöyük exposed a sequence of deposits covering a span of ca. 280 years (6280-5900 cal BC) at the end of the Neolithic occupation of this UNESCO site. Abundant finds, including about 220,000 animal bones and 13,000 pottery fragments, were obtained from various contexts such as floors, ovens, hearths, and special deposits within domestic buildings as well as from middens.

Pottery data, especially of vessel types and sizes as well as ware groups, supported by lipid analysis give an insight into cooking practices, while archaeozoological data provide information on the cultural, social, and economic practices relating to production, processing and consumption of animal foods.

We combine these lines of evidence with spatial and functional changes in the TP Area around Çatalhöyük’s Late and Final periods of occupation in order to track changes in animal foodways, detect commensality practice, and discuss them on the broader background of social and economic transformations in the Late Neolithic in Anatolia.

5

CULINARY PRACTICES AS A MATTER OF SCALE: CALCITIC DEPOSITS ON POTTERY IN PREHISTORIC ANATOLIA AND EUROPE

**Abstract author(s):** Rosenstock, Eva (Freie Universität Berlin, Einstein Center Chronoi) - Hendy, Jessica (BioArCh, University of York)

**Abstract format:** Oral

Scale-like substance adhering to the inside of pottery vessels is a rare, yet regular phenomenon on Neolithic sites in Anatolia and the Balkans. Moreover, there is anecdotal evidence for similar deposits from later periods and other regions in Southwest Asia and Europe. However, easily to be confused with post-depositional sinter, such concretions have so far received little attention in archaeological research (Sauter et al. 2001; Vieugué et al. 2015). Analyses performed on samples from Çatalhöyük West dated to 5900 – 5800 cal BCE have recently shown that such deposits have the potential to trap several food biomarkers including proteins (Hendy et al. 2018) and can hence allow unprecedented insights into prehistoric food processing and consumption. The paper reviews the current state of knowledge on calcitic deposits, possible implications with hard water, dairy and beer, and outlines how further targeted research on these concretions can contribute to our understanding of food practices in prehistoric Southwest Asia and Europe in general and Neolithic Anatolia and the Balkans in particular.

6

NEOLITHIC FOOD-WAYS AND SUBSISTENCE IN NORTHWESTERN AND WESTERN ANATOLIA

**Abstract author(s):** Galik, Alfred (Austrian Archaeological Institutue)

**Abstract format:** Oral

The Neolithic archaeozoological material from three sites is the initial point of the presentation, the Çukuriçi Höyük at the western coast of Anatolia and Barcın Höyük and Aktopraklık Höyük northwest of Anatolia. The interpretation on food ways bases largely on archaeozoological assemblages, which answers potentially central questions on agricultural and dietary developments, when husbandry certainly supplied a large part of animal protein. Hunting, fishing and gathering of molluscs contributed to the daily diet on the Neolithic foundation and settling period. The scientific focus lies on animal exploitation pattern at the beginning of the 7th millennium Neolithic and the development of animal exploitation throughout the subsequent phases of the Neolithic period.

Intra- and inter-site examinations reveal pattern of husbandry and environmental exploitation comparable with other contemporary nearby European sites. The “Neolithic Package” at the 7th millennium settlers will be discussed from an archaeozoological and food-way point of view, especially due to the earliest stock keeping, mobility as well as potential regional and interregional interactions. An attempt is undertaken to pattern diachronic trends in husbandry and exploitation of natural resource in varying environs at such Neolithic coastal and inland sites.

7

BRIDGING NEOLITHIC TURKEY, GREECE AND BULGARIA THROUGH FOODWAYS: INTEGRATED ZOOARCHAEOLOGICAL AND ISOTOPE DATA

**Abstract author(s):** Cakirlar, Canan - Kamjan, Safoora (University of Groningen) - de Groene, Donna (University of Reading)

**Abstract format:** Oral

Investigating the role of cultural transmission in dispersing foodways along the Neolithic routes in the Anatolian-Balkan region has been restricted due to difficulties in data compatibility. So far, NISP (Number of Identified Species) and published stable isotopic records have been tackled in relation to geographical properties of sub-regions and climatic conditions. This paper assesses the zooarchaeological and isotopic evidence for animal-based food production and processing behavior of Early Neolithic (ca 6700/6600 to 5500 cal BC) farmers in western Turkey, Bulgaria and Greece. New interoperable zooarchaeological and stable isotopic data from the region inform on taxonomic choices, animal husbandry strategies, and carcass processing (the latter for the first time). Combined with new radiocarbon dates, data from Istanbul, Izmir, and northern Bulgaria allow a closer examination of how animal-related foodways are transmitted and transformed across this vast region during this transformative period. Results provide insights into modes of cultural transmission across early farming societies in this pivotal area.

8 THE NEXT MEAL: STORAGE PRACTICES IN NEOLITHIC ANATOLIA AND SOUTHEAST EUROPE

**Abstract author(s):** Cilिंगiroglu, Ciler (Ege University)

**Abstract format:** Oral

Food producing economies based on animal herding and cultivation of cereals and pulses emerged in southwest Asia in the Early Holocene. Plant cultivation based on the so-called the “founder crops” is adapted in few millennia by groups in diverse environmental settings across Neolithic Anatolia and Southeast Europe. Increased production of food, unless they are immediately consumed, necessitated some form of storage facility for preservation. Neolithic groups across time and space tackled this vital problem implementing various approaches. Different materials were used to store food, both organic and inorganic. The most eye-catching storage technique is the clay bin and box placed inside the houses. In this talk, I would like to explore key Neolithic sites across Anatolia and Southeast Europe to compare and contrast archaeological features that pertain to the storage practices in order to assess whether patterns and regularities can be observed through time and space in the long-term process of Neolithization.

9 FOODWAYS DURING THE NEOLITHIC PERIOD OF NORTHERN GREECE

**Abstract author(s):** Lymperaki, Marianna - Kotsou, Dushka (Democritus Univesity of Thrace) - Kotsos, Stavros (Ephorate of Antiquities of Thessaloniki City) - Metoki, Areti (Ephorate of Antiquities of Kozani)

**Abstract format:** Oral

Understanding culinary traditions entails the thorough examination of the utensils used for the preparation of food, which provides an insight into prehistoric societies. Cooking pots constitute a use category whose study can offer a great deal of information, not only about diet and dietary preferences, but also about broader issues such as construction of social and cultural identities, social relations and economies.

In this presentation, the local characteristics of foodways and the formation of foodscapes during the Neolithic in the area of Northern Greece will be explored. Our focus will be on the information we gain from the macroscopic, chemical and microbotanical analysis of the cooking pots in order to understand the differences and similarities of local cuisines and culinary traditions. To that end the spatial distribution of cooking facilities at the Neolithic settlements of Northern Greece will be linked to the processes of food preparation in forming foodscapes. Everything about eating, including what we consume and how we prepare it, is a form of communication imbued with meaning . Therefore the study of food preparation practices can give us insight into the intangible practices, attitudes and beliefs that formed the foodways of Northern Greece.

10 WHEN THE ‘PACKAGE’ HIT THE MOUNTAINS: THE EMERGENCE OF NEOLITHIC FOODWAYS IN THE CENTRAL BALKAN HIGHLANDS

**Abstract author(s):** Filipovic, Dragana (Institute for Pre- and Protohistory, Christian Albrecht University, Kiel) - Bulatović, Jelena (Laboratory for Bioarchaeology, Faculty of Philosophy, Belgrade) - Burke, Clare (Austrian Archaeological Institute, Department of Prehistory and WANA Archaeology, Austrian Academy of Sciences, Vienna) - Milić, Bogdana (Archaeology and History of Art Department, Koç University, Istanbul, Turkey) - Horejs, Barbara (Austrian Archaeological Institute, Department of Prehistory and WANA Archaeology, Austrian Academy of Sciences, Vienna)

**Abstract format:** Oral

Elements of the southwest Asian Neolithic ‘package’ appeared in the central Balkans at the end of 7th/start of 6th millennium BC. Northeast of the Axios/Vardar course – a corridor of Asia-to-Europe cultural transfers – the package hit the mountains of southern Serbia, the narrow valleys of the Južna (South) Morava river and its tributaries, and a more continental climate. Settling into these environments likely entailed adjustments in the behaviour of humans, domesticates and crops. Perhaps this partly explains why, apparently, only few Neolithic groups initially resided here and, unsurprisingly, near the rivers, where sources of food and raw materials would have been plentiful and sustenance secured even without, or with very limited, farming and herding.

Until recently, little could be said about how these groups met their subsistence needs beyond broad descriptions as crop growers and animal herders. In the last two decades, excavations of some previously (un)detected Early Neolithic settlements in the region offered an opportunity to systematically collect plant and animal remains and use them to determine which plants were grown or collected and which animals herded or hunted, and to what extent, and infer how the environment shaped these food economies. We present the evidence of plant and animal food sources from the Early Neolithic site of Svinjarička Čuka, at the foothills of the Radan Mountain, investigated by the NEOTECH project (“Neolithic technological trajectories in the Balkans”) of the Austrian Archaeological Institute. The typology and function of stone tools and ceramic pots found here give us a glimpse into food provision and consumption strategies, aiding the reconstruction of foodways in the highlands. We aim to compare this evidence with that from the neighbouring but biogeographically distinct northern Serbia and explore if, even within a relatively small geographical area, different foodways developed on the south-north Neolithisation route.

222 LOST IN TRANSLATION: TRANSFORMED AND FORGOTTEN KNOWLEDGE

**Theme:** 6. Material culture studies and societies

**Organisers:** Kneisel, Jutta (Kiel University) - Damm, Charlotte (Tromsø University) - Eriksen, Berit Valentin (Centre for Baltic and Scandinavian Archaeology)

**Format:** Regular session

Knowledge production is a pivotal driving force of the ‘human condition’. It stimulates social, cultural and economic changes. The accelerated expansion of scientific, technical, behaviour and other forms of knowledge may alter societies and environments. Knowledge, whether practical or theoretical, tacit or discursive, is in many ways the glue of human societies. Our individual survival depends on it, but in particular any society’s mutual understanding rests on many overlapping “knowledges” that are transmitted within and between collective networks of practitioners. For knowledge to persist it relies on continued transmission.

But we know for certain that much past knowledge was forgotten, be it technologies, environmental know-how, healing practices, symbolic meaning etc. In many cases, technologies were replaced by other technologies, or the use of tools/things/symbols got lost. In other cases, particular events, such as accidents, environmental disasters, diseases, migration, warfare and deliberate destruction of books or removal of knowledgeable people led to knowledge being lost or suppressed.

Forgotten knowledge can be traced in many ways. Be it networks routes, means of transport, cosmology, images and symbols, cultural practice such as processing of poisonous food, crafts such as pyrotechnology, flint technology, access to resources or parts of landscape etc.

However, there are examples of knowledge not being entirely lost, but transformed as it was adjusted to new circumstances (trade routes, means of transport, construction work, skeuomorphism in artefacts); cases where knowledge previously transmitted discursively, became tacit and embedded in practical performances or routine activities (raw material procurement, food preparation); and examples of revitalisation of forgotten knowledge (crafts specialization, hunting practices).

This session will deal with the wide range of topics related to lost knowledge:

- How and under what circumstances may knowledge have been lost in the past?
- What were the consequences?
- And was it really forgotten or rather translated and latent?

ABSTRACTS:

1 RE-GAINING KNOWLEDGE – DEVELOPING WAYS TO TRACE CHANGE

**Abstract author(s):** Hinrichs, Moiken (Cluster of Excellence ROOTS, Subcluster Knowledge)

**Abstract format:** Oral

From the Late Neolithic to the Early Bronze Age – ca. 2350–1500 calBC – the skill and knowledge of flint knapping in Scandinavia reached its peak, not only as a craft but also as an art. The knowledge of flint knapping was ever so slowly lost for the major part of the population and became specialist knowledge before it vanished from the pool of technologies.

Centuries later, dedicated flint knappers, like Errett Callahan, Greg Nunn and Jan Apel, set out to regain the knowledge of working elaborate bifacial daggers. Most analysis focus on the prestigious type I or IV daggers and was concerned with the how and why of production. Here, the focus is laid on the learning aspect of the production of bifacial sickles and daggers. How was the knowledge transmitted? Is it possible to detect technological fingerprints in the archaeological record, hinting to a strict and taught tradition for production? Does this change over time? If so, which parts do change? Does this involve loss of knowledge or even the opposite; re-gaining of prior lost or unused knowledge?

A first step in answering the questions is to determine the possibility of detecting differing production sequences in the same technology complex. First part of the study is therefore dedicated to the analysis of experimental inventories conducted by several knappers. Comparing knappers from different regions and with different backgrounds will show if it is possible to separate individual ways of production. And maybe, by comparing works from successive years and mutual contact, even how learning can be traced. For this, the chaîne opératoire analysis is used. Preliminary results show that some attributes seem to be dependent on personal choice, like edge angle and preparation and form of striking platforms.

2 CHANGING SOCIAL CONTEXT OF LITHIC PRODUCTION IN THE SOUTHERN GERMAN NEOLITHIC. CONSEQUENCES FOR PRODUCTION AND TRANSMISSION OF KNOWLEDGE

**Abstract author(s):** Fisher, Lynn (University of Illinois Springfield) - Harris, Susan (Santa Barbara, California) - Knipper, Corina (Curt Engelhorn Zentrum Archäometrie) - Schreg, Rainer (Otto-Friedrich-Universität Bamberg)

**Abstract format:** Oral

Stone tool production took place on a changing cultural landscape in the Central European Neolithic. Activity at quarries and mines intensified and diversified over time, including skilled production of standardized forms such as axes at some locations while others showed little evidence for standardized production. This paper explores repercussions of change in the location and social context

of lithic production for production and transmission of knowledge. Questions to be considered include: How might shifts in the location of knapping affect access to knowledge? Does attention to the context of knapping provide ways to assess specialization through characteristics of a network of practitioners rather than attributes of products such as standardization?

Evidence to examine these questions comes from a program of landscape archaeology on the southeastern Swabian Alb in southern Germany. Geomagnetic surveys and test excavations at a chert quarry and two settlements allows comparison of spatial and social contexts of lithic production over the course of the Neolithic. In the Early Neolithic, all stages of production were observed in settlement features, suggesting dispersed production in a household context. In the Middle Neolithic, early stages were carried out at the quarry while tool production was concentrated at a nearby settlement. Later Neolithic quarry features include all stages of production, suggesting that lithic production may have moved away from settlements. These patterns suggest change over time in characteristics of a network of knappers. We explore the implications of these changes for distribution of knowledge, considering whether the practice of lithic production became more specialized over the course of the Neolithic in the study area even while products themselves remained unstandardized.

3 **TRAVELLING CRAFTSMEN AND ARTEFACTS IN MOTION. THE DECLINE AND FALL OF FLINT CRAFTSMANSHIP IN BRONZE AGE DENMARK**

**Abstract author(s):** Eriksen, Berit Valentin (Centre for Baltic and Scandinavian Archaeology)  
**Abstract format:** Oral

During the Late Neolithic and Earliest Bronze Age the art of flint knapping reached an exceptionally high level in Denmark. Few, very skilled, artisans produced one-of-a-kind masterpieces in flint. Few hundred years later the situation had changed and bronze tools were becoming increasingly important while flint tools were clearly less wanted. This paper will address the demise of knowledge during the early metal using societies from the point of view of the now increasingly obsolete flint knapping craft. Questions to be discussed include – what happens during the last millennia of apparent decline and fall of flint technology? For how long does flint tools and flint knapping maintain a general importance in everyday life? And what happens to flint knapping specialists?

The lithic inventories examined in the case study belong to a series of Bronze Age settlement sites situated in the flint rich province of Thy, Denmark. Based on a contextual chaîne opératoire analysis the presentation will focus on the technological and socio-economic processes pertaining to the production of flint sickles. It will address raw material exploitation patterns and procurement strategies through time and it will examine the question of control over and access to resources. The concluding discussion will address the role of flint craftsmanship and craft specialization on a diachronic scale in relation to contemporary socio-economic structures in the region.

4 **LOST IN TRANSLATION OR LOST IN RESEARCH? SURVIVING STONE KNAPPING EXPERTISE IN BRONZE AGE SOUTHERN ITALY**

**Abstract author(s):** Vilmercati, Melissa (Sapienza - University of Rome)  
**Abstract format:** Oral

Interest in Bronze Age lithic technology in Italy has been generally scarce, due to the paradigm of its progressive abandonment contextually to the rise of metallurgy. This has resulted into biases in archaeological research. Bronze Age stone artefacts are scarcely diagnostic in terms of chronology but can be very useful for the understanding of the manufacture/use processes and of the social organisation of productions. Archaeologists, nevertheless, have focused much on other categories of artefacts, developing a model of a completely lost and forgotten lithic expertise. In Southern Italy archaeological evidence pertaining to the Bronze Age is abundant, but publications related to lithic industries remain limited. Thus, was the lithic technology entirely lost, or did it become more latent, not simply transmitted, but embedded in the knowledge of communities?

The availability and use of metal progressively increase during the Bronze Age; notably in the Late Bronze Age a vast range of metal objects was produced, substituting some curated lithic tools (e.g. sickles, arrowheads). Yet, the analyses of stone artefacts from the Bronze Age long-lived settlement of Coppa Nevigata (Apulia) are demonstrating that stone knapping remained a common activity, although it underwent substantial modifications over time. Does this picture apply to coeval centres in Southern Italy? In this presentation I will discuss the results of techno-morpho-functional analysis of stone artefacts from Coppa Nevigata and revisit the available evidence of stone manufacture in southern Italian Bronze Age contexts. I will try to evaluate as to whether the knowledge of knapping processes was completely lost, or whether it did persist, changing over time, rooted in the know-how and in the skills of the communities. The aim is to understand if the idea of the forgotten lithic technology is more related to research biases rather than to the real loss of knowledge in distant past.

5 **MIND THE GAP - INVESTIGATING KNOWLEDGE TRANSMISSION AS THE STOREGGA TSUNAMI BATTERED THE COASTAL SETTLEMENTS OF WEST-NORWAY 8200 BP**

**Abstract author(s):** Nyland, Astrid (Museum of Archaeology, University of Stavanger) - Damlien, Hege (Museum of Cultural History, University of Oslo)  
**Abstract format:** Oral

Mesolithic hunter-gatherer-fisher societies are traditionally interpreted as small scale, mobile societies. Furthermore, knowledge of technology, social practices, traditions and world views are presumed to have been orally transferred or through master-apprentice or other types of relations. Approximately 8200 years ago, the Storegga tsunami battered parts of the Norwegian coast. As a result, some communities may have been wiped out, while others may “only” have had their infrastructure and environment destroyed. Nevertheless, having one’s ontological security challenged, what happened in these societies? From modern disaster studies, we know that although events like tsunamis are destructive, they may also make room for change. Our paper uses this known event as a point of departure to discuss whether knowledge of lithic technology changed or was modified as a consequence, or whether we can use identified continuity in technological elements to argue strong institutions making knowledge transmission resilient when challenged. In the project Life After the Storegga Tsunami (LAST), we investigate whether studies of lithic technology in multiple case study areas along the coast of South-Norway can identify gaps in knowledge transmission or other changes that can potentially be ascribed a reorientation after the tsunami. If no gap can be found, is that a testimony to the institutional power of craft, traditions, social practices, and technological tradition? Can our study give insight into the scale of social networks necessary for a technology to survive?

6 **TRADITIONS ON A MICROSCALE**

**Abstract author(s):** Mahlstedt, Svea (NIhK) - Niekus, Marcel (University of Groningen)  
**Abstract format:** Oral

Microoliths are known as the diagnostic flint implements of the European Mesolithic. They are made of blades and microblades. Their outer appearance seems to change or diversify throughout the mesolithic period. Starting with micropoints and triangular forms, a major new developement in shape shows up around 6000calBC with the introduction of trapezes. For the area of the so-called Northwest Group in the northern Netherlands and northwestern Germany the early types and the trapezes seem to go on and be produced synchronically. In the final Mesolithic the trapezes are proofed to develop from narrow to broad forms (Niekus 2008). Is this a sign of on-going tradition from broad trapezes to the use of the tanged transverse arrowheads of the Funnelbeaker Culture? What happened to the knowledge of micropoints and triangles? Was it lost at the end of the Mesolithic? Or earlier?

This poster will take the microlith tradition in the Netherlands and Northern Germany as point of departure and discuss possible breaks and persistence.

7 **A THRICE INVENTED, TWICE LOST TECHNOLOGY: CERAMIC TILED ROOFS IN ANCIENT GREECE**

**Abstract author(s):** Jazwa, Kyle (Maastricht University)  
**Abstract format:** Oral

Ceramic roofing tiles have a unique technological history. On three separate occasions, they were independently invented in mainland Greece – during the Early Bronze Age (3100-2100 BCE), the Late Bronze Age (1600-1050 BCE), and the Archaic Period (700-479 BCE) – and, in each of the first two instances, forgotten after just a few centuries of use. Only with the third episode of invention did the technology endure, spreading throughout the Mediterranean and beyond. This paper explores the processes that led to the “forgetting” of this technology in ca. 2100 BCE and 1050 BCE, along with the social, political, economic, technological, and visual contexts that prompted each rejection.

What is immediately apparent is that the two episodes of “forgetting” were contemporary with periods of intense change/crisis in mainland Greece and environs. I argue, however, that the crises themselves were not the sole reason for the failure of the technology to successfully anchor. Instead, the prehistoric ceramic tiled roofs were forgotten because of their high cost in resources and manpower (specialist and non-specialist), related developments in ceramic production and technology, and the movement of population within, to, and out of Greece. Perhaps, most impactful on the tiles’ long-term outcomes was that the surrounding areas and people never adopted the tiled roof to sustain the technology through these crises. This contrasts with the Archaic period when the tiled roof was quickly disseminated throughout the Mediterranean by Greek colonists. As a coda, I explore how in that third, successful invention, the technology was adapted and transformed by different groups adopting the technology.

8 **„LOST AND (RE)FOUND“: MERCURY REDEFINED?**

**Abstract author(s):** Szigli, Kinga (Ludwig-Maximilians-Universität München)

**Abstract format:** Oral

The correlation between pre-Roman and Roman religious systems shows a colourful and complex picture in terms of archaeology and geography. While certain provinces of the Roman Empire (e.g. Gaul, Germania, Britannia) indicate a clear continuity of indigenous cults, Illyrian and African regions seem to signal subtle differences: discontinuity, oblivion or innovation.

Moreover, within the same province itself various categories of archaeological material provide a highly diverse information. Literary testimonies can serve, despite their fairly precarious value, as a basic reference knowledge of sociocultural and religious life. Despite representing a general continuity (or transfer) of indigenous beliefs, the sources merely give a general description of cults and essence (vis) of deities.

Epigraphic sources, on the other hand, tend to provide a more coherent picture of deities (giving names & identity) merely in the Western and Northwestern provinces. In other provinces, inscriptions do not contain any additional information about them. Similarly, statuettes of gods seem to illustrate only in certain territories a pre-Roman set of knowledge and particular cultural identity.

Is this discrepancy a matter of forgotten knowledge in certain provinces, a part of a translation process (interpretatio or translatio), or a switch in the reference frame of certain groups, that update their original collective „reserve of knowledge” and symbolic meanings? Which consequences could such behavioural pattern have on society and culture?

Current work attempts to answer such questions in a multidimensional context from the perspective of religion, sociology, cultural theory, with the help of a case study about the cult of Mercury in Pannonia, in which statuettes are compared to votive inscriptions and literary sources as well as to significant epigraphic sources and statues from provinces with a different intensity of Romanisation, such as Gaul, Germania and Britannia.

9 VISUAL ART AS A RESOURCE FOR VIKING AGE POETRY

**Abstract author(s):** Neiß, Michael (Uppsala University, Department of Archaeology & Ancient History)

**Abstract format:** Oral

A recurring theme within Old Norse literature is a about a skald who encounters pictures on a beautiful building, shield or tapestry and who feels inspired to recite a poem – thus generating ekphrasis! Yet in real life, archaeologists tend to encounter Viking pictures more often on utensils. Amongst scholars in archaeology and Old Norse, the discourse on Viking ekphrasis tends to focus on human figures from monumental picture stones and wood carvings that are perceived as narrative compositions, whereas the Animal Art on utensils is dismissed as meaningless décor, or – at best – as symbolic representation. The focal point of my work is a brooch type that is best likened to interactive sculptures that change shape as the viewer changes perspective. Recent studies revealed several parallels between sculptural brooches and skaldic poetry in regards to context, cognition and imagery. Therefore, it seems fair to ask whether both expressions of Viking culture could have been linked through ekphrasis. In regards to ekphrasis, different schools of thought rely on diametric concepts. On the one hand, we have ekphrasis as the creation of a poem by verbalizing a picture, on the other hand ekphrasis as the creation of mental images by reciting poems. The first concept derives from Art History and suffers from a heavy bias towards logocentrism. The other concept derives from Literary Studies and is more suitable for sociosemiotic inquiries that focus on multimodal texts that combine verbal, visual and other resources. By leading the current discourse about ekphrasis onto sculptural brooches, I challenge established hierarchies that place humans above animals, narratives above symbols and written texts above pictures. This enables me to present a new concept of ekphrasis that seems better suited to understand the interplay between picture and poetry within the memory culture of Viking Scandinavia.

10 WHEN THE WORLD BURNS, THE NETTLE DOES NOT

**Abstract author(s):** Kauhanen, Riku (University of Turku)

**Abstract format:** Oral

Nettle (*Urtica dioica*) is one of the oldest fibre plants used by humans. After cotton became the most common fibre in 18th and 19th century, the use of nettle declined and in many parts of world, it was a weed plant. However, during the 20th century nettle was again used during times of war as food, fodder, fibre and even pesticide.

Central Powers used nettle increasingly in World War I and in Finland during Second World War the plant was promoted as a healthy food and source of fibres. Using the plant was encouraged in several ways, and many newspapers promoted it with a variety of recipes. In Finland museum pieces of old textiles made of nettle were used as examples of craftsmanship to show, that there was nothing new in using nettle as fibre. Nettles use and its worth was still promoted after the depression that ensued the war.

After the conflicts and depression following times of war loosened, the plant was again forgotten and considered to be weed. This representation addresses the use of nettle during times of crisis, the ways with which this forgotten and scorned plant was promoted and the oblivion, which usually followed. The rediscovering and forgetting of this “war time plant” shows, how a connection to the material culture of conflict is damaging, even though the subject itself remains the same and is even more useful than alternatives.

11 ETHNOBOTANY AND WRITTEN SOURCES ON FLORAL RESOURCES IN EVERYDAY LIFE AS PROXY DATA FOR BRONZE AGE ECONOMY RECONSTRUCTIONS

**Abstract author(s):** Slusarska, Katarzyna (Uniwersytet Szczecinski)

**Abstract format:** Oral

The European Lowlands’ environmental conditions do not support the possibility of survival merely based on the Bronze Age economy’s agricultural products. Villagers use to incorporate wild resources to their everyday practice even in after industrial revolution times. Written sources attest quite well the plant resources’ importance in not so remote past. Though all these attestations come

from modern times, some can be traced back to prehistory, to “everlasting” knowledge that allows survival in Northern European Plains.

This project’s primary goal is to look through written sources attesting wild plant in dietary and medical use and compare these records with archaeobotanical data available for the Bronze Age and early Iron age from Polish Plain. Archaeobotanical record from later prehistory and medieval offer also proxy data. This procedure does not allow a full and comprehensive “reconstruction” of the past economy. Moreover, this is not a goal. The archaeobotanical data are relatively sparse, but many other factors, besides the preservability, limit the possibility of plant-derived residues detection in an archaeological context. In archaeology, we do not have access to “living culture”. We observe a distorted and incomplete picture, similar to looking through the keyhole, and we usually do not know the scope of the distortion and incompleteness. Written sources review and listing the plant resources mentioned there offer insight in living culture even if the written sources are not complete, subjective and time distant. Having these observations listed, we can consider why we do not have a particular plant source attested by the archaeobotanical record. Furthermore, this procedure provides the possibility to discuss the scope of wild resources input in the past economy and the scope of tradition change, potential taboos, remembering and oblivion of traditional knowledge.

12 THE RICHNESS OF THE MATERIAL AND IMMATERIAL HERITAGE IN THE ALGARVE MEGALITHISM (PORTUGAL)

**Abstract author(s):** de Oliveira Teixeira, Luisa (Universidade Autónoma de Lisboa)

**Abstract format:** Oral

The Megalithic monuments of the Algarve region have been the subject of interest and numerous studies over several decades. Their importance increases with each investigation that is carried out. The landscape in which they are inserted, contains crucial information about the reality and complexity therefore, studies of the Algarve Megalithic monuments are fundamental for the understanding of the communities that idealized, planned, built and used them, as well as for toponymy, legends and local traditions that are still in use, as many of them are in the process of disappearing due to the globalization process.

The legends and traditions that are directly or indirectly linked to Megalithism, have enriched the imagination of peoples across time and geography. They are testimony and historical wealth that the populations had to make these places eternal. Rescuing the forgotten original knowledge and understanding the transformed one by oral tradition, will provide key information that until now has not been addressed in the context of Algarve Megalithism.

The study and analysis will be a major contribution to the identification and protection of the material and immaterial cultural heritage of the Algarve region, with an interdisciplinary approach, compiling information, methods and results on Megalithic monuments, thus articulating the knowledge of archaeologists, anthropologists, geographers and historians.

13 REMEMBRANCE OR LOST KNOWLEDGE? – SEPULCHRAL CULTURE IN THE NORTHERN BRONZE AGE

**Abstract author(s):** Kneisel, Jutta (Christian-Albrechts-University of Kiel; Johanna-Mestorf-Academy)

**Abstract format:** Oral

Remembrance and reference to the past are an important process in many cultures, contributing to the strengthening of the social fabric. At the same time, political and social power can be claimed as a result. The legitimation of one’s social position can thus be achieved, for example, with the erection of burial mounds or urn- graves at or nearby the “ancestors” burial. This presupposes that the knowledge of the burial place of the ancestors was known. In a ritual context, this can be traced in northern Europe throughout the Bronze Age and into the Iron Age.

Burial sites have been used, transformed, and expanded since the Late Neolithic, and reference to the older burial mounds is still made in Late Bronze Age and Iron Age. In addition, in Period V of the Later Bronze Age the custom of constructing large burial mounds is revived. In more recent times, they not only serve as landmarks, but are also used as boundary marks, e.g. for “Celtic Fields” as well as medieval to modern boundary markings.

This paper examines the complexity of ritual connections, their continuity and discontinuity at selected burial sites in Northern Europe. The dynamics in the temporal use of the burial sites will be demonstrated.

With the help of new 14C-datings gaps in the occupation can be identified. Isolated cases of destroyed mounds and natural elevations erroneously addressed as barrows testify to discontinuities. Robberies from later epochs such as the late Iron Age and reports from the modern period attest to traditional knowledge about the purpose of these prominent features in the landscape.

14 TRANSLATING KNOWLEDGE AND IDEAS. A 1. MILLENNIUM AD BURIAL SITE AT POINT HOPE IN ALASKA

**Abstract author(s):** Odgaard, Ulla (Independent researcher) - Houmard, Claire (Chrono-Environnement CNRS, Université Bourgogne Franche-Comté)

**Abstract format:** Oral

At Point Hope in Alaska a large site from the Ipiutak culture was excavated in the 1940ties. The Ipiutak culture is known from only a few sites. Because of its uniqueness, especially in its carvings, and its relatively short time of existence from around AD 200 –900 with an intensive blossoming before its disappearance, it has been characterized as “mysterious”.

At the same time in other parts of the world, far away from the Arctic hunting societies, the Iron age technology, ecology, and ideology was prevailing. In Alaska, however, only a few small pieces of metal have been found, although small in size and numbers, indicating some kind of contact. Although smelting metallurgy never came to the Arctic regions, the knowledge about it was not totally lost for the Ipiutak people. The fantastic openwork ivory carvings of the Ipiutak craftsmen probably mirrors knowledge about metallurgy and shamanistic ideas of transformation connected to it. Translated into other materials, the numerous carvings reflect how this culture, although being restricted in their choices of materials, was mentally connected to the wider world and was able to take part in knowledge and ideas on a macro-regional level.

15 **ROCK ART IN NORTHERN FENNOSCANDIA: ABANDONMENT AND REVIVAL**

**Abstract author(s):** Gjerde, Jan Magne (NIKU - Norwegian Institute for Cultural Heritage Research) - Damm, Charlotte (UiT - The Arctic University of Norway)

**Abstract format:** Oral

Rock art in northern Fennoscandia has for more than 100 years been almost exclusively associated with hunter-gatherers. A general assumption is that rock art ends c. 0 AD, which is also when farming consolidated in many areas, and when Sámi and Germanic languages replaced former ones. There are, however, several rock art panels with figures, initials, names and years which clearly date to early modern times. Some of these occur at sites with prehistoric motifs. Often this “modern” rock art was viewed as miscellaneous graffiti, and hence received little attention during the initial documentation. Some of the site names at prehistoric rock art panels holds appellative information, such Värrikallio (the coloured rock) in northern Finland and Ruksesbákti (the red rock) in northern Norway demonstrating long term local awareness of the sites. The early modern rock art in northern Norway is typically situated at places associated with Sámi landscapes, and even Sámi ritual landscapes. The selection of motifs may refer to the motifs on the Sámi drums, but also has affinities with Christian motifs. The early modern rock art is here viewed in the light of forced abandonment of the traditional Sámi drums as well as syncretism between the Sámi and Christian religion. It is in this context latent memories and practices of rock art were revived. The paper will cover briefly the transmission from rock art panels to Sámi drums, but in particular focus on the revival of lost practices with examples from sites in northern Norway and the implications of the neglect in the initial documentation for the interpretation of “modern” rock art.

228 **AGRICULTURAL CHANGE AND SOCIAL INEQUALITY: APPROACHING COMPLEXITY**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Kerig, Tim (ROOTS Subcluster Social Inequalities) - Lechterbeck, Jutta (Arkeologisk Museum Universitetet i Stavanger) - Wilkes, Fynn (ROOTS Subcluster Social Inequalities)

**Format:** Regular session

Social inequality and agricultural change are both “hot topics” in current societal debates, especially when facing the challenges of global climate change. It is obvious that there is a systemic connection between agricultural production and social inequalities. Those connections are evident, but the complexity of these interactions is not well understood: Archaeological approaches which assess social inequality and agricultural change offer a unique long-term, deep-time perspective. Today, vast amounts of archaeological and archaeobotanical data is available. New perspectives towards social inequality in archaeology have arisen in the last couple of years through the implementation of economic, demographic, and evolutionary methods. The Gini-index for measuring social inequality, for example, has been successfully applied to different archaeological datasets.

Progress in scientific methods makes it possible to analyse agricultural change in greater detail. Isotope analyses, sediment aDNA analyses, high resolution pollen analysis and land cover reconstructions enable us to measure land use change on various scales. Modes of production and societal organisation are intertwined. This applies to the level of societal organisation, ownership of production and the mobilisation of the workforce, to name but a few.

In this session we want to address the following issues: Does production determine societal complexity? Does social inequality constrain choices in the past and is it possible to discover path dependencies? What sources do we have and how do we combine them?

This session aims to explore the complex interconnections between production and social inequality. We invite evidence-based papers which discuss changes in social inequality, agricultural production, (or a combination of the two) on local, regional, interregional, and continental scales for all archaeological periods.

**ABSTRACTS:**

1 **LONG-TERM DEVELOPMENT OF EURASIAN AGRARIAN PRODUCTIVITY AND ITS RELATION TO SOCIAL COMPLEXITY AND INEQUALITY**

**Abstract author(s):** Kerig, Tim (Cluster of Excellence ROOTS, CAU Kiel) - Markert, Cornelius - Amlinger, Marc (Institut für die Geschichte und Zukunft der Arbeit - IGZA)

**Abstract format:** Oral

A relation between the development of productivity and the emergence of social inequalities seems obvious but difficult to describe archaeologically. High social inequality requires a high level of productivity, but does higher social complexity always require high surplus?

Knowing and differentiating productivity levels is important when looking for social inequalities eg. by constructing the social inequality frontier: unequal access to the modes of production as well as the structure of the labour force are actual restrictions or opportunities for the potential income of households.

An index for agrarian productivity will be presented: The amount of labour required to produce a bread from 1 kg of wheat. The index fits the Eurasian and North-African zone, where wheat has been regularly produced for millennia. The index can be understood as giving market basket values allowing comparisons across time and space, measured in standardised working hours.

The index is based on the Cologne Tableau (KöTa), inter alia a collection of hundreds of agrarian practices gathered from historical, ethnographic, ethno-archaeological literature as well as from archaeological experiments. For every considered good, the inputs, used resources and technologies, and the outcomes are recorded. From this, minimal and maximal efforts, average costs, “best practices” and the archaeologically most likely scenarios can be constructed.

Here we present the development of the index for paradigmatic case studies, or test modes, starting before the neolithization up to the 18th cent. AD and representing different Eurasian ecological settings. Doing this, allows to relate the index to critical economic stages in the particular social evolution (introduction of plant-production, animal husbandry, storage practices, urbanism) and look for general lessons to be learnt from the relationship between productivity and social complexity and social inequality.

The most striking finding is that the case studies of emerging state societies show the same level of productivity.

2 **WHAT IF EQUALITY WAS EQUALLY –OR EVEN MORE– COMPLEX?: RECONSIDERING THEORETICAL MODELS FROM THE LANDSCAPE OF AN ANDEAN AGROPASTORAL SOCIETY**

**Abstract author(s):** López Lillo, Jordi A. (Institute of Heritage Sciences, National Research Council - Incipit-CSIC) - Franco Salvi, Valeria L. - Salazar, Julián (National University of Córdoba - UNC; National Scientific and Technical Research Council - CONICET)

**Abstract format:** Oral

Located in Northwest Argentina, Tafí cultural tradition (250 BC-AD 850) is among the most outstanding expressions of the so-called Formative or Neolithic period of this region. It gets its name from one of the main valleys connecting the plains and “yunga” forest of Tucumán Province with the Andean Highlands, a position which provides a relatively temperate climate and an almost continuous praire vegetation. Such traits, but above all the ubiquity of the remains of circular stone structures along the road that crosses the valley, favored an early knowledge of this tradition by Archaeology. Not for nothing, scholars noticed the carved monoliths which have popularly characterized it in the late 19th century; and despite their archaeological context was partially lost, it is known that a few were gathered around an earth mound excavated in turn in the 60s. The uniqueness of the latter structure together with the monumentalization implied by monoliths, the newly developed agropastoral-based livelihood, and its co-occurrence with an unprecedented population density led to a social interpretation in terms of emergent hierarchies and chieftainship. However, the most prominent –and monumental– characteristic of Tafí tradition are in fact those aforementioned stone structures, most of which correspond to households sharply segregated from the outside and scattered all over the landscape in more or less blurred clusters; so in the following decades, self-sufficiency and egalitarianism have been primarily stressed. Our aim is to problematize this apparent paradox as the result of a weak understanding of primitive politics, ultimately rooted in the teleological mythology of Modernity. An alternative approach will be discussed instead from the point of view of the agents, their political goals and ontologies, as they were actualized by inhabiting the landscape. To this end, GIS analyses were conducted in Tafí and neighboring areas, where previously unknown mounds have been documented.

3 **INCREASING RETURNS TO AGRICULTURAL INTENSIFICATION AT ANGKOR, CAMBODIA**

**Abstract author(s):** Klassen, Sarah (Leiden University) - Ortman, Scott (University of Colorado Boulder) - Lobo, Jose (Arizona State University) - Evans, Damian (École française d’Extrême-Orient)

**Abstract format:** Oral

A dominant view in economic anthropology is that agricultural intensification implies decreasing returns. This is difficult to reconcile with the emergence of urban systems that require agricultural surplus for non-food producers living in urban centers. The quandary is starkly posed by the rise of urbanism in the Greater Angkor Region (Cambodia, 9th-14th centuries CE), which arose from an economy underpinned by rice production. We use settlement scaling theory to argue that supra-household scale organization of agricultural production yielded increasing returns to farming labor, enabling a sizeable urban population to be supported. We find spatial patterns

in temple communities consistent with the Alonso-Muth-Mills model of urban land use and the incorporation of agricultural production within the urban economy. Our results suggest the rise of urbanism at Angkor was enabled by increasing returns to agricultural labor, resulting from social processes and use of infrastructure common in other urban systems, past, and present.

4 REPRESENTATIONS OF POPULATION DYNAMICS

**Abstract author(s):** Zimmermann, Andreas (Inst. Prehistoric Arch. Köln)

**Abstract format:** Oral

There are different kinds how to represent population dynamics (Whitmore et al. 1990). None of these representations are wrong. However, for a better understanding of systemic relations between agricultural change and social inequality as well as their interactions with population dynamics, the properties of these representations have to be taken into account. Of major importance are the scale of population axis as well as scales of time and space of the respective area analyzed.

In this talk the standard linear model (“arithmetic-exponential” in terms of Whitmore et al. 1990), the logarithmic model (“logarithmic-logistic”) as well a regionally differentiated segmental model of the Gordon Childe type are discussed with their specific properties and illustrated by standardized estimations of population densities covering Europe or Central Europe in the time since the Upper Paleolithic (Schmidt et al. 2020).

It is proposed to choose population dynamics in specific representations as a response to production in general and food procurement as a specific factor. A side line of the argumentation considers space requirements based on the plant-animal ratio of food-stuffs. This ratio may be controlled by a compilation of isotopic analyses of human bones. Finally, it is discussed where to place hunter-gatherers as well as early farmers with their typical patterns of population dynamics on the gradient between egalitarian groups and societies with marked social inequality.

5 PATTERNS OF DEMOGRAPHIC CHANGE AND LAND USE IN SEDENTARY SOCIETIES

**Abstract author(s):** Hilpert, Johanna (CAU)

**Abstract format:** Oral

A modeling approach to quantify past agricultural systems is presented. Its stringent application allows the comparison of (pre-) historic land cover change and agricultural production volumes of different time slices. It balances the supply of nutrients provided by plants and animals with the human demand, thus calculating the necessary amount of farmland and the production volume to provide the subsistence of the people (Wendt et al. 2019). The model integrates archaeological information as well as historical, ethnographical and modern data about energy yield of different plant and animal species. Population numbers regarding the covered time slices were generated using an upscaling model to estimate population densities. The methodical framework bases on the controlled transfer of data between different archaeological scale levels of space (Schmidt et al. 2021). The results are helping to integrate processes of cultural history into interpretation.

Assumptions about food habits are basic for the reconstruction of field sizes and meadows as well as the stocking rate for selected time horizons from ~5.300 BC (Bandkeramik) to 1830 AD (Preindustrial Modern Times). Bandwidths of demand and production volumes were determined considering regionally differing conditions. The periods under consideration vary greatly regarding their economic and social organization. This allows diachronic analyses of time immanent patterns as well as general economic trends. The model discloses not yet fully exploited possibilities of visualization and comparative analysis.

6 WHAT DROVE INEQUALITIES?

**Abstract author(s):** Gronenborn, Detlef (Römisch-Germanisches Zentralmuseum, Mainz; Johannes-Gutenberg-Universität, Mainz)

**Abstract format:** Oral

The trajectory between c. 5500 cal BCE and c. 3500 cal BCE in Temperate Europe saw a succession of three large cycles during which Neolithic societies underwent considerable internally and externally driven transformations.

The last two cycles, generically called the Middle and Young Neolithic respectively, also saw the emergence of considerable forms of social and political inequalities. Despite the sometimes enormous archaeological manifestations of political power, the individual representations of this phenomenon never seem to have persisted for more than several generations at most. They seem to be phase-dependent, probably also indicating changing concepts of inequalities within the societies themselves.

The presentation will look at the period of the first emergence of political inequalities in Neolithic societies across Temperate Europe after 5000 cal BCE and will try to find answers for the phenomenon: why did societies begin to develop political inequalities, why social inequalities? Why did these phenomena only last for brief periods, why do they appear during certain phases? And how have they changed societies internally, both from the perspective of the elites as well as from those under their rule?

7 ASSESSING WEALTH INEQUALITY VIA GINIS: A WORLDWIDE RETRO/PROSPECTIVE

**Abstract author(s):** Kohler, Tim (Washington State University; Santa Fe Institute; Crow Canyon Archaeological Center)

**Abstract format:** Oral

I briefly review the main findings of a 2017 Nature Letter in which wealth inequality was assessed via Gini coefficients calculated from household size distributions in a number of penecontemporaneous settings, discuss reactions to it, and assess the present state of inquiry into patterns in the prehistory of wealth inequality around the world. Profitable future directions for such work include development of long local and regional sequences at high chronological resolution to (1) compare with other proxies for wealth inequality; (2) investigate the relationships of wealth inequality with differential power and status; and (3) assess relationships with political and economic structure and violence through time; (4) develop connections with the contemporary world through investigation of Ginis computed with house-size data compared with Ginis computed on data on wealth.

8 HOUSE SIZE DOES NOT ALWAYS MATTER! INEQUALITY IN THE PREHISTORIC BURIAL LANDSCAPE OF THE CARPATHIAN BASIN

**Abstract author(s):** Wilkes, Fynn (ROOTS Cluster of Excellence; Christian-Albrechts-Universität zu Kiel)

**Abstract format:** Oral

Recently, the topic of quantitative inequality research in archaeology has been supplemented by the incorporation of house-related data (Kohler et al. 2017). Multiple studies have replicated this premise by incorporating house sizes and household demography into their quantifications (e.g., Porčić 2019, Basri/Lawrence 2020, Ames/Grier 2020). While houses remain useful for positioning inequality within a “living society”, the burial-derived data allows overcoming many archaeological problems related to household archaeology such as the estimation of the number of inhabitants or the identification of structures used for housing. While focusing on burial data as a proxy for inequality remains a classical direction in such research (e.g., Zalai-Gaál 2010, Siklósi 2013), it provides a sound basis for inequality-based research in areas where high-quality house data can generate a fragmented dataset.

This talk focuses on combining burial data and inequality measurement to discuss the development of wealth disparities in the Carpathian Basin. With a set of case studies representing a transect from the Late Neolithic to the Early Bronze Age, it aims to show the overall development of inequality, as well as its dynamics related to different social groups. It is intended to look beyond the “household” approach and open a discussion of the involvement of a difficult group of archaeological sources in the quantitative exploration of prehistoric inequality. While the socio-economic interpretation of the data is of primary significance, the talk will also focus on outlining the methodological issues related to the on-going PhD research project “Social Inequality in the Carpathian Basin from the Neolithic to the Bronze Age” (working title).

9 TESTING HYPOTHESES OF SOCIO-ENVIRONMENTAL HAZARD IN FOSTERING SOCIAL INEQUALITY ACROSS LATE NEOLITHIC AND BRONZE AGE EUROPE

**Abstract author(s):** Großmann, Ralph (Kiel University; Cluster of Excellence ROOTS)

**Abstract format:** Oral

It is evident that environmental hazards recurred throughout the Holocene. Episodes of heightened socio-environmental stress combined with resource narrows have probably fostered inequality and possibly triggering migration. Here we test hypotheses of socio-environmental dynamics in a trans-European perspective and presents the first results regarding the impact of climate and environmental hazards on past societies. In particular, the project questions how past societies dealt with changing climatic and environmental conditions and how these changes affected material and ritual culture.

The project focuses the time period between 3500 and 1500 BCE. Within this time frame we are aiming to quantify settlement structures and settlement intensities and calculate social inequalities based on house size and household differences. Additionally, these results are correlated with climatic and ecological data to evaluate the impact of environmental hazards and especially of the 4.2 kyr climate event. In focus are several regions with high diachronic agglomerations of settlement records (Central Germany, Alpine Foothills, and Southern France). In comparing these regions enable to identify Late Neolithic to Bronze Age settlement dynamics and transformations of social inequality, which may have been accompanied by changes in agricultural production.

CHANGING BEHAVIOUR IN STOCKPILING? NEW APPROACHES TO THE YOUNGER AND LATE NEOLITHIC OF HESSE AND EASTERN WESTPHALIA (4200-2800 BCE)

**Abstract author(s):** Hoffmann, Robert - Schwarck, Nadine (Institut fuer Ur- und Fruehgeschichte Kiel; CRC 1266)

**Abstract format:** Oral

This paper is focused on ceramic finds connected to subsistence as an indicator of economic transformations in the region of the German Lower Mountain Range during the transition of the Younger to the Late Neolithic during the 4th millenium BCE. The results shall be used to contribute towards a better understanding of the shift from Michelsberg to Wartberg culture in the region of eastern Westphalia and Hesse. The alteration in the collective idea, which changes e.g. from the construction of large enclosures to the erection of gallery graves, testifies that significant transformations in the second half of the 4th millennium BCE took place.

New data concernig economic practice will be gained on settlements. Therefore, find material linked to harvest, production and storage of food is evaluated to answer questions about subsistence strategies. Previous analyses of settlement structures and house sizes have shown that there is a notable change from the Middle to Younger and Late Neolithic and one aim of this project is to find out if these changes have an impact on subsistence strategies or vice versa.

In a first analysis, we are examining the ceramic inventory of selected settlement sites, since pottery is the most numerous and informative category of the movable goods of households. In a second step, out of find catalogues, storage vessels are extracted and examined in terms of form and capacity with statistical analysis, as the capacity of stockpiling in a settlement might indicate a change in agricultural strategy from the Younger to the Late Neolithic. The first results of our approach will be presented here.

PREPARING THE GROUND SUBSISTENCE ECONOMY AND HIERARCHY IN LATE NEOLITHIC SCANDINAVIA

**Abstract author(s):** Johannsen, Jens (ROMU; Aarhus University - Department of Archeology and Heritage Studies)

**Abstract format:** Oral

The Scandinavian Late Neolithic (2350-1700 BC) is part of a comprehensive discussion of the hierarchical society’s origin and the beginning of the Scandinavian Bronze Age. Here, the elite’s agency is in focus, and the development is seen as a result of the elite’s widespread network and power. However, the social development at the end of the Neolithic cannot be understood in the light of elite agency alone. By mainly focusing on the elite, its network, and the connected material culture, the rest of the population and the subsistence economy’s role is neglected.

The idea behind the present project is that an efficient subsistence economy, capable of providing the society with plenty of food, is an underlying prerequisite for social development since a food surplus must be fuelled into all power sources to keep them going. The project is based on a synthesis of material related to the Scandinavian Late Neolithic subsistence economy. The preliminary results indicate several changes compared to the preceding period. New agricultural methods made it possible for people to feed better than earlier, resulting in increased average stature and a denser distribution of settlements. The social changes in the Late Neolithic were not a consequence of these developments but a prerequisite for them to happen.

THE POLITICAL ECONOMY OF SLAVES, UNFREE OR CAPTIVES IN THE NORDIC EARLY BRONZE AGE?

**Abstract author(s):** Sørensen, Casper (Viborg Museum) - Kristiansen, Kristian (University of Gothenburg) - Mikkelsen, Martin (Viborg Museum) - Earle, Timothy (Northwestern University)

**Abstract format:** Oral

In the Nordic Early Bronze Age (1500-1100 BCE), Northwest Jutland had unprecedented amounts of wealth in bronze and gold placed primarily in graves. Recently, the role of captives and slaves have been documented as a global phenomenon in fairly small-scale societies and introduced into macro-level interpretations of prehistoric political economies. Two models involving these aspects have been presented to explain ability of people in Early Bronze Age NW-Jutland to accumulate wealth, challenging the classic view of amber as the Nordic gold. Building on ethnographic and Viking Age analogies, one presents the maritime mode of production focusing on slave raiding as a means to obtain a valued exchange commodity. Based on a detailed analysis of regional settlement patterns and supported by recent advances in aDNA and isotope studies, the other model presents a decentralized agro-pastoral mode of production, dependent on a stable segment of unfree for surplus production. Besides being an integral part of subsistence production, it is suggested that they also were exchanged as a valuable commodity.

This paper aims to compare these two models to create a comparative platform for future discussion and elaboration of the subject. Furthermore, we emphasize a conceptual distinction between captives and unfree in a Nordic perspective. It is key to comprehend the social role and cultural context of the unfree to progress future discussion and elaboration into this topic. With the archaeological record of burials and households in the contexts of ecology and demographic conditions, we scrutinize the two models in a bi-scalar manner focusing on the internal record of the region and scaling up to supra-regional maritime routes of communication, raiding and exchange. One possible resolution may be to show that the two models solved different and perhaps complementary problems involving local vs. distant processes in the political economy.

EGALITARIANISM IN COMPLEX AGRARIAN SYSTEMS: ALTERNATIVE INTERPRETATIONS IN IRON AGE ARCHAEOLOGY

**Abstract author(s):** Sastre, Inés - Currás, Brais - Orejas, Almudena (CSIC) - Álvarez, Yolanda (Terra Arqueos)

**Abstract format:** Oral

The usual connection between agriculture, complexity and inequality deserves an in-depth review. The archaeological record of some agrarian societies challenges this apparently obvious systemic connection between changes in agricultural production and social inequalities and points to social factors that allow other forms of development. Control over the size of settlements and control over surplus production are two of their main indicators.

We propose an overview of the Northwestern Iberian Iron Age record on storage systems and different forms of organising production. We will show that the practice of a complex agriculture is not univocally related to hierarchies or visible inequalities and how this changes depending on different historical factors, mainly imperialist domination. The link between production and societal complexity must be seen as a proactive, two-ways, relationship, not as a determinism of the means of production. We propose to look back at social egalitarianism as an historic factor that marks its own historical paths.

AGRICULTURAL AND SOCIAL CHANGE IN NORWAY BETWEEN EARLY BRONZE AGE AND LATE IRON AGE – EVIDENCE FROM SOILS AND HOUSES

**Abstract author(s):** Lechterbeck, Jutta - Dahl, Barbro (Arkeologisk Museum, Universitetet i Stavanger)

**Abstract format:** Oral

There is a systemic connection between agricultural production and social inequality though it is not easily assessable in the archaeological record. In this study from South West Norway, we use anthropogenic soils as an archive for agricultural change and the house sizes as indicator for social change. We establish a correlation in time between these two sources by radiocarbon dating. The shift in land use strategies implies several possible changes: arable fields would be more stationary, more work would be put into them and animal dung would become a scarce good, to name only a few. Social changes might concern family structures and sizes, unfree labour, or hierarchies.

Anthropogenic soils are widespread in South Western Norway. They have been recorded and dated in the last decades during archaeological excavations. Over a hundred radiocarbon dates are taken from these soils. A sum calibration of the dates reveals that the practices leading to anthropogenic soils started at latest in the Pre-Roman Iron Age, furthermore the sum calibration shows clear phases of land use.

As well, numerous three-aisled houses have been excavated and radiocarbon dated showing a development in house size and architecture from the Early Bronze Age to the Late Iron Age. We will use the house size as a simple proxy for household size and the summed radiocarbon dates for occurrence over time, both for large and small houses.

In this study we will concentrate on the region of Rogaland in South Western Norway and use the site of Forsandmoen as a starting point where the remains of 255 houses show a continuous settlement from 1500 BC to AD 700.

FEEDING ANGLO-SAXON ENGLAND: THE BIOARCHAEOLOGY OF AN ‘AGRICULTURAL REVOLUTION’

**Abstract author(s):** Hamerow, Helena - Bogaard, Amy - Forster, Emily - McKerracher, Mark - Stroud, Elizabeth (University of Oxford) - Holmes, Matilda (University of Leicester)

**Abstract format:** Oral

Across much of Europe, the period from c AD800-1200 saw the advent of new forms of cereal farming capable of yielding regular, large surpluses. These enabled landowners – for the first time since the Roman period -- to amass wealth by exploiting the labour of others. By 1066, England had thousands of such landowners with their own estates, prospering from rents extracted from peasants who worked the land. A link thus existed in medieval Europe, as in prehistory, between the expansion of cereal farming and the growth of wealth inequalities. The ‘medieval climate anomaly’ may also have played a role. Medieval farmers appear to have expanded cereal production largely by adopting increasingly extensive forms of farming (in which the area of land under cultivation increased while the amount of manure and human labour per land unit decreased), systematic crop rotation and the heavy mouldboard plough. This paper will present selected results from a project that is reconstructing medieval cultivation regimes by by applying a range of analytical methods to the remains of early medieval crops, arable weeds, livestock, and pollen and comparing the results with the archaeological evidence for farms. The results provide direct evidence of the conditions in which early medieval crops were grown, enabling us to address longstanding questions from a new perspective.

THE VOICE OF THE MEDIEVAL FARMER LOCAL TOPONYMS AS A SOURCE FOR AGRICULTURAL CHANGE AND SOCIAL INEQUALITY

**Abstract author(s):** Schreg, Rainer (Medieval and postmedieval archaeology, Otto-Friedrich-Universität Bamberg)

**Abstract format:** Oral

Even in historical times we often face a lack of documents, reporting about daily life and the agency of the ‘normal’ people, especially in rural landscapes. Even in the Middle Ages agricultural change and social relations in rural communities are often invisible. Written documents are highly influenced by a manorial perspective.

However, local toponyms are an important source for understanding social and economic spaces of medieval farmers. Whereas early research was well aware of these sources they lost attention during the last decades. In Germany their documentation and interpretation was in general a topic for local amateur historians. Their main interest was in the etymology of the names of fields and forests, mainly in their own village. While most toponyms are already present in late medieval rentals, their exact chronological context remained controversial.

This paper widens the horizon by integrating toponyms research into the debate about medieval agricultural change and the role of various social groups in the process of village formation. Different methodological approaches combining toponyms and archaeological data will be used in order to look closer at the interdependencies between changing social complexity within rural communities, settlement reorganisation, and agricultural innovation. Examples from Southern Germany show the potential of an archaeological perspective in order to make toponyms to a valuable voice of the otherwise silent farmers, herders and even woodsmen.

VITIS VINIFERA, OLEA EUROPAEA, AND CASTANEA SATIVA ANTHRACOLOGICAL REMAINS AS MARKERS OF SOCIAL COMPLEXITY IN THE MEDIEVAL WESTERN MEDITERRANEAN

**Abstract author(s):** Santeramo, Riccardo (Università degli Studi di Genova) - Buonincontri, Mauro (Università degli Studi di Siena) - Di Pasquale, Gaetano (Università degli Studi di Napoli Federico II) - Bianchi, Giovanna (Università degli Studi di Siena) - Quirós Castillo, Juan Antonio (Universidad del País Vasco)

**Abstract format:** Oral

The anthracological study of medieval rural settlements located in the Upper Ebro Basin (northern Spain) and southern Tuscany (central Italy), allow us to discover important correlations between landscapes dynamics and economic and social changes in the western Mediterranean. According to anthracological and historical sources, the 10th-11th century turned out to be a key moment for landscapes of the studied areas. In central Italy, expansion of olive and chestnut began while viticulture increase in the Upper Ebro Basin. Those events are globally related to the set-up of the economic establishment of the lordship domination and the political organism of the medieval towns. It is not a linear process, but in spite of a continuous tension between different social agents, lords and municipal councils established a landscape, apparently fruit of their own will. However, the rural communities did not have to participate passively in such process. In particular, anthracological and archaeological analysis for the Upper Ebro Basin can show how during the Early Middle Ages rural communities can develop a strong identity and a capacity of active transformation of the agrarian landscape. In particular, viticulture was already practised by certain rural communities before being promoted by the supralocal lords in the 10th century. Those communities were already able to manage the workforce, to organize collective-practices, and to realize complex agronomic and silvicultural practices, factors possibly presupposing the existence of a collective identity. In this research, we want to discuss the presence/absence of some iconic Mediterranean woody species (grapevine, olive tree and chestnut), in the context of the medieval rural settlements, in order to stress the connection between the landscape construction, the agricultural production strategies and the social complexity.

CHARRED PLANT REMAINS AS A PROXY FOR DETECTING INEQUALITY. CASE STUDIES FROM THE NEOLITHIC TO BRONZE AGE IN SOUTHERN POLAND

**Abstract author(s):** Korczynska, Marta (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) - Nowak, Marek (Institute of Archaeology, Jagiellonian University, Kraków) - Kapcia, Magda (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) - Kenig, Robert (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków; Institute of Archaeology, Jagiellonian University, Kraków) - Moskal - del Hoyo, Magdalena (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków)

**Abstract format:** Oral

The first farmers of the Linear Pottery culture implemented husbandry practices in southern Poland. Their successors – communities of the so-called Lengyel-Polgar complex pursued the intensive agriculture. This way of cultivation changed, as a new economy and settlement pattern of the Funnel Beaker culture required the exploitation of extensive areas. In general, due to the lack of convincing determinants of a social hierarchy in the archaeological record, this three cultural groups are traditionally described as rather egalitarian societies. It is worth noticing, however, that during the first half of the fourth millennium BC in the south-eastern group of Funnel Beaker culture, appeared large settlements (like e.g. Bronocice, Mozgawa, Gródek Nadbużny). As they cumulated production activity, they might be interpreted as the central and highest points in the network of micro- and mezoregional decision making. In the following presentation, we will examine if the social and/or functional (in)equality might be visible in diversification of charred plant remains, both in qualitative and quantitative terms. Further, the site catchment areas, as well as predictive agricultural potential of the Neolithic settlements, will be discussed.

In the long-established discourse social inequality is connected with formation and development of Bronze Age societies. For that reason, in the second part of our presentation we will compare the degree of diversification of Neolithic patterns (and further land-use strategies) with differentiation of the archaeobotanical and environmental data, obtained from Lesser Poland Bronze Age settlements. In order to do so, we will take into consideration functionally diverse sites (like hill forts, open hilltop settlements, or settlements connected with a specialized production).

AGRICULTURAL PRACTICES DURING THE ITALIAN BRONZE AGE: C AND N STABLE ISOTOPE ANALYSIS AS INDICATORS FOR FERTILIZATION AND IRRIGATION

**Abstract author(s):** Cortese, Francesca (Prehistoric Archaeology Laboratory. University of Rome Tor Vergata) - Carrara, Nicola - Dalla Longa, Elisa (University of Padua) - De Angelis, Flavio (Centre of Molecular Anthropology for Ancient DNA Studies, University of Rome Tor Vergata) - Silvestri, Letizia (Prehistoric Archaeology Laboratory. University of Rome Tor Vergata; Durham University, Department of Archaeology; Sovrintendenza Capitolina ai Beni Culturali) - Rickards, Olga (Centre of Molecular Anthropology for Ancient DNA Studies, University of Rome Tor Vergata) - Rolfo, Mario (Prehistoric Archaeology Laboratory. University of Rome Tor Vergata)

**Abstract format:** Poster

The spread of agriculture leads to innovative soil management techniques: earlier fertilization and irrigation records date back to the Late Neolithic. During Copper and Bronze Ages, exploitation strategies were improved and intensified, leading to a better soil fertility and productivity; nonetheless archaeological signs of agricultural practices are scarce. In this context, Carbon and Nitrogen stable isotope analyses are noteworthy to analyse agricultural change and production methods, such as fertilization and irrigation. Published works demonstrate that manuring mainly modifies Nitrogen values, while intensive watering practices alter Carbon data.

This work aims to examine the results of stable isotope analyses carried out on carpological remains from Bronze Age Italian sites: Pastena Cave and Ledro. The former, in central Italy, is a funerary and a cult cave. Among several finds of different material categories, this site presents hundreds of thousands of burnt seeds of Vicia Faba (90%) and cereals (10%). In northern Italy, Ledro is a pile-dwelling site returning several carpological remains: grains were the focus of stable isotope analyses.

Preliminary data show that, at least in Pastena Cave, seeds seemed to be manured and watered: fertilization appears to have been homogeneous for all the species; instead, irrigation seems to have mainly concerned legumes. Such enhanced agricultural management technique might have been carried out by specifically trained individuals, indicating a diversification of tasks within the community and therefore an increasing social complexity. Nevertheless, combined stable isotope analyses on the human remains and the seeds do not necessarily testify to social inequality in this context, due to the small sample and the scarcity of comparative studies. For the same reason, the evidence of similar dietary habits for all the analysed individuals does not exclude the presence of a social stratification within the wider community.

Further analyses are still ongoing to validate the obtained results.

A MULTI-PROXY CASE-STUDY OF MIDDLE BRONZE AGE (1600 – 1250 BCE) LAND USE PRACTICES IN THE NORTH-WESTERN ALPINE FORELAND

**Abstract author(s):** Höpfer, Benjamin - Scherer, Sascha - Deckers, Katleen (University of Tuebingen) - Lechterbeck, Jutta (University of Stavanger) - Lehnndorff, Eva (University of Bayreuth) - Marinova-Wolff, Elena (State Department for Cultural Heritage Baden-Württemberg) - Meister, Julia (University of Wuerzburg) - Scholten, Thomas - Kühn, Peter (University of Tuebingen) - Knopf, Thomas (University of Tuebingen & Keltenmuseum Hochdorf/Enz)

**Abstract format:** Poster

We present results from a soil-scientific and archaeological, -botanical and -zoological collaboration focused on Middle Bronze Age (MBA) land use practices in the north-western Alpine foreland. We combined data on onsite archaeological features, near-site (<5 km to the site) colluvial deposits and offsite pollen bogs. The study-site, Anselfingen, lies ca. 20 km west of Lake Constance and is one of the most completely excavated MBA settlements in the region. Optically stimulated luminescence (OSL) and radiocarbon (AMS 14C) dating of colluvia showed a first major erosion phase during the MBA. Charcoal spectra indicate forest management favouring Quercus. Analyses of faecal biomarkers (5β-stanols) and bone remains suggest forest pasture of pigs, especially north of the village. To the south, an arable field with a buried plough horizon was discerned micromorphologically and by low phytolith-concentrations from grass inflorescences. Onsite botanical remains stem from Hordeum distichon/vulgare, Triticum dicoccum, Triticum monococcum, Triticum spelta, Triticum aestivum/turgidum, which were probably stored in stilted pantries within the settlement. Urease-activity and faecal biomarkers from colluvia and buried topsoils indicate grazing on fallow land and/or manuring. Polycyclic aromatic hydrocarbons (PAHs) and their spatial distribution indicate fire-use for various purposes, e.g., landscape maintenance, domestic burning, and technical applications. An MBA peak of micro-charcoal and alternating Quercus and Fagus curves in the offsite pollen spectra reflect these anthropogenic vegetation changes also on a regional scale.

Our data give insights into the MBA subsistence economy in a depth that had hitherto been hardly available apart from wet-preserved sites. They indicate a very diversified, self-sustaining subsistence, which, along with technological developments (e. g. bronze tools like sickles, stockpiling etc.), might have improved the resilience and versatility of the MBA landuse system to a degree that allowed not just for a consolidation, but even for an expansion of the settlement networks - despite deteriorating climate.

**Theme:** 6. Material culture studies and societies  
**Organisers:** Nilsson Stutz, Liv (Linnaeus Univeristy) - Tarlow, Sarah (University of Leicester)  
**Format:** Regular session

“Everything is held together with stories. That is all that is holding us together, stories and compassion.”

Over the past decades, materiality and material culture have highly theorized in a range of academic disciplines outside of archaeology, including history, cultural anthropology, and sociology. Material items can be containers of collective and individual memory, devices capable of triggering emotional, psychological, and even physiological reactions, and tools for expressing or retaining identity. At the same time, the cross-disciplinary field of memory studies has grown out of psychology, cognitive science, history, museum and archive studies etc., and has addressed the processes of memory, the creation of memory and concepts such as collective memory, bringing a deeper analysis to the creation and perception of the past in self-definition and identity processes.

Material culture and memory studies can enrich and sharpen theoretical and methodological approaches to the things that have always been at the center of our discipline. Archaeological approaches can add sophistication to the ranges of memory, emotion and affect of lived experience in the past and in the present, as discussed in other disciplines. At the same time, we can incorporate their insights to enrich our own understanding of the past.

This session seeks to explore theories of memory and emotion through archaeological case studies. Through the analysis of material culture - from small objects such as heirlooms or everyday tools, to large structures such as monuments or buildings - these studies will explore the connections between materiality, emotion, and memory in the lived experience of the past and present.

**ABSTRACTS:**

**ON THE EDGE OF MATERIALITY: STORIED LANDSCAPES AND COMMUNITY NARRATIVES**

**Abstract author(s):** van den Berg, Mathilde (University of Oulu)

**Abstract format:** Oral

Much of the landscape in Kilpisjärvi, Finland, is characterized by what has never been built nor penned in ink. Reindeer grazing pastures; ancient migration routes; old milking grounds; ancient and new camp sites: these all leave minimal to no traces in the landscape from a modern perspective. Many of these remains are bodiless, and to the one beholding this landscape with its bodiless remains, it might appear empty. These landscapes are not empty however, on the contrary. Rather, modern infrastructures and buildings now often come to influence what has never been demarcated or built before: tourist paths meander through age-old pastures and signs have been put up in attempts to protect ‘nature’ from reindeer, even though historically these grounds have been grazing pastures for centuries. In contrast to these built over landscapes are the spacious and seemingly empty landscapes surrounding Kilpisjärvi. But emptiness must be in the eyes of the beholder, as material and disembodied remains have stories lingering over and hidden inside of them. These are the small, local and intimate, stories of the village, its enveloping landscape, and the inhabitants that make the past and the present ‘touchable’. ‘Dis-enstoried’ remains are contrasted here with storied, disembodied remains. This essay glances at what has never been built nor written down, what has been built over, the local anecdotes that speak to these, and how this assemblage intermingling of materiality and disembodiment shape a emic and etic understandings of Kilpisjärvi and its inhabitants. Furthermore, it views how ancient remains and an ancient way of living becomes entangled with modern infrastructure, and how an ancient way of thinking becomes questioned by modern takes on reality.

**MORTUARY RITUALS AS TECHNOLOGIES OF REMEMBRANCE: THE CASE OF THE HUNTER AND GATHERERS OF CHECUA SITE, COLOMBIA (9500-5000 CAL BP)**

**Abstract author(s):** Archila, Sonia (Department of Anthropology, University of Los Andes) - Ospina, Juan (Cultural Heritage Studies Faculty, Universidad Externado de Colombia; Department of Anthropology, University of Los Andes)

**Abstract format:** Oral

Archaeological studies have shown that the inscription of social memory is not necessarily correlated to monumental marks in the landscape, on the contrary, it is accepted that human societies have drawn upon diverse mechanisms either to remember or forget. In some cases, people in the past relied on ritual events to enhance social memory, where they borrowed elements and actions of daily life to make them solemn as they were involved and intertwined in the scaffolding of rites. Ritual events associated to death commemoration can be approached as technologies of remembrance, which might allow us to understand how structured ideas about death and life are strongly related to the contriving of collective memory. In this paper, we will present the archaeological case of the hunter and gatherers that inhabited the site of Checua (9500 to 5000 Cal BP), and we will discuss how a ritual event, accomplished to commemorate death, turned into an active device for memory construction. We will show evidence of ritual activity, where hunter and gatherers deliberately reunited nine dead people at a posthumous event that must have operated as a well-planned and methodical act of remembrance. Our purpose is to problematize the ways in which different materials associated to the ritual paraphernalia such us human bodies, burial goods, fire and smells became temporary containers of memory. Each of these elements, we believe, has its own biography, and they were carefully selected to make part of this act of memory. Furthermore, some

goods such human and animal bones might have been conceived as “ancient heirlooms”. Finally, this discussion will consider distinct manners in which memory can be vividly materialized without monumentality; instead, we focus on efficient tasks that re-signified elements, places and actions that might have triggered deep emotional reactions.

- 3

**EMOTIONS, EMOTIONAL EXPERIENCES AND ARCHAEOLOGY: A CASE STUDY FROM LATER MEDIEVAL BRITAIN**

**Abstract author(s):** Standley, Eleanor (University of Oxford)

**Abstract format:** Oral

In this paper I use the new concept of ‘emotants’ to explore emotions and material culture in the later medieval period. I have defined an emotant as a physical agent that is characterised by or serves in the capacity of emotion (Standley 2020). Using this concept, I attempt to advance our understanding of emotions in the past by presenting a case study that investigates emotional experiences in the later medieval period.

The case study is based on an archaeological find that is not an obvious ‘emotional’ object: a plough iron excavated in a medieval site from the North-East of England. I argue that this everyday tool was an emotant characterised by feelings of hope, and was part of both an individual and communal emotional-practice.

The final part of the paper will consider how archaeologists can approach material, emotion and memory. By investigating the inter-dependency of the material world, aesthesis, feelings and the body, I hope to further our interpretations of the agency of things. The approach is influenced by the literary concept of ekphrasis and enargeia. I argue that the metaphysical or immaterial (memories, feelings and imagination) are experienced and affected by the ‘energy’ of an emotant when it is seen or touched.

**PROBLEMATIC STUFF: REINTERPRETING THE STRUCTURED DEPOSITS OF IRON AGE BRITAIN**

**Abstract author(s):** Büster, Lindsey (University of York)

**Abstract format:** Oral

The deliberate deposition of cached objects in Iron Age Britain is well acknowledged, and is commonly used as a proxy for the presence of ritualised behaviour. Traditional modes of study (based on criteria such as intrinsic value, context, presence/absence of a human body) have, however, created arbitrary divisions between the categorisation and interpretation of these assemblages (as hoards, structured deposits, grave goods, cenotaph burials etc).

By considering contemporary attitudes to death, dying and bereavement, this paper explores the relationship between material culture, the living, and the dead, and considers these assemblages as the disposal of ‘problematic stuff’ associated with deceased individuals, particularly in later prehistoric Britain where normative visible funerary rites are rare. The concept of problematic stuff takes us beyond the sub-disciplinary boundary of mortuary archaeology, which places the physical remains of the dead centre stage, and allows us to consider broader categories of cached objects within a single interpretative framework. It also demonstrates how contemporary attitudes to important rites of passage can provide opportunities to embed emotion into our archaeological narratives, without resorting to pseudo-phenomenological approaches, and helps us better understand the nuanced behaviours represented by the ‘ritual’ deposits that we so often encounter in the archaeological record.
- 5

**FAMILY HEIRLOOMS: BRIDGES BETWEEN INDIVIDUALS AND CONTEXTS**

**Abstract author(s):** Wessman, Anna (Bergen University Museum)

**Abstract format:** Oral

This is a fascinating story about two Viking Age objects: an arm ring and a penannular brooch deriving from the Curonian peninsula in Latvia. A Finnish soldier who was a volunteer in the German Jägers infantry (in Finland called the Jäger Movement) purchased them in 1917 and he brought them home with him one year later. He gave the arm ring to his young wife as a gift and she wore it on her arm until she died 40 years later.

While the arm ring was in constant use and is today heavily worn, the penannular brooch was stuffed into a chest with other personal belongings and not touched for 50 years. The brooch was later framed and placed on the wall and is in mint condition even today.

Very little is known about the archaeological lives of these objects, but we are able to study their contemporary use histories. In an object-centred interview conducted by the author, new and personal meanings to these objects have come up. They are heirlooms that function as catalysts for a broader family saga. Still in the possession of the same family after 100 years, they form the basis of a narrative with grandchildren and great-grandchildren who are not only curating but also passing on the story.
- 6

**MEMORY AND LANDSCAPE STABILITY ON THE WELSH SEVERN ESTUARY**

**Abstract author(s):** Dwan, Christopher (The University of Sheffield)

**Abstract format:** Oral

Past studies of memory within the archaeological record have examined the continuities and reuse of past features and materials across generational, historical and mythical time. This approach takes a primarily human-centric perspective on how memories were

created and transmitted. Much less consideration is given to how materials and landscapes participate in and shape the formation of memory.

My research aims to understand how a landscape’s relative stability and rate of change affected how memories were incorporated, interpreted, and recalled. This paper presents a theoretical approach and a case study from the Welsh Severn Estuary. The Severn’s intertidal landscape was divided into various ‘stability zones’ based on the rates of change in sedimentation and vegetation: from the daily rhythms of tides and the seasonal cycles of salt marsh to long term processes of marine sedimentation and erosion. The study area emerges as a patchwork landscape of shifting temporalities, which offered different potentials for remembrance and erasure. The stability zones were compared with the archaeological evidence for prehistoric life on the intertidal zone. The analysis examines how the stability of landscape zones correlated with different forms of human occupation and continuities.

7 NORTH-WEST OF EDEN: UTOPIAN NARRATIVES AND THE STATE OF OREGON

**Abstract author(s):** Witcher, Robert (Durham University) - Hanscam, Emily (Amsterdam University) - van Helden, Daan (Leicester University)

**Abstract format:** Oral

Stories bind us together, but can also bring us into conflict. This paper considers civilizational imaginaries and their relationship to the material world. We explore how groups and individuals project onto real and imagined spaces their values and anxieties about how people lived in the past and about how they should live in the future. We explore these issues through the case study of Oregon in the Pacific Northwest. Oregon was founded in 1859 on the eve of the American Civil War (1861-1865). It was established as a white supremacist state, its founders seeking to define a particular future for the territory in the context of the deep social and political division what would soon bring the northern and southern states into conflict. Writing two decades later, Jules Verne chose Oregon as the setting for his 1879 novel The Begum’s Fortune, which concerns the conflict between two newly founded cities, one utopian, the other dystopian. The novel both nationalizes and historicizes these imagined places, one a French Athens, the other a German Sparta. From its very origins, therefore, the space of Oregon has been used to project different stories and identities.

A century and half later, narratives are still being projected onto Oregon, now centering around the idea that the city of Portland, and the broader Pacific Northwest, are either a liberal paradise or a hotbed of anarchy and violence. Moreover, these stories – more often than not told by outsiders – are being used to precipitate real-world conflict, in places such as Portland, where these contrasting imaginaries are materialized. Using the Portland federal courthouse as a focus, this paper considers the ways in which these narratives combine and conflict in the experience of physical space, thereby materializing competing stories about civilization, the past and the future.

8 FAC-SIMILE CATACOMBS IN EUROPE BETWEEN THE 19TH AND THE 20TH CENTURY AS MONUMENTAL EXPRESSION OF MEMORY AND EMOTION

**Abstract author(s):** Cecalupo, Chiara (Universidad Carlos III Madrid)

**Abstract format:** Oral

In the 19th century, due to the discoveries of early-Christian catacombs in Rome the enthusiasm about Christian art exploded in Europe up to the point that several architectural buildings and constructions were built, inspired by the layout of Roman catacombs. The speech will focus on two of these places: the fac-simile, temporary catacomb created by the Vatican State for the Universal Exhibition of Paris in 1867, and the Roman Catacomb Museum opened in Valkenburg (The Netherlands), the “real” fac-simile Christian catacomb built in 1910 replicating the ancient ones as seen in Rome.

These two monuments of archaeological taste are fairly known; however, they should be investigated in further detail and inserted into the wider European framework to understand their role in the building of shared memory and in the living experience of the past for all Europeans. These cases fit perfectly in the session aim. The Vatican fake catacomb in Paris will help to prove the international diffusion of Christian archaeology as a propaganda tool for expressing Roman historical identity, just before the end of the Papal State; while the Valkenburg fake catacomb complex will be used to underline how the spatial re-creation of ancient monuments in different contexts was conducted and what kind of psychological repercussions it had on the society where it was implanted.

In the second part of the speech, archival texts and old newspapers will be presented for both cases, to provide evidence regarding public response to those monuments. The incredible fascination of original Roman catacombs appears to remain really vivid in these fac-simile exemplars, to generate emotions and enrich visitors’ understanding of the past. In this sense, the speech will strongly contribute to the definition of the role that reception of antiquity had in Europe with regard to the emotional experience of past and present.

9 TATTOOED SKIN, DEFORMED SKULLS, FILED TEETH: EMBODIED MEMORIES AND EMOTIONS IN ARCHAEOLOGICALLY EVIDENT PERMANENT BODY MODIFICATIONS

**Abstract author(s):** Kerk, Lukas (Westfälische Wilhelms-Universität Münster, Historisches Seminar, Abteilung für Ur- und Frühgeschichtliche Archäologie)

**Abstract format:** Oral

Archaeologically documented permanent body modifications such as tattoos, skull deformations and dental modifications hold a high potential of knowledge regarding the human body as socio-cultural unit and projection surface of culturally determined messages. In this context, body modifications are to be seen as embodiment, thus a focus is put on their quality as carriers of various meanings and functions within a social framework. In addition, the ability to shape the human body provides important indications for conceptualizing it as an artefact and part of material culture, and for systematizing it as a medium of communication processes. However, due to its materiality and malleability, the body not only represents an artefact, but can also be considered a ‘mentefact’ (Eggert 2014), whereby its semiotic dimension comes to the fore. Because of the unique character of permanent body modifications in archaeology, it is possible to pose questions regarding the embodiment of memory and emotion to the research object and to answer them in a theoretically well-founded way. Not least thanks to the involvement of a variety of disciplines, statements about their history and the lived past can be elicited from the silent bodies of the past. Moreover, archaeologically evidenced cases of tattoos in particular continue to contribute a not inconsiderable share to the culture of remembrance and identity even today.

Starting from the probably best and most intensively studied tattooed mummy, known as Ötzi the Iceman, plausible possibilities, but also limits of the analysis of the embodiment of emotions and memories are pointed out by adding further cases of archaeologically evident permanent body modifications, thus laying the foundation for further considerations.

10 ANIMATE OBJECTS, EMOTION, AND THE NON-PERSON: DEPOSITIONAL PRACTICES IN SCANDINAVIA FROM THE BRONZE AGE TO THE VIKINGS

**Abstract author(s):** Eriksen, Marianne Hem (University of Leicester)

**Abstract format:** Oral

Deposition of carefully selected artefacts in three-aisled houses occur over deep time in prehistoric Scandinavia. Eclectic things ranging from beads to Neolithic axes, from anthropomorphic images to ceramic vessels, are placed in pits, postholes, and hearths across generations. Rather than seeing these as merely ‘house offerings’, I consider these practices to be inherently relational, connected to community, memory, storytelling, and affect. Deposition weaves together different temporalities as well as different agencies, e.g. the maker of an object and its users, the human inhabitants and their non-human collaborators, ancestors and incumbents. In this way, a deposited loom weight in a posthole can embody affective stories of a specific ancestor, textile production and gender, clay sourced from a specific landscape, and house-building and kinship, criss-crossing time and space.

However, not all deposition is necessarily about compassion. From the Pre-Roman Iron Age onwards, disarticulated human remains start to appear in settlements. Some of these ‘body-objects’ show signs of trauma, and some are reworked. The second move of this paper is to consider the transformation of a human body to an object, and whether this necessarily constitutes commemorating cherished persons. In some cases, may it be that the status of the dead as a non-person is what makes the transformation into ‘body-object’ possible or even desirable? While depositing a cranial fragment or an infant in the house can certainly be about creating mnemonics of belonging and place; the question is, for whom, and at whose cost?

231 EMBRACING CHANGE: NEW INSIGHTS AND THEORIES ON THE CHANGING “EUROPEAN WORLDS” FROM THE 3RD AND 2ND MILLENNIUM BC

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Basílio, Ana Catarina (Fundação para a Ciência e Tecnologia; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour of University of Algarve) - Becerra Fuelleo, Paula (Departamento de Prehistoria y Arqueología, Universidad de Sevilla) - Schlicht, Jan-Eric (Institute for Pre- and Protohistoric Archaeology, CAU Kiel; CRC 1266 - Scales of Transformation, CAU Kiel)

**Format:** Regular session

The strange times we are living in are showing us how quickly humans can adapt to change. Keeping in mind that transformations are most likely a constantly occurring aspect of human life we want to ask: How was change in prehistory? Was it perceptible on a human scale? Were past communities able to readjust and reinvent themselves in the face of adversity?

These, and other questions, are particularly applicable to the fluctuations that occur during the transition between the 3rd and 2nd millennium BC, a period marked by cultural shifts archaeologically visible throughout Europe. Transformative processes in population dynamics, mobility practices and material exchange networks have been in the spotlight for quite some time. The Iberian Peninsula in particular functions as an excellent example for this development whereby a plethora of prehistoric contexts may indicate different socio-political trajectories. Adding to that, the existence of multiple ongoing long term projects in key sites (as ditched enclosures) has allowed the application of new methodologies like research on ancient DNA, paleoclimatic reconstructions

and mobility studies (mainly through isotopic analysis) that have made the Iberian Peninsula a stage on which current theoretical backgrounds are being questioned.

As such, there is a pressing necessity to confront, match and reconcile new sets of data and the archaeological evidence not only in Iberia but also throughout the rest of Europe, allowing to rethink and update theories and biographic narratives that will contribute to a possibly closer grasp on the lifeways of prehistoric communities.

For this session, we invite presentations dealing with change in European contexts of the 3rd/2nd millennium BC in order to stimulate comparisons between different theories and methodologies. We would also appreciate input from archaeological science researchers (aDNA, mobility, demography).

Eventually, we intend to provide new insights to the prehistoric lifeways, based on solid interpretive hypothesis.

ABSTRACTS:

1 CHANGING EUROPEAN WORLDS? A CLOSER LOOK AT COASTAL COMMUNITIES DURING THE 3RD MILLENNIUM BC IN NORTHERN EUROPE

**Abstract author(s):** Kleijne, Jos (Groningen Institute of Archaeology)

**Abstract format:** Oral

The MSCA-IF project MicroTRASH started in January 2021. In this talk, we will give the first results of some parts of the project. The 3rd millennium BC is a period in which most communities already follow a fully agricultural way of life, but simultaneously many social and cultural changes take place across Europe. For the coastal communities along the North Sea and Baltic coasts, it is often unclear how much these large-scale changes have an impact on local practices. Therefore, our focus is on the refuse middens that were formed during this period. By taking a microscopic approach, we gain an insight in very local practices: subsistence practices and the importance of coastal resources, the temporality, rhythm, and chronology of occupation, and ways in which the local landscape was modified. These various aspects are central to understanding coastal communities, and the ways in which these communities dealt with social and cultural changes.

2 MOVING BETWEEN SCALES OF TIME AND SPACE: HOW CAN THE CURRENT MOMENT INFORM OUR UNDERSTANDINGS OF 3RD-2ND MILLENNIA BCE IBERIA?

**Abstract author(s):** Lillios, Katina (University of Iowa)

**Abstract format:** Oral

Over the past year, we have witnessed and experienced profound and rapid changes to our lives and the world around us, which naturally make us reflect, as archaeologists, on periods of marked cultural change in the ancient past, such as the 3rd-2nd millennia BCE in the Iberian Peninsula. It is even tempting to imagine that a pandemic might have been a factor in the abandonment of settlements and the transformations in ritual and mortuary practices that are detected archaeologically at this time. However, scale – both temporal and geographic - needs to be taken into account, as the scales of analysis that we have access to as archaeologists are generally quite different from those experienced at the individual level. How can we move across these scales to understand what happened in the Iberian Peninsula over the 3rd and 2nd millennia BCE? This paper will draw on my observations of material changes in the use of space in my local community over the summer of 2020 that were consequences of the reduced mobility of people, and use these material traces as a way to think in new ways about the complex demographic, cultural, and ecological shifts of mid-Holocene Iberia (Lillios et al. 2016; Blanco et al. 2018).

3 TRANSFORMATIONS DURING THE THIRD MILLENNIUM BC IN THE IBERIAN PENINSULA: ASSESSING THE PAST AND FUTURE CONTRIBUTIONS OF ANCIENT DNA

**Abstract author(s):** Olalde, Iñigo (Institute of Evolutionary Biology - UPF-CSIC, Barcelona)

**Abstract format:** Oral

The 3rd millennium BC in Iberia is arguably one of the most intensively sampled periods in the ancient DNA literature over the past 5 years. These studies documented the arrival of groups from central Europe starting ~2,500 BC and their widespread long-lasting demographic impact so that after ~2,000 BC, all the Bronze Age individuals with available genomic data, from north to south and from west to east, derived 30-50% of their ancestry from these newcomers. It is also clear from the genetic data that during this event the local Chalcolithic paternal lineages became virtually extinct and were replaced by the lineages carried by the incoming groups, whereas the local maternal lineages were maintained, pointing to a sex-biased event. However, to understand the underlying human processes at local and familiar scales that eventually resulted in the large-scale patterns we observe with ancient DNA, all this pal-

aeogenomic evidence needs to be interpreted together with other type of bio-archaeological evidence and contextualized with the rich archaeological record for this time period in Iberia. In this contribution, I will explore ways to integrate the available ancient DNA data with the archaeological record and discuss multidisciplinary study designs that will help to achieve this goal.

4 STRONTIUM ISOTOPE ANALYSIS IN IBERIA: A REVIEW OF THE EVIDENCE

**Abstract author(s):** Becerra Fuello, Paula (Departamento de Prehistoria y Arqueología, Universidad de Sevilla) - Vicent García, Juan (Departamento de Arqueología y Procesos Sociales, CSIC) - Pérez Villa, Alberto (Independent Researcher) - Uriarte González, Antonio - Díaz-del-Río Español, Pedro (Departamento de Arqueología y Procesos Sociales, CSIC)

**Abstract format:** Oral

This oral presentation summarizes current available data on strontium isotopic values from Iberian archaeological samples. Although a very recent development, publications on the subject matter have increased substantially over the last decade.

We review the location, chronology, context, sex and age group for over 1300 values of 87Sr/86sr ratios recovered in more than 50 archaeological sites. The ratios of these strontium isotopes 87Sr and 86Sr are being used in archaeological sciences to identify human migration and mobility patterns.

The quality of the evidence and its regional distribution will allow us to discuss some geographical patterns and critically discuss the possibilities of building an informed approach to late prehistoric regional mobility patterns. Furthermore, gathering all this data provides us with several approaches which could be used to reconstruct, at least partially, the migration processes inside the Iberian Peninsula, applicable to the changes that took place during the 3rd and 2nd millennium BC.

5 THE LOWER AND MIDDLE GUADALQUIVIR VALLEY AT THE END OF THE 3RD/BEGINNING OF THE 2ND MILLENNIUM BC

**Abstract author(s):** Bartelheim, Martin - Chala Aldana, Döbereiner - Díaz-Zorita Bonilla, Marta (Universität Tübingen)

**Abstract format:** Oral

The Bronze Age in the Lower and Middle Guadalquivir Valley is strongly under-researched compared to that in neighbouring regions in the southeast and southwest of the Iberian Peninsula. While the Chalcolithic and the so-called “Tartessian” Final Bronze Age and Early Iron Age have been well studied in this region, which is favourable for settlement and rich in raw materials, little is known about the intervening Bronze Age. On the basis of a comprehensive new investigation of the Bronze Age in the Guadalquivir Valley as well as recent fieldwork there and in the neighbouring Sierra Morena, new insights into the development of the settlement landscape at the transition from the 3rd to the 2nd millennium BC are presented. The main focus is on questions of resource use, mobility and connectivity, and the validity of the previous perception of the region as the periphery of other Bronze Age cultural centres is questioned.

6 RITUALS AND FUNERARY PRACTICES IN MARROQUÍES BAJOS (JAÉN) DURING THE 3RD MILLENNIUM BC: A BIOARCHAEOLOGICAL GENDER APPROACH

**Abstract author(s):** Díaz-Zorita Bonilla, Marta (University of Tübingen) - Rísquez, Carmen - Torres, María Isabel (University of Jaen) - Alemán, Inmaculada (University of Granada) - Serrano, José Luis - Zafra, Narciso (University of Jaen) - Vilchez, Miriam (University of Granada) - Herranz, Darío (Complutense University of Madrid)

**Abstract format:** Oral

This paper presents the multi-proxy results investigating diet ( $\delta^{13}C$  and  $\delta^{15}N$ ) and mobility (87Sr/86Sr and  $\delta^{18}O$ ) through isotope analysis but also mtDNA analysis and radiocarbon dating (14C), on human and faunal remains from a series of funerary structures from the Copper Age mega-site of Marroquíes Bajos, Jaén (Spain). The site is a ditched enclosure located in SE Iberia made up of about 113 ha and defined by a densely occupied sector including huts, workshops, storage pits and funerary areas, surrounded by crops and several necropolises.

The comparative analysis of the funerary contexts including the analysis of the buried bodies and the interesting offerings and the sacrificed animals is done regarding the different areas of necropolises and funerary spaces. This is considering the chronological differences marking the changes in social relations and kinship relations which in the local community will be defined by gender and age relationships, to approach how individual and group identities were constructed.

In addition, we could investigate through isotopic analysis and mtDNA the mobility patterns of this community including the herding strategies which indicates a complex network of interactions, as appears to be clear from the results of the analyses carried out. The reconstruction of the dietary patterns and the ecological niche for this community based on isotopic analysis was also carried out and gave us hints regarding the settings of Marroquíes Bajos.

THE CHANGE OF THE SETTLEMENT PATTERN DURING THE BELL BEAKER PHENOMENON IN THE VINALOPÓ AND SERPIS BASINS (ALICANTE, SPAIN)

**Abstract author(s):** Saura Gil, Pedro José (University of Alicante)

**Abstract format:** Oral

The archaeological evidences in the southeast of the Iberian Peninsula shows multiple social and economic changes since the middle of the 3rd millennium BC. A good example is the change in the location of some settlements in the Vinalopó and Serpis basins (Alicante, Spain), but also in their neighbouring areas, between 2600 and 2200 cal. BC. This period coincides with the development of the Bell Beaker and the appearance of significant changes in the archaeological register, such as burial practices, ornaments, or pottery. Our proposal tries to analyse different variables (settlements location, catchment resource areas, visibility, etc.) that allow us to define the evolution of the settlement pattern according to the principles of the Archaeology of the Territory. We will approach this topic from two perspectives. On the one hand, the synchronicity of these transformations in the southeast of the Iberian Peninsula, especially in the Vinalopó and Serpis basins, will be observed. On the other hand, the evolution of these changes, from the Chalcolithic to the Bronze Age, will also be analysed. Data derived from other units of observation, mainly material culture, domestic spaces, and areas of activity, will complement the territorial analysis. The concatenation of these levels of information will be the basis to make a representation of the process of social changes in this context, which seems to have their most evident archaeological expression in the displacement of settlements from the plain to high places.
- 8

WEAVING CHANGES: TRANSFORMATIONS IN TEXTILE PRODUCTION IN THE 3RD AND 2ND MILLENNIUM BC IN THE SOUTHEAST IBERIA

**Abstract author(s):** Basso Rial, Ricardo (University of Alicante)

**Abstract format:** Oral

Between the end of the 3rd millennium and the beginning of the 2nd millennium BC, important changes took place around Europe and the Mediterranean area. The Southeast of the Iberian Peninsula is one of the territories where archeology has been able to verify with greater clarity the magnitude and significance of these transformations. Some authors associate them with an episode of climate change. Others, on the other hand, with social and political factors, in addition to population movements. Regardless of what the determining factor of these transformations may have been, the disappearance of Los Millares cultural group and the formation of the Argaric group in the same territory is observed from notable changes in the archaeological record. Nevertheless, while archaeological research focused on issues such as changes in funeral rituals, architecture and settlement patterns or the development of production processes such as metallurgy, jewellery, and pottery, it left aside some significant aspects in the archaeological record. Among them is textile production, a subsistence activity whose evidence is present in practically all excavated archaeological sites. With this contribution we intend to analyze and evaluate to what extent these changes also affected the production and consumption of fabrics, as well as what their social significance could have been during this relevant process.

SOCIAL RESILIENCE AND CLIMATE CHANGE IN SOUTHERN IBERIA DURING THE CHALCOLITHIC AND BRONZE AGE

**Abstract author(s):** Schirrmacher, Julien - Ribeiro, Artur - Kneisel, Jutta - Rinne, Christoph - Weinelt, Mara (CAU Kiel)

**Abstract format:** Oral

The Chalcolithic to Bronze Age transition on the southern Iberian Peninsula is a period of major societal turnover. Transformations in the archaeological record are evident on various scales including economy and subsistence as well as ritual and social practices. The sudden abandonment of nearly all ditched enclosures in south-west Iberia serves as an outstanding example. At the same time, this abandonment exemplifies the spatial diversity within social trajectories and transformations at that time. During the same period, a series of major climatic anomalies – commonly known as 4.2 ka event – was threatening many societies across the entire Mediterranean region. Against the background of this climatic deterioration, the question arises whether the spatial diversity in the archaeological record may point to differences in social resilience and adaptation of past societies in southern Iberia.

A comprehensive analysis of compiled palaeoclimatological data from the Iberian Peninsula including own investigation of marine sedimentary archives provides a detailed reconstruction of past seasonal climate constraints with respect to precipitation and temperature during the 4.2 ka event. In combination with the investigation of human activity based on compiled radiocarbon dates from south Iberian settlement sites, we are able to define certain geographic regions of social stability during this period. But we also note phases of varying social resilience with migration being one potential adaptation strategy.

DO YOU EVEN HUNT? LONG-TERM CHANGES IN CENTRAL AND SOUTHERN PORTUGAL FAUNAL RECORDS DURING THE CHALCOLITHIC AND THE BRONZE AGE

**Abstract author(s):** Almeida, Nelson - Detry, Cleia (Uniarq, Centro de Arqueologia da Universidade de Lisboa)

**Abstract format:** Oral

The 3rd and 2nd millennium BC were times of important changes in SW Iberia. In Portugal, the study of these occurrences has traditionally focused on archaeological sites, their material culture, and chronologies. Faunal remains have been occasionally included in these discussions more as an accessory variable, traditionally linked to the Secondary Products Revolution and the development

- of agriculture. These perspectives started to change in recent years, mainly by acknowledging animals’ relevance on structured depositions and funerary contexts, while an increase in stricter economic analysis accompanied the still incipient development of stable isotopic data on animal diet and mobility.

Existing data demonstrates differences in faunal representativeness during the Chalcolithic, between the coastal Estremadura and inland Alentejo regions. Data for the Bronze Age is scarce, thus hindering comparisons even if some sites, specifically Late Bronze Age large settlements, demonstrate the relevance of domesticated species. The evidenced differences can relate to several factors as the type of sites (e.g., larger vs smaller, walled vs ditched, settlement vs non-settlement, funerary vs non-funerary), the ecological characteristics of the surroundings (e.g., coastal vs inland) and environmental and climatic pressures, as well as other harder to discuss possible socio-cultural and ideological aspects of these societies. We present a diachronic update on Chalcolithic and Bronze Age faunal evidence for Central and Southern Portugal, and discuss the species different representativeness in relation to long-term changes in the archaeological record.

EMERGENCE OF SOCIAL SPACES: RAW MATERIAL DISTRIBUTIONS AS PROXIES FOR HABITUAL PRACTISE BETWEEN 4000 AND 2000 BCE IN SOUTH PORTUGAL

**Abstract author(s):** Schlicht, Jan-Eric (CRC 1266 - Scales of Transformation; Kiel University)

**Abstract format:** Oral

The southwestern Iberian peninsula has been shown to be host to highly dynamic and diverse developments over the course of prehistoric times, especially during the 4th and 3rd millennia BCE. During this period, it is evident that south western Iberian populations were involved in far reaching networks of exchange and interaction. While much research has been and is being conducted towards a better understanding of these large and far-reaching connections it is still apparent that the focus on a larger part of conducted studies lies and lay on site-based and regional research, particularly so in Portugal. Achieved results on regional scales are often being extrapolated towards over-regional interpretations, when at the same time large scale studies can often lose grip on ‘the subtle differences’.

This paper aims to establish a perspective on a meso-level between large scale and regional scales of observation, whereby integrative considerations based on Complexity Theory as well as Bourdieu’s ‘Theory of Social Practise’ form the theoretical frame of this work. The research focus therein lies with the investigation of raw material distributions which are put in place as a proxy for habitual practise in two areas of southern Portugal: Estremadura and Alentejo. Data collected from literature as well as online databases are being used to conduct a series of hierarchical cluster analyses based on 21 raw material categories. While clear cut distinction could not be achieved, the results show large potential for further investigations and anchor points for the redevelopment of explanatory approaches towards the changing and dynamic social systems of southern and central Portugal between 4000 and 2000 BCE.

DIET AND MOBILITY THROUGH STABLE ISOTOPE ANALYSES IN HUMAN REMAINS BETWEEN THE CHALCOLITHIC AND IRON AGE IN SOUTHERN PORTUGAL

**Abstract author(s):** Melo, Linda (Foundation for Science and Technology - FCT-SFRH/BD/130165/2017. Laboratory of Prehistory, Research Center in Anthropology and Health - CIAS, Department of Life Sciences, University of Coimbra) - Díaz-Zorita Bonilla, Marta (Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters, Tübingen Universität) - Silva, Ana Maria (Laboratory of Prehistory. Research Center in Anthropology and Health - CIAS, Department of Life Sciences, University of Coimbra. UN-IARQ-WAPS, University of Lisbon) - Soares, António Monge (Centro de Ciências e Tecnologias Nucleares - C2TN, Instituto Superior Técnico, Universidade de Lisboa)

**Abstract format:** Oral

This study is based on an interdisciplinary methodological approach combining anthropological, archaeological and biochemical data. We analysed a total of 82 samples (70 human and 12 faunal remains).

In one hand, we worked with strontium and oxygen (<sup>87</sup>Sr/<sup>86</sup>Sr, δ18 O) in dental enamel. In another hand, we worked with nitrogen and carbon isotope ratios (δ15N, δ13C) in bone collagen. The goal of this study is try to understand if /how the communities life changed over this period. Mobility data will help us to understand if were there any exogenous individuals in the communities. Through diet data we will try to understand if it changed within and between communities. We also consider very important to address other questions such as: evidences of disease and signs of physiological stress, and if there were inequalities between community members/social distinction (age, sex or status) during 2500 years in Beja geographic area, in southern Portugal.
- 13

GETTING OUT OF THE “BOXES”: PRELIMINARY DEMOGRAPHIC APPROACH BASED ON THE PREHISTORIC CISTS FROM SOUTHERN PORTUGAL

**Abstract author(s):** Basílio, Ana Catarina (ICArEHB / FCT)

**Abstract format:** Oral

The transition from the 3rd-2nd millennium BC in Europe is a key-theme to understand a set of simultaneous cultural shifts and declines. In Iberia, this transition has different regional rhythms, one of the most intriguing in southern Portugal. Here this cultural transition is apparently abrupt, with a sharp archaeological contrast between the overwhelming Chalcolithic visibility, either in terms of materials, architectures, practices and sites, and the Early Bronze Age, marked by general invisibility of archaeological remains.

Several interpretative hypotheses have been drawn in the last decades. Still, due to the growing significance of the human-environment relationships, some already suggested but unexplored proxies gain new attention.

That is the case of the variable demography. It is suggested that a demographic decline might explain the transition between these two historical moments. This idea originates from the comparison between the uncountable Chalcolithic monuments and the reduced Early Bronze Age funerary expressions, mainly in cists.

While Chalcolithic structures present extended biographies that encapsulate collective burials with ossuaries, primary and secondary depositions, the Bronze Age structures are the opposite. In general terms, the cists represent a phenomenon with multiple chronological and cultural moments characterised by individual or multiple burials with ossuaries or primary depositions. They are morphologically and typologically variable, being found in addition to previous funerary structures (megalithic monuments), but also isolated or forming clusters.

However, these contexts have not been used as a demographic proxy so far, although being part of the transition explanatory narratives. In this sense, and to empirically test the validity of these hypotheses and start assessing the possible role that populational variability had on this transition in southern Portugal, a preliminary demographic approach based on cist burials will be presented. Some of the existing problems and limitation will also be highlighted and discussed.

SWORDS TO PLOUGHSHARES – CONCILIATION AS AN ALTERNATIVE TO CONFLICTS. A DIACHRONIC PERSPECTIVE BETWEEN LATE NEOLITHIC AND VIKING AGE

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Skorna, Henry - Kneisel, Jutta (Kiel University, Cluster of Excellence ROOTS) - Jaeger, Mateusz (Adam Mickiewicz University Poznań, Institute of European Culture) - Schneeweiß, Jens (Kiel University, Cluster of Excellence ROOTS; Centre for Baltic and Scandinavian Archaeology - ZBSA)

**Format:** Regular session

Thoughts on non-violent conflict solution strategies within pre- and proto historic societies are scarcely published, while works on warfare, warriors and violence are quite prominent in recent archaeological research. Violence and conflict can easily be read from material culture such as finds of weapons, war booties or even mass graves. But what about peaceful solutions? Naturally it is beneficial for everyone to either avoid, prevent, dissolve or end conflicts before the escalate ultimately.

The aim of this session is to spark a discussion about strategies to solve conflicts without violent means and identifying such strategies in the archaeological record. Fortifications as tool of spatial organisation defining borders can be seen as deescalating/deterrent and conflict reducing factor. Borders and territoriality might be another solution for conflict avoidance. Regional meeting places indicating coexistence. Weren’t fortifications built as a deterrent as avoidance of conflicts? Do pit alignments in the landscape mark areas of influence or territorial claims? Does the joint use of rare resources suggest peaceful coexistence? Can diachronic patterns be observed that point to a connection between violence and a. o. the construction of fortifications, the laying down of weaponry hoards or mass graves?

Contributions which approach the following questions are welcome:

- What archaeological proxies can we use to identify violence avoiding strategies?
- Can we observe diachronic changes in the level of violent conflicts where a decline could be attributed to peaceful conflict resolution strategies?
- Is there a potential for reinterpretation or revaluation of archaeological features like pit alignments, fortifications, (causewayed) enclosures, war booty sacrifices and weaponry hoards in the light of conflict avoidance or peaceful conflict resolution strategies?
- Can historical sources on peaceful solutions and conflict suppression (e.g. inter-group social relations as marriages, gift exchange, keeping/giving hostages etc.) can provide a clue for a new reading of archaeological sources in prehistoric Europe?
- How to balance the models between “real” or “symbolic” proxies of warfare and warriorhood?

ABSTRACTS:

1

GRASPING CONCILIATION IN THE EARLY BRONZE AGE

**Abstract author(s):** Skorna, Henry (Institut fuer Ur- und Fruehgeschichte Kiel; Kiel University, Cluster of Excellence ROOTS) - Bátor, Jozef (Institute of Archaeology of the Slovak Academy of Sciences, Nitra)

**Abstract format:** Oral

Conflicts in archaeology are often equated with war and violence. This one-sided perception of the phenomenon is implicitly grounded on two premises: the emphasis on artefacts related to combat, interpreted as tools used for inter-group violence, and the interpretation of social discontinuities where conflicts are equated with catastrophic events. However, conflicts are a common encounter in social settings, representing contexts of divergent opinions, opposite choices as well as different outlooks on how to proceed in specific instances. Therefore, in order to fully understand instances of conflicts, it is necessary to expand the common sense

archaeological definition by identifying historical processes leading up and following their occurrence by incorporating the notion of conciliation. Since the formation of societies is always a process of solving problems or providing opportunities to overcome their potential ramifications, defining and determining forms of conciliation is necessary towards developing viable models of social developments.

The aim of this presentation is to explore the potential conflicts and conciliation on the basis of the Early Bronze Age fortified, multi-layered settlement of Vráble-Fidvár (Slovakia). By drawing from the anthropological theory of conflict and conciliation studies, the presentation aims at presenting the narrative of the historical trajectory of the site in order to identify the potential historical and everyday conflicts in order to determine social means of conciliation.

2

NEIGHBOURS MAKE BETTER ENEMIES – LOCAL SOCIETIES IN WAR AND PEACE DURING THE NORDIC BRONZE AGE

**Abstract author(s):** Horn, Christian (Gothenburg University) - Artursson, Magnus (Arkeologarna) - Austvoll, Knut (University of Oslo) - Nordvall, Linn - Potter, Rich - Ling, Johan (Gothenburg University)

**Abstract format:** Oral

On a broad scale, the Nordic Bronze Age (1800/1700- 550/500 BC) has produced a remarkably similar material culture across large swathes of Scandinavia and Northern Germany. Differences exist, but often come down to scale, with more accentuation during the Late Bronze Age. These societies are, therefore, often seen as uniform and coexisting without much conflict or competition. These are more often seen as having existed vertically between different social classes rather than horizontally between neighbouring groups. Other conflicts are often thought to have moved into the north through external groups. However, modelling local data such as rock art, weapon depositions, use-wear, and human remains indicate that most conflict was probably carried out between neighbours belonging to the same socio-cultural framework, interpreted as ranked societies, decentralized complexity, or chiefdoms. The data and theoretical considerations also indicate conflict avoidance strategies and conciliation in the form of depositional practices and natural boundaries in the landscape.

3

VATYA CULTURE FORTIFICATIONS IN CENTRAL HUNGARY. BUILDING INNER AND OUTER BORDERS IN THE MIDDLE BRONZE AGE

**Abstract author(s):** Jaeger, Mateusz (Adam Mickiewicz University in Poznań)

**Abstract format:** Oral

One of the most characteristic features of the Vatya culture communities dominating in the first half of the II millennium BC in the area of the central Danube basin, were massive fortifications built around the settlements.

For decades, the presence of fortifications has been interpreted as an expression of a specific defensive strategy to contain the tide of migrating Tumulus culture communities. The reason for this was not only the structure and scale of the fortifications, but also their location in space, suggesting the desire to defend the undefined borders of “archaeological cultures” equated with living communities.

Finds and discoveries from recent years indicate the likely more complex processes behind the fortification of settlements and their regional and chronological diversity.

The submitted paper aims not only to confront information about fortifications with knowledge about other sources related to warfare, but it will also concern specific cases of settlements whose fortifications not only surrounded the inhabited space, but also divided it into separate parts.

The long-term habitation of individual settlements, resulting in the creation of multi-layer and tell archaeological sites, allows for a discussion on the significance of territoriality phenomenon developing in the Bronze Age and the construction of boundaries (spatial and social) reflected in the preserved fortifications.

4

VISIBLE AND INVISIBLE BOUNDARIES IN LANDSCAPE

**Abstract author(s):** Kneisel, Jutta (Christian-Albrechts-University of Kiel; Johanna-Mestorf-Academy) - Rose, Laura (Christian-Albrechts-University of Kiel; ROOTS)

**Abstract format:** Oral

Conflict studies in prehistory is a topic that has received much attention in the past. But what about the reverse case of pacification or conflict resolution. Not only can fortified sites contribute to mutual territorial demarcation, they can also be erected as conflict resolution or conflict prevention. In recent years, large-scale linear boundaries have also been increasingly uncovered in the landscape, e.g. in northern or central Europe. These include pit alignments and pit zone alignments, but also cooking pit alignments and rows of palisades that stretch across the landscape for hundreds of metres. The construction of field boundaries and field divisions, house and settlement enclosures also show the need for demarcation, a phenomenon that begins in the Bronze Age and becomes increasingly common in the Iron Age.

The following contribution examines the significance of these linear boundaries, their occurrence in the landscape and their chronological classification. Did they serve to delimit territories and can a simultaneous evidence be found in material culture for conflict

potential such as weapons and defensive technology? Or did they serve other purposes, such as ritual gatherings, as is often assumed for the cooking pit alignments.

5 CHANGES IN LATE BRONZE AGE TRANSDANUBIAN WEAPON HOARDING

**Abstract author(s):** Tarbay, János Gábor (Hungarian National Museum)

**Abstract format:** Oral

The paper discusses trends in Late Bronze Age (ca. 1500-900 BC) weapon hoarding and its interpretation in Transdanubia, West Carpathian Basin. In this area, weapons were mainly selected to different kind of large scrap hoards besides burials, funerary hoards, and wetland sites. Based on use-wear analysis, a hoarded Transdanubian weapon can be an as-cast, a miscast, a used, or a heavily used object. Although the main trend is the selection of finished and functional products with minor or intense traces of use. From the perspective of the entire Transdanubian Late Bronze Age, hoarding of weapons is a continuous phenomenon. However, at the time of the Ha A1 (ca. 1200-1100 BC), we can observe a ‘radical’ increase in the quantity and variety of hoarded weapons compared to the previous and followings periods. These are generally used or heavily used objects that were intentionally fragmented and manipulated by plastic deformation. Towards the following periods (Ha A2/Ha B1–Ha B2) the quantity of hoarded weapons decreased intensively. One can also observe changes in styles, ways of manipulations and the reduction of functional types and disappearance of armours. The paper introduces this local trend in the context of the West Carpathian Basin and the Northern Balkans. It also seeks out explanations to the processes and causes behind these changes in weapon hoarding. Our main question is can the Ha A1 mass deposition and destruction of used weapons be interpreted as a manifestation of a collective conflict resolution strategy?

6 BROTHERS IN DISARM. A DE-ESCALATION PERSPECTIVE ON PREHISTORIC WEAPON SACRIFICES

**Abstract author(s):** Gentile, Valerio (Leiden University)

**Abstract format:** Oral

Archaeological and osteological data from Bronze Age and Early Iron Age Europe provide evidence for substantial armed encounters. In the same period, specific kinds of weaponry such as swords and spears were deliberately taken out of circulation and intentionally buried in hoards underground or deposited into rivers and lakes throughout the continent. In some cases, these weapons were also altered by the means of intentional destruction.

Current archaeological discourse often interprets these deposits as ‘war booty’ and sacrifices in which the weaponry of the enemy group was offered as a tribute to the gods by the victors. Such an interpretation sees the weapon sacrifice as an ultimate display of supremacy and an effort for the legitimization of ‘status’ by one party. Although these circumstances plausibly occurred in the past, one has to consider whether also other possible scenarios could have taken place.

In this talk, I will briefly present the reconstruction of the life-path of a sample of Late Bronze Age and Early Iron Age weaponry from different contexts through an in-depth artifact analysis. I will then expand on alternative perspectives on prehistoric weapon deposition and consider aspects such as togetherness, de-escalation of conflict, and short-term function as opposed to long-term memory formation.

7 IS THE WORLD FORCED OR PLANNED?

**Abstract author(s):** Chikunova, Irina (Tyumen scientific center SB RAS)

**Abstract format:** Oral

The Trans-Urals southern taiga was characterized by a favorable natural and climatic situation and was especially convenient for settlement in ancient times. The abundance of flowing lakes and numerous tributaries of large rivers contributed to a fairly dense settlement of this territory by a diverse population. This territory could satisfy the population with different economic preferences: hunters, fishermen, gatherers, cattle breeders and horse breeders. Various raw materials were also enough: clay, wood, marsh ore, hemp, bast, hides, leather, bone. Excavations of the settlement Lisiy Bor 2 have shown that in the early Middle Ages there were close relationships between the population of several cultural entities. Fragments of dishes of Bakalsky, Karymsky, Kushnarenkovsky and Ipkul cultural types were found together in one of the studied dwellings. The characteristics of the housing structure and the ceramic collection indicate the existence and use of this structure in the transition period from the Early Iron Age to the Middle Ages, in the IV-VII centuries AD. It is possible that the carriers of different cultures, having similar economic and cultural characteristics, practiced not only trade and exchange, but also marriage relations. These assumptions are indirectly confirmed by the materials of the neighboring settlement and the nearby Ipkul burial ground, which combines multicultural artifacts in one burial and/or burial mound.

What made them exist together? We can offer at least two possible answers:

1. The scattered remnants of the tribes, driven from their habitats by the Great Migration of peoples, were forced to find a suitable place for their economic life and put up with co-existence with refugees like them.
2. This area is very rich in archaeological sites. It is possible that the shores of Lake Ipkul were a “base”, transshipment, guard or exchange point for traders or nomadic groups of multicultural population.

8 THE FUNCTION OF EARLY MEDIEVAL FORTIFICATIONS IN THE VOLGA-KAMA REGION: AN ARCHAEOLOGICAL PERSPECTIVE

**Abstract author(s):** Vyazov, Leonid (Kazan Federal University)

**Abstract format:** Oral

Hillforts occupy central positions in the Migration period agglomerations of the Middle Volga region, playing a formative role in spatial structure of local settlement groups. Slightly more than 100 of them, nearly all of promontory type and comparatively small, are known from the river Sura in the west to the river Belaya in the east and from the Kama to the Samara in the north-south direction. Despite being for a long time of investigations suggested to be used as refuges or fortified communal storages, those are of a very scarcely supported military implication. The geomorphological settings make a bulk of them useless in any kind of protection for widely opened nearby settlements, usually situated adjacent to the front side of rampart. The gateless type of earthworks devaluates the assessment of these enclosures as emergency protection for stored goods or fleeing people.

Typically, simultaneous houses inside the hillforts were not abundant and formed a homestead-type development with one central dwelling and several outbuildings around it (Maklasheevka, Osh-Pando, Imen’kovo). Outside homestead, numerous cache-pits and campfires fill the space. Artifacts found here support neither elitist nor communal-storage explanation of hillfort construction since there is no direct evidence of any difference in their assemblages between hillforts and nearby settlements. On the other side, it is hard to imagine hillforts with their impressive fortifications as dwelling places for some regular family communities.

We suppose that the archaeological evidence rather indicates the utilization of hillforts as some special centers of communal being and areas of public festivals. This can explain mandatory presence of hillforts within settlement groups as well as solid fortifications and excessive presence of some groups of artifacts in assemblages (such as hundreds of spindle-whorls and their fragments in Sholm). Some details of hillforts found parallels in ethnographic materials of Kama peoples.

9 NO FORTIFICATION IS NOT THE SOLUTION. CAN FORTIFICATIONS PROVIDE PEACE?

**Abstract author(s):** Schneeweiss, Jens (University of Kiel, Centre for Baltic and Scandinavian Archaeology; Cluster of Excellence ROOTS; University of Göttingen)

**Abstract format:** Oral

Conflict potential arises when several people come together. The potential for conflicts and the ways of coping with them are as manifold as people’s interests are. Archaeologically, we can only approach a few of them. Peace leaves no traces that could be clearly interpreted. Concrete findings allow reliable statements to be made only when conflicts escalated and resulted in destruction and violence.

Most prehistoric and early historic fortifications reveal such traces. Nevertheless, it is possible to claim that fortifications have predominantly contributed to the de-escalation of conflicts, although they can never ultimately prevent them completely. There is more than a hillfort to an effective defence system set up against a concrete threat. Its efficiency and configuration depend on the type and strength of the threat. In addition to the actual military-strategic function of a fortification, which can be directed against a siege, for example, it has also a symbolic dimension, which is not only expressed in the deterrence of potential opponents. The construction of a fortification is a great collective work that creates a sense of community and can have an identity-forming impact, especially if it is directed against an external threat. It does not matter how real this threat is. Strengthening the community has a de-escalating effect internally and externally.

In most cases, the castles will have fulfilled their de-escalating potential, even if they sooner or later became subject to an escalation of violence. For the identification of peace phases from an archaeological perspective, it is therefore important to know the entire lifespan and period of use of a stronghold and to put it in relation to the verifiable evidence of battle and violence. Often the destruction is only the end of a longer, sometimes decades-long peaceful or at least non-combatant use of a fortification.

10 THE BUSINESS OF WAR. THE ROLE OF THE ROMAN ARMY IN BUILDING NEW POLITICAL AND ECONOMIC REALITIES IN LOWER MOESIA

**Abstract author(s):** Duch, Michal (Adam Mickiewicz University in Poznan)

**Abstract format:** Oral

The expansion of the Roman Empire since the 1st century BC in the Balkans was carried out as part of extensive and often very brutal military operations. As a result, territories along the lower Danube were included in the Empire. One of the provinces resulting from these conquests was Lower Moesia (Moesia Inferior).

The proposed presentation focuses on the stage that followed the period of intense military actions by the Roman army. The sources that show the Roman army primarily as a stimulator of economic changes, enabling the inclusion of the conquered area into the economic structures of the Roman Empire will be analyzed.

The effects of the economic actions taken by the army, its individual units and individual soldiers, which had an impact on the shape and functioning of the local economy, will be discussed. From the very beginning of the existence of Lower Moesia, the Romans adapted its economy to the needs of the army stationed in its area. As a result, this led to the development of a peculiar economic system in which almost every aspect of the economic life of Lower Moesia was related to the military. In order to achieve this goal, it

11 was necessary, on the one hand, to maintain the military readiness of the legions, and on the other hand, to build peaceful relations with the local communities of the conquered inhabitants of the province.

11 CLAD IN PEACEFUL TOGA. ON THE ROLE OF DRESS IN THE CULTURAL EXCHANGE BETWEEN ROMAN EMPIRE AND DANUBIAN PROVINCES

**Abstract author(s):** Kaczmarek, Zofia (Adam Mickiewicz University)

**Abstract format:** Oral

On their path to the military and economical conquest of the known world, Romans met different indigenous communities. As a result of meeting the other, the identities of both Romans and indigenous population had to be renegotiated to find their place in the fluctuating society. This could be achieved with violent solutions, like rebellions, but also peacefully – with the cultural exchange. The latter is clearly visible regarding dress and fashion. It can be also considered an universal medium of communication - clothing for Romans was of vital importance, as it determined gender, age, function, identity or status of the wearer. It seems that for indigenous populations of Roman Noricum and Pannonia in the 1st to 3rd centuries AD clothes have also become a medium of sustaining and reinforcing their identity. The analysis of the provincial material and visual cultures proves that clothing can also be considered a symbol of peaceful opposition and disagreement with the process of integration with the Roman Empire (i.e., Romanization).

233 IN SEARCH OF THE URBAN HABITAT: EXPLORING THE CONNECTION BETWEEN TOWNS AND THEIR ENVIRONMENT IN TIME AND SPACE (URBAN ARCHAEOLOGY)

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands) - Balbi, Nicholas (Colchester Archaeological Group) - Belford, Paul (Clwyd-Powys Archaeological Trust)

**Format:** Regular session

The town and the environment are closely connected. A determining factor within the environment is the landscape, but other aspects can also play an important role like climate, natural resources, stars and cardinal points. It is this environment which determines the location of towns – and not only the location, but also spatial orientation, form and layout, infrastructure, buildings. Even the reasons for their existence, and the way towns functioned and developed can't be understood without the environment. In this main session of the EAA Urban Archaeology Community we would like to investigate this relationship more closely.

The relationship between towns and their environment can be explored on four different levels:

- The location of towns;
- The layout of towns;
- The type of buildings and structures within towns and how they are constructed;
- The way towns function in relation to its surroundings.

The main questions for this session are how these levels are manifested and more important why and when, as towns are not static entities and are continuously changing. The next main question is whether the interaction with the environment is a local or supra-local phenomenon. Are interconnections between towns, regions and periods recognisable and how do they manifest?

In this session we will explicitly not focus on one specific period and region. Exploring the diversity throughout time and space can help us develop a better understanding of underlying patterns and interconnections. This will also be the focus in the discussion slots of this session.

We welcome contributions from across Europe and outside Europe which addresses one or more of these themes.

ABSTRACTS:

1 THE IMPORTANCE OF THE ENVIRONMENT FOR THE EARLY URBANIZATION IN DENMARK

**Abstract author(s):** Runge, Mads (Odense City Museums)

**Abstract format:** Oral

In the research project, From Central Space to Urban Place, funded by the VELUX FOUNDATION, the early urbanization in southern Scandinavia is analyzed based on the relationship between town and hinterland within the period 400-1100 AD. The project involves archeology, history, place names and natural sciences and the participants come from a streak of museums and universities. The project has just come to an end.

The focus of the project is the urbanization process leading to the emergence of the two Danish towns, Aalborg in North Jutland and Odense on Funen. Both towns emerged in fjord landscapes rich in archaeological prestige findings, predating the towns' establishment around 900 AD. However, the two fjord landscapes are very different. The Limfjord, where Aalborg is located, is a central waterway with an important function for national and international traffic east-west. At the same time, the hinterland is characterized by distinctive hill islands and large marine foreland, which have set very sharp boundaries for the settlement's location. The fjord landscape around Odense has a different character, where several natural harbors are an important element. At the same time

the landscape around Odense fjord is less "hilly" although with some distinctive plateaus. The landscape variations lead to varying driving forces in the urbanization process.

The landscape's variation between the two areas meant that communities in Aalborg and its hinterland were oriented towards the water and, to some extent the international contacts, while Odense rather oriented itself towards the inland and the local and regional connections. On this background the two areas underwent various developments within the study period. Where significant centrality-creating factors for Aalborg seem to be trade and international contacts, centrality in the religious and military sphere is decisive for Odense's background. These conditions meant that the earliest towns had a different design.

2 CROSSING THE LINES – URBAN RELATIONSHIPS WITHIN VIKING-AGE IRELAND

**Abstract author(s):** Boyd, Rebecca (University College Cork)

**Abstract format:** Oral

Boyd's current work explores the emergence of towns in Viking Ireland. Despite a homogeneity of architecture in the Viking Age, these three towns of Dublin, Waterford and Cork, develop in quite different environments and at different points in the chronology. This paper seeks to expand our understanding of the different landscape and chronological contexts within which Dublin, Waterford and Cork emerged and grew between the 9th and 12th centuries AD. Whilst much attention has focussed on Dublin's 9th and 10th century relationships between Dublin and York or Kaupang, or on 12th and 13th century connections with Bristol or Chester, less is known about links between these towns in Ireland.

Beginning with a physical comparison of their surroundings, we will compare their physical locations and different types of landscape settings – rivers, hills, mountains, coasts, marshes. We will look at town boundaries – constructed walls or natural boundaries such as waterways – as well as connecting routeways between the towns. Especially important will be the connections via waterways – rivers, lakes and coasts. We will consider how these towns began to transgress these boundaries over time, establishing suburban growth, connecting with suppliers outside the town walls and connecting with each other. This can be achieved through comparisons of material culture, find spots and environmental data.

Finally, we will consider questions of scale, pace and change over time in each town and comparatively between the towns. Can we reflect the pace and nature of developments of 9th century Dublin with developments of the first urban phases in 11th century Cork or Waterford? How quickly did these later settlements develop suburban growth in comparison to Dublin? Historically, Dublin has always outpaced other urban centres in Ireland – does this stretch back to its origins as Ireland's first town?

3 ARLES: THE STUDY OF CULTURAL AND POLITICAL PROTAGONIST AS PROTECTION AGAINST URBAN DEVELOPMENT

**Abstract author(s):** Balbi, Jose (Colchester Archaeological Group; Dirección de Cultura y Educacion BA) - Leone, Isabella (SIA (Società Italiana de Archaeo Astronomia) - Balbi, Carolina (FADU - Facultad de Arquitectura, diseño y Urbanismo - Universidad de Buenos Aires)

**Abstract format:** Oral

This work is oriented with historical-archaeological rigor to study the city urban development and the relationships with History, Culture and conservation. Arles, in French Provence, where we can go back millennia to study its history and which today essentially faces that what we call a "tourist urbanization", with a very important cultural heritage.

Our question is: If modern societies have in many cases destroyed their cultural heritage in pursuit of development and progress and the search for the preservation of cultural treasures stop urban transformations, could heritage protection be an end to the line of the city time? The tasks would include the definition of identity, protection of the remains, the opening of its contents for use in studies and, eventually, tourism development at different levels, with a strict protection and conservation program.

The proposal is a brief but impressive journey on the History of this city, small in size but of enormous cultural, religious and political importance; the archaeological analysis of its buildings and monuments and its comparison with the usual indicators: urban development and demographic variations, adding a brief observation on its economic and cultural present.

We will see the functionality of its buildings, the Archaeo-astronomical orientations, the relationship of the constructions with the landscape and the disappeared constructions, and their functions and position in the current city.

At the end we will be able to feel the historical development of a city appreciated by Ligurians, Phoenicians, Greeks, Romans, medieval Christians, Burgundians, Franks and Germanics among others, its royal coronations, its religious and political importance in the Middle Ages and the protagonists who positioned the city in the European power game for centuries and whose landscape was immortalized, almost at the turn of the last century, with the brushstrokes of an inspired Vincent Van Gogh.

4 **TOWNS BY THE KING’S WILL – URBANISATION IN THE NORTH-EASTERN TRANSDANUBIAN REGION OF HUNGARY BETWEEN THE 11TH-16TH CENTURIES**

**Abstract author(s):** Kolláth, Ágnes (Institute of Archaeology, Research Centre for the Humanities)

**Abstract format:** Oral

The Hungarians had established their kingdom at the turn of the 10th-11th centuries in the Carpathian Basin. The ruling Árpád Dynasty had chosen the middle part of the country as their core territory, constantly moving between smaller manor houses and a few main seats. The locations of the latter had been chosen with particularly great care and the kings constantly supported their development. Large-scale building projects (town walls, churches, marketplaces, etc.) had been carried out, and they had been first made ecclesiastical, then secular administrative centres. The Árpadian kings and their successors of various dynasties had given out privileges to them as well, but not all of these would-be towns could use them equally. Their development was influenced by both external and internal factors, like the Mongolian invasion of 1241-1242; or losing their rights as free cities to the episcopates rising in power. Consequently, they have reached different levels of urbanisation, with Buda emerging as the true capital of the kingdom by the end of the 15th century.

The paper aims to examine the topographic features that had played a role in choosing the sites of these settlements, their changes in territory and infrastructure through the centuries. The main focus will be on Székesfehérvár (the coronation town of the Hungarian kings) to present the results of its archaeological topography project in progress, but the other cities of the region (e.g. Esztergom, Győr, Veszprém, Buda and Visegrád) will also be discussed.

5 **TOWN REDEFINED. SOCIO-ECOLOGICAL SYSTEMS OF TAKLAMAKAN DESERT’S OASES AND THE PROBLEM OF ENVIRONMENTAL RESILIENCE**

**Abstract author(s):** Hanus, Kasper Jan (TBD)

**Abstract format:** Oral

The arid environment of the Taklamakan Desert (contemporary Xinjiang, western China) might be seen as a hostile one from a perspective of temperate Europe. Nevertheless, since prehistoric times there were human societies, which called that place “home”. My presentation highlights how the inhabitants of oasis-towns, focusing on the first half of the first millennium CE, interacted with their environment. The study of archaeological and historical record suggest ingenuity in landscape modification, which were facilitating resilience. Those resilience-improving endeavours included a distinct layout of settlements and types of building and structures. During the presentation, I will introduce the audience to comprehensive models of local socio-ecological systems, which allowed me to evaluate connections between various human and environmental problems. The configuration is not surprisingly different from regional socio-ecological systems of historic Europe and provides a new perspective on possible arrangements between people, towns they inhabited and the environment they were part of.

6 **OPPIDUM AS AN URBAN LANDSCAPE. MULTIDISCIPLINARY APPROACH TO THE STUDY OF EMPTY SPACES ‘INTRA MUROS’**

**Abstract author(s):** Golánová, Petra (Masaryk University, Department of Archaeology and Museology, Brno) - Hajnalová, Mária (Constantine the Philosopher University, Nitra) - Lisá, Lenka (Institute of Geology CAS, Prague) - Milo, Peter (Masaryk University, Department of Archaeology and Museology, Brno) - Patrik, Flammer (Oxford University, Department of Zoology) - Petr, Libor (Masaryk University, Department of Botany and Zoology, Brno) - Petřík, Jan (Masaryk University, Department of Geology and Department, Brno) - Fránková, Markéta (Institut of Botany CAS, Department of Paleoecology, Brno)

**Abstract format:** Oral

‘Empty spaces’ within urban centres are deliberately not built up and are maintained as such for a prolonged period of time. The archaeological excavations of oppida - the fortified urbanized centres spanning the Late Iron Age to Early Roman transition - almost exclusively focus on the originally built-up areas. Projects studying the entire enclosed area as one urban space, and thus, also looking at the role and function of seemingly ‘empty’ areas, are rare. The extensive use of geophysics at these sites during the last decade has substantially extended the knowledge gained through excavations. The possible structures detected during these surveys have only rarely been verified by subsequent archaeological excavations, and no special attention has been paid to the areas where no traces of buildings have been found. The function of large areas within the hilltop oppida with almost no traces of human activities is not clear. Several possible functions have been suggested for their role, such as use as fields, pastures, space for social events (gatherings, marketplaces), refuge, or spare land for urban development.

This paper presents a multidisciplinary approach for the examination of such a large empty spaces based on a case study - oppidum Bibracte/Mount Beuvray (Burgundy, France).

7 **THE ORGANISATION OF THE URBAN SPACE: A GEOARCHAEOLOGICAL PERSPECTIVE**

**Abstract author(s):** Devos, Yannick (Vrije Universiteit Brussel)

**Abstract format:** Oral

Many European historical town centres are affected by major transformations. This frequently results in the removal of tons of soils and sediments, including the ubiquitous Dark Earths: thick, dark coloured, humic, homogeneous units that cover large surfaces

and that are often rich in archaeological remains, including ‘floating’ archaeological structures (Nicosia et al., 2017). Due to a lack of internal stratigraphy they compose a major challenge for urban archaeologists. Over the last decades geoarchaeology, and soil micromorphology in particular, has shown to be a particularly valuable approach as it permits to recognise the major processes involved in their formation and to detect human activities and natural events triggering them. Beyond understanding the stratigraphy of each individual site and the reconstruction of the individual site biographies, systematic research on the Dark Earth in the historical centre of Brussels significantly contributes to the understanding of the evolution of the spatial organisation of the town as the location of houses, gardens, quarries, crop fields and grasslands can be detailed for different time periods, including the periods for which almost no other resources are available.

8 **SPA TOWNS AS SPECIAL SETTLEMENTS LINKED TO THE NATURAL RESOURCE OF HEALING SPRINGS**

**Abstract author(s):** Schaer, Andrea (Berne University, Institute of Archaeological Sciences)

**Abstract format:** Oral

The emergence of spa towns is linked to two factors: the presence of the healing springs and the appreciation of these springs by the people. The latter, in particular, determines the short- and long-term development, the existence or disappearance of this particular type of settlements during the times.

Some spa towns are developing into regional centres with the corresponding functions and infrastructures. Others remain rather isolated and focused of the single purpose of bathing-tourism.

Against the backdrop of changing political and social structures, value systems and developing medical science, the importance and the image spa towns is constantly changing.

The paper presents the development of the Swiss spa town of Baden (Canton Aargau) through two millennia from the Roman Aquae passing by the medieval “Wildbad” to today’s modern city, that is just about to rediscover its unique history as a spa.

In addition to the presentation of the archaeology and history of the particular infrastructure of the spa, the paper examines the specific interactions between the special settlement type of the spa as a place of otium and the “ordinary every day” city of the negotium.

9 **WHEN PROFIT CREATED A TOWN – URBAN LANDSCAPE OF MEDIEVAL MINING TOWNS IN CENTRAL EUROPE**

**Abstract author(s):** Cembrzynski, Pawel (Cluster of Excellence ROOTS, Kiel University)

**Abstract format:** Oral

The economy of mining towns was based on the extraction of mineral resources. This fact impacted their localization, morphology and built environment. This paper aims to show how mining shaped the urban form in case of medieval towns. To achieve that I will analyse archaeological and written sources from several sites in Central Europe (Germany, Czechia, Slovakia, Poland).

Medieval miners tended to settle down close to mines. In some cases, mining settlements developed into a town (a place with urban status). Many of them had never grown larger than a village and were eventually abandoned, but several became major urban centres. Such centres were located on mining fields or very close to them in rough terrain. They developed “organically”, without organised structure, along older communication routes and settlement nuclei or in some cases were founded by lords as a town with a regular grid. The layout was often shaped by existing elements of mining operations (old shafts, waste heaps etc.). Buildings belonging to mining authorities alongside infrastructural elements (shafts, ore mills, smelters) were typically located in the town’s area. Large incomes generated by mines attracted investors, merchants and artisans, who created a wealthy urban commune. They manifested their status by outstanding, highly decorative elements of architecture (churches, houses). Nevertheless, living in the vicinity of mines had a price. The land was deforested and eroded, smelting sites were often close to the town causing a constant threat to health due to toxic fumes. Besides, mining towns were very vulnerable to crises in mining production. These could easily lead to the impoverishment of miners and urban commune resulting in depopulation. Once flourishing centre could quickly fall into decay and lose its’ position as a hub of financial and social development.

10 **“LIFE IN A COLD, REMOTE PLACE”: EXAMINING THE RELATIONSHIP BETWEEN THE ENVIRONMENT AND A 20TH CENTURY ICELANDIC HERRING TOWN**

**Abstract author(s):** Westmont, V. Camille (University of the South)

**Abstract format:** Oral

Changes in Icelandic society in the 19th century spurred previously small villages on Iceland’s North Coast to develop into full-fledged towns supported by fishing industries. Although these towns developed well into the late modern period, their marginal environments and remote locations meant that the development of the fishing towns was oftentimes heavily shaped by both the landscape and available natural resources. This paper examines the industrial rise and decline of Siglufjörður during the 20th century with particular reference to the relationship between the environment and the structure and development of the town. Drawing on

aerial and ground photography, I examine how feedback loops between the environment and human activity brought Siglufjörður to the brink of collapse -- but also created reservoirs for new potential. By examining the development and growth of the town from an environmental perspective, we can develop a fuller understanding of the relationship between human industrial activities and nature.

11 **BUILDING (ON) THE URBAN LANDSCAPE IN THE NETHERLANDS. FROM ADAPTING TO CREATING THE URBAN ENVIRONMENT**

**Abstract author(s):** Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands)  
**Abstract format:** Oral

Traditionally the landscape and environment were considered as a very, if not the most, deterrent factor on urban development and the way buildings within towns were constructed. In my paper I would like to argue that during the rise of towns in the Netherlands a change of attitude arose towards buildings in relation to the landscape. It is true that in the early towns the way buildings were constructed was very much adapted to the type of soil and landscape. For example, heavy buildings would sink into the wet peat and clay subsoils, so as a consequence the buildings were small and lightweight. During the high Middle Ages this changed. New technologies were introduced. Foundations were adapted to meet the special requirements of these environments. In Dordrecht they went even one step further and made heavy adaptations to the subsoil of a new town quarter. They constructed large wooden frameworks filled with clay on which heavy brick houses had been built.

The environment and subsoil weren't the decisive criteria anymore for the construction method. Far more important became other factors like the availability of certain building materials like brick and wood. This could also explain why in some regions the construction of brick town walls were relatively late compared to other parts of the Netherlands.

In this dynamic period the concept of dealing with the environment changed. Men changed the environment to be able to build where and what they wanted. This became one of the pillars of the medieval urbanization of the Netherlands resulting in one of the most dense urbanized regions within Europe.

12 **EMBEDDING AND DEFENDING ANCIENT MESSENE IN ITS LANDSCAPE: THE CASE OF A GREEK CITY OF THE 4TH C. BC**

**Abstract author(s):** Mùth-Frederiksen, Silke (National Museum of Denmark)  
**Abstract format:** Oral

The city of Messene in the south-western Peloponnese was founded as the new Messenian capital after the liberation of the Messenians from Spartan supremacy in 369 BC and was laid out at the south-western foot of the prominent rock Mt. Ithome (802 m). This contribution will analyse how the layout of the city and its defences was adapted to the terrain and how the landscape was actively used to strengthen its protection. Moreover, it will investigate the location of fortifications in the closer surroundings as well as the whole region of Messenia with the aim of evaluating possible overarching protection plans.

The street network of the new city was organised almost regularly and stretched homogeneously over all its area, a few deviations probably representing reminiscences to old sanctuaries and reflecting the city's search for historical identity. The grid was oriented after the general slope of the hill, but as it was the custom of Classical Greek cities, it did not react to smaller changes of terrain and was rather implemented in spite of such challenges. The city walls followed the best possible line of natural protections around the city in order to fully exploit the terrain for defence. Additional fortifications can be observed on prominent hills and crests around Messene and although difficult to date, they seem to be related to the city walls, which could point to a landscape-integrated fortification programme at some point before the Roman conquest of Greece. Furthermore, there are indications for the systematic protection of the most important routes into Messenia from neighbouring regions by fortifying distinctive features in the border landscapes, and it will be evaluated in this contribution, in how far this allows conclusions on an overarching fortification plan on the regional scope.

13 **ANCIENT MAKYNEIA IN WESTERN GREECE: THE EVOLUTION OF AN AETOLIAN SITE THROUGH TIME AND ITS CONNECTION TO THE SURROUNDING LANDSCAPE**

**Abstract author(s):** Georma, Fragoula - Saranti, Foteini (Hellenic Ministry of Culture and Sports / Ephorate of Antiquities of Aitolakarnania and Lefkada) - Vlachopoulos, Andreas (University of Ioannina)  
**Abstract format:** Oral

Makynia is known through ancient texts as a Greek town of Western Lokris that was incorporated in Aetolia around the middle of the 4th century BC. Settlement remains, most probably belonging to this small town, were excavated in 2009-2015 during the construction of a highway crossing the Prefecture of Aetoloakarnania in West Greece.

The habitation site is located a few kilometers northwest of the Antirrio pass, at a favorable location: next to a copious stream, along a central land route and close to the coast. Due to these advantages it attracted habitation since prehistoric times and had a long-lasting history extending mainly from Late Geometric to Hellenistic times. The settlement remained un-walled throughout its history, while a small citadel with excellent view, a few hundred meters to the northwest, served as a refuge for the urban and rural communities in times of danger.

The excavated part of the settlement comprises of 32 buildings, representing private houses of different periods and types. They are valuable examples of domestic architecture in the region of Western Greece in terms of layout and spatial organization of the town, house plans, building techniques and materials.

The features and overall layout of the settlement eloquently indicate the interactive relationship with the surrounding landscape, especially as throughout its life an irregular town plan, with clusters of buildings adjusted to the natural slope and ground morphology, was retained. The houses were oriented southwards, making best use of the light and sun and adapted to ground features, while irregular roads and pathways followed the contour lines. Other constructions as wells, water-tanks and drains indicate the treatment of water as a valuable natural resource through communal works aiming at the sustainability of the settlement.

235 **IS MACHINE LEARNING IN ARCHAEOLOGY FACT OR FICTION?**

**Theme:** 5. Assembling archaeological theory and the archaeological sciences  
**Organisers:** Price, Henry (Imperial College London) - Girotto, Chiara (Ludwig-Maximilians-University Munich)  
**Format:** Discussion session

Based on last year's session "Traum -Tracing Reality in Archaeology Using Machine learning" we aim to expand on this idea. The tremendous potential of machine learning is starting to be explored in archaeology alongside network models and other more traditional statistical applications. However, if these are used to explore new societal structure quite often social theory as well as methodological assumptions are neither discussed nor explored. Predominantly, this applies to the fact that human society is a complex system and therefore inherently more than the sum of its part.

We fully endorse the idea that including complexity is not requisite in all models and one should always choose the most basic approach that still explains the phenomenon. However, current social models are often harnessing the power of machine learning and modelling as they are able to spot new patterns, invisible to humans and standard approaches. This power comes with new problems, as the usual approaches are black box based. Whilst these can be judged by their accuracy, they cannot be easily understood. Without prior white box modelling and feature engineering these results are almost non-interpretable. Without strict, clear feature classification and knowledge of the data itself the model's outcome more often resembles magic than usable results.

In our session we aim to discuss new approaches to Machine Learning in archaeology, to work on a framework for these models in social and theoretical archaeology as well as explore their ties to complexity theory and how it can improve results.

**ABSTRACTS:**

1 **SHINING A LIGHT INTO A BLACK BOX USING GRAD-CAM APPROACHES TO MAKE AUTOMATIC CLASSIFICATION MORE EXPLAINABLE**

**Abstract author(s):** van Helden, Daniël - Woldegeorgis, Eliyas - Zhou, Quinghua - Tyukin, Ivan - Allison, Penelope - Nuñez Jareño, Santos (University of Leicester)  
**Abstract format:** Oral

Machine Learning outputs traditionally have a high 'black box-ness'. We can evaluate the accuracy of the results and use this to evaluate the machine's performance on a specific task, but this often comes down to just believing the machine does what it is supposed to until it makes a demonstrable mistake. In very simple tasks, it is sometimes possible to reason backwards from patterns of mistakes to make educated guesses about what went wrong, but we do not really know. Furthermore, as Machine Learning's major selling point is that it can be used to spot patterns in very complex material where humans cannot, this option is generally not available in real-life applications of Machine Learning.

In this paper, we present the results of an experiment we ran as part of the Arch-I-Scan project, in which we used Grad-CAM to gain insight into our classifier's performance for recording Roman pottery, and specifically tablewares. We have an AI classifier trained to classify photographs of whole vessels. Grad-CAM examines the gradients in the feature space to see which layers in the classifier contributed the most to a particular classification. This can then be visualised as a heat map on the original photograph, showing which regions of the image were considered to be distinctive by the classifier. This form of transparency can contribute a lot to the trustworthiness of our classifier, since we can see what influenced its decisions. In a later stage, it can potentially be used as a feedback mechanism, informing us about the difficulties the classifier has and allowing us to modify the training set to better equip the machine for its task.

2 **AUTOMATED CLASSIFICATION OF CERAMIC FABRICS WITH CONVOLUTIONAL NEURAL NETWORKS: A CASE STUDY FROM THE SITE OF GUADALUPE IN NORTHEAST HONDURAS**

**Abstract author(s):** Lyons, Mike (University of Bonn; German Archaeological Institute)  
**Abstract format:** Oral

This paper proposes a new method using machine learning with convolutional neural networks to automatically classify ceramic fabrics. The characterization and classification of ceramics are among the more fundamental and long-practiced archaeological goals through which questions regarding ceramic technology, provenance, and exchange can be better understood. One of the well-estab-

BALANCING BIOARCHAEOLOGY AND MACHINE LEARNING AS INTERDISCIPLINARY YIN AND YANG

**Abstract author(s):** Mircea, Cristina (Department of Molecular Biology and Biotechnology, Faculty of Biology and Geology, Babes-Bolyai University, Cluj-Napoca; Molecular Biology Center, Interdisciplinary Research Institute on Bio Nano Sciences, Babes-Bolyai University, Cluj-Napoca) - Mircea, Ioan (Department of Computer Science, Faculty of Mathematics and Informatics, Babes-Bolyai University, Cluj-Napoca) - Kelemen, Beatrice (Department of Molecular Biology and Biotechnology, Faculty of Biology and Geology, Babes-Bolyai University, Cluj-Napoca; Molecular Biology Center, Interdisciplinary Research Institute on Bio Nano Sciences, Babes-Bolyai University, Cluj-Napoca)

**Abstract format:** Oral

It has become now more apparent than ever that we are facing a bottleneck when it comes to achieving true interdisciplinarity between Machine Learning and Deep Learning and other areas of scientific research. Although domains of deep social importance such as the medical or economical fields have already progressively started complying with the requirements imposed by the Machine Learning realm, leading the research deeper into exciting uncharted territories, there is still much to be achieved to enabling true interdisciplinarity between contemporary archaeology and the enormous potential offered by novel machine learning techniques.

The purpose of the present study is to distinguish the bottlenecks that prevent a better manifestation of interdisciplinarity between the realms of state-of-the-art Artificial Intelligence and the already interdisciplinary world of Bioarchaeology based on the analysis of concrete case studies. The assessment of such bottlenecks will provide solutions to overcoming the current standstill and widening new interdisciplinary horizons in the form of a novel rendition of archaeological data harvesting methodologies both on-site and in the laboratory on the one hand and new measures of performance for machine learning-based algorithms, customized to the Bioarchaeological scientific needs, on the other hand. These two complementary actions are intended to bring balance to the interdisciplinary duality of the monad that organically and inextricably binds Machine Learning and Bioarchaeology altogether.

THE TREATMENT OF MISSING VALUES IN THE ANALYSIS OF PREHISTORIC EUROPEAN ANTHROPOLOGICAL DATA

**Abstract author(s):** Ryan-Despraz, Jessica (University of Geneva) - Villotte, Sébastien (University of Bordeaux) - Desideri, Jocelyne - Besse, Marie (University of Geneva)

**Abstract format:** Oral

In recent years, the fields of archaeology and anthropology have begun to see a shift in the standard methods of data analysis. In addition to the traditional hypothesis testing, various methods of machine learning and modeling are also becoming more common. A recent study examining skeletons from the Bell Beaker period of the third millennium BCE in Europe attempted to address and apply modeling methods in terms of data missingness. Osteological remains, especially those dating to prehistory, are rarely well-preserved and for this reason even the most thorough methods of data acquisition will contain missing data. This study therefore applied data imputation models to missing at random (MAR) datasets using the MICE (Multivariate Imputation by Chained Equations) package in R for quantitative data and the missMDA (Handling Missing Values with Multivariate Data Analysis) package for qualitative data. These approaches not only enable analyses applying dimension reduction (e.g. PCA and MCA), but imputations also allow for the exploitation of data that listwise deletion would have otherwise excluded. This communication will additionally explore the application of these methods to datasets containing various data types, including both quantitative and qualitative data, as well as evaluate the efficacy of these methods. Lastly, it is worth considering the other functions of these imputation modeling tools, such as for regression analyses. A critical look at these methods will evaluate not only their feasibility for non-statisticians, but also their reliability as a tool in anthropological and archaeological science. Applying such additional steps to a complete data analysis protocol has the potential to provide valuable supplementary insights to numerous studies in archaeology and anthropology.

REPRESENTATION MATTERS – DIVERSITY IN VISUAL REPRESENTATIONS OF THE PAST

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Scheyhing, Nicola (Seminar of Oriental Archaeology and Art History, Martin-Luther-University Halle) - Gutsmedl-Schumann, Doris (Department of Archaeology and Cultural Anthropology, Rheinische Friedrich-Wilhelms-University Bonn) - Matias, Jo Zalea (Department of Social Science, Wilbur Wright College Chicago)

**Format:** Regular session

Visual representation of the past are powerful tools to communicate archaeological research to the general public. Image of the past can be found in popular media as well as in museums, books, and heritage communication, to name a few. These images shape not only the popular perception of the past, but also the popular understanding of archaeological scientific work.

In the last few years, the representation of men, women and children in the visual picture of the past has been discussed in detail. However, other aspects of diversity and intersectionality still remain underrepresented, namely the representation of people of color, disabled individuals, and the elderly.

Therefore, important members of society are often missing in visual representations of Europeans past. This is especially important as past individuals could serve as integrative links in museums, books and documentations. Representation and visibility in the past matters as much as it does in the present.

In this session, we would like to ask for contributions focusing on the diversity of past societies in visual representation and popular science communication. What representation exists, especially for marginalized groups? In which ways are they displayed and in what roles are they represented? Do these create a true representation of the past that can be linked to the archaeological record or do they fall into stereotypes?

ABSTRACTS:

REPRESENTATION MATTERS – HOW DIVERSE IS OUR VISUAL REPRESENTATION OF THE DE FACTO PAST?

**Abstract author(s):** Scheyhing, Nicola (Seminar for Oriental Archaeology and Art History, Martin-Luther-University Halle) - Gutsmedl-Schuemann, Doris (FU Berlin) - Matias, Jo Zalea (Department of Social Science, Wilbur Wright College Chicago)

**Abstract format:** Oral

The situation of Museums and other Institutions during the Covid-19 pandemic event stirred a newly enlivened discussion on the responsibilities and roles of science communication.

The 2020 NEMO (European Network of Museum Organisations) conference “Museums and Social Responsibility – Values Revisited” stated that Museums have a significant responsibility in the development and preservation of social values in communities. They declared analogous to a new statement of ICOM the importance of such institutions for moral guidance throughout the present challenges in Europe. Both explicitly mentioned migration, integration and inclusion of all parts of society.

In archaeology, visual representations are a common used tool. Pictures, drawings, videos or animated images are an easy accessible, low maintenance possibility to communicate and vivify information. Yet, are the images we create representative of past societies?

In the last decades, several conference sessions, publications, discussion groups and round tables focused on the representation of gender and childhood in the picture of the past. However, we are still missing a discussion on the virtual representation of the past towards the visibility of BIPOC, those with disabilities, and the elderly.

To challenge this absence, we would like to address broader diversity in the visible picture of the Past, with the goals of inclusion and fighting harmful stereotypes. We would like to challenge the presumption that in most cases the visible representation created for past societies is coded as white, young, and visibly able-bodied. Therefore, we ask:

- Do visual representations in archaeology offer a realistic image of past societies? Are they rooted in archaeological data or affected by other factors (personal bias, creative license, etc.)?
- Besides gender stereotypes, are other stereotypes dominating reconstructions in museums and publications?
- What picture of past societies are we offering to the public?
- Do archaeologically-created visual representations of the past reference the public?

2	<p><b>CRITICAL APPROACHES TO ARCHAEOLOGICAL VISUAL REPRESENTATIONS: THE PASTWOMEN PROJECT</b></p> <p><b>Abstract author(s):</b> Masriera-Esquerra, Clara (Universitat Autònoma de Barcelona - UAB; Universitat de Barcelona - UB) - Colomer-Solsona, Laia (Norsk Institutt for kulturminneforskning - NIKU) - Delgado-Hervás, Ana (Universitat Pompeu Fabra - UPF) - Díaz-Zorita-Bonilla, Marta (Eberhard Karls Universität Tübingen) - González-Marcén, Paloma (Universitat Autònoma de Barcelona - UAB) - Herranz-Sánchez, Ana Belén (Universidad de Jaén - UJA) - Jardón-Giner, Paula (Universitat de València - UV) - Rísquez-Cuenca, Carmen (Universidad de Jaén - UJA) - Sánchez-Romero, Marga (Universidad de Granada - UGR) - Soler-Mayor, Begonya (Museu de Prehistòria de València - MUPV)</p> <p><b>Abstract format:</b> Oral</p> <p>The visual image of ideas about the past has played a key role in understanding the past and illustrations have had long lasting power in spreading those ideas in popular culture and society. Thus, representation in archaeology can be defined as the production of meaning through visual language to communicate the past. Meaning is not established through words and then given visual image; rather it is created by a series of pictorial conventions that are loaded with symbolic content.</p> <p>In the 19th century, both Romantic and Orientalist painters and the first reconstructions of primitive humans by evolutionism generated a whole series of images that tended to establish representational stereotypes associated to specific cultural and moral values. At present, this connotative value of archaeological visual reconstructions continues to appear in most of the informative supports directed to all type of public (historic or scientific popularization, education, publicity, visual creation, etc.). Certainly, the communicative content of these illustrations is only considered as historical representation if it contains human representations that are those that visually express the social relations and cultural values attributed to those societies of the past.</p> <p>In this presentation we intend, besides reviewing these canons of representation of human bodies in historical situations, to present and discuss the implications of the Pastwomen project aimed at creating new and inclusive images of the archaeological past based on a critical perspective of gender/social identities and relations.</p>
3	<p><b>ENGENDERING SPANISH MUSEUMS: A RECENT HISTORY</b></p> <p><b>Abstract author(s):</b> Torres Gomariz, Octavio (University of Alicante) - Moreno Conde, Margarita (Museo Arqueológico Nacional)</p> <p><b>Abstract format:</b> Oral</p> <p>The interpretation and visual representation of past societies plays a fundamental role in the transmission of knowledge produced by archaeologists to the general public. Museums are one of the most visible and privileged scenarios for this transmission. In museums the forms, rhythms of the exhibition and the decisions about the display are fundamental in the understanding of the past. Archaeologists working in museums have been pioneers in the critique, revision, and introduction of a gender perspective in museum exhibitions. In this paper we undertake a historical analysis of the development of the way gender is represented in archaeological museums in Spain. We will explore the pace of change from an initial stage in which the past was fundamentally male, to a more balanced gender perspective that can be seen in a few archaeological museums in Spain. We explore who is behind the recent engendering of museum displays and examine the socio-political and cultural context in which some curators started to perceive the display of gender in their museums as problematic and decided to make something about it. Moreover, we assess whether there are also issues of gender behind the group of initiators of this change, as it seems clear that the curators who have fostered this change are, <i>sauf</i> exception, women. A comparison will be made between national and regional museums, and also among museums of different Autonomous Communities in Spain. This paper is part of the ArqueólogAs project (<a href="http://www.ub.edu/arqueologas">www.ub.edu/arqueologas</a>), a project aiming at discussing the role of women in Spanish archaeology.</p>
4	<p><b>BRINGING INVISIBLE PEOPLE TO THE FORE: NEW APPROACHES TO REPRESENTATIONS OF THE PALAEOLITHIC ERA IN MUSEUM</b></p> <p><b>Abstract author(s):</b> Karkazi, Elli (Department of Cultural Technology and Communication, University of the Aegean; Museolab)</p> <p><b>Abstract format:</b> Oral</p> <p>The archaeology of the Palaeolithic Era and the origins of humankind have long fascinated the public. Nevertheless, they have usually been conceived in a confusing and incomprehensible way, partly due to the popular culture which has been providing a distorted picture. Several museums in Europe include findings concerning human evolution and the Palaeolithic Era in their collection, while a number of museum exhibitions are totally devoted to them. The last decades, activities organized by museums have contributed decisively to restoring misconceptions about Palaeolithic societies, offering an essential, although limited perception about our Palaeolithic ancestors. During the last few decades the archaeological research has been widened and oriented towards new topics, resulting in a bulk of new data, which can provide a better understanding of social life's aspects. The present project emphasizes on the representation of aspects of social life related to Palaeolithic children and disabled individuals, which are so far set aside, in museum exhibitions. The aim of this presentation is to point out the main of the existing misconceptions and to propose new topics based on recent archaeological data, which could generate relative representations in museums, so as to better understand Palaeolithic societies. Furthermore, we stress the educational role of the museum in communicating scientific knowledge to the public and restoring the Palaeolithic narratives.</p>

5	<p><b>WHO IS WHO IN ROMAN FOREIGN AFFAIRS OR ROMAN STRATEGIES OF MARGINALIZING THE SOUTH-EAST</b></p> <p><b>Abstract author(s):</b> Adlung-Schönheit, Lilian (Hamburg University)</p> <p><b>Abstract format:</b> Oral</p> <p>In Roman art foreign people are mainly characterized as defeated barbarians. In this respect Roman art does not distinguish much between near and far neighbors – at least since the second century AD. Still there are people, who did not fit into those generalizing depictions. Therefore, another group of undifferentiated strangers encounter in roman depictions. People with whom Romans stood in contact, but never fought. In semiotic history there were only few conventions for non-romans, non-enemies. Part of these were People from India and Ethiopia. Parts of them were highly entangled trading partners who seldomly visited roman territories in particular Italy. Still there was a fair good knowledge as demonstrated in descriptions of India and Ethiopia in e.g., Pliny or Strabo. Even better known were imported products, which did a good deal to mental images in the Roman Empire. Mercantile contacts, historical knowledge and imported goods interacted to construct the Roman image of Indians and Ethiopians. To depict images of unfamiliarity, luxury and exotic artists used the same traditional semiotic conventions for both (generalized). On the basis of these matching semiotic characteristics for stereotyped Indians and Ethiopians in Roman depictions this contribution is going to deduce Roman self-location in an entangled ancient world and ways of European provincializing in antiquity.</p>
6	<p><b>IMAGES OF SCYTHIAN NOMADIC HORSE RIDERS IN PUBLICATIONS AND MUSEUMS</b></p> <p><b>Abstract author(s):</b> Iwe, Karina (Staatliches Museum für Archäologie Chemnitz)</p> <p><b>Abstract format:</b> Oral</p> <p>Scythian nomadic horse riders of the first millennium BC are represented not only for their specific form of life and economy but also by a remarkable art, the so-called Scytho-Siberian Animal Style. Their domain, the Eurasian steppe belt, is characterised by a variety of climatic conditions and landscapes.</p> <p>For decades, the public and scientific interest in the archaeological stories of these groups from the Iron Age remains unchanged. The artifacts are regularly at the centre of larger and smaller special exhibitions in many different countries worldwide.</p> <p>This contribution is about diversity within Scythian societies in the Eurasian steppe belt. Focusing on various modern visualizations, I would like to analyze the common images and key players which are part of the spread of media information, used in scientific publications and on display at various museum exhibitions in different countries. Who is always on display? Who is missing? Can we detect stereotypes?</p>
7	<p><b>WHITEWASHING, HETERONORMATIVITY AND EUROCENTRISM: THE STONE AGE ACCORDING TO PRIMARY SCHOOL TEXTBOOKS</b></p> <p><b>Abstract author(s):</b> Foldøy, Isabella (University of Stavanger)</p> <p><b>Abstract format:</b> Oral</p> <p>School textbooks are among our earliest encounters with representations of the past. However, they are also political documents: they are approved by governments to teach children how to make sense of the world. Analysing the visual representations in such books tells us about the society that made them, its values and its ideologies. My PhD research explores representations of the pre-agricultural Stone Age in Norwegian school textbooks, and the underlying ideology and messages these representations transmit to the reader. In the textbook representations, Stone Age hunter-gatherers are portrayed through a colonial gaze that undermines diversity through the use of stereotypes, dehumanization and essentialism. However, the representations speak not only through what they show, but also through what we are not shown. There is not a single person of colour in the books, no queer people, there are no people with disabilities, and there are very few elderly. In this paper I will discuss why the choice was made to exclude these groups. I will also examine how problematic representations of Stone Age hunter-gatherers also affect representations of contemporary minority groups. The indigenous population of Norway, the Sami, are frequently compared to Stone Age hunter-gatherers in school textbooks. The representations convey the idea that “we”, the contemporary Norwegian society, evolved and became modern, while the Sami, through their hunter-gather lifestyle continued to live in the Stone Age.</p>
8	<p><b>ARCHAEOLOGICAL REPRESENTATIONS IN VISUAL FICTION</b></p> <p><b>Abstract author(s):</b> Annis, Karissa (University of Wisconsin-Milwaukee)</p> <p><b>Abstract format:</b> Oral</p> <p>Representations have been a contentious topic in the past, and representations made by the public have been a point of disagreement and debate within the field. My research focuses on representations of archaeology and the past in fiction. Whether we openly recognize it or not, the public’s image of the past and archaeology often informs us as much as we inform them. This presentation will discuss the archaeological representations within various popular fiction within the last few years, and whether these images do or do not create accurate representations or fall into the stereotypes that have often followed popular representations. All of these representations are visual, whether in a graphic novel, TV show, or video game, to ensure that there is a link between visual images made by archaeologists and those made by the public. How the public forms their images will often inform our own stereotypes, and</p>

archaeologists need to be aware of these images in order to interact with them and ensure that we are not furthering beliefs that may be inaccurate and to approach the public with their viewpoint in mind.

9 THE ONE-HANDED HERO. INCLUSIVENESS IN HISTORICAL FICTION FOR CHILDREN

**Abstract author(s):** de Roest, Karla (University of Groningen, Groningen Institute of Archaeology)

**Abstract format:** Oral

Growing up with a disabled sister, meant growing up with the reality of hurdles in daily life. It also meant automatically taking this normality into the fictional world of the past. Therefore, when Drem from Sutcliffe’s Warrior Scarlet (1958) crossed my path, I didn’t think much of it. He was just a boy with one functional arm. Only when I taught history classes, I realised he’s one of few protagonists with a disability playing the lead role in a historical novel. This lack of inclusiveness is problematic.

Firstly, it is problematic in terms of being able to identity oneself with the physical fitness of the hero or heroine. For disabled children, this can take the form of escapism (leading the protagonist’s abled life) or deception (I could never achieve this). In either form, it helps to build the self-image of the young reader. Simultaneously, an able child is not given the opportunity to imagine life without their fully functional body.

Secondly, from an archaeological perspective, the number of healthy, unharmed people in historical children’s novels is rather unlikely. The representation of the past is too idealistic; reminiscing the noble savage living in paradise. In reality, past populations often had lower life expectancies than present-day, as shown by osteological evidence. Being born with a disability would have made this even harder. The fact that it concerns ‘fictional stories for children’ should not entirely justify this idealisation.

I explore here whether the author or publisher should acknowledge and actively raise such issues. As archaeologists, we can provide them with a more informed description of the past. We must engage in dialogue with writers and readers. Not with the aim to criticise their choices, but to explore what is truly fiction. The past was inclusive; it is us that tend to forget.

10 VISUALISING THE ROLE OF PAST WOMEN AS ARTISTS: A PROPOSAL FROM ARSMAYA RESEARCH GROUP

**Abstract author(s):** Vidal Lorenzo, Cristina (Universitat de València) - Meijide Jansen, Erika (Universidad Complutense de Madrid) - Feliú Beltran, Núria (Universitat de València) - Horcajada Campos, Patricia (Universidad Complutense de Madrid) - López Bertran, Mireia - Martí Bonafé, Àngels (Universitat de València) - Muñoz Cosme, Gaspar (Universitat Politècnica de València) - Parpal Cabanes, Esther - Vázquez de Ágredos Pascual, María Luisa (Universitat de València)

**Abstract format:** Oral

In this contribution, we would like to present the project “Women, Art and Antiquity. Breaking clichés”, created by Arsmaya Research Group of the University of Valencia (Spain). It is intended to make visible the role played by women in ancient societies, especially in the performance of tasks beyond the household context. On this occasion we present two visual representations of the past set in the Maya culture and in the Iberian culture, in which women appear involved in works related to the artistic field.

The Maya visual picture takes place in a room of the Royal Palace of K’anpat (Chilonché), whose murals and hieroglyphic frieze that runs along the vault were discovered by the La Blanca Archaeological Project, to which Arsmaya researchers belong, and dated to the 8th century AD. The Iberian scene takes place inside a pottery workshop of the city of Edeta (Llíria, València), where a female artist is painting an inscription of on a kalathos, a local type of clay vessel, of the 3rd-2nd century BC. Both visual pictures show different phases in the execution of painting works. The presence of women in this kind of activities is a proposal that attempts to break clichés about their involvement in these artistic activities. In addition, we have also included images of children and the elderly, which are usually underrepresented.

The pictures were made by the artist Erika Meijide under the supervision of the Arsmaya Research Group team. Therefore, through this presentation, we would like to expose how the joint creation process was. In addition, we want to share the reasons to undertake this project, in order to overcome the lack of greater diversity of ways when we represent women in the recreated scenarios of the past.

11 WHAT IS WRONG WITH THIS IMAGE? REFLECTING ON PAST DIVERSITY THROUGH VISUAL REPRESENTATIONS OF GENDER STEREOTYPES IN ARCHAEOLOGY

**Abstract author(s):** Gaydarska, Bissierka (Durham University; Archaeology and Gender in Europe - AGE - Community of the EAA) - Coltofean-Arizancu, Laura (Archaeology and Gender in Europe - AGE - Community of the EAA; University of Barcelona) - Matić, Uroš (Austrian Archaeological Institute, Austrian Academy of Sciences) - Radosavljević, Nikola (Faculty of Applied Arts, University of Belgrade)

**Abstract format:** Oral

Gender and feminist archaeologists have fought for decades against gender stereotypes through academic writing, museum exhibitions and popular literature, among others. Despite their efforts, many of these stereotypes – e.g. from the classical image of men as hunters and producers of tools, and women as gatherers and caregivers, to same sex practices being considered a modern invention or a disorder – continue to live and even flourish, both in academic and non-academic settings, especially in countries where gender archaeology does not exist or where gender in archaeology is barely discussed. These stereotypes reflect essentialist inter-

pretations and (visual) representations of the past, which often replicate contemporary ontologies, perceptions and dichotomies. The past, however, was probably just as diverse as our contemporary reality. This paper discusses the possibilities and challenges of creating more diverse and inclusive visual representations of the past. It does so by presenting the case study of an editorial project resulting in an illustrated booklet on gender stereotypes in archaeology, edited under the aegis of the Archaeology and Gender in Europe (AGE) Community of the European Association of Archaeologists. The booklet thought-provokingly and openly addresses through images and texts often uncomfortable topics concerning gender in archaeology, in an attempt to raise awareness both among the professionals and fans of the discipline.

238 HUMAN VISUAL ARCHIVES, GLOBALLY. MATERIALS, FORMS AND MEANINGS OF HUMAN REPRESENTATIONS IN ANCIENT TIMES

**Theme:** 4. Globalisation and archaeology

**Organisers:** Gallinaro, Marina (Dipartimento Scienze dell’Antichità - Università di Roma La Sapienza) - Lesure, Richard (Department of Anthropology, University of California, Los Angeles - UCLA)

**Format:** Regular session

Since the Upper Palaeolithic (at least) humans represent themselves. The oldest evidence known from Europe and North Africa shows standardised forms mainly expressed through figurines (in different raw materials) and some examples of rock art (both petroglyphs and paintings). With the introduction of the first forms of food production (Mesolithic; Neolithic; other equivalents), we see a drastic increase of human representations all over the world, with a lower standardisation of forms and a growing variety of media, including pottery and an array of other materials. Different approaches have characterised the study of this evidence, spanning from diffusionist to micro-contextual overviews; from pre-iconographic to iconographic to iconological studies; from gender-based to body performative to general covering model; from behavioral considerations to ritual and religious ones. Where have those discussions left us? How do we approach the phenomenon of human representation in ancient contexts, which analytic tools do we use, and what meaning (implicit or explicit) do we attach to the imagery?

The session aims to bring together scholars with experience engaging of data from research areas characterised by lively theoretical and interpretative traditions (e.g. Europe; Near East; Northern Africa; Mesoamerica) to discuss the different approaches adopted, going beyond descriptive presentations of a single case study. As contemporary research is experiencing the definition of new analytic tools and methods (such as image processing and material analyses, 3D modelling and large databases) and at the same time is applying theoretical frameworks (such as materiality, gender theory and critical approaches) introduced by post-processual research, an open-ended discussion of the development for the future is timely.

ABSTRACTS:

1 EXPLORING THE EMERGENCE OF SCENES AND ANTHROPOCENTRISM IN ROCK ART: LEVANTINE ROCK ART AS A CASE STUDY

**Abstract author(s):** Domingo Sanz, Ines (ICREA; University of Barcelona)

**Abstract format:** Oral

Levantine rock art (LRA) is a rock art tradition unique to Mediterranean Iberia dating sometime around 7500 years ago. It represents a singular change in the history of prehistoric art in this part of the world: a new explicit focus on humans, their material culture, and their cultural practices, with narrative scenes used for the first time as innovative visual storytelling conventions. This new binomial humans-scenes marks a shift on the evolution of visual storytelling and of human perception of the self, or at least on the way humans decided to project their own images, behaviors and practices in the visual arts.

Narratives of hunting, warfare, violence, honey hunting, maternity and others dominate now the panels of more than a thousand sites located in the open air.

What are the causes behind such a shift in the art? Are they due to exogenous or endogenous pressures?

Our aim with this presentation is to go beyond LRA to explore other major rock art traditions around the world experiencing similar shifts in the content of the art. Our idea is to catalog the variety of endogenous and exogenous variables causing these sorts of shifts and to analyse if there are any underlying universal relations causing this global change in the way humans started depicting themselves in scenes.

2 SAHARAN HERDERS. ABOUT THE VISUAL REPRESENTATION OF HUMANS IN THE PASTORAL NEOLITHIC

**Abstract author(s):** Gallinaro, Marina (Dipartimento di Scienze dell’Antichità - Università di Roma La Sapienza)

**Abstract format:** Oral

Since the upper Palaeolithic, we assist in Northern Africa to the emergence of the first human representations in the form of unfired clay figurines or petroglyphs. Such evidence seems to be confined/limited to the Mediterranean shore, somehow defining the southernmost border of the wide phenomenon that involved the Eurasian continent. It is only at the beginning of the Holocene that we observe the flourishing of a long-lasting tradition of rock art (both painted and carved) in the central Sahara that will develop until

3

recent times. Humans represent the prominent motif in the thousands rock art sites dotting the central Saharan massifs, in the heart of the desert.

Such an impressive visual archive has been investigated through several approaches, including structuralist perspectives, semiotic and contextual analyses, ethnoarchaeological suggestions, and gender-oriented approaches. However, these interpretations were based on a few systematically recorded sites, or on generic data without specific reference to the quantitative and detailed data-sets.

This paper will propose a synthesis of the main approaches adopted and a new tentative to build significant ontologies for Pastoral rock art. In particular, the preliminary analysis of an ongoing project\* based on the full archive of the Pastoral petroglyphs and paintings of the Tadrart Acacus and Messak massifs will be discussed. The research process will move from a site-specific analysis, outlining variability and local sets of regularities, to a subsequent search for enforcing regularities at the macro-regional scale, in order to identify possible patterns of the contacts and ideological interactions inside Sahara during the Pastoral Neolithic period, since its formative phases.

\* ASArt-DATA Project (Funded by the European Union’s Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 795744).

4

**PREHISTORIC ANTHROPOMORPHS FROM THE CENTRAL WESTERN DESERT OF EGYPT: A STUDY OF FORM AND MEANING**

**Abstract author(s):** Polkowski, Pawel (Poznan Archaeological Museum)

**Abstract format:** Oral

Prehistoric rock art in Egypt (apart from the Predynastic tradition, as well as various painting ‘styles’ from Gilf Kebir/Gebel Uweinat region) is largely dominated by zoomorphic depictions. Anthropomorphic component seems to be less explicit; such petroglyphs being usually simpler in form, smaller in size etc. But exceptions do exist and one such group of anthropomorphic images that strikes us with its level of detail, as well as its involvement in larger compositional ‘syntaxes’, encompasses images that are known only from the central Western Desert.

These petroglyphs have already attracted some attention from scholars, although an overall discussion and specific interpretations are lacking. Most often they are considered depictions of women, and for a number of examples this seems to be true. The vast majority of these figures have highly exaggerated lower bodies in contrast to their upper parts and many have a specific protrusion that has been usually interpreted as indication of pregnancy – the feature that has played a major role in previous conceptualisations of their meaning. There are, however, fairly numerous examples devoid of features unequivocally feminine, putting certain identifications into question.

In this paper I intend to present a study of the relevant material from Dakhleh, collected by the Dakhleh Oasis Project over the years. Beginning with a short overview of previous interpretations, I’d like to set a point of departure for further discussion. I will focus not only on formal features of recorded petroglyphs, but also on their potential meaningful relationships with other motifs. Certain recurrent associations of motifs seem to be particularly important in this context, among them pairs of anthropomorphs that involve a thinner and an ‘obese’ specimens, sometimes connected by a line. All of this should be followed by a discussion on potential role(s) of this rock art among Dakhleh prehistoric communities.

5

**IMBALANCE IN ORDER TO REIGN: ONTOLOGICAL SHIFT DURING EGYPTIAN PREDYNASTIC PERIOD AND ESTABLISHMENT OF THE REDEMPTIVE ROLE OF THE RULER**

**Abstract author(s):** Graff, Gwenola (French Institute of Research for development)

**Abstract format:** Oral

A recent review of the study of the painted vases of Nagada I (the White Cross-lined) with geometric and apparently non-figurative decorations has shown that they were in reality a dynamic, often three-dimensional representation of a conception of the universe and the arrangement of its elements. This cosmography is expressed through a simple, recognizable pattern. An ordered, self-stable universe then appears, which regulates itself by integrating variants and recompositions of the basic scheme. The forms are rendered in a very allusive way. They are shown in perpetual transformation. This universe does not require the intervention of an external agent. Human representation is absent.

This figuration of the universe corresponds to a period, at the beginning of the fourth millennium, when social structuring and hierarchisation had not yet led to the concentration of all powers in the hands of a single man. The cosmography transcribed by C-Ware predates the introduction of this dynamic stabilising vector embodied by the sovereign. To justify this central role of royal ideology, it was necessary to introduce the notions of duality, the permanent opposition of balance and chaos and the impotence of the universe to stabilise itself, so that the sovereign, paragon of humanity, could invest himself with a role indispensable to its maintenance. Without threat, there is no reason to be in power.

It is this dialectic and this shift between two relationships to the world that we would like to explore and present in order to contribute to understanding how the transition to production societies impacts human representation.

5

**ANTHROPOMORPHIC FIGURINES OF SOUTH-WEST ASIA THROUGH THE NEOLITHIC TRANSITION: SOCIAL FUNCTION AND INTERACTION NETWORKS**

**Abstract author(s):** Atakuman, Cigdem - Gemici, Hasan Can - Sürer, Elif (Middle East Technical University)

**Abstract format:** Oral

Anthropomorphic figurines constitute one of the most interesting and equally enigmatic objects of the prehistoric era. These miniature statues of the human form are often perceived as representations of gods or goddesses, and treated as static images of worship. More recent approaches investigating their context and materiality, however, have begun to highlight these objects’ active agency in the construction of personhood and the creation of a sense of place and identity in prehistoric societies, with references to a variety of issues such as gender, identity, regeneration, and ancestry.

In tandem with the recent developments in the theory and method of prehistoric figurine studies, this presentation aims to focus upon the thematic variation, raw material choices, manufacture processes, discard patterns and spatial contexts of the Neolithic figurines of South-west Asia through time (c.10000-6000 BC). Our purpose is to understand the shifts in social function and cultural interaction spheres represented by these objects. We will discuss some of our results within the context of our ERC funded ancient DNA project that explores the Neolithic transition in the region.

6

**THE HUMAN IMAGE IN THE PRE-POTTERY NEOLITHIC OF THE NEAR EAST. POSSIBILITIES OF ENGAGEMENT**

**Abstract author(s):** Dietrich, Oliver (Freie Universität Berlin)

**Abstract format:** Oral

For a long time research into anthropomorphic in the Near East has focused on later Neolithic clay figurines with an interpretational emphasis on fertility cult centering around the ‘great goddess’. The last three decades of research have confronted archaeologists working in the Near East with a continually growing number of anthropomorphic (and zoomorphic) stone sculpture from early periods, including a large number of male depictions. Particularly Pre-Pottery Neolithic (9600-7000 BC) sites like Nevalı Çori or Göbekli Tepe in Turkey have delivered a wide array of sometimes life-sized and quite detailed depictions in varying degrees of abstraction. While the subdisciplines of archaeology dealing with the historical periods of the Mediterranean and the Near East have long developed a methodology to interpret visual art, a methodological framework beyond intuition and ethnographic or historic comparisons is still widely lacking for prehistoric periods, for which written sources giving at least basic information on the meaning of imagery are absent. New approaches so far tested include Panofsky’s iconology as well as semiotics and psychological reasoning. The contribution will explore the possibilities of inferring meaning from Early Neolithic stone imagery.

7

**HUMAN FACES DEPICTIONS OF EARLY NEOLITHIC IN THE NEAR EAST**

**Abstract author(s):** Huet, Thomas (LabEx ARCHIMEDE, ANR-11-LABX-0032-01) - Ibañez, Juan (Archaeology of Social Dynamics IMF-CSIC) - Pozo, Jose - Alexander, Craig (Independent researcher)

**Abstract format:** Oral

The early Holocene witnessed the end of Upper Paleolithic imaginary with its range of wild animal depictions, and the progressive adoption of a farming life-style with a proliferation of human representations. It is commonly accepted that this proliferation is linked to demographic growth and settlement densification; the Neolithic is as much a domestication of animal and vegetal species as it is a self-domestication of human beings. From then on, human depictions will be one of the privileged means of official speech aiming to manipulate “collective representations” as defined by E. Durkheim. Among human depictions, the human face and human silhouette are the most common modes of representing a person. Faces in particular, seem to hold a special importance in the ancestor veneration cult with its well known modeled skulls, but also stone funerary masks, small clay figurines, plaster statuettes, etc., where the face is often the most detailed part of the human depiction.

Our purpose is to present a first quantitative study of the spatial variability and chronological variations of the human face compositions, *stricto sensu*, throughout the Near East Natufian-PPN. First, we present a detailed analysis of the spatial organization of the elements of the human face (presences/absences, modalities, etc.): headdress, hairnet, earrings, T-shaped facial representation, eyes, nose, facial tattoo, mouth, beard, etc. Among these variables, we pay particular attention to the different modalities of the depictions of eyes and mouth with their two antagonistic/complementary modalities: closed or open. We will use the new R package *iconr* (<https://cran.r-project.org/web/packages/iconr/index.html>) which implements concepts and functions for modeling prehistoric iconographic compositions.

8

**PREHISTORIC HUMAN REPRESENTATION IN ANCIENT CHINA**

**Abstract author(s):** Dematte’, Paola (RISD)

**Abstract format:** Oral

Human figural representation is limited in prehistoric China as compared to other parts of the world. However, though Paleolithic art is practically non-existent, some evidence of human representation is documented in few Neolithic contexts.

9

The Chinese Neolithic was characterized by significant geographic and cultural diversity and the various traditions did not share the same material, stylistic or spiritual expressions. I identify four main traditions of human representation: 1) The northeast (Hongshan and related cultures) which is characterized by a small number of clay statues and figurines of what appear to be female individuals. Located at the edge of China proper bordering north Korea, this culture is different in key aspects from the agricultural Neolithic traditions of the Chinese core and was probably constituted by semi-settled north Asian populations; 2) The northwest (Yangshao, Majiayao and Qijia) with few clay figurines but a larger number of painted ceramic vessels with representations of single human figures, faces, or groups involved in communal activities; 3) The eastern coastal area of the Yangzi river delta (Liangzhu, Lingjiatan etc) presents several jade objects with representations of human and semi-human figures; 4) The middle Yangzi river valley (Shijiahe culture) where human figurines in clay and jade have been discovered alongside animal figures in ritual contexts.

The meaning of this material has been explored in mostly simplistic terms which have ranged from goddess cults, to fertility, or shamanistic interpretations. However, what is perhaps more interesting is the limited presence of human representation in comparison to animal, floral or abstract figuration.

9

**FROM UNIQUE ANIMALS TO A GENERALIZED HUMANITY? A DIACHRONIC PERSPECTIVE ON CLAY FIGURINES IN THE PITTED WARE CULTURE**

**Abstract author(s):** Lindström, Tobias (Stockholm University)

**Abstract format:** Oral

Ever since they were first discovered in the early 1900s, the zoomorphic and anthropomorphic clay figurines found on Middle Neolithic (c. 3200-2300 BC) Pitted Ware culture sites in eastern Sweden, Gotland and the Åland islands (Finland) in the Baltic sea have generally been treated as works of art or as enigmatic ritual objects. Thorough attempts at understanding the figurines have been few and far between, often culminating in general discussions of their supposed ritual or symbolic connotations. In this paper, I instead attempt to ascertain what the figurines might tell us about the society in which they were produced and used, with special reference to their possible implications for human-animal relations during the period in question.

A closer consideration of the chronological and geographical distribution of the clay figurines indicate certain differences between the zoomorphic and the anthropomorphic figurines. Zoomorphic figurines are present in comparatively small numbers on many sites during the entirety of the Middle Neolithic period. Anthropomorphic figurines, however, start to appear around 2900 BC, with notable concentrations on two sites: Tråsättra in eastern Sweden and Jettböle II on the Åland islands. An examination of the morphology of clay figurines reveals further disparities between the zoomorphic and the anthropomorphic figurines, with the latter category exhibiting a higher degree of standardization than the former.

The chronological, geographical and morphological differences between zoomorphic and anthropomorphic figurines might suggest changing relationships between humans and animals, as well as a shift from small-scale manufacture and use of figurines to a more standardized manufacture of figurines used in communal settings.

10

**BODYSCAPES IN NORTH-CENTRAL CHILE. EXPLORING HUMAN BODY DEPICTIONS THROUGHOUT PRE-HISPANIC HISTORY**

**Abstract author(s):** Armstrong, Felipe (Departamento de Antropología, Universidad Alberto Hurtado) - Troncoso, Andrés (Departamento de Antropología, Universidad de Chile)

**Abstract format:** Oral

Over the past few decades, archaeology has seen an array of studies on the human body as a social phenomenon, going beyond traditional biomedical approaches. Such understanding has offered new ways of thinking about the relationship between the human body and its social, historical and political milieu. One particular type of relationship is that between the human body and anthropomorphic objects and images. In this paper, we offer a discussion on the differential ways in which the human body has been depicted throughout the pre-Hispanic history of North-Central Chile, from the scarce hand imprints produced by hunter-gathers on rockshelters (ca. 3000 BCE - 500 CE), to an array of dressed bodies depicted during the Inka occupation of the region (ca. 1470 - 1535 CE), both in rock art and in pottery. We focus specifically on rock art, but also consider other types of anthropomorphic objects/images, such as pottery decoration and figurines. We argue that these objects can be seen as examples of different bodyscapes (sensu Geller 2009), that are related to specific socio-historical contexts, playing part in particular relational fields. Our approach focuses on the historicity of human body and human body part depictions by hunter-gatherer communities, the first agricultural groups, and communities annexed into the Inka empire, in order to understand the transformation of bodyscapes and its social implications. We aim at discussing this evidence from a more-than-representational approach, stressing their material qualities and the relationships they established with other elements of their historical contexts. This work is part of the FONDECYT 1200276 research project.

Geller, P. L. 2009. Bodyscapes, Biology, and Heteronormativity. *American Anthropologist* 111/4. 504–516.

**HUMAN IMAGES IN FORMATIVE-PERIOD MESOAMERICAN HOUSEHOLDS: CONTEXT, SCALE, AND INTERPRETIVE SYNTHESIS IN THE STUDY OF PREHISTORIC OF FIGURINES**

**Abstract author(s):** Lesure, Richard (University of California Los Angeles)

**Abstract format:** Oral

Why did villagers across much of Formative-period Mesoamerica make small human figurines of fired clay? Figurines were common household objects in many communities, and their path to discard and deposition was similar to that of ceramic vessels, stone tools, and animal bone. Formative figurines seem to have represented people (rather than deities), yet they are generally understood to have been used in “household rituals.” On the basis of particular collections, investigators have tried to specify that vague expression in various ways, suggesting that figurines were used specifically in divinatory rituals or to propitiate ancestors. Others have emphasized instead the social implications of use of figurines in domestic settings – for instance, that they were points of reference in the negotiation of social relations or models of comportment that helped constitute people as subjects.

This paper examines two interrelated problems in efforts to characterize the intended purpose of Formative figurines: the uneasy balance between ritual and social perspectives and the challenge of developing interpretations that are both sensitive to context and consistent with multiple scales of analysis. Evidence is drawn from two sizable collections from different areas of Mexico, the Soconusco region on the Pacific coast of Chiapas (1900-900 BC) and central Tlaxcala (900-400 BC).

Recent work on relational ontologies helps with the first problem (ritual versus social function) yet threatens to exacerbate the second (the attempt to balance context and scale). The radical contextualism of the ontological approach leads (ironically) to the resurrection of unhelpful simplifications along the lines of “the West versus the rest.” This paper deepens the “household ritual” model of figurine function with inspiration from the ontological approach. To rein in that approach’s simplifying tendencies, I draw on the framework of synthesis through multiple local contextualizations.

12

**HUMAN REPRESENTATION BEYOND THE HUMAN**

**Abstract author(s):** Joyce, Rosemary (University of California, Berkeley)

**Abstract format:** Oral

This paper explores the limits of what it means when we demarcate our object of study as “human representation”. Aligned with feminist new materialism on the one hand, and anthropology “beyond the human” on the other, it considers a series of examples of materials with visually evocative markings that sometimes suggest a human presence, and at other times defy that suggestion. It draws on body phenomenology and monist ontological thought, specifically from indigenous scholars, to suggest that when human hands and eyes shaped the things under discussion, those gestures were part of a relational emergence of moments of self-consciousness that shaped a subject, but not a subject we can assume operated like the subject of modernist or postmodernist Euro-American philosophy. The alignments of subjectivity we need to attend to may very well have identified the human maker with the mineral, animal, or vegetal materials they were engaging with as part of the establishment of provisional boundaries of a corporeal self. This presents challenges that are not insuperable: we will need to bracket many of our preferred terms of engagement while we sketch out the experiential dimensions of what I will provisionally call image-making in specific moments and locales. We will need to thicken our descriptions of the “context”, that is, the material relations of any of the things we regard as images. We will need to explicitly theorize the process of meaning production, and avoid any reliance on the idea that meanings are encoded in, or transmitted by, things as a kind of information vehicle. And we will need to ask about affect—the sensuous properties of things—while acknowledging that affect and emotion cannot be separated but also cannot be generalized as uniform human experiences, even if the bodies that are experiencing sensory engagements have the same physical capacities.

**THE SEA AND THE CITY: UNRAVELLING STORIES FROM THE SEAFARING WORLD FROM THE 9TH TO THE 18TH CENTURY**

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Toreld, Christina (Bohuslän Museum) - Johansson, Marianne (Viken fylkeskommune) - Poulain, Maxime (Ghent University)

**Format:** Regular session

We seek ways and good practices on how to unravel hidden stories of an early European seafaring world, and how to make these stories available to various audiences. A world inhabited by people who exchanged goods and ideas, who explored their world and made friendly alliances across borders, but who also fought and conspired against each other. The ships, the emerging coastal towns and ports were instrumental in this cultural exchange.

Today, these hidden stories only come to light for a brief amount of time in archaeological excavations and historical research. They are being studied by scholars, filed, documented, and subsequently reburied in archives, where they remain available for a selected few. There are ways to change this, to open our archives and bring the stories out to various audiences, by drawing from experiences in these post-covid times, with a multitude of digital and analogue outreach examples. By digital technology, creative artists, participatory research and activities, the stories generated by archaeological and historical research are livened and made available to Europeans of today, highlighting our common European heritage of trade, unions, transnational migration, and connections.

The goal of this session is to strengthen interaction between the academic, cultural heritage, museums, and creative sectors by using archaeology as a source of inspiration for contemporary creation and innovation. The scope of such interaction is transnational and inclusive, making shared narratives of sea trade and contact between Europe’s member states and further, available to various audiences, engaging all sorts of people in experiencing, enjoying, and valuing arts and culture. We therefore invite papers that are set between the 9th and 18th century, follow the emergence of coastal towns, ports, networks and interactions of people and goods at sea, and that specifically aim to bridge the divide between archaeological research and public outreach.

## ABSTRACTS:

### 1 THE SEA AND THE CITY – A NETWORK OF KNOWLEDGE AND STORIES IN THE MAKING

**Abstract author(s):** Toreld, Christina (Bohusläns Museum)

**Abstract format:** Oral

How to collect the stories of people who lived in a sea-faring world of the past, whose traces we can detect in archaeological remains and historical records? How to bring those stories alive and make them meaningful to present day people? How to disperse these stories in sustainable, innovative, and Covid-19-safe ways?

A group of people coming from museums, cultural heritage, and academia in different European countries, with scientific point of reference, felt an urge to highlight, to spread and to make this part of our history and cultural heritage available. A desire to strengthen interaction between the cultural heritage sector and other cultural and creative sectors by using cultural heritage as source of inspiration for contemporary creation and innovation. By joining forces with partners from interactive game design, film and visual storytelling, VR/AR, tourism, and artists the network and project Sea and the City was created.

In this paper the making and the ideas of the network and project Sea and the City are presented. A network whose core values are enhanced availability to, enhanced awareness of, and artistic approach to our common European heritage of trade, unions, and transnational migration.

### 2 ‘THE MAJOR HARBOUR’ IN NYA LÖDÖSE AS DESCRIBED BY SIXTEN STRÖMBOM AFTER THE 1915 – 1918 EXCAVATION

**Abstract author(s):** Ortman, Oscar (The conty museum of Bohuslän)

**Abstract format:** Oral

Before the excavation, Sixten Strömbom knew that the town he was about to investigate was the predecessor of Gothenburg. Nya Lödöse was founded in 1473 as the Swedish port to the North Sea. The town existed between 1473 and 1624.

The reasons for the excavation were twofold:

- A new suburb was required for the workers of SKF (The Swedish Ball Bearing Factory).
- More information about Gothenburg’s predecessor was needed for the 300-year anniversary of the founding of Gothenburg in 1921.

In the 1916 excavations, two events occurred that affected the result of the excavation. First, the decision was made to dredge River Säreån, which ran through the town site. The dredging resulted in an increased amount of finds. Second, during the excavation of the town they came across an over 200 metre long wooden construction running alongside River Göta Älv. The construction was interpreted as a large wooden pier; the major port of the town.

Strömbom’s interpretation of where the actual harbour was situated was criticized by another researcher Albert Lilienberg who claimed that the harbour was located in River Säreån. Lilienberg, Gothenburg’s town architect at the time, based his assumption on written sources. This debate about the location of the harbour continued until the beginning of the 1950s.

In my presentation, I will discuss why it was important for Strömbom to insist on the existence of a major harbour at Nya Lödöse, and how presentation of Nya Lödöse as a main harbour town was important for the self-image of Gothenburg right up until the beginning of the 1970s.

### 3 TELLING A STORY THROUGH FORM, COLOR, OBJECTS AND IMAGES

**Abstract author(s):** Hansson, Pia (Bohusläns museum)

**Abstract format:** Oral

How do we make our story accessible and exciting for a wide audience? Maybe even arouse a curiosity about something that a person never showed the slightest interest in? Those are the questions a designer is faced with at each new exhibition project whether it is ancient times or contemporary subjects.

In this example, the project is about the 16th century, the port town of New Lödöse and a travelling exhibition. The target group is 10-12 year olds who are just reading about this time in school and as we know, it will usually be just as exciting for adults if it attracts children. The task was to show results from the excavations and tell about life in the 16th century in Nya Lödöse, Gothenburg, Sweden.

### 4

### A SEA IN THE MIDDLE: CONNECTING PRESENT AND PAST MATERIAL ASPECTS AROUND GENDER AND COLONIALISM

**Abstract author(s):** Escribano-Ruiz, Sergio (University of the Basque Country, UPV/EHU) - Azpilicueta, Mercedes (Visual Artist living and working in Amsterdam and Buenos Aires)

**Abstract format:** Oral

This presentation is conceived as a reflective exercise among an artist (Mercedes Azpilicueta) and an archaeologist (Sergio Escribano-Ruiz). The first contacted the second in her search for collaboration for an exposition based on the figure of Catalina de Erauso, a 17th century Basque nun from the who travelled to the New World, where s/he lived under male identities and became a ruthless lieutenant in the Spanish colonial army. The resulting work is going to be exposed in Gasworks London from April to June 2021. Among other activities, the exhibition plans to record a discussion around this research for the show, between historians and archaeologists, with the artist acting as chair. We envision this session as a setting to think critically about the results of this collaboration. It brings us the opportunity to consider what has been the contribution of Archaeology to this artistic work, both from the side of the artist and the archaeologist. In addition, we might be able to reflect on the way in which the audience may have perceived the role of Archeology in the process of creation and communication of Art.

### 5

### REVIVING THE LOST HARBOURS OF THE ZWIN: A FRUITFUL COLLABORATION BETWEEN CREATIVE ARTISTS, ARCHAEOLOGISTS AND LOCAL EXPERTS

**Abstract author(s):** Poulain, Maxime - De Clercq, Wim - Trachet, Jan (Ghent University)

**Abstract format:** Oral

Medieval Bruges has been coined as “the cradle of capitalism”, a place where goods, ideas and people converged into a unique, international and productive environment. The development of the city into one of Europe’s main commercial hubs was only possible via its connection to the North Sea. A tidal inlet, called the Zwin, linked Bruges to the rest of Europe and beyond and was dotted with a series of outports at its banks. Each one of these harbours had a particular role to play in a strongly connected socio-economic network dominated by Bruges. Natural, political and economic factors all resulted in the eventual downfall of Bruges and the Zwin in the 16th century. The outports shrunk from cities into hamlets or even disappeared entirely from the landscape.

In an effort to revive this lost harbour system, an interdisciplinary team of archaeologists, historians and geologists teamed up with local experts and creative artists. The result is a cycle route, along which VR viewers visualize what is now lost, and an immersive exhibition, where innovative technologies introduce the visitors to new insights on the medieval Zwin and the many people who lived and traded there.

This fruitful collaboration is a strong plea to recognize the potential of knowledge available within local communities and to incorporate artistic creation as an intrinsic part of the scientific process. 3D films are more than pretty pictures: they are a clear illustration of the current state of the art of research, they unveil the gaps in our knowledge and offer – for the first time – an experience of how it must have been to navigate these waters and be confronted with the symbols of power that were strategically positioned at its shores.

### 6

### MANAGING CULTURAL LANDSCAPES: KAUPANGER STAVE CHURCH AND KAUPANGER HOVEDGÅRD IN SOGNDAL IN VESTLAND COUNTY

**Abstract author(s):** Knagenhjelm, Christoffer (Kaupanger Hovedgård)

**Abstract format:** Oral

Kaupanger Hovedgård (Kaupanger Manor) is a large private property in western Norway, owned by the same family since 1710. The Manor and surrounding area, approx. 30 hectares, are designated as national heritage site by the Norwegian Directorate for Cultural Heritage. The Manor lies deep in the Sognefjord, by a bay nestled between several lesser fjords branching out from the Sognefjord. Included in the heritage site is the archaeological remains of Kaupanger, one of 13 medieval towns in Norway and Kaupanger stave church, the only remaining building after the former town.

Parts of the open cultural landscape, which is an important part of the heritage site, and for the understanding of the old city of Kaupanger, can also be traced back to the Bronze Age, and today flowering meadows make the area an important habitat for pollinating insects. In other words, the cultural and natural values in the area are of significant value. At the same time, the development of infrastructure, and the establishment of large spruce seed plantations 60 years ago covering large parts of the protected area, have led to challenges, such as loss of biodiversity and cultural heritage.

	<p>As part of a necessary large-scale restoration of this diverse cultural landscape, Kaupanger Hovedgård, in collaboration with the local municipality and Western Norway University of Applied Sciences, established the largest privately funded restoration project in Norway of cultural landscapes.</p> <p>The project aims to preserve and develop cultural heritage and biological diversity in a living cultural landscape in operation and make these resources available to the public. In order to engage and confront various audiences and create a better understanding of the importance of the history of the area, we have explored and conveyed the archaeology and history in different ways, while also distinguishing between the audience.</p>
7	<p><b>AN OLD PORT BY THE SEA: THE CITY OF SON AND CONTRIBUTIONS TO A LOCAL IDENTITY</b></p> <p><b>Abstract author(s):</b> Johansson, Marianne (Viken fylkeskommune)</p> <p><b>Abstract format:</b> Oral</p> <p>The city of Son, in eastern Norway, is today mainly known as an idyllic small town and yachting harbour, with cafés, galleries and gift shops. However, this town was one of the region’s main export ports for timber products in the 16th to18th centuries. From the 16th to the late 18th century, this trade was dominated by Dutch ships that came to fetch Norwegian timber, while also bringing trade goods from many other countries to Norway. But the full story connecting Son to the Continent goes back to another archaeological site, just northeast of Son: the site of Labo. The character of finds from this site shows of a trading place established in the Middle Ages - perhaps already in the Viking Age. The archaeological finds from the 13th century onwards tell of trade, import of goods, and occupants of high status. This was obviously the forerunner of the small town of Son.</p> <p>In this presentation we will tell the story of the sites of Son and Labo, and how the archaeological material has been used to promote local identity for the inhabitants of Son and the Follo region. Through exhibitions, books, informational signs, film and the school-programme Archaeologist for a Day, the local community has a raised awareness of their common history and local identity. For over ten years local schoolchildren have worked together with archaeologists, sifting for finds from the Labo site while learning about the objects, their own local history and Son’s connection to Europe through commerce. One of the objects found at the site of Labo is a medieval horse-shaped weight – The Labo Horse. This item has become an object of identity for the inhabitants of Son, with its own statue in the city centre – and it has its own board game!</p>
8	<p><b>FORGOTTEN CITY – HISTORY OF THE MEDIEVAL HARBOUR IN PUCK BAY (POLAND)</b></p> <p><b>Abstract author(s):</b> Pydyn, Andrzej - Popek, Mateusz (Institute of Archaeology, Nicolaus Copernicus University, Torun)</p> <p><b>Abstract format:</b> Oral</p> <p>The Puck harbour was discovered in late 70’ of 20th century by three recreational divers. They were looking for pirate’s harbour but they found a large number of wooden piles. After almost 40 years of research, archaeologists realised that in Puck Bay are located remains of three medieval harbours.</p> <p>History of this harbour started in the 9-10th century. In that time very long wharfs and massive breakwaters were constructed. Communities that use these structures had contacts with different regions of the Baltic Sea. The best proof of these contacts is a shipwreck with both Slavic and Scandinavian features.</p> <p>The second phase of the harbour falls on the second part of the 12th century A.D. The harbour of this phase was probably built on the unused area. Most of the relics from that phase were destroyed by dredging fairway that leads to Puck Mechanical Factories. However, some relics of wharves and moles survived on two sides of the fairway.</p> <p>The third phase of the harbour is dated between the late 13th century and the 14th century. The main element of this phase was the mole with the entrance to the dock, where two shipwrecks were found. One of them is dated from the 12th century (P3), and the second one (P5) is dated from the 13th century. The constructions from that time were probably the remains of the fishing station called Trzęsawisko, given to the Cistercians monastery by prince Mestwin II (Mściwój II).</p> <p>After this phase, the city of Puck was located about one kilometre to the east, and the old harbour was forgotten for more than 600 years. Recently underwater archaeologists from the Centre for Underwater Archaeology, Nicolaus Copernicus University revaluated submerged structures and proposed reconstruction of three phases of this medieval harbour.</p>
9	<p><b>THE PROVIDENTZ 1721-RE-ESTABLISHING CONNECTIONS BEYOND NATIONAL BOUNDARIES</b></p> <p><b>Abstract author(s):</b> Fawsitt, Sarah - Johannessen, Jørgen (Norwegian Maritime Museum)</p> <p><b>Abstract format:</b> Oral</p> <p>District court documents from Mandal, Norway, in 1721 describe proceedings to establish the cause of a shipwreck in a nearby strait. The cargo ship Providentz had sailed out of Cork harbour, in Ireland, bound for Arendal on the south coast of Norway. It sank on a clear, calm, moonlit night, a short journey from its final destination. The crew were drunk or the pilot mixed up starboard and port. The ship was carrying a cargo of grain, flour, malt and Irish butter.</p> <p>This account having tantalised a local dive club for many years resulted in in the discovery of a wreck site in late 2020. The Norwegian Maritime Museum investigated the wreck site in early 2021. A large area of wreckage remains intact below a shallow layer of sand. Loose artefacts of barrel staves, bottles and jugs were lying on top of the ships planking.</p>

	<p>The shipwreck’s dual nationality has provided obstacles and opportunities. Having a wreck that that is not Norwegian means it is harder to place it in the context of national importance. It falls outside of the responsibility of heritage agencies in Ireland. We are still trying to make contact with all stakeholders and, importantly, find funding to carry out a closer inspection of the ship. But even at this early stage in the process we have been able to share information with a much wider audience and find communities that this wreck is especially important to, in Norway and Ireland. Finding the wreck site has ignited a flurry of research and outreach between Irish and Norwegian stakeholders, from the public, to diplomatic services, to heritage organisations.</p>
10	<p><b>JOURNEYS CARVED IN STONE – DECIPHERING STORIES OF MARITIME TRAVELLERS TROUGH HISTORIC GRAFFITI AT THE NATURAL HARBOUR OF HAMNHOLMARN</b></p> <p><b>Abstract author(s):</b> Nordell, Linnea (Bohusläns museum) - Strid, Lars (Vitlycke museum)</p> <p><b>Abstract format:</b> Oral</p> <p>This paper deals with Hamnholmarna, a natural harbour on the west coast of Sweden and its historic graffiti. The aim is to show our process of digitally documenting these carvings and how these documentations simultaneously are used to tell the stories of the site.</p> <p>Along the coast there are several natural harbours that have been used by international traders during medieval and early modern times. The bottom of the Hamnholmarna harbour basin has yielded rich finds including Danish and German pottery dating from 1300 to 1700 CE. Surrounding the harbour are more than 1000 individual carvings, making this the largest site in Scandinavia. The motives include merchant marks, initials, dates, and a unique collection of late medieval coats of arms.</p> <p>Unlike an urban environment, the harbour has barely changed since the 17th century, providing a unique opportunity to experience the harbour as it was 400 years ago. Through the carvings we encounter hard working sailors and traders of different nationalities side by side with the cream of Danish aristocracy, while in transit across the sea.</p> <p>Bohusläns museum and Vitlycke museum launched a research project with the aim of surveying and documenting the carvings for the first time, using a combination of onsite interpretation and digital documentation, i.e. SFM and laser-scanning.</p> <p>The newly documented carvings draw a lot of public interest. Hamnholmarna however are not easily accessible, as getting there requires the use of a boat and getting around is physically demanding. The harbour will never become easily accessible, but it can be made accessible digitally. Our goal is to create a trans-digital destination with both ongoing onsite and digital communication. The scientific documentation plays a central role in achieving this. We aim to show how the documentation helps us visit the site and meet the persons behind the carvings.</p>

	<p><b>LOST IN TRANSLATION? - INTERPLAY OF ARCHAEOLOGICAL THEORY AND SCIENTIFIC PRACTICE AS KEY FOR MODERN ARCHAEOLOGICAL REASONING</b></p> <p><b>Theme:</b> 5. Assembling archaeological theory and the archaeological sciences</p> <p><b>Organisers:</b> Girotto, Chiara (Ludwig-Maximilians-University Munich) - Rose, Thomas (Department of Bible, Archaeology and the Ancient Near East, Ben Gurion University of the Negev; Scienze dell’Antichità, Sapienza - Università di Roma)</p> <p><b>Format:</b> Session with keynote presentation and discussion</p> <p>The increase of new methodologies and scientific analyses in current archaeological studies have revolutionised archaeological questioning and reasoning. Quantitative approaches, such as isotope or genetic analyses have become ubiquitous in most modern research proposals. Undoubtedly powerful tools, they often are not embedded in a theoretical framework. They are applied because of their popular appeal and seeming simplicity, rather than methodological, theoretical or archaeological necessity. Scientific data is produced to exist, without prior hypotheses demanding its presence. Similar approaches are often seen in the applications of statistics or modelling, where archaeological data is mainly treated as big data, whereas in fact it is usually messy data with many limitations. Whilst this is often considered the epitome of interdisciplinary research, it rarely is. Generally neither side properly understands the methods and reasoning of the other leading to parallel research strategies.</p> <p>In our discussion session we aim to find new pathways to generate true interdisciplinarity, and improved understanding and knowledge of “the other side”. We aim to explore the transdisciplinary potential of scientific analysis and archaeological interpretation and theory to tighten the network of archaeological and analytical methodologies in our discipline. We particularly welcome young researchers, people working in transdisciplinary research projects, and those who wish to participate in bridging the gap and translating between different research frameworks and methods.</p> <p>They keynote will be given by Mark Pearce (University of Nottingham):</p> <p>In 1959, C.P. Snow drew attention to the existence of ‘two cultures’, the divide between science and the arts, and I shall use his famous essay as a starting point to highlight the failure of communication and indeed of comprehension between archaeological science and mainstream archaeology and try to explain the reasons that underly it.</p> <p>Abstracts should introduce the discussants; there will be no traditional presentations except the keynote.</p>
--	--

ABSTRACTS:

1 TWO CULTURES? IS THERE A COMMUNICATION PROBLEM BETWEEN ARCHAEOLOGICAL SCIENCES AND MAINSTREAM ARCHAEOLOGY?

**Abstract author(s):** Pearce, Mark (University of Nottingham)

**Abstract format:** Oral

There has been an explosion in the application of scientific techniques in archaeology (what Kristian Kristiansen has termed the “Third Science Revolution”) but in most cases it seems that their results are poorly integrated into archaeological discourse. Sometimes their results are archaeologically banal, and not situated in a theoretical framework or research questions. They are still often relegated to appendices and ignored in the main text. Likewise, archaeologists still often fail to understand the scientific techniques whose results they are interpreting, or use the wrong techniques to address research questions, leading to errors. The two sides’ publication arenas are often different, with separate journals and communities, constituting non-communicating silos. Even at conferences like the EAA there are few sessions which are truly interdisciplinary. Whose fault is all this? How can it be overcome?

I shall explore a number of case studies to discuss these issues, from applications of genetics, isotope studies, compositional analysis and radiocarbon dating. My aim is stimulate debate as to how this failure of communication and indeed of comprehension between archaeological science and mainstream archaeology can be overcome.

2 INVESTIGATIVE INTEGRATION THROUGH CRITICAL PURPOSE: WHAT TO DO WHEN SCIENTIFICATION REARS ITS HEAD

**Abstract author(s):** Vis, Benjamin (University of West Bohemia)

**Abstract format:** Oral

Finishing my studies in archaeology in the late 2000s there was a sentiment of disencumberment from the yoke of the grand paradigms that dominated discourse on disciplinary history and theory. Recurrent themes revolved around archaeology’s ability to make genuine theoretical contributions, persistence of paradigmatic remnants, neglect of non-Anglophone schools of thought, submitting archaeology to concepts and methods from other disciplines, and optimism about data sourced from new technologies and scientific methods. Concern about the overall direction of archaeological discourse seemed to be a predominantly (north-western) European preoccupation. The prevalent acceptance of ‘eclecticism’ essentially paved the way for permitting theoretically disengaged smörgåsbord approaches and pick’n’mix research designs. In 2011 I convened a session at TAG (Theoretical Archaeology Group) which identified the risks of the epistemological ‘tolerance trap’ and missing out on conscious efforts of integration to ensure commensurability between data, concepts, methods, techniques, and eventually interpretation. Since then, coming from Mesoamerican archaeology, crossing over into human geography, promoting digital humanities and geohumanities, I have come to pursue an agenda that addresses sustainable urban development and (mapping) methods in urban morphology. Consequently, I have contributed to many fora on the challenges of interdisciplinarity research and multidisciplinary collaborations. There is significant commonality in the puzzlement over how to navigate these contemporary research expectations and challenges, the hunger for data alongside a data deluge, and concerns about renewed scientification in archaeological discourse. There is also commonality in how novel technology-driven fields and scientification represent vogues in science policy, (re)presentation, financing, and support for careers. I will use this baggage to argue from a vantage of critically purposive and phenomenon-driven research design to avoid (archaeological) discourse and practice becoming determined by fashions and novelty in data or methods.

3 FINDING INTERDISCIPLINARITY

**Abstract author(s):** Loy, Anna (ROOTS Kiel)

**Abstract format:** Oral

My ventures into interdisciplinary research have started early on when I trained for my bachelor’s degree in Ancient History and Prehistory, Archaeology of the Middle Ages, and the minor of Archaeological Sciences in Tübingen. For my Master’s I went on with a combination of environmental and Landscape archaeology and at the same time was a student assistant in a project firmly located in Theoretical Archaeology at the Freie Universität Berlin. Currently I am part of the interdisciplinary Cluster of Excellence ROOTS in Kiel working on my PhD in the Subcluster ‘Conflict and Conciliation’. During all stages of my education I have experienced the problems and sometimes the accomplishments of interdisciplinarity in archaeology but am yet to find a way to truly experience and nurture deep mutual understanding. Nevertheless I am confident this understanding fosters a more comprehensive insight into archaeology. Consequently, I am passionate about bridging the divide to enable meaningful exchange, creative work and learning between different disciplines.

4 ARCHAEOOMETRY GROUP FROM THE INSTITUTE OF ARCHAEOLOGY OF THE CAS, PRAGUE

**Abstract author(s):** Danielisova, Alzbeta (Institution of Archaeology of the CAS, Prague) - Bursák, Daniel (Institution of Archaeology of the CAS, Prague)

**Abstract format:** Oral

As the assignment of this abstract is to introduce ourselves - we are two members of the Natural Sciences and Archaeometry Department of the Institute of Archaeology of the CAS, Prague. We currently finished a project aimed at geochemical analyses of the copper alloy, silver and glass objects from the Iron Age in central Europe (“Mobility of materials and life cycles of artefacts: archaeometry of metals and glass of the La Tène and Early Roman period”), our primary focus was provenance analysis with respect to historical questions. During the course of the project, we have encountered many issues that resonate strongly with the points made in this session proposal - especially the one regarding the lack of contextualization and proper archaeological or historical question underlying the analyses. Therefore, we would very much like to attend this discussion and welcome the keynote given by Mark Pearce. This last sentence is purely for completing the mandatory word count.

5 TRANSLATORS ON AN ARCHIPELAGO

**Abstract author(s):** Rose, Thomas (Ben-Gurion University of the Negev, Be’er Sheva, Israel; Sapienza – University of Rome, Rome, Italy)

**Abstract format:** Oral

On “both sides” the ever increasing knowledge and complexity of analytical methods requires a high degree of specialization from the beginning. During my studies, finding or creating one’s own niche of research was recommended as the best strategy to survive in academia. This development is fueled by the shift of archaeological publications towards article-like formats instead of books, narrowing down the focus of publications to specific aspects with little chances (or even the need) to develop a more holistic approach. As a result, “the other” is already among us on both “sides”. Or to put my perception more clearly, there is no “other side” anymore but an archipelago.

Being archaeologist and geoscientist by training and working in archaeometallurgy, I am used to combine different materials and methods, and concepts from different archaeological and scientific fields. Sometimes I struggle not to get lost in translation within my own thoughts. How much more challenging must it be for people with a different background to understand what I am doing and how I approach things!

There are two ways of not to get lost in translation: Stop to communicate and learning to become a translator, regardless how painstaking the latter might be. For me, the first is no valid option. Therefore I am looking forward to discuss how favorable conditions can be created to encourage researchers in becoming translators as well with the aim that one day we easily understand each other.

6 COMPLEXITY THEORY AS AN ONTOLOGICAL GUIDELINE: TOWARDS A BETTER INTEGRATION OF QUANTITATIVE AND QUALITATIVE APPROACHES

**Abstract author(s):** Schlicht, Jan-Eric (CRC 1266 - Scales of Transformation; Kiel University)

**Abstract format:** Oral

Jan-Eric Schlicht is currently working as a research associate in parallel to working on his doctoral dissertation in the subproject A1 of the CRC 1266 - “Scales of Transformation” at Kiel University in Germany.

During the course of his undergrad and graduate studies in Leipzig and Kiel he developed a keen interest in archaeological theory as well as philosophy while at the same time being rooted in quantitative methodologies in Archaeology. These two different fields of interest lead him to aim for integrative approaches between qualitative and quantitative perspectives culminating in his MA-thesis which aimed to integrate theoretical notions from the fields of Complexity Theory and Bourdieus Theory of Social Practise with archaeogeographic analyses using hierarchical clustering of aoristically weighted data on raw material distributions during the south Portuguese Late Neolithic and Chalcolithic periods as a proxy for an ‘emergence of social spaces’.

Following that, his doctoral thesis will focus on quantitative approaches towards ethnographical and archaeological data as means to conduct large scale cross-cultural analysis in the context of non-sedentary societies and transformative processes. This endeavour necessitates the development of a sound theoretical frame revolving around analogical reasoning, notions of ‘culture’, ‘similarity’, ‘universals’ and ‘particulars’ as well as developing a methodological framework allowing for the translation of qualitative, textual information into quantitative measurements and indexes. As such his work needs to find a balance between both perspectives and aims for an integrative approach following an ‘ontological guideline’ derived from Complexity Theory.

CONTRIBUTIONS OF GEOMETRIC MORPHOMETRICS TO ARCHAEOLOGY: POTENTIALITIES OF A NEW APPROACH TO ARTEFACT SHAPE ANALYSIS

**Abstract author(s):** Araujo, Renata (Museum of Archaeology and Ethnology, University of Sao Paulo) - Okumura, Mercedes (Laboratory for Human Evolutionary Studies, Department of Genetics and Evolutionary Biology, Biosciences Institute, University of São Paulo)

**Abstract format:** Oral

Archaeology could be considered the most interdisciplinary of all disciplines. As a currently Ph.D student in Archaeology, since the beginning of my career I have been experiencing diverse ways of thinking and approaching archaeology, manifested in fieldwork, laboratories, in the classroom and in the literature. The discussion proposed for this session pinpoints to the acknowledgment that archaeology is an idiosyncratic science presenting the great potential to be epistemologically intertwined with all sciences. In reason of this particular character, a reassessment and critical thinking of the advances, borrowings and new approaches in terms of theory, methods and techniques which our discipline has been experimenting through its history – and mainly in the last 50 years – is an absolutely necessary debate.

With this view, this session caught my special attention, as the thread it proposes is very much related to my topic of research, which is the application of a method for artefact shape analysis named geometric morphometrics (GM). GM is a quantitative method originated in the Biological Sciences and is most used in Evolutionary Biology studies for the analysis of organismal form. Evolutionary archaeologists have just recently (over the last ten years) started applying this method to material culture, shedding new light to artefact analysis. The use of GM in archaeology has seen very much increase in lithic studies in particular, where analyses of artefact shape offers new insights to traditional technological approaches.

I am currently developing a doctorate project in the Museum of Archaeology and Ethnology, University of São Paulo (Brazil). My research is on Brazilian prehistory, and it focuses on geometric morphometric analysis of formal lithic artefacts – bifacial projectile points and plan-convex artefacts – from Southeastern Brazil. The main goal of this research is to contribute to the understanding of human occupation of this geographic area.

IMPR – PHYTOLITHS IN INTEGRATED ARCHAEOBOTANICAL AND ETHNOARCHAEOLOGICAL STUDIES

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Dal Corso, Marta (Kiel University) - Out, Welmoed (Moesgaard Museum)

**Format:** Regular session

The session “Phytoliths in integrated archaeobotanical and ethnoarchaeological studies” is dedicated to the wide range of applications of phytoliths in archaeology, paleoanthropology and palaeoethnobotany. The identification of plant remains at an archaeological site can be indicative of the resources and environments exploited by peoples, their subsistence strategy and further economic and cultural practices. Research questions that can be addressed concern agronomy, economy and diet in the past, i.e. how phytoliths can be used to reconstruct the cultivation, processing and use of plants for food and animal fodder. In addition, phytoliths can help to disentangle plant uses for non-food purposes as well. In this case, information can be gained about, for instance, architecture, medicinal uses, textiles and other aspects of domestic, economic and ritual spheres.

In this session, studies of modern ethnographic contexts are also welcome, that offer insights into traditional plant uses and that can be used to calibrate the interpretation of the phytolith fossil assemblage from comparable archaeological contexts. Through this comparison, deposition processes, traditions and cultural choices behind human behaviour in the past can be better identified and understood. Presentations can focus on the investigation of phytoliths from specific objects or from different contexts from one or multiple sites. Contributions that show a comparison of the phytolith record with other kinds of archaeobotanical records (macro-remains, wood/charcoal, starch, pollen and NPPs, plant biomarkers), as well as with other proxies (stable isotopes of osteological records or seeds, faunal assemblages, etc.) are particularly welcome. Case studies and reviews may concern different periods and geographical regions.

This session is part of the 12th International Meeting for Phytolith Research, or IMPR, the official scientific conference of the International Phytolith Society.

ABSTRACTS:

1

TRACES OF LIFE: INTEGRATING PHYTOLITH AND ETHNOARCHAEOLOGICAL ANALYSIS IN LEVANTINE SITES

**Abstract author(s):** Jenkins, Emma (Bournemouth University)

**Abstract format:** Oral

The Neolithic in southwest Asia (c 11,700–7800 cal BP) is an important period in human history that saw the advent of sedentism, agriculture and ultimately paved the way for increased social complexity and urbanism. It is also, however, one of the most poorly understood. This is partly because of the paucity of Neolithic sites and also because when sites are found preservation is often limited, particularly for organic remains. This presentation outlines results from an integrated phytolith and ethnographic study conducted

on the 20th Century site of Al Ma’tan, Jordan which was similar in construction and layout to Levantine Neolithic sites. We split our samples into different context categories for example middens, hearths and floors. We found that phytolith signatures were in accord with what would be expected based on the oral histories provided by former residents of the settlement and that signatures were strongest for categories linked to construction practices rather than activities.

2

THE USE OF PHYTOLITHS ANALYSIS FOR THE INTERPRETATION OF THE CONTENT OF POTTERY: AN EXPLORATORY STUDY OF AFRICAN ETHNOGRAPHIC SAMPLES

**Abstract author(s):** Garnier, Aline (University of Paris East; Laboratory of Physical Geography CNRS - UMR 8591) - Mayor, Anne (University of Geneva) - Vieugué, Julien (CNRS - Prêtech UMR 7055) - Fichet, Valentine (Laboratory of Physical Geography CNRS - UMR 8591) - De Milleville, Lucile (Laboratory of Physical Geography CNRS - UMR 8591) - Regert, Martine - Drieu, Léa - Mazuy, Arnaud (CNRS - CEPAM UMR 7264)

**Abstract format:** Oral

Because it may be used for storing, transporting, preparing and serving food commodities, pottery represents a key evidence of the food practices of past societies. However, the plant content of archaeological pottery is difficult to track because of (i) the low preservation of their molecular biomarkers in organic residues, (ii) the scarcity of well-preserved botanical remains and (iii) the lack of interpretative references.

This communication aims at presenting the potential and limits of phytoliths as an indicator of plant content of pots, and culinary practices of past societies.

Because of their siliceous structure, phytoliths analysis offers new perspectives for identifying plants remains in organic residue, where other biological and molecular indicators are poorly preserved. Differentiating the parts of plants and Poaceae subfamilies may furthermore supply detailed information about the substances prepared inside pottery (seeds, leaves, roots, etc.).

This preliminary study focuses on the phytoliths analysis of the residues and clay paste from more than 20 ethnographic pots from Senegal used for different purposes.

These were collected in two present day communities in Casamance and Bedik Country representing two regions with different traditional food systems, according to their farming practices (rice farming vs rainfed agriculture). This study has been developed in the framework of an international research program with a wider perspective of establishing an ethnoarchaeological reference of the functions of pottery that combines different proxies (typometry, use-wear, lipids, proteins, phytoliths and starch grains analyses). The first results highlight a contrasted signal of phytolith assemblages according to the content of the pots and reveal the necessity to adopt a salient sampling strategy.

3

THE POTTER, BETWEEN SPECIALISED PRODUCTION AND ROUTINE ACTIVITIES? MULTIDISCIPLINARY STUDY OF A COPPER AGE KILN

**Abstract author(s):** Dal Corso, Marta (Kiel Univeristy / CRC1266 / ROOTS) - Hofmann, Robert (Kiel University / CRC1266) - Ohlrau, Renè (Kiel Uiversity / ROOTS) - Dreibrodt, Stefan (Kiel University / CRC1266) - Müller, Johannes (Kiel University / CRC1266 / ROOTS) - Benecke, Norbert (DAI Berlin) - Videiko, Mihail (Borys Grinchenko Kyiv University) - Kirleis, Wiebke (Kiel University / CRC1266 / ROOTS)

**Abstract format:** Oral

One of the peculiar aspects of the Trypillia sites in Eastern Europe (beginning of the 4th mill. BCE) is the first attestation of some fired constructions in earthen architecture, mostly interpreted as technologically advanced kilns for pottery making. These structures had separate compartments for the heating material and the pottery to be fired and two or more parallel channels in the under-construction. Based on the fine quality and large quantity of painted ware assemblage at Trypillia sites, pottery production is seen as one of the earliest specialised handicrafts in Europe. In order to understand more about the potter’s activities and the role of the potter in society, at the mega-site of Maidanetske, in central Ukraine, we applied a multidisciplinary approach to the investigation of one of these structures, including its surroundings and related pits. Evidence from charred botanical macro-remains, phytoliths, faunal remains, geochemistry, archaeological finds and stratigraphic information related to the kiln will be discussed and, when possible, compared with data from other excavated structures unrelated to the kiln. How do cereal processing, wood selection, and an unusual faunal record enter the potter’s lifestyle? Can we trace a first, strict, labour division or is there attestation also of daily routine activities at the kiln? Through the archaeological, archaeobotanical and zooarchaeological record at Maidanetske, in comparison with similar excavated kilns at other Trypillia sites, some socio-economic aspects will be discussed about Copper Age society and production, on the light also of ethnographic models.

4 USING PHYTOLITHS TO RECONSTRUCT ARCHAEOLOGICAL STORAGE PIT FUNCTION IN BRONZE AND IRON AGE ANATOLIA (TURKEY)

**Abstract author(s):** Turnbull, Molly (University of Queensland School of Social Science, Archaeology) - Crowther, Alison (University of Queensland School of Social Science, Archaeology; Max Planck Institute for the Science of Human History) - Fairbairn, Andrew (University of Queensland School of Social Science, Archaeology) - Omura, Sachihito (Japanese Institute of Anatolian Archaeology)

**Abstract format:** Oral

Excavations at Kaman-Kalehöyük in Central Anatolia (Turkey) have identified the partial remains of several thousand storage pits, many of which had clearly visible linings. Identical lined storage pits appear across Bronze and Iron Age archaeological sites in Anatolia, coincident with significant socio-political reorganisation and environmental change, and are even referred to in ancient Sumero-grams and Classical records. Despite their abundance, reconstructing the function and construction technology of pits been difficult, largely due to damage caused to them during continuous rebuilding in long lived settlements and the poor preservation of their contents. To overcome these issues, phytolith analysis was used to reconstruct the lining and fill of pits from the Early Bronze Age and Late Iron Age occupations of Kaman-Kalehöyük. The phytoliths recovered from the linings were dominated by inflorescence and culm long cell types from wheat/barley (*Triticum/Hordeum*), *Setaria/Panicum* (millet) and wild grass (*Pooideae*), likely reflecting the in situ decay of formerly stored crop contents and botanical materials used to line the pits to improve storage performance. In contrast, fills were dominated by high frequencies of grass short cells along with various *Cyperaceae* and spheroid dicotyledon/monocotyledon types, likely the remains of refuse from the end of the pit's use life. Taxonomic variation in the phytolith composition of pit linings and fills likely reflects local plant selection, availability and management strategies related to socio-political and environmental change in Bronze and Iron Age Anatolia.

5 PLANT WAYS IN MIDDLE BRONZE AGE ANATOLIA – AN ARCHAEOLOGICAL INTERPRETATION OF PHYTOLITHS AND PLANT REMAINS AT ZINCIRLI HÖYÜK, TURKEY

**Abstract author(s):** Ögüt, Birgül (German Archaeological Institute) - Karakaya, Doga (Eberhard Karls Universität Tübingen, Institut für Naturwissenschaftliche Archäologie)

**Abstract format:** Oral

The Middle Bronze Age is marked by the increasing internationalism in the Near East through the seizure of political control by Amorite kings. Various texts mention these nomadic tribes as threatening the political order of the Ur III dynasty in southern Mesopotamia at the end of 3rd millennium BC. With the beginning of the Middle Bronze Age, however, Amorite kingdoms were successfully established in large parts of the Near East. International contacts are also apparent from the Mari and Kültepe texts which document that rulers from Mesopotamia, the Levant and Minoan Crete were exchanging gifts and commodities among each other. While some of these texts mention long-distance trade of value-added commodities like olive oil and wine; they are not particularly descriptive of the production and processing stages of these products. In this paper, we present the joint results of the micro-botanical (phytoliths) and macro-botanical (seeds and fruits) remains from a Middle Bronze Age layer (ca. 1650 BCE) at Zincirli Höyük (Turkey). The study area was destroyed after a single conflagration event with several food processing installations and restorable vessels in-situ. In addition, the archaeological contexts were minimally disturbed by later sedimentary and anthropogenic activities. This preliminary contribution aims to comprehend the potential link between micro- and macro-botanical remains by focusing as to whether different crops have been stored and processed in different locations in the studied context.

6 IDENTIFYING THE WATER REGIME AND ITS ASSOCIATION WITH CROP HIERARCHIES DURING 1850-1750 CAL BC IN THE XINZHAI SITE, CHINA

**Abstract author(s):** An, Jingping - Dal Corsol, Marta - Kirleis, Wiebke (Pre-and Protohistorical Archaeology, Kiel University) - Jin, Guiyun (Institute of Cultural Heritage, Shandong University)

**Abstract format:** Oral

A vital factor in the rise of urbanization is the development of a complex farming system employing labor-intensive irrigation. It is, therefore, of great significance to probe the water regime in the Xinzhai period (1850-1750 cal BC), a key period pursuing the emergence of early urbanization in China. To recover the water management in the Xinzhai period, correspondence analyses based on phytolith ecological categories and ratio analyses of Sensitive to Fixed morphotypes of 59 phytolith sediment samples from the Xinzhai site were performed. They clearly show that rice and millet were grown in different ecological settings with possibly intensive rice farming under an irrigation system and a rainfed millet farming system. Meanwhile, a regional comparative-research of phytolith and macro-remains suggests that rice was more concentrated in central settlements and the aristocratic residential area in the Xinzhai site. Since there was a rice-favorable warm and wet climate during the Xinzhai period, we argue that the uneven distribution of rice can be explained by cultural factors instead of climatic factors. Due to the intensive labor inputs, irrigated rice has been chosen from ordinary ingredients into luxury food for the wealthy and powerful while rainfed millet was more for calorific needs probably as a major staple. More than that, the practice of irrigation likely had a prolonged impact on the agricultural pattern and the social complexity in the subsequent Erlitou (1750-1550 cal BC) and Shang (1550-1046 cal BC) periods. This research proves archaeobotanical evidence can enable us to evaluate how certain crops became powerfully associated with social-cultural distinction under an irrigated system and also how it possibly contributed to the social complexity.

7 PHYTYLITHS, SEEDS AND WOODEN CRAFTS: THE STUDY OF JAPANESE COLONIALISM IN NORTHERN TAIWAN (HEPING DAO, KEELUNG)

**Abstract author(s):** Chevalier, Alexandre (Royal Belgian Institute of Natural Sciences) - Martín-Seijo, María - Serrano Herrero, Elena (Universidad de Cantabria) - Tsang, Chenghwa (National Tsing Hua University) - Cruz Berrocal, María (Universidad de Cantabria)

**Abstract format:** Oral

The archaeological site of Heping Dao (northeast Taiwan) has produced relevant information about the ephemeral material culture related to the day-to-day life of the Japanese occupation of the island. The exceptional preservation of organic remains by water saturation has provided the opportunity of developing a multidisciplinary study. The study of a set of wooden remains dated to mid-20th century including the base of a bucket or a small cask, a takamakura, a koma geta and other items of unknown function has provided the opportunity of combining wood analysis, and morpho-technological studies with phytolith identification. The base of the wooden container preserved an organic adherence in the inner part which contained plant macro-remains visible at naked eye (*Cucurbitaceae* seeds) and phytoliths. This case study highlights the relevance of integrated archaeobotanical studies in colonial contexts to address aspects related to the daily life of these communities such as food storage or consumption but also about objects, wood, and identities.

8 PHYTOLITHS, STARCH GRAINS AND ANDEAN CROPS: THE INPUT OF THEIR DIVERSITY FROM AMERICA TO ARCHAEOBOTANICAL RESEARCH

**Abstract author(s):** Musaubach, Maria (National University of Jujuy; Institute of Andean Ecoregions - CONICET-UNJu) - Plos, Anabela (Museo Argentino de Ciencias Naturales - CONICET; GBIF Argentina; Sistema Nacional de Datos Biológicos)

**Abstract format:** Oral

This paper presents preliminary results of the archaeobotanical study of South-Central Andes Culinary Heritage Digital Database. We review Andean crops collection sample and reference collection of starch grains and phytoliths making procedures. Besides, both collections include processed products from these crops (for example, flour, roasted seeds, and mote), which were found and collected from fairs and markets. Finally, samples obtained during our ethnoarchaeological and ethnobotanical fieldwork are incorporated. The collection sample includes, plants in natural or dry state, as well as those already transformed throughout culinary processing. Phytoliths and starch grains are a useful tool to identify which crops were part of ancient food. They are analyzed and described with description and identification protocols used in our archaeobotanical research. Usually, Andean crops are defined as traditional crops, growing on the Andes, with a diverse taxonomy, having in common characteristics such as drought, frost and salinity-resistant. Some of them, such as corn, potatoes, quinoa, beans, among others are produced and consumed by families from the central and south central sector of the Quebrada de Humahuaca (Argentina) at small-scale agriculture. Andean taxa with food uses, its culinary processing knowledge and practices, food serving and consumption are retrieved and systematized in a digital database. These reference materials are relevant for archaeobotanical studies. They also contribute to community bio cultural heritage recovery. Their description and registration allows us not only to catalog them in the JUA Herbarium heritage, but to enhance, visibility, safeguarding and management of South-Central Andes Culinary Heritage.

9 SONDONDO’S AGRICULTURE AS REFLECTED IN PHYTOLITHS. USE OF SOIL ANALYSIS TO UNDERSTAND SOCIAL DEVELOPMENT IN PREHISPANIC TERRACES IN PERU

**Abstract author(s):** Aparicio, Patricia (Pontificia Universidad Católica del Perú; Universidad de Oviedo) - Korstanje, Alejandra (Instituto de Arqueología y Museo, Universidad Nacional de Tucuman, Instituto Superior de Estudios Sociales - CONICET-UNT)

**Abstract format:** Oral

In Peru, studies of pre-Hispanic agriculture have been adopted a number of different approaches. Some researchers have focused on botanical aspects, others on agrarian technologies, while others have concentrated on social and economic relationships. However, in almost all cases, typological and structural views have prevailed leading to conclusions strongly based on relative chronologies and broad generalizations, especially for the more complex stages of social development, mainly the horizons of the Wari and Inca Empires. Aligned with the theme of this conference, our team has begun to conduct phytolith analysis in relation to soil and land use to more fully interpret terrace construction, use, and their social implications.

The interdisciplinary methodologies and techniques that we are applying on the terraces allow the implementation of new approaches in Agrarian Archeology in Peru that examine the cultivation sites themselves without relying exclusively on ethnographic or ethnohistorical analogies. In our paper, we will present the results of the first multiple microfossil analysis of soils analyzed from agricultural terraces in the Sondondo Valley (Department of Ayacucho, Peru) at 3200 m.a.s.l.. For example, we have been able to identify the standardization of agricultural terraces in the southern Peruvian Andes during the expansion of the Inka Empire and directly related to the need to harvest corn. Our innovative methods not only shed light on the types of crops cultivated, but also demonstrates how shifts in cultigens can serve as measures of sociopolitical transformations.

DARK EARTHS PLANT MANAGEMENT AND THE REGIONAL DEVELOPMENT OF TAPAJÓ CULTURE IN THE LOWER AMAZON

**Abstract author(s):** Alves, Daiana (Federal University of Pará) - Iriarte, Jose (University of Exeter)

**Abstract format:** Oral

The highly fertile Amazonian Dark Earths (ADE) results from landscape transformations found in association with archaeological sites throughout Amazonia. In the Santarem region (Lower Amazon), ADEs are mainly found in ancient Tapajó settlements (AD 1000-1600), though observed in some older occupations. Our paper brings together results from different lines of evidence (phytoliths, geochemistry, micro-charcoal, and archaeology) to address landscape and social changings following the regional organization of the Tapajó culture. The data stems from three ADE sites sampled on terrestrial cores, excavation profiles, and cultural features such as house floors, fire pits, hearths, caches and refuse pits. Phytolith revealed an overall increase in plant foods, consisting of food crops and edible native species concomitant to a shaded vegetation cover. Additionally, inter-site comparison indicated a gradient of vegetation change correlated to the formation of ADEs, varying according to site size (population) and length of occupation. Microcharcoal (<125µm) showed a sharp increase throughout the ADEs layers on the studied sites indicating intense charcoal input resulting in soil amelioration confirmed by the geochemical data. Altogether, these data suggest a long-term polyculture agroforestry practice, including crop cultivation, management of edible native species, and soil enrichment beginning before the Tapajó advent and intensified by them. Therefore, regional socio-cultural and landscape transformations during the Late Holocene connect to traditional ecological knowledge and ancient subsistence practices, which applied controlled fire as a tool for shaping their surrounding environment.

4000 YEARS OF RESILIENT PASTORALISM: THE PHYTOLITH ASSEMBLAGE FROM A MULTIPERIOD HABITATION SITE IN NORTHWESTERN MONGOLIA

**Abstract author(s):** García-Granero, Juan José (Spanish National Research Council - IMF-CSIC; University of Oxford) - Égüez, Natalia (Universidad de La Laguna) - Seitsonen, Oula (University of Oulu) - Wright, Nathan (University of New England) - Broderick, Lee (Oxford Archaeology) - Bayarshaikhan, Jamsranjav (National Museum of Mongolia) - Houle, Jean-Luc (Western Kentucky University)

**Abstract format:** Oral

Currently, the development of mobile pastoralism and the chronology and nature of early pastoralist societies in Mongolia is known almost exclusively from burial and ritual contexts. Here we present the results of archaeological excavations carried out at a deeply stratified multiperiod habitation site situated in a protected valley draw in the Züünkhangai region of northwestern Mongolia, an area used by present-day pastoralist as a winter camp. Our data include artefacts, botanical and faunal remains, geological information and chronology that document the development of pastoralism in this region since the Early/Middle Bronze Age (c. 2000-1700 cal. BC). Our findings attest to the adaptive resilience of pastoralism for 4000 years, up to the present day, despite major changes in the sociopolitical, socioeconomic and environmental conditions through time. The phytolith assemblage is composed almost entirely of wild pooid grasses, which predominate in the Mongolian steppe. Interestingly, inflorescence phytoliths are extremely scarce throughout the site occupation sequence, suggesting that this area has been consistently used by herders as a winter camp for four millennia. Moreover, the ratio between Poaceae phytoliths fixed and sensitive to water conditions (short and long cells, respectively) suggests that during the earlier (Bronze Age) occupation of the site environmental conditions were drier than during later occupations (Iron Age and subsequent periods).

RECONSTRUCTING BRONZE AGE AGRO-PASTORAL PRACTICE IN THE MESOPOTAMIAN-ZAGROS FOOTHILLS: PHYTOLITH AND FTIR ANALYSIS OF DUNG-RICH SEDIMENTS FROM KHANI MASI (IRAQ)

**Abstract author(s):** Laugier, Elise (Dartmouth College) - Cabanes, Dan (Rutgers University)

**Abstract format:** Oral

The Zagros foothills have one of the longest histories of agro-pastoral practice globally, beginning in the Epipaleolithic. While the domestication process and Neolithic subsistence in this region have recently received much archaeological science research, the subsequent Mesopotamian Bronze Ages (late 4th–2nd millennium BCE) remain principally assessed with traditional excavation and textual evidence. As texts are often related to state-level institutional affairs in distant regions, our knowledge of local, day-to-day agro-pastoral management strategies remains conjectural. Phytolith analysis is a particularly productive method for assessing agro-pastoral practice in regions with poor macrobotanical preservation. While this approach has not been widely applied in Mesopotamia (Iraq), it has the potential to shed light on the production systems supporting its Bronze Age cities, states, and empires.

In this study we use phytoliths, dung spherulites, and Fourier Transform Infrared (FTIR) spectroscopy to identify and examine dung-rich sediments from Khani Masi, an 8 hectare mid-second millennium BCE Kassite site located in the Kurdish Region of Iraq. Our aim was to investigate (1) the range of local pastoral management strategies, (2) the degree of integration between agricultural and pastoral practice, and (3) the presence of signals related to the local ecology, seasonality, and environmental change and continuity.

Phytolith analysis reveals that sheep/goats were primarily free grazed on wild grasses. The dominance of wild grass inflorescences, a potentially strong seasonality indicator, may suggest transhumant pastoralism. However, further evidence, including occasional foddering with cereal chaff, a diverse range of crop types, and significant accumulations of burnt dung within the site, collectively

BEDDING LAYERS FROM BORDER CAVE, SOUTH AFRICA: A PHYTOLITH AND FTIR INVESTIGATION

**Abstract author(s):** Esteban, Irene (ERAAUB - Universitat de Barcelona; Evolutionary Studies Institute, University of the Witwatersrand) - Wadley, Lyn (Evolutionary Studies Institute, University of the Witwatersrand) - Backwell, Lucinda (Instituto Superior de Estudios Sociales - ISES-CONICET; Evolutionary Studies Institute, University of the Witwatersrand)

**Abstract format:** Oral

Border Cave is a well-known South African Middle and Later Stone Age archaeological site located in KwaZulu-Natal, that has provided exceptional plant preservation, probably unparalleled in South African archaeology. The site preserves multiple bedding structures in numerous layers, some survived as visually ephemeral fragments of silicified plant material while in others desiccated plant is preserved. We recently reported the discovery of grass bedding used to create comfortable areas for sleeping and working by people who lived in Border Cave at least 200,000 years ago. The complexity and distinctiveness of these deposits provide an excellent opportunity to study the relationship between plant exploitation strategies and sleeping behaviours of the ancient inhabitants of Border Cave. This study presents ongoing research on the phytolith and chemical composition of sediments from bedding layers dating from ~227 to 24 ka. The results here presented are further investigated from a taphonomical perspective, that is critical to conducting a more reliable interpretation of plant-human behaviours in the cave.

TAPHONOMY, ENVIRONMENT OR HUMAN PLANT EXPLOITATION STRATEGIES? DECIPHERING CHANGES IN PLEISTOCENE-HOLOCENE PLANT REPRESENTATION AT UHMLATUZANA ROCK SHELTER, SOUTH AFRICA

**Abstract author(s):** Murungi, May (Human Evolution Research Institute, University of Cape Town; Evolutionary Studies Institute, University of the Witwatersrand) - Esteban, Irene (ERAAUB, Dept. Història i Arqueologia, Universitat de Barcelona; Evolutionary Studies Institute, University of the Witwatersrand; Centre for Coastal Palaeoscience, Nelson Mandela Metropolitan University) - Sifogeorgaki, Irini (Faculty of Archaeology, Leiden University) - Dusseldorp, Gerrit (Faculty of Archaeology, Leiden University; Palaeo-Research Institute, University of Johannesburg)

**Abstract format:** Oral

The period between ~40 and 20 ka BP encompassing the Middle Stone Age (MSA) and Later Stone Age (LSA) transition has long been of interest because of the associated technological change. Understanding this transition in southern Africa is complicated by the paucity of archaeological sites that span this period. With its occupation sequence spanning the last ~70,000 years, Umhlatuzana Rock Shelter is one of the few sites that record this transition. Umhlatuzana thus offers a great opportunity to study past environmental dynamics from the Late Pleistocene (MIS 4) to the Late Holocene, and past human subsistence strategies, their social organisation, technological and symbolic innovations. Although organic preservation is poor (bones, seeds, and charcoal) at the site, silica phytoliths preserve generally well throughout the sequence. These microscopic silica particles can identify different plant types that are no longer visible at the site because of decomposition or burning to a reliable taxonomical level. Thus, to trace site occupation, plant resource use, and in turn reconstruct past vegetation, we applied phytolith analyses to sediment samples of the newly excavated Umhlatuzana sequence. We present results of the phytolith assemblage variability to determine change in plant use from the Pleistocene to the Holocene and discuss them in relation to taphonomical processes and human plant gathering strategies and activities. This study ultimately seeks to provide a palaeoenvironmental context for modes of occupation and will shed light on past human-environmental interactions in eastern South Africa.

TOWARDS A MODEL OF A MAMMALIAN INTERFACE WITH THE PHYTOLITHS IN THEIR NATURAL ENVIRONMENT: INSIGHTS FROM TAI CHIMPANZEE FAECAL PHYTOLITHS

**Abstract author(s):** Power, Robert (Institute for Pre-and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig-Maximilians-University Munich; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology, Leipzig) - Wittig, Roman (Department of Primatology, Max Planck Institute of Evolutionary Anthropology, Leipzig; Tai Chimpanzee Project, centre Suisse de Recherches Scientifiques, Abidjan) - Stone, Jeffery (Department of Earth and Environmental Systems, Indiana State University) - Kupczik, Kornelius (Max Planck Weizmann Center for Integrative Archaeology and Anthropology, Max Planck Institute of Evolutionary Anthropology, Leipzig, Germany; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology, Leipzig) - Schulz-Kornas, Ellen (Max Planck Weizmann Center for Integrative Archaeology and Anthropology, Max Planck Institute of Evolutionary Anthropology, Leipzig; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology, Leipzig)

**Abstract format:** Oral

In recent years, there has been increasing use of human dental calculus as a source of phytoliths for inferring dietary data on ancient human subsistence and behaviours. The dental calculus of contemporary human and non-human populations with known diets have been used as reference data sets, including the chimpanzees of Tai National Park (Côte d'Ivoire), but explaining the preservation mechanism involved is challenged by our incomplete knowledge of the microremain content within the diets of these reference

populations and our rudimentary information on the process of microremain incorporation into dental calculus. This paper presents phytolith analysis of faecal samples from a population with previously published dental calculus phytolith assemblages to assess to what extent dietary phytoliths are reflected in the dental calculus as well as in the egested faeces.

In this study, we detect and identify faecal phytolith assemblages as an indicator of plant consumption in two Western chimpanzees of the Tai National Park (Côte d’Ivoire) before (wet season), during (dry season) and after (dry season) a dust-rich period. In tandem, observational dietary records of these two individuals were compiled to improve the interpretability of this dental calculus phytolith dataset. The most common phytolith morphotypes were eudicot plates, single-cell and multi-cell tracheids, monocot rugulose and echinate spheroids. Using observational dietary records as a starting point and our faecal results as a terminus, we consider how dental calculus can accumulate phytoliths. Our findings enable identification of the phytolith morphotypes that are under-represented in dental calculus such as eudicot plates, single-cell and tracheids, which is informative for future dental calculus research strategies.

INVESTIGATING DIETARY CHANGES AT TELL KAMID EL-LOZ, BETWEEN THE 2ND-1ST MILLENNIA B.C.E USING PLANT MICROREMAINS RECOVERED FROM DENTAL CALCULUS

**Abstract author(s):** Gur-Arieh, Shira (Ludwig-Maximilians-Universität München)

**Abstract format:** Oral

Tell Kamid el-Loz, identified as the site of Kumidi in the Amarna Letters, is located in the Lebanese Beqa Plain on the central trade axis between the southern Levant and the early urban centers of Syria. The tell was inhabited since the late Neolithic (5th millennium BC) and flourished during the Middle (ca. 2000-1600 BC) and Late Bronze Age (ca. 1600-1200 BC), as attested by the temples and palaces uncovered during excavation. The settlement lost its importance in the Iron Age (1200-600 B.C.), the most important find in the subsequent Persian period (600-330 B.C.) being a large cemetery.

Approximately 108 burials of individuals dated between the Middle Bronze Age and the Persian period were uncovered at the site. These burials had previously been investigated within the framework of the Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM) at the Max Planck Institute for the Science of Human History in Jena (MPI-SHH) to identify population genetic developments, biological relationships between individuals, their mobility and diseases. In addition, all of the individuals were radiocarbon dated. Of these burials, fifteen usable samples of dental calculus from individuals dating to the Middle Bronze Age through to the Persian period were studied using phytolith and starch analysis to understand the diversity and dynamics of individual human nutrition. Here, I will discuss the results of the micro-remain analysis carried out on dental calculus from individuals at Kamid el-Loz, and integrate this new dataset with the existing bioarchaeological data to inform on the dietary changes of its inhabitants.

A GLIMPSE INTO SHELLMOUND BUILDERS DIET DURING MID-TO-LATE HOLOCENE ON MARAJO ISLAND

**Abstract author(s):** Hilbert, Lautaro (University of São Paulo) - Alves, Daiana (Federal University of Pará) - Iriarte, José (University of Exeter)

**Abstract format:** Oral

Shellmounds are anthropic intentional constructions produced by pre-Columbian fishing/gathering communities. In general, they are composed of a primary layer of mollusc carapaces, fish bones and, in some cases, human burials. This paper briefly reviews the literature on Marajo Island’s landscape transformations, highlighting anthrosols formations following social changes during the mid-to-late Holocene. Our case study is the Tucumã shellmound located on western Marajó Island. The site has two occupation components comprising sequential formation of anthrosols: the shellmound layers buried under an Amazonian Dark Earth soil. These soils are addressed as ecological legacies resulting from a cumulative knowledge of the environment and related to social changes within the island. Our results reveal the impact on the vegetation composition and a shift in plant dietary preferences from the beginning to the end of the occupation. Changes from known domesticates such as maize (*Zea mays*) and squash (*Cucurbita* sp.) shifted to palms and cassava (*Manihot* sp.) at the upper layers.

DUNG IN THE DUMPS: AN ARCHAEOBOTANICAL COMPARISON OF PHYTOLITHS, POLLEN AND SEEDS IN DUNG PELLETS FROM EARLY ISLAMIC SHIVTA (ISRAEL)

**Abstract author(s):** Dunseth, Zachary (Brown University) - Langgut, Dafna (Tel Aviv University) - Fuks, Daniel (McDonald Institute for Archaeological Research, University of Cambridge)

**Abstract format:** Oral

Dung pellets and degraded dung sediments are increasingly studied in archaeology. In this paper, we present a methodological comparison of three archaeobotanical proxies: phytoliths, pollen and seeds of dung pellets and corresponding archaeological refuse sediments in tandem with geoarchaeological analysis. The pellets and sediments were sampled from three Early Islamic (6th-9th centuries CE) middens excavated at Shivta, located in the Negev desert (modern Israel). Our research goals were to: 1) evaluate the strengths, weaknesses and compatibility of the three methods regarding archaeobotanical interpretations of dung; 2) infer on-site herding and foddering practices; and 3) assess the relative input of botanical remains from dung in archaeological refuse assemblages.

Methodologically, incomplete reconstructions appear when only one method is used, with each proxy possessing its own advantages and limitations. Focusing on phytolith analysis, the main advantages of phytoliths include: 1) preservation in both desiccated and charred dung pellets, as well as archaeological sediments, and 2) identifying consumption of sedges and foddering with cereal by-products, both missing in the other analyses. Evaluating seasonality based on phytoliths alone is unreliable, especially when there is a significant dietary component of chaff/hay fodder. However, phytolith studies may be helpful in supporting other archaeobotanical evidence of seasonality. Additionally, our combined results demonstrate that Shivta’s Early Islamic refuse middens are only partially composed of dung remains and originated primarily from domestic trash.

This study’s significance lies both in its methodological contribution to archaeobotany, and in lasting discussions regarding the influence of dung remains on the composition of archaeological deposits. We offer a rigorous archaeological method for determining whether deposits derive from dung alone, contain no dung, or are mixed assemblages. This has important ramifications for archaeological interpretation, generally.

19

PHYTOLITHS, POLLEN, AND PALEOECOLOGY AT A MIDDLE WOODLAND SITE IN THE AMERICAN SOUTHEAST

**Abstract author(s):** Balco, William (University of North Georgia) - Scott Cummings, Linda (PaleoResearch Institute)

**Abstract format:** Oral

Phytoliths and pollen are complementary forms of evidence attesting to paleoecological conditions at archaeological sites. When considered together, ancient environmental conditions can be posited, helping to reconstruct the paleoecological contexts that humans lived in and interacted with. Here, we present a study of pollen and phytoliths from a midden context at Rice Farm, a Middle Woodland Native American site in the American Southeast. Sample collection and analysis methods will be presented before discussing the social and environmental significance of the results. Our data contextualizes a record of native vegetation alongside use or discard of the cultigen maize by Native Americans at the Rice Farm site. The pollen and phytolith records couch this local signature within the broader environmental context of north Georgia’s Piedmont during the Middle Woodland period. Taken alone, the phytolith data would not have provided an adequate means to properly contextualize past human-environmental interaction at the site, demonstrating the necessity of combining the results with pollen analysis to best reconstruct the paleoecological context at this site and archaeological sites in general.

A.

FURTHER EVIDENCE FOR SEASONAL TRANSHUMANCE OF YAMNAYA COMMUNITIES DURING THE LATE COPPER – EARLY BRONZE AGE OF THE CARPATHIAN BASIN

**Abstract author(s):** Lisztes-Szabó, Zsuzsa (Isotope Climatology and Environmental Research Centre, Institute for Nuclear Res) - Filep, Anna Fruzsina (Pál Juhász-Nagy Doctoral School of Biology and Environmental Sciences, University of Debrecen) - Heyd, Volker (Department of Cultures, University of Helsinki) - Kulcsár, Gabriella (Institute of Archaeology, Research Centre for the Humanities) - Włodarczak, Piotr (Polska Akademia Nauk, Instytut Archeologii i Etnologii, Ośrodek Archeologii Gór i Wyzyn) - Dani, János (Déri Museum)

**Abstract format:** Poster

To learn more about the diets of Yamnaya communities (LCA/EBA, 3rd Millennium BC) in the Carpathian Basin, we studied the dental calculus of a woman’s remains from a burial place (Bojt, Great Hungarian Plain). Plant microfossils (starch grains and phytoliths) were identified in the matrix of the calculus. Based on our findings, millet could be a consumed crop. Besides meat and milk – as the primary food source for the Yamnaya people – the young Yamnaya woman might have supplemented her diet with immature grass or crop shoots. However, the most exciting result is that the calculus matrix was rich in conifer phytoliths, apparently from *Abies alba* (silver fir) and *Picea abies* (Norway spruce) needles. As there were no conifers in the Great Hungarian Plain of the Carpathian Basin about five-thousand years ago, this may be new evidence for immigration or transhumance. The closest conifer habitat is located in the Transylvanian Apuseni Mountains, with higher pastures on the mountains’ top. A traditional transhumant route of Yamnaya people between the western part of the Apuseni Mountains and the microregion of the burial site has been presumed based on evidence of both archaeological and stable isotope data sets of human remains. The hypothesis is that the transhumance with livestock passing the winter and spring in the Great Hungarian Plain’s milder regions and returning to higher pastures in the warmer months is supported by our results. Consequently, we found further evidence for the seasonal transhumance of Yamnaya communities during the LCA-EBA Transitional Period of the Eastern Carpathian.

B. GRINDING PLANTS FOR FOOD AT THE EARLY BRONZE AGE SITE OF AGIOS ATHANASIOS: A MULTIPROXY APPROACH

**Abstract author(s):** Kasapidou, Georgia (LIRA Laboratory, Department of Archaeology, School of History and Archaeology, Aristotle University of Thessaloniki; Center for Interdisciplinary Research and Innovation - CIRI-AUTH, Balkan Center, Thessaloniki) - Tsartsidou, Georgia (The Malcolm H. Wiener Laboratory for Archaeological Science, The American School of Classical Studies at Athens; Ephorate of Palaeoanthropology-Speleology) - McNamee, Calla (The Malcolm H. Wiener Laboratory for Archaeological Science, The American School of Classical Studies at Athens) - Chondrou, Danai - Valamoti, Soultana (LIRA Laboratory, Department of Archaeology, School of History and Archaeology, Aristotle University of Thessaloniki; Center for Interdisciplinary Research and Innovation - CIRI-AUTH, Balkan Center, Thessaloniki)

**Abstract format:** Poster

In recent years, multiproxy approaches to ground stone tool analysis, which incorporate plant micro-remains with use-wear, have become integrated component of archaeological projects around the world, increasing our understanding of plant processing and culinary practices. These methods however have not been frequently applied in Mediterranean research. This poster aims to demonstrate the value of combining the results of phytolith and starch grain analyses with multi-scale use-wear analyses through the examination of 10 ground stone tools recovered at the Early Bronze Age short-term settlement of Agios Athanasios, in northern Greece. The selected tools were recovered from both interior and exterior occupational contexts and, for comparative purposes, the analysis was conducted on residue extracted from utilized and unutilized surfaces. The results indicate that the inhabitants of the site were exploiting a wide variety of plant products, including different kinds of legumes and cereals. The condition of the micro-remains also suggests that a range of practices were employed during the processing of different plants. Above all this study demonstrates the usefulness of a combined methodological approach for enhancing our understanding of tool use and plant processing activities at archaeological sites in Greece.

C. UNDERSTANDING CROP PROCESSING MODELS AND THEIR SOCIAL MEANINGS DURING THE XINZHAI PERIOD (1850-1750 CAL BC)

**Abstract author(s):** An, Jingping - Kirleis, Wiebke (Pre-and Protohistorical Archaeology, Kiel University) - Jin, Guiyun (Institute of Cultural Heritage, Shandong University) - Zhao, Chunqing (Institute of Archaeology Chinese Academy of Social Sciences)

**Abstract format:** Poster

In China, the Xinzhai period (1850-1750 cal BC), which is exclusively recorded in the Central Plain, has widely been regarded as a critical period for the formation of Chinese urbanization. However, little is known about the labor and social organization in this period. In this research, archaeobotanical assemblages were used to explore the crop-processing model and further provide insights into the mobilization of labor and the organization of society at the archaeological site of Xinzhai on the Central Plain. It offers the first case study linking agricultural activities and social organization about the Xinzhai period. By integrately discussing macro-botanical remains and phytolith remains, it concludes that hulled cereals foxtail millet, common millet, and rice and also the free-threshing pulse species soybean were all semi-processed before storage with minor labor involved in the initial harvest period. Since they are all summer crops and harvested during the later summer and autumn, the practice of semi-processing might imply less labor was deployed before storage. Thus, the labor in crop processing appeared to be organized on a small scale in more focused units of production such as household basis. This pattern is different from the bulk processing of crops before storage by the communal community in the contemporaneous Dongzhao site. Differentiation of social organization among settlements in the Xinzhai period thus can be suggested. This conclusion contributes to a comprehensive understanding of the social development in the Central Plain by indicating it highly possibly witnessed a constant increase in social complexity before urbanization.

D. BEFORE AND AFTER OF THE HUDSON VOLCANO ERUPTION: PALEOECOLOGICAL APPROACH BY MULTIDISCIPLINARY ANALYSIS OF CAMELID COPROLITES

**Abstract author(s):** Benvenuto, María Laura - Burry, Lidia Susana - Velázquez, Nadia - Martínez Tosto, Ana Cecilia - Petrigh, Romina (IIPROSAM, CONICET-UNMdP. Centro de Asociación Simple CIC PBA; Facultad de Ciencias Exactas y Naturales, UNMdP) - Camiolo, Ivana (IIPROSAM, CONICET-UNMdP. Centro de Asociación Simple CIC PBA) - Bozzuto, Damián (INAPL-CONICET; Facultad de Filosofía y Letras, Universidad Nacional de Buenos Aires) - Fernández, Natalia (IMHICIHU-CONICET) - Maveroff, Nicolás (INAPL-CONICET; Facultad de Filosofía y Letras, Universidad Nacional de Buenos Aires) - Guichón, Ricardo (Laboratorio de Ecología Evolutiva Humana y Núcleo de Estudios Interdisciplinarios sobre Poblaciones Humanas de Patagonia Austral; Facultad de Ciencias Sociales, Universidad Nacional del Centro de la Provincia de Buenos Aires)

**Abstract format:** Poster

The earliest human occupation evidence in the Pueyrredón-Posadas lake basin (Santa Cruz, Argentina) is dated to ca. 8,600 cal BP. However, there are no archaeological records between ca. 8,100-7,700 cal BP. This hiatus coincides with the H1 Hudson volcano eruption about 7,900 cal BP, as indicated by the presence of tephra in the stratigraphy of two archaeological sites in the area. This eruption was recorded as the largest in the southern of the Andes during the post glacial period. The proposed hypothesis is that this event influenced the permanence of camelids and the human population in this region. Camelids were the main resource of hunter-gatherer populations of Patagonia during the Holocene. At regional scale, archaeological studies showed variations in lithic technology, styles of projectile points, instrument size and rock art among the sets recorded before and after the H1 eruption. The

hypothesis will be tested in part through a multiproxy analysis of camelid coprolites collected from layers immediately below and above the Hudson ash level at the Cueva Milodón Norte 1 site (47.30°S 71.89°W). Silicophytoliths, pollen, plant remains, stable isotopes (C and N) and aDNA of coprolites will be analyzed to evaluate changes in the frequency and abundance of these proxies that may be associated with paleodiet, seasonality in the use of the site before and after the H1 eruption. In the present work, results of silicophytoliths, pollen and plant remains in current guanaco feces collected near the site are presented as a reference model for the coprolites analyses. Forest taxa such as, Nothofagus spp. (Nothofagaceae) and steppe taxa such as, Caryophyllaceae, Cyperaceae, Poa ligularis (Poaceae subf. Pooideae), Empetrum rubrum (Empetraceae), Mulinum spinosum (Apiaceae), among others, were identified. These results will contribute to interpreting the changes and interactions in pre- and post-eruption scenarios.

E. PREDATOR-PREY RELATIONSHIPS INFERRED BY COPROLITE PHYTOLITH ANALYSIS FROM ARGENTINE PATAGONIA

**Abstract author(s):** Benvenuto, María Laura - Velázquez, Nadia - Martínez Tosto, Ana Cecilia (IIPROSAM, CONICET-UNMdP. Centro de Asociación Simple CIC PBA; Facultad de Ciencias Exactas y Naturales, UNMdP) - Fernández, Natalia (IMHICIHU-CONICET) - Civalero, María Teresa (INAPL-CONICET) - Osterrieth, Margarita (Instituto de Geología de Costas y del Cuaternario, UNMdP-CIC) - Burry, Lidia Susana (IIPROSAM, CONICET-UNMdP. Centro de Asociación Simple CIC PBA; Facultad de Ciencias Exactas y Naturales, UNMdP)

**Abstract format:** Poster

Knowing about past biological interactions is possible thanks to the study of coprolites found in archaeological sites. Evidence of herbivores consumption by omnivorous organisms was found in Patagonia through bone remains studies. With the aim to recognize the limitations and potentialities of the phytolith analysis to infer predator-prey relationships, a comparative analysis among the content of phytoliths obtained from omnivores and herbivores coprolites was performed. The coprolites were found in the archaeological site Cerro Casa de Piedra 5, Perito Moreno National Park, Patagonia, Argentina, in an archaeological layer dated to 7,402 cal BP. According to their morphological features and content, the coprolites were assigned to omnivores organisms and camelids. Samples were rehydrated, filtered, concentrated, dried, and mounted in immersion oil. Counting and identification of phytoliths were made under optical microscope. The results showed the dominance of phytolith association of the subfamily Pooideae in the omnivore and camelid coprolites suggesting that the grasses were part of the diet of these organisms. This result was even confirmed through pollen and plant remains analyze. Also, isolated and articulated phytoliths and preserved silicified cells within the producing plant tissue were observed in camelid coprolites, while in omnivore samples only isolated phytoliths were observed. The presence of isolated phytoliths in these last samples could indicate that the phytoliths consumed could have been subjected to alteration processes, such as chewing, food processing prior to consumption, digestion or were indirectly incorporated by the consumption of guanaco viscera, exposing phytoliths on more than one occasion to the alteration processes. Future studies on the qualitative and quantitative production of phytoliths in species linked to the diet of herbivores and omnivores as well as on the effects of taphonomic processes from the digestive systems of consumers may contribute to the knowledge of past biological interactions.

PLEISTOCENE EARLY WEAPONRY TECHNOLOGIES: A MULTIFACETED MOSAIC OF NEW EVIDENCE AND BEHAVIOURS (PAM)

**Theme:** 6. Material culture studies and societies

**Organisers:** Milks, Annemieke (UCL Institute of Archaeology) - La Porta, Alice (University of Manchester, Department of Earth and Environmental Science) - Moncel, Marie-Hélène (Muséum National d'Histoire Naturelle, Paris) - Rios-Garaizar, Joseba (Consorcio CENIEH - Centro Nacional de Investigación sobre la Evolución Humana)

**Format:** Regular session

Direct and indirect evidence of weaponry in the Pleistocene archaeological record provides a framework for evaluating numerous facets of human evolution, including hominin subsistence behaviours, hunting strategies, cooperative group behaviours, cognitive flexibility, technological complexity, innovation, use of landscape, and the ability to adapt to different ecological niches. In the last few decades in particular, our ability to identify and evaluate the use of hunting weapons during the Middle and Late Pleistocene has been improved through remarkable archaeological discoveries and advances in methodological approaches. This has reshaped the dialogue around perceptions of performance differences between weapon technologies and hunting strategies of different species of \*Homo\*. Therefore, this session invites abstracts from researchers currently looking at the diversity of evidence on Middle and early Late Pleistocene use of early weapons (with a specific focus on hand-delivered weapon technologies) for hunting and/or confrontational events, including evidence of early weapons or hunting lesions, experimental archaeology, biomechanical approaches, use-wear methodologies, social perspectives (e.g. gender, age, learning, cooperation), ethnoarchaeology, indigenous perspectives, and zooarchaeological studies that provide evidence for hunting. We also invite contributions that aim to contextualise both existing evidence and/or newer research within the developing comparative models of weaponry and hunting strategies utilised by different species of \*Homo\*.

1

NEANDERTHAL STONE-TIPPED SPEAR TECHNOLOGY: AN EXPERIMENTAL INVESTIGATION

**Abstract author(s):** La Porta, Alice (University of Manchester; University of Exeter)

**Abstract format:** Oral

This research investigates the use of the Middle Palaeolithic stone-tipped spear technology among Neanderthal populations. Although the presence of stone tool projectiles in European Middle Palaeolithic sites may suggest the adoption of composite hunting weapons possibly from MIS 6 onwards, the use of these weapons as close-range thrusting spears or long-range throwing spears and their effectiveness is still an outstanding argument in the Palaeolithic archaeology. Here we present controlled experiments that extensively tested the use of hand-delivered throwing and thrusting stone-tipped spears, using Levallois point replicas. Trained human participants threw and thrust experimental stone-tipped spears into animal carcass targets. For each throw and thrust, several variables were recorded. The influence that different experimental variables, such as delivery modes (throwing vs thrusting), and ballistic parameters, can have on the formation of macroscopic and microscopic traces during projectile impacts was investigated. Integrated results between macroscopic and microscopic use-wear analysis and ballistic investigation show that trace patterns provide useful markers for distinguishing throwing from thrusting hand-delivered spear systems. These findings provide methods for further testing of the hypothesis that the hand-delivered throwing stone-tipped spear technology was in use at least from MIS 5 in the European Middle Palaeolithic.

2

TIPS FOR BEGINNERS: FIRST EVIDENCE OF LITHIC WEAPONS IN THE MEDITERRANEAN OF THE IBERIAN PENINSULA AT COVA DEL BOLOMOR (VALENCIA)

**Abstract author(s):** Cuartero, Felipe (Fundación Atapuerca) - Fernández-Peris, Josep - Hortelano, Laura (Servei d'Investigació Prehistòrica, Diputació de València) - Blasco, Ruth (Institut Català de Paleoecologia Humana i Evolució Social - IPHES)

**Abstract format:** Oral

The first use of lithic points as weapons remains a subject of intense debate, sometimes due to different methodological approaches. In this paper we analyze the case study of Cova del Bolomor (Valencia, Spain), a Middle Pleistocene sequence spanning 400 ka to 100 ka BP with a repeated series of occupations throughout this period. Throughout the sequence lithic points are always present. At lower levels Tayac points (and other thick, retouched by hard-hammer) are dominant, while in the upper levels (XII to I, MIS 6 to 5e) Mousterian points, Levallois points and Levallois technology are more often present. Some levels, such as level VII, have a high representation of points; breakage of the tips could indicate a key use of these points as weapons in hunting activities. This increase of Mousterian points along with some evidence of use as weapons during MIS 6 onwards agrees with some other examples in South-western France and the Northern Iberian Peninsula, and could represent the first occurrence in the Mediterranean area of the Iberian Peninsula. We hypothesise that the use of lithic points (both Levallois and Mousterian) as weapons was typical from MIS 6 onwards in the Mediterranean area of the Iberian Peninsula, when Levallois technology and the systematic use of hafting spread in the area.

To test this hypothesis we have developed a large experimental program recording the fractures produced in different activities on three axes: 1) the relationship between shape of the point (different tip penetrating angle, retouch angle, thickness) and the raw material; 2) the location of breakages and their relationship to micro-wear traces; and 3) the preservation of all these macroscopic and microscopic traces after several taphonomic processes in the artifacts used in the previous experiments.

3

HIT OR CRACK? AN EXPERIMENTAL STUDY ON BREAKAGE PATTERNS OF SOLUTREAN FOLIATE POINTS AS HUNTING WEAPONS IN INLAND IBERIA

**Abstract author(s):** Castillo-Jiménez, Samuel (University of Alcalá) - Cuartero, Felipe (Atapuerca Foundation) - Mangado Llach, Xavier - Sánchez de la Torre, Marta (SERP. Prehistory and Archaeology Section, University of Barcelona) - Alcolea-González, José-Javier - Alcaraz-Castaño, Manuel (University of Alcalá)

**Abstract format:** Oral

Bifacial and unifacial foliate points were the main hunting weapons during the Solutrean technocomplex of Southwest Europe (~25 – 19 ka cal BP). In this contribution we aim to understand functional and technological processes involved in their production and use in the poorly-known regions of inland Iberia. We focus on the archaeological record of the Solutrean layers of the Peña Capón rock shelter (Central Spain), where a large foliate point collection has been recorded during recent fieldwork. Preliminary technological analysis of these points and associated lithic assemblages has shown a fragmented Chaîne Opératoire, as products found at the site are limited to the final knapping stages, including thinning flakes and finished points.

Most of these points are distal fragments broken by bending once the piece was finished or nearly finished. However, it remains unclear whether these points were broken during (1) the final stages of knapping reduction and retouch or (2) as a result of impacts during hunting activities. In the latter case, the distal fragments of the points would have been taken to the shelter into the corpses of hunted preys. We aim to test these alternative hypotheses by means of an experimental study with the main objective of clarifying the causes originating the type of fractures found in the Solutrean assemblages of Peña Capón. To achieve this goal, we designed an experiment involving four steps: (1) technological analysis of the Solutrean foliate points and associated assemblages; (2) experimental replication; (3) recreation of hunting activities using the experimental points; and (4) comparison of breakage pat-

4

HOW DOES A PROJECTILE FLY? USING BALLISTICS AND FRACTURE MECHANICS TO TRY AND RECOGNISE PALAEO LITHIC WEAPON SYSTEMS

**Abstract author(s):** Coppe, Justin - Rots, Veerle (TraceoLab / Prehistory, University of Liège, Belgium)

**Abstract format:** Oral

Ballistics and fracture mechanics are important disciplines for understanding the variables that influence the breakage of lithic armatures on impact. In particular, kinetic energy and angle of impact have been judged to be key variables for understanding impact fracture formation. In this presentation, we take the investigation of these parameters a step further and explore the variability in kinetic energy and the direction of applied stress. We do this for each of the four modes of propulsion traditionally considered relevant for the Palaeolithic (bow, spear-thrower, hand-cast spear, thrusting spear). Our goal is to evaluate whether each propulsion mode produces a reactional impact stress that is sufficiently distinct to offer clues to the propulsion mode on the basis of the fractures on archaeological stone projectiles.

5

COMPREHENSIVE 3D MODELING AS AN IMPORTANT TECHNIQUE IN OPTIMAL CONSERVATION OF WATERLOGGED WOODEN ARTIFACTS – A PALEOLITHIC WOODEN POINT (EXPERIENCE)

**Abstract author(s):** Eric, Miran (Institute for the Protection of Cultural Heritage of Slovenia) - Guček Puhar, Enej (Faculty of Computer and Information Science, Ljubljana University) - Korat, Lidija (Slovenian National Building and Civil Engineering Institute) - Solina, Franc - Jaklič, Aleš (Faculty of Computer and Information Science, Ljubljana University)

**Abstract format:** Oral

Paleolithic wooden tools and weapons represent one of the most precious and rare remnants of human cultural heritage. There are eight similar specimens in Europe. Protection represents responsible and demanding approach if the wooden artifact have to be preserved as closely as possible for future generations. A particularly responsible approach requires the preservation. As a rule, archaeologists and conservators opt for traditional and proven methods and techniques of conservation. In recent years, more researcher are opting for new methods with which they want to keep the artifact as protected as possible in its in situ conditions. In order to avoid hasty decisions and negative experiences in wood conservation (pronounced volumetric changes, bends, fractures, etc.), new technologies, such as e.g. 3D modeling using structured light, lasers or computed tomography are being used. Surface as well as volume modeling can significantly facilitate decision-making and work for conservators, as well as permanent monitoring of the condition of artifacts.

An indicative example is the experience of 3D modeling and conservation of a Paleolithic wooden point from the Ljubljana River. Volumetric comparisons 3D models showed that the point length was shorter by 6.5%, width reduced by 7.5%, thickness by 21.3%, and volume by 20.6%. A comparison of the 3D models showed that large volumetric deviations occurred during the process of preserving wood with melamine. This information is useful for conservators in planning the preserve and protection of valuable artifacts. Consistent use of 3D modeling in all phases of conservation of wooden artifacts is highlighted as a necessary standard in the design, implementation of wooden remains and as an incentive in finding new solutions for conservation and storage of valuable remains of wooden cultural heritage. This is not just a commitment stemming from the London Charter and the Seville Principles, but a commitment to future generations.

6

AGE? SKILL? PHYSIOLOGY? COMPARING SPEAR THROWING PERFORMANCE OF ADOLESCENT AND ADULT BAYAKA FORAGER AND BONDONGO FISHER-FARMER MALES

**Abstract author(s):** Milks, Annemieke (UCL) - Lew-Levy, Sheina (Simon Fraser University, Department of Psychology; Aarhus University, Department of Archaeology and Heritage Studies) - Kiyabiya Ntamboudila, Francy (Marien Ngouabi University, Brazzaville)

**Abstract format:** Oral

Experimental studies of hand-delivered spears have increased significantly in the last few decades, typically focusing on damage to weapons and/or animal bodies. However, there remains a dearth of understanding of the influence of age, skill, and physiology as variables in spear thrusting and spear throwing, a key technology throughout the Middle and Late Pleistocene. We have extended our previous work with javelin athletes to work with BaYaka forager and Bondongo farmers, including both adolescents and adult participants. These groups both regularly use thrusting and throwing spears for hunting in the Congo rainforest basin. We further compare experimental outcomes (velocity and accuracy of spear throwing) amongst the BaYaka with those of a ranking task in which adults assessed their peers on their spear hunting skills and overall hunting skills. Our results improve existing data on spear throwing ballistics and the effects of age, skill and physiology. Furthermore, we are able to explore links between these experimental results and social perceptions of hunting success. We emphasise the benefits when researchers engage with and learn from communities who develop a range of skills over entire lifetimes in their use of technologies. Not only does this improve our ability to understand and accurately replicate technologies, but it provides richer contexts of how technologies are embedded in social worlds whilst being inclusive of indigenous perspectives.

7

THE ROLE OF HIDE THICKNESS IN TESTING THE HUNTING EFFICACY OF PLEISTOCENE WOODEN SPEARS

**Abstract author(s):** Hardy, Bruce (Department of Anthropology, Kenyon College) - Turner, Paula (Department of Physics, Kenyon College)

**Abstract format:** Oral

Wooden spears represent the earliest known hunting technology and appear as early as c. 400 ka at Clacton-on-Sea. At c. 300ka, the preserved spears (n=10) at the Paleolithic site of Schoeningen constitute the majority of wooden spears preserved from the Middle Pleistocene. Although they were initially interpreted as throwing spears, many researchers questioned this interpretation due to their large size and weight, suggesting that their range would have been limited to 5-10m if thrown. Instead, these researchers proposed that they were thrusting spears used in close-quarters hunting of large game. Experimentation with modern replicas has been used to support both sides of this argument. Recent experiments with trained throwing athletes demonstrate the ability to hit a target in at least the 15-20m range. While these experiments show that wooden spears have flight capabilities to hit targets at a significant distance, they do not address the efficacy of the spears at penetrating hide and thus wounding an animal. We describe a series of experiments that suggest that hide thickness is a significant variable that must be considered in the evaluation of wooden spears as effective throwing weapons.

8

DID COOPERATIVE ATLATL HUNTING DRIVE NON-GENDERED LABOR PRACTICE AND HUMAN DISPERSAL DYNAMICS IN THE PLEISTOCENE?

**Abstract author(s):** Haas, Randy (University of California, Davis)

**Abstract format:** Oral

Recent research suggests that early big-game hunting may have been a gender-neutral activity, or nearly so. Toward understanding why this pattern differs from the man-the-hunter pattern observed in ethnography, we consider that certain technological, social, and ecological conditions of the Pleistocene may have favored cooperative hunting strategies with female participation. From basic geometric principles, life history traits, technology performance characteristics, and ethnographic observations on cooperative vicuña capture by Aymara communities in the Andes Mountains, we show that cooperative hunting is economically profitable and entails increasing returns to scale when big-game densities are high. Such conditions would often have been met in the Pleistocene, favoring female big-game hunting. We further show that this socioeconomic pattern would have been meta-stable. The simple economic model drives ideal free distribution dynamics in the context of Pleistocene human dispersals. Initial populations would tend to occupy the most game-rich territories first, with the efficiency of cooperative resource extraction increasing super-linearly in response to human population growth. At some critical point, the population-resource balance would invert, creating an economic dilemma, social discord, and population fissioning into new territories where the cycle would repeat. This model captures a number of qualitative features observed or suspected in Pleistocene archaeology including the apparent emphasis on big game, female participation in big-game hunting, the use of atlatl technology, rapid terrestrial dispersals, system meta-stability, and intense interest in social signaling as suggested by the ubiquity of red ocher and showy lithic technologies.

FORESTRY, SUBSISTENCE AND INDUSTRY: THE CHARACTER AND CONSERVATION OF WOODLAND HERITAGE

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Holyoak, Vincent (HE - Historic England) - Byrnes, Emmet (Forest Service, Department of Agriculture, Food and the Marine)

**Format:** Regular session

The nature and extent of Europe's modern forestry cover is a key characteristic of its landscapes and of their history. Exploitation of forestry for subsistence, agriculture and industry shaped earlier settlement patterns, and as a result, ancient forestry is not only strong in cultural significance and folklore, but a rich repository of archaeological evidence of past activity. Because of this, new planting (for carbon sequestration, nature, public goods such as health, wellbeing and access, or simply timber production) provides an opportunity for recognising, celebrating and enhancing historic character. This session will explore, compare and contrast the historic and archaeological character of woodland and forestry across a range of countries. It will discuss the challenges for sustaining the heritage and the historic character of forestry and woodland, and the differing national approaches to doing so. Papers will also explore the suite of affordances, both natural and cultural that the forest offers, from raw material to the support of industries and how evidence of this is being recorded and understood today. With the increased role which woodlands now play around health and wellbeing, as well as the social benefits seen through community archaeology and public engagement, the session will also examine the role of this work around the recording, promotion and protection woodland heritage.

ABSTRACTS:

1

SUCSESSES AND FAILURES OF THE ARCHAEOLOGICAL HERITAGE MANAGEMENT IN SAXON FORESTS

**Abstract author(s):** Strobel, Michael - Westphalen, Thomas (Landesamt für Archäologie Sachsen)

**Abstract format:** Oral

In forests archaeological sites are well preserved. Visible ramparts or grave hills were the first remains that were listed in inventories and registered as protected monuments. The extent in which archaeological areas in forested lands are nonetheless threatened, depends on various factors: In GDR-times planting pine trees or spruces in monocultures as well as using the forest plough during the 1960ies to 1980ies caused disastrous damages to monuments which are still endangered today by an improper management and thinning. On humid ground heavy harvesters and forwarders can leave behind severe on site-destructions and mush up sites hauling logs along a wrong traced skid trail. Finally the building of paths and storm damages should not be underestimated. Whether the extensive airborne lime fertilisation of forests has negative effects on soil structures and finds is yet unknown.

For a number of years the Saxon archaeological heritage management and the state forestry department have been maintaining a close partnership by exchanging data, implementing joint projects and organising common information events. Best practice projects will show the efforts and successes, but also the limits of an intensive cooperation now facing new challenges: climate change, bark beetles attacks and forest restructuring. On a state level the cooperation is almost always effective and sustainable. On the other hand much more problems need to be resolved in private forests. Storm damage repair and forest restructuring are often conducted irrespective of well preserved and protected archaeological monuments. Worst case examples are also object of the paper.

2

ARCHAEOLOGICAL MANAGEMENT STRATEGIES AND CLIMATE-RESILIENT FOREST CONVERSION

**Abstract author(s):** Cott, Eva (LVR-Amt für Bodendenkmalpflege im Rheinland)

**Abstract format:** Oral

Due to climate change, the forests are subject to strong changes. In the German state of North Rhine-Westphalia (NRW), this affects many tree species, but spruces in particular. Current counts estimate effected areas of about 600 km2, caused by drought and bark beetle infestation. This concerns approximately 15% of the forests in NRW. The resulting actions taken for reforestation by far exceed the regular forestal activities, thus becoming an increased threat to archaeological sites in the wood lands. It is for this reason that an intensification of the cooperation between the archaeological state services as well as the forestry agency is desired. Four points are focused on especially:

First, the digital exchange of specific data relevant to both agencies is to be facilitated, in order to better coordinate the necessary actions. This involves the digital integration of the archaeological data into the databases and geographical information systems of the forestry agency. Similarly, data from the forestry agency is to be made accessible to the archaeological state service to identify potentials for conflict in time to ascertain protection strategies.

Second, different categories of archaeological sites are defined, which indicate the vulnerability of the objects to the forest manager. That way the planned procedures can be adjusted to the special circumstances.

Based on these categories, damage monitoring is to be conducted in different landscapes, in order to carry out damage evaluation of cleared areas or those which are planned to be cleared in the future.

Third, crop strategies are to be developed which are specifically suitable to protect different categories of archaeological sites.

Fourth, a recurring training event is to be established to strengthen mutual understanding and to gain further multipliers for the protection of archaeological heritage in forests.

3

ARCHAEOLOGICAL HERITAGE MANAGEMENT IN FLANDERS FORESTS: OPPORTUNITIES AND THREATS

**Abstract author(s):** Cordemans, Karl (Flemish Land Agency) - Meylemans, Erwin (Flanders Heritage Agency) - Goeminne, Nele (Archaeological Monument Watch)

**Abstract format:** Oral

The combination of the low visibility of archaeological traces (features as well as finds) on the ground and on aerial photographs and the limited number of interventions, resulted in few known archaeological sites in forested areas. The emergence of LIDAR data changed this dramatically. Especially the second generation of the Digital Elevation Model of Flanders (2013-2015), available for the whole of Flanders in very high resolution (min. 16 points/m²) for free, accelerated the number of new detected archaeological sites. At the same time, this huge dataset provides us valuable insights on the preservation state of these sites. From this it is clear that (sub)recent and future forest management practices (in light of ecological diversification, climate change, etc.) had and have a potential major impact on this valuable and less known archaeological heritage. Through a number of cases we highlight some of the challenges but also the opportunities these new insights present.

4

IF YOU ARE THE BIG TREE; A TREE TRUNK COFFIN BURIAL IN A LANDSCAPE OF DROWNING FORESTS

**Abstract author(s):** Allen, Tim (Historic England) - Willmott, Hugh (University of Sheffield) - Panter, Ian (York Archaeological Trust)

**Abstract format:** Oral

What does it mean to be buried in a tree trunk? The trees of the late Neolithic to early Bronze Age emerge from the shores of England’s east coast as stumps and fallen boughs, but more rarely they are revealed beneath its fields, hollowed out, shrouding the dead. This is a landscape of dynamic change on the shifting boundary between wet and dry, between trees and sea. In August 2018 a large, apparently Bronze Age, tree trunk coffin was unearthed during ground-works on a site in Lincolnshire, England. The find was brought to the attention of the local authorities when human remains were found. Examination revealed that the barrow comprised a gravel mound buried by later alluvium such that only its top was visible as a slight rise. A tree trunk coffin containing human remains accompanied by a hafted stone mace/axe had been set into the underlying clay below the mound. This paper outlines work following the emergency intervention of Historic England (the national heritage body) to secure, analyse and conserve the remains in partnership with the University of Sheffield; supported by York Archaeological Trust and individual specialists. Research questions and initial results span; wood working, burial practice, environmental reconstruction, climate change, dendrochronological dating and the challenges of emergency intervention as a curatorial response. For an overview of previous finds of tree trunk coffins see Pearson M. P., Sheridan, A., and Needham,S. Bronze Age Tree-Trunk Coffin Graves in Britain in N. Melton, C. Knusel and J. Montgomery, Eds, 2013 Gristhorpe Man.: A Life and Death in the Bronze Age, Oxbow.

5

CLIMATE CHANGE, NATURE RECOVERY AND THE HISTORIC ENVIRONMENT: WOODLAND CREATION IN ENGLAND

**Abstract author(s):** Robertson, David (Forestry Commission England) - Shaw, Lawrence (Forestry England)

**Abstract format:** Oral

The British government’s 25 Year Environment Plan outlines ambitious targets for large-scale tree planting and woodland creation to increase carbon sequestration, improve confidence in domestic timber supply, and secure economic and environmental benefits at a landscape scale. It presents aspirations to plant 180,000 hectares of new woodland in England by the end of 2042, with the aim of increasing woodland cover from 10% to 12%.  
  
Forestry Commission England has a pivotal role to play in achieving these ambitions, as forestry regulator, administrator of woodland creation grant schemes and custodian of the public forest estate. This paper will outline how Forestry Commission England (Forest Services and Forestry England) is using the UK Forestry Standard, advice, training, incentives, and research to ensure the conservation and incorporation of the historic environment within these ambitions is seen as a significant public benefit of work undertaken for climate change mitigation and nature recovery. It will use case studies and pilot projects to explain how approaches have developed in recent years and are likely to evolve in the future.

6

FARMING AND FORESTRY IN THE BLACKSTAIRS MOUNTAINS, IRELAND; LOOKING TO THE PAST TO MANAGE THE FUTURE

**Abstract author(s):** Ó Murchú, Séamus (Forest Service, Department of Agriculture, Food and the Marine, Ireland)

**Abstract format:** Oral

Situated in South-East Ireland, the Blackstairs Mountains are the focus of a locally-led European Innovation Partnership (EIP) project initiated in 2018. Entitled ‘Blackstairs Farming Futures’, the project aims to manage the upland resource in a manner which is sustainable for the farmer whilst simultaneously improving biodiversity on the commonage. In looking to the future, it is useful to reflect on the past, particularly in establishing baselines or targets. Archaeological research on these same uplands indicates that modern farmers represent the present custodians of a landscape which has been farmed and exploited since the prehistoric period, as evidenced by a multitude of sites and monuments including pre-bog field walls, settlement sites and burial features. Consequently, the seemingly wild landscape we see today has been shaped by thousands of years of human activity. In the absence of palynological data, archaeology combined with historical research can contribute to a more detailed understanding of past land cover in the area. In particular, archaeological, documentary, cartographic, folklore and placename evidence demonstrate that woodland was far more prevalent in the past. Exploited and removed by the early 20th century, large expanses of the lowland slopes have been afforested in recent decades with private or state-owned commercial plantations. Whilst most of these modern forests are sterile and largely devoid of human interaction apart from periodic harvesting events, some have become the focus for development works including recreational trails and wind-farms. Local folklore and documentary evidence indicate an even more diverse use of the woodland resource in the Blackstairs region historically which ranged from individual to communal activities and events. The Blackstairs Farming Futures Project, in combination with archaeological and historical research, offers the opportunity to reflect on how we manage the upland resource into the future and the potential role of forestry in sustainable upland land management.

7

FOREST HISTORY AND INDUSTRIAL DEVELOPMENT INTERLINKS AT TERRITORIAL SCALE INFERRED FROM A COMBINATION OF WOOD AND CHARCOAL PAST USE EVIDENCES

**Abstract author(s):** Robin, Vincent (LIEC - Lorraine University - CNRS) - Knapp, Hannes (LabEx DRIIHM CNRS) - Gocel-Chalté, David (Chrono-Environnement CNRS) - Guérold, François (LIEC - Lorraine University - CNRS) - Rochel, Xavier (LOTERR - Lorraine University)

**Abstract format:** Oral

Previous studies have shown the importance of wood as a key resource for long-term socio-economic development, as well as the environmental consequences of the use of this resource. However, only a few studies have examined the historical exploitation of forest biomass related to local industrial needs. Therefore, we present one of the first attempts to study historical wood consumption related to industrial development at the territory scale. This study is based on a combination of data from charcoal kilns and written archives from a territory unit, the “Pays de Bitche” (Northern Vosges, France). Analysis of 124 charcoal kilns and 415 written records provided information on woodland exploitation, industrial consumption, and forest dynamics. The datasets were chronologically coherent, because the kilns date to the 17th and 18th centuries, and archival records were found for that period. Quercus and Fagus were the most abundant taxa, with Fagus dominating the west and Quercus the east of the investigated territory. This spatial pattern fit the preferential consumption of Fagus by glassworks in the west and the consumption of Quercus for on-site charcoal production in the east for forges. However, it is not clear whether previous changes in forest composition determined the type of resource available locally and thus the location of different types of industries, or if this forest spatial pattern was related to the type of substrate, which significantly varied from west to east within the investigated territory. Moreover, we have identified that the past forest distribution, inferred from written sources and charcoal data, presented significant similarities with the current distribution of trees in the area. Finally, we showed that the combination of the methods we used was highly complementary for assessing the historical use of forests and providing relevant and valuable insights for the reconstruction of forest history.

8

WOODEN MATERIAL CULTURE. PRACTICES AROUND THE UTILITY AND USE OF TREES DURING THE EARLY MEDIEVAL AND VIKING PERIOD IN IRELAND

**Abstract author(s):** O Carroll, Ellen - O’Donnell, Lorna (School of Archaeology, University College Dublin)

**Abstract format:** Oral

Many of the historical objects that form part of our cultural heritage are made of wood. In the past woodlands were valued as a resource for many objects used in everyday life. This paper will present a selection of wooden objects identified and studied by the authors in understanding how these materials were obtained, manufactured, and valued in Ireland as well as giving us an insight into the everyday life of these people as well as places they may have travelled to and traded with. There are clear associations between characteristics of each tree species and the use of its wood. Each wood species was selected for object use based on the attributes of the wood type, its availability as well as the natural beauty of certain wood species. Objects include wooden vessels, wheel fragments, spear shafts, tool handles, gaming objects, domestic objects and several highly finished enigmatic objects. These objects are tangible evidence of the importance, skill and in-depth knowledge related to Irelands woodlands that our ancestors passed on from generation to generation.

9

NATURE VERSUS HERITAGE: NATURE INCLUDING HERITAGE

**Abstract author(s):** Schreurs, José (Cultural Heritage Agency of the Netherlands)

**Abstract format:** Oral

In the Netherlands large-scale nature restoration projects and forest planting schemes are being carried out. These tasks arise from nature restoration objectives in Natura 2000 areas, among other goals. Natura 2000 is the largest coordinated network of protected nature areas in the European Union and one of the largest in the world. It offers a safe haven to Europe’s most valuable and threatened species and habitats. These areas are under threat by nitrogen emissions from agriculture, traffic and industry. Not only do these protected areas contain valuable habitats, but also they are often rich in historical and archaeological sites of which some are also protected. However, most likely many sites are still not discovered. Moreover, the preservation potential of archaeological remains in nature reserves is much higher than in agricultural areas.  
  
As a rule, cultural heritage is not included in planning and implementation in many natural restoration projects since in most cases only a small part is listed and as a result no permits are required.  
  
The Cultural Heritage Agency of the Netherlands, in collaboration with Staatsbosbeheer (State Forestry department), has drawn up a working protocol to take cultural heritage into account when planning. So in addition to ecological studies, culture historical and archaeological studies are included. Dissemination of culture historical and archaeological information is part of the protocol.  
  
This will be discussed in more detail in the presentation.

EVIDENCE FOR A HORNBEAM WOODLAND FROM CHARCOAL KILNS IN MEUSE LOWLANDS (NORTHEASTERN FRANCE): PAST MANAGEMENT RECORD OR LOCAL ANOMALY?

**Abstract author(s):** Oliveira, Cláudia - Bouquerel, Jonathan (LIEC - Université de Lorraine) - Rochel, Xavier (LOTERR - Université de Lorraine) - Devin, Simon - Robin, Vincent (LIEC - Université de Lorraine)

**Abstract format:** Oral

An anthracological study is being conducted in Meuse (northeastern France) to assess past forest resources exploitation to produce charcoal for local industries.

The study area comprises 57 km2 of mainly broadleaved-mixed forests in a lowland region with former royal (now state-owned), municipal and private forests. The analysis of airborne LiDAR images allowed to infer that there are around 2600 potential charcoal kilns in the area.

The sampling campaigns yielded the validation of 285 platforms and 48 of them were sampled for charcoal remains in an area of 3.5km2. Results from charcoal analysis provided the identification of 12 taxa being *Carpinus betulus* (hornbeam) the dominant taxon with over 66% of total diversity, followed by *Fagus sylvatica* (c. 12%) and *Corylus avellana* (c. 7%), *Quercus* sp. (3%) and the remaining taxa are residually represented.

These results, especially the dominance of hornbeam relegating to a second plan the presence of *Fagus* and *Quercus*, appear to be in contradiction to the so far admitted forest trajectory in the area. Indeed, today lowland temperate forests in northeastern France are largely dominate by oak and beech woodlands. This was also the case in the past since, at least, the antiquity and, at least at regional scale.

Several questions arise from this disparity between the dominance of oak and beech in the woodlands and their relative subrepresentation in the charcoal assemblage. Are they a consequence of a prioritization of understorey vegetation for charcoal production instead of oak and beech? Or the display of former management practices (e.g. coppicing), while standing trees, possibly oak or beech, were reserved for other purposes?

To develop these hypotheses, this study will be enriched with data from written sources since the 17th century onwards, allowing a better clarification of former woodland exploitation in the region, according local industrial development.

CELEBRATING THE WOODLAND HERITAGE OF THE SOUTHERN PENNINES: A COMMUNITY ARCHAEOLOGY INVESTIGATION

**Abstract author(s):** Atkinson, Christopher (University of Sheffield; Pennine Prospects)

**Abstract format:** Oral

Woodlands of the South Pennines, a region including West Yorkshire, Lancashire and Greater Manchester covers approximately 75km² of the landscape. A combination of ancient woodland and woodland plantation, these woods are largely found hugging the steep slopes of the narrow valleys, below the fertile plateaus and sweeping moors.

Though accessible and popular for public recreation, the historic development and management of woodlands in the region is traditionally less understood. Under the title ‘Celebrating Our Woodland Heritage’, Pennine Prospects led a community project between 2016 and 2020 to reveal the history and archaeology of the region’s woodlands. Through programs of community engagement, which included community archaeological surveys, excavations, workshops and forest schools, 37 woodlands across the region were investigated. Each investigation served to connect participants to ‘their woodlands’ and promote and explore the hidden history within each site.

The project raised awareness and appreciation of the contribution woodlands have played in society, with over 4,000 young people from inner city conurbations experiencing woodlands, many for the first time, and over 1,300 new archaeological records were produced by the public.

This paper will summarise the results of the project, and highlight the unexpected impact of the investigations. In particular, land-owners are now involving the public in the archaeological investigation of landscapes as part of new woodland management and planting strategies across the region.

Three community excavations of charcoal burning platforms undertaken as part of the project have also led to further research into the value of these monuments in enhancing our understanding of historic woodland management/development.

DARK FORESTS: AN ARCHAEOLOGY OF THE FRANCOIST INDUSTRIAL FORESTATIONS IN SPAIN

**Abstract author(s):** Millan-Pascual, Rafael (CSIC- Spanish National Research Council, Institute of Heritage Sciences)

**Abstract format:** Oral

This contribution examines the social and historical impact of the Francoist forestry plans in Spain focusing on its archaeological consequences. Industrial forestry combines the political and bureaucratic administration with technology and engineering services in order to transform rural land through legal statements of expropriation, but also through the agency of trees. The Dictatorship used this mechanism to appropriate and transform many private and communal properties all around the country in an exercise of internal coloniality of power. In fact, industrial forestry was part of large-scale operations developed by the Francoist regime in his quest for the material construction of his ideal Spain with more or less unexpected consequences. On the one hand, the forestation

implies the final migration event of many rural inhabitants and the formal extinction of their municipalities. On the other, the progressive rising of the pines converted many villages into a forest, destroying their historical landscape and concealing its remains. Industrial forestry was here an agent of ruination and abandonment. The sequence of this process is straightly related to the historical Spanish rural depopulation, as the State intervention intensified the already structural weakness of the countryside. Today, the forestation process reveals its strategic functionality for the Dictatorship in the long term, since the forestry policy is one technique of “naturalization” of old peasant’s places and so of the political actions that change those lands. Different social agents from the far-right movement to more popular ecologist’s common-sense defend this forestry heritage as valuable and positive, while some others point out its dramatic effects. Here I will highlight how the Francoist forestry policy still determines the access of rural land and prevents the knowledge of the historical and popular roots of the countryside. Archaeology could reveal what is hidden in the woods.

AUTOMATIC DETECTION OF CHARCOAL PRODUCTION PLATFORMS BY DEEP-LEARNING TECHNIQUES – A CASE STUDY IN NORTHEASTERN FRANCE

**Abstract author(s):** Oliveira, Cláudia (LIEC - Université de Lorraine) - Aravecchia, Stéphanie - Pradalier, Cédric (GeorgiaTech Lorraine) - Robin, Vincent - Devin, Simon (LIEC - Université de Lorraine)

**Abstract format:** Poster

Forest exploitation for wood resources has long lasting imprints on landscapes. Wood as a source of raw material for energy production was used for millennia until recent times and some reaching the 20th century as a primary source of energy for industrial purposes (e.g. iron smelting). Charcoal kilns are some evidences of these activities and they are spread and preserved in forest areas being recognizable in airborne images such as LiDAR (Light Detection and Ranging).

With the continuous availability of high-quality images, automatic methods can be developed to achieve a better quantification of these structures in the landscape. To improve the detection and quantification, automatic detection based on machine learning for image analysis, is being developed and tested in a forest area in Meuse Department (Northeastern France). On this area (57,3 km2), an expert-labelled dataset with more than 2600 potential kilns was identified, an algorithm using the TensorFlow Object Detection API was implemented and tested.

The first results of the method developed are encouraging where c. 90% of the kilns were detected, and only 15% of the predictions were not kilns. Despite these promising results, the method can be upgraded by improving the model. The detections proposed by the network will be validated or not by an expert, refining the available dataset to train the network.

The development of an expedite and reliable methodology highly adaptable to a new environment must be used to routinely perform analysis in airborne images to increment the detection of kilns in order to better understand the history and evolution of forest resources’ exploitation.

IMPR – PHYTOLITH IDENTIFICATION, CLASSIFICATION AND MORPHOMETRY

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Out, Welmoed (Moesgaard Museum) - Vrydaghs, Luc (Maritime Cultures Research Institute - MARI – VUB)

**Format:** Regular session

Phytolith analysis is an established field of research that is applied worldwide to a broad range of research areas, including archaeobotany and palaeo-ecology, amongst others. One the one hand, classification of a large number of common phytolith morphotypes is very well established. As a result, it is well possible to identify phytoliths on (sub)family, genus and sometimes species level, and/or to assign them to plant parts. On the other hand, when considering all plants of the world, it is only partly known which plants produce phytoliths, what type of phytoliths they produce, and whether and how these phytoliths can be distinguished from those of other taxa and plant parts. Another challenge is the description of phytolith in a uniform way, so that outcomes of different studies can be easily understood and compared. While the publication of the International Code on Phytolith Nomenclature versions 1.0 and 2.0 were important milestones, improvement of phytolith taxonomy, which, by definition, includes description, identification, nomenclature and classification of phytoliths, continues to be an ongoing important line of research.

The session “Phytolith identification, classification, and morphometry” aims to discuss the above-raised topics and welcomes all types of contributions about phytolith taxonomy and classification, for example, but not limited to, the application of the International Code for Phytolith Nomenclature 2.0, studies concerning the development of new identification criteria based on morphology, and studies presenting or applying identification criteria based on phytolith morphometry. These studies can relate to both archaeological and modern plant material.

This session is part of the 12th International Meeting for Phytolith Research, or IMPR, the official scientific conference of the International Phytolith Society.

1 PHYTOLITH NOMENCLATURE AND TAXONOMY

**Abstract author(s):** Neumann, Katharina (Goethe-Universität)

**Abstract format:** Oral

Phytoliths are botanical objects. Like in any other field of biological research, a clear and unambiguous affiliation of phytoliths to biological entities is required, including clear and unambiguous names. Only an internationally accepted name will allow communication between researchers and comparison of different datasets. However, In contrast to whole plants or most morphological plant parts, like flowers, wood or pollen, many phytoliths originate from vegetative tissues poor in diagnostic feature, like parenchyma, sclerenchyma, or epidermis. The high degree of redundancy and multiplicity of elements in these tissues prevents the assignment of phytoliths to taxonomic entities. As long as their origin is not clear, these phytoliths are best described as morphotypes. The application of the International Code for Phytolith Nomenclature (ICPN 1.0 and ICPN 2.0) has brought great progress in standardizing naming and description of the most common morphotypes. But what about all the others? When is it justified to use names of well-established taxonomical entities, such as family, genus or species, or, more general, dicot or monocot? In which cases is identification of a plant organ or tissue, e.g. seed or epidermis, applicable? Recent studies on phytolith assemblages in modern plants have shown considerable variation in the presence of diagnostically relevant phytoliths among different plant families. My paper explores chances and pitfalls of naming and attributing phytoliths to morphological or taxonomic categories and is an appeal for more standardization.

2 AN ATTEMPT TO CHARACTERIZE ARTEMISIA SPECIES ON THE BASIS OF PHYTOLITHS

**Abstract author(s):** Attolini, Davide (Laboratory of Palinology and Archaeobotany - DISTAV, University of Genova; Department of Antiquities, Philosophy and History - DAFIST, University of Genova) - Caracciolo, Daniela (Regional Agency for the Protection of the Environment - Liguria - ARPAL) - Montanari, Carlo (Laboratory of Palinology and Archaeobotany - DISTAV, University of Genova)

**Abstract format:** Oral

*Artemisia* pollen characterizes the dry continental climatic phases of the Late Pleistocene in the Northern Hemisphere and it is often found in high abundance. The identification of this pollen type at species level is very challenging and it often leads to difficulty in the interpretation of palaeoenvironments. The identification of phytoliths belonging to species with ecological meaning, possibly indicating different environments, could represent a solution to this problem. There is a general lack of studies on *Artemisia* phytoliths; therefore, a descriptive approach to species that can be used as ecological indicators is needed to get fundamental palaeoenvironmental information. In this study, as a first step, we examined the phytoliths of 11 *Artemisia* species belonging to three different ecological groups: sub-desertic or steppe species, arctic or alpine tundra species, and anthropogenic-nitrophilous ones. The first preliminary results show that some types of phytoliths are common to different species, while others are observed more rarely, only occurring in two or three species among those studied. In particular, the species of alpine tundra are those exhibiting the lowest variety. It seems therefore possible that phytoliths could lead to a better definition of palaeoenvironments characterized by a considerable amount of *Artemisia* pollen, and further studies could provide useful complementary data.

3 PHYTOLITHS FROM PLANTS OF THE CERRADO - THE BRAZILIAN SAVANNA

**Abstract author(s):** Dias, Raphaella (Universidade Federal Fluminense) - Coe, Heloisa (Universidade Federal Fluminense; Universidade do Estado do Rio de Janeiro) - Vasconcelos, Alessandra (Universidade Federal dos Vales de Jequitinhonha e Mucuri) - de Carvalho, Alex (Universidade Federal de Minas Gerais) - Mendonça Filho, Carlos (Universidade Federal dos Vales de Jequitinhonha e Mucuri) - Chueng, Karina (Universidade Federal Fluminense) - Ricardo, Sarah (Universidade Federal do Rio de Janeiro - Museu Nacional) - de Sousa, Leandro (Universidade Federal Rural do Semi-árido)

**Abstract format:** Oral

The Cerrado is a kind of savanna that covers about 22% of Brazilian territory and is considered a global biodiversity hotspot. It presents an extreme abundance of endemic species and suffers from habitat loss. From the point of view of biological diversity, the Brazilian Cerrado is recognized as the richest savanna in the world, housing 11,627 species of previously catalogued native plants. There is a great diversity of habitats, which determine a remarkable alternation of species between different Phyto physiognomies. In this study, 38 plants from 15 families were analysed, in order to identify and characterize the presence of phytoliths in species from the Cerrado. The aim was to establish modern reference collections that will enable further environmental reconstruction studies using this indicator, thus contributing to a better understanding of the biome. The samples were collected from the South Espinhaço Mountain Range, in the state of Minas Gerais. The results showed that, in general, Cerrado plants produce many phytoliths, with TRACHEID, POLYHEDRAL, ELONGATE, BILOBATE and BULLIFORM types predominating. It is also possible to observe a great silicification of trichomes, which may indicate adaptation of the vegetation to the environment. However, it should be noted that there was considerable variation in quantity and morphotypes between species, indicating the need for further studies on the phytolith production of plants in the Cerrado. Phytoliths have shown to be promising tools for better understanding of the region's vegetation, as well as for use in paleoenvironmental studies on the biome.

4

CONTRIBUTION TO REFERENCE COLLECTIONS OF PHYTOLITHS FROM CAATINGA PLANTS: A CASE STUDY IN THE SERRA DE URUBURETAMA, CEARÁ, BRAZIL

**Abstract author(s):** Aguiar, Antônia (CaSEs – Culture and Socio-Ecological Dynamics research group. Departament d’Humanitats, Universitat Pompeu Fabra; Universidade Estadual do Ceará, Departamento de Humanidades) - Coe, Heloisa (Universidade Estadual do Rio de Janeiro - UERJ) - Madella, Marco (CaSEs – Culture and Socio-Ecological Dynamics research group. Departament d’Humanitats, Universitat Pompeu Fabra; ICREA - CaSEs, Departament of Humanities, Universitat Pompeu Fabra) - Sousa, Leandro (Universidade Federal Rural do Semi-Árido, Departamento de Biociências) - Ruiz-Pérez, Javier (CaSEs – Culture and Socio-Ecological Dynamics research group. Departament d’Humanitats, Universitat Pompeu Fabra) - Gomes, Jenifer (Universidade Federal Fluminense) - Gomes, Emilly (Universidade Estadual do Rio de Janeiro - UERJ) - Almeida, Iaponan (Universidade Estadual de Pernambuco) - Cruz, Maria (Universidade Estadual do Ceará, Departamento de Humanidades)

**Abstract format:** Oral

The Caatinga, the only genuinely Brazilian biome, is typical of the Northeast Region, where there is a semi-arid climate characterized by vegetation adapted to high temperatures, low precipitation, and uneven distribution of rainfall throughout the year. The climatic variations that occurred in the Caatinga region over a period of 20 thousand years created this unique biome. Despite this exceptional and unique situation, the biome has been heavily damaged by agricultural expansion and remains poorly studied. The area that is the focus of this study is the Uruburetama massif, located in the northern portion of the State of Ceará, which, despite presenting an environment with slightly more humid conditions, can be taken as characteristic of Caatinga vegetation. Phytolith analysis is used to understand the evolution of the vegetal cover in the region and such studies require the use of modern reference collections for the vegetation. Eighteen species from 16 different families typical of the region were analysed, in order to establish a reference collection of modern phytolith production to serve as a basis for future paleoenvironmental reconstruction work. The results showed that, of the 18 species analysed, 13 produce large amounts of phytoliths, with SPHEROID PSILATE predominating, followed by POLYHEDRAL, TRACHEARY, ACUTE BULBOSUS and ELONGATE, among others. The phytolith morphotypes identified will be used to investigate the sedimentary phytolith assemblages and identify vegetation changes in the area due to climatic fluctuations.

5

USING RONDELS IN BOP CLADE POACEAE TO BETTER RESOLVE CERTAIN TAXA AND HABITATS OF THE TEMPERATE ZONE: A PROPOSED CLASSIFICATION

**Abstract author(s):** Blinnikov, Mikhail (St Cloud State University; Kazan Federal University)

**Abstract format:** Oral

Rondels (after the Old French for “small circle” also known as hats, short trapezoids and various other synonyms in ICPN 2.0) have been an important morphotype (or, rather, a group of morphotypes) in the phytolith analysis of grasses. They are especially common in the members of the BOP clade, i.e., Bambusoideae, Oryzoideae, and Pooideae, representing over 5,400 known species of grasses throughout the world. While not exclusive to BOP clade, Rondels for sure have not been adequately described or analyzed within the clade and there is as yet no satisfactory overall nomenclature of these phytoliths. This presentation makes a humble attempt at reviewing some available evidence from the published literature and from field and lab studies in a few locations in the temperate zone of Northern Hemisphere conducted by the author (Alaska, Pacific Northwest, Minnesota, the Altay, Northern Caucasus, and the Middle Volga in Russia) on the utility of some basic classifications of Rondels in distinguishing certain taxa and also some habitats of the temperate zone (alpine, aquatic, meadows, forests, and steppe). Some potentially confusing nomenclature of Rondel subtypes is clarified. Positive and consistent identification of a few subtypes may adequately distinguish certain plant communities of the temperate region. It is hoped that the proposed classification will help in making open online databases of phytolith samples and photographs more consistent and easier to use.

6

GEOMETRIC MORPHOMETRICS AS A TOOL FOR ANALYSIS OF GRASS PHYTOLITH SHAPE EVOLUTION

**Abstract author(s):** Hošková, Kristýna - Herben, Tomáš - Neustupa, Jiří (Department of Botany, Faculty of Sciences, Charles University in Prague) - Pokorná, Adéla (Department of Botany, Faculty of Sciences, Charles University in Prague; Institute of Archaeology, Czech Academy of Sciences, Prague) - Pokorný, Petr (Center for Theoretical Study, Joint Research Institute of Charles University and Czech Academy of Sciences)

**Abstract format:** Oral

Phytoliths appear to be the most reliable source of fossil evidence for tracking grasses' evolutionary history. The recent work of Gallaher et al. (2020) quantitatively documented that grass phytolith (GSSCP) shape carries a phylogenetic signal, which can distinguish grass subfamilies and tribes. They investigated 70 species from the early-diverging grasses, plus Oryzoideae, and Bambusoideae. Nevertheless, phytolith shape evolution in other taxonomic groups (even of lower levels), same as intra-individual phytolith shape variation remained unexplored.

We analysed 3650 grass phytolith outlines from 73 extant species, 48 genera, 18 tribes, and 8 subfamilies (special attention paid to Pooideae) using geometric morphometric methods (GMMs). GMMs quantitatively assess the entire 2D phytolith shape (Hošková et al. 2020). We aimed to explore phylogenetic pattern in phytolith shape against the background of intra-individual phytolith shape variation. The phytolith shape variation was proven to be phylogenetically constrained at the subfamily level; moreover, we found significant differences even between some genera and species. Geometric morphometrics proved to be suitable to analyse large numbers of phytolith outlines which also makes it an excellent tool within paleo- and archaeological context.

**AUTOMATED, QUANTITATIVE IMAGING ANALYSIS OF GRASS SILICA (PHYTOLITH) FOSSILS: A TOOL TO SHED LIGHT ON GRASS EVOLUTION AND DOMESTICATION**  
**Abstract author(s):** Stromberg, Caroline (University Of Washington) - Gallaher, Timothy (University of Washington; Bishop Museum, Hawai'i) - Akbar, Sultan - Jessett, Kari (University of Washington) - Klahs, Philip (Iowa State University) - Marvet, Claire - Sen-ske, Ashly - Zard, Kailyn - Zender, Callie (University of Washington) - Clark, Lynn (Iowa State University)

Abstract format: Oral

Grasses (Poaceae), which today dominate in 40% of terrestrial ecosystems, play an outsize role in Earth history during the last 30 million years and in human history. Plant silica (phytoliths) are vital tools to uncover these histories, because of their excellent preservation in many depositional settings and their taxonomic specificity within Poaceae compared to pollen and grass macrofossils. For example, analysis of phytolith assemblages from the Americas and eastern Mediterranean has shed light on the evolution and ecology of ancient grasses. This work has shown that, prior to the Oligocene (33.9 million years ago), grasses were relatively rare and consisted primarily of forest-associated grasses. However, these inferences are based on taxonomic schemes for so-called grass silica short cell phytoliths (GSSCP) that suffer from being semi-quantitative, inherently subjective, and not strongly linked to phylogeny; for this reason, they remain untested.

We aim to create a quantitative method for robust taxonomic and ecological inference from fossil GSSCP. Specifically, we have developed new methods for confocal imaging of GSSCP stained with fluorescent dye and image conversion to 3D surface models that can be quantified and analyzed using 3D geometric morphometrics. We have compiled >4,000 3D models from 190 grass species across Poaceae, which we combine with 2D images of cleared grass epidermis showing the distribution and relative abundance of GSSCP in leaf tissue. Our work demonstrates that this approach can robustly classify fossil phytoliths into grass subclades (e.g., subtribe), although precision varies depending on subclade and method. We therefore use a mixed methods approach to data analysis which combines our new quantitative methods with traditional morphotype-based analysis. Application of our methods to Eocene-Miocene grass phytoliths from central North America and Turkey confirms the presence of woody and herbaceous bamboos in the Eocene, allowing a better understanding of Poaceae diversification and Cenozoic paleoenvironments.

**TESTING QUANTITATIVE APPROACHES FOR PHYTOLITH MORPHOTYPE SHAPE DESCRIPTION AND CLASSIFICATION FOR CALIFORNIAN GRASSES**  
**Abstract author(s):** Evett, Rand (Department of Environmental Science, Policy, and Management, University of California, Berkeley)  
**Abstract format:** Oral

Phytolith morphotypes have typically been distinguished and classified qualitatively through visual cues requiring an expert observer. An increasing number of phytolith studies have used quantitative approaches to differentiate closely related, visually indistinguishable morphotypes. While techniques for quantitative shape analysis have progressed dramatically in other scientific disciplines, qualitative approaches still dominate phytolith research. Most quantitative phytolith studies currently conducted continue to rely on simple size and geometric shape descriptors first utilized more than 30 years ago. To progress as a science and take advantage of recent time and labor-saving advances in computerized analysis developed in other disciplines, phytolith analysis must become much more quantitative. The broad purpose of my ongoing research is to combine traditional geometric with other shape descriptors that have proved useful in other disciplines to improve quantification of phytolith shapes, leading to standardized morphotype description and classification data that are amenable to automated analysis. In the current study, boundary outlines of qualitatively identified phytolith morphotypes found in 11 Californian grass species were digitized and input into software that output simple geometric and elliptic Fourier descriptors (EFDs). The range and mean of each shape parameter were described for each morphotype of each species, and a database was built to facilitate classification of unknown phytoliths through discriminant analysis. The database was applied to discriminate visually similar BILOBATE phytoliths produced by two common native grasses in California: *Stipa pulchra* and *Danthonia californica*. The discriminant function, consisting of 5 terms (including 2 EFDs), successfully classified 93% of the BILOBATE phytoliths examined. The discriminant function for the trichome morphotype had 6 terms (3 EFDs), successfully classifying 100% of the trichomes from the 11 grass species examined.

**OAT CHAFF IDENTIFICATION BASED ON PHYTOLITH MORPHOLOGY AND MORPHOMETRY: A VIKING-AGE EQUESTRIAN BURIAL AT FREGERSLEV, DENMARK**  
**Abstract author(s):** Out, Welmoed (Moesgaard Museum, Department of Archaeological Science and Conservation) - Portillo, Marta (Department of Archaeology and Anthropology, Archaeology of Social Dynamics - 2017SGR 995, Institució Milà i Fontanals - IMF, Spanish National Research Council - CSIC, Barcelona) - Schifter Bagge, Merethe (Museum Skanderborg)

Abstract format: Oral

In 2017, an equestrian burial dating to the late Viking Age was excavated in Fregerslev, Denmark. Metal finds have revealed spectacular remains of a horse harness and a quiver with 22 arrows. Apart from highly degraded pieces of fur, wood and leather, organic remains were scarce, or their association with the grave was unclear. However, analysis of a single block sample attested the presence of plant remains in the form of multi-celled phytoliths, so well preserved that they were most likely taphonomically undisturbed. Hence, phytolith and pollen analysis was applied to the complete grave to further investigate the presence of vegetative grave goods.

The aim of the phytolith analysis was to get a better understanding of the grave and its contents. Questions were: 1) Which taxa and plant part(s) do the phytoliths in the area of the block sample represent? and 2) Was this material present all over the grave or deposited in a concentration?

The initially attested phytoliths concerned a concentration of grass silica skeletons (multi-celled phytoliths), interpreted as horse fodder. In order to identify the material, both morphological and morphometric analysis were applied, based on a large number of chaff fragments and phytoliths. The results of the two methods were compared with reference material and subjected to statistical analysis. The majority of the phytolith concentration consisted of oat chaff. The bottom of the grave was covered with straw, mixed with some other plants. This study is of methodological relevance since it allows thorough analysis and comparison of both morphological and morphometric identifications. Additionally, it is one of the first times that morphometric identification criteria are applied to material from historical periods, for which these methodological approaches are mostly lacking, and to oat chaff phytoliths.

**TOWARDS FAIR PHYTOLITH DATA - FIRST STEPS DOWN A LONG AND WINDING ROAD**  
**Abstract author(s):** Karoune, Emma (The Alan Turing Institute) - García-Granero, Juan José (Spanish National Research Council) - Ruiz-Pérez, Javier - Madella, Marco - Lancelotti, Carla (Universitat Pompeu Fabra)  
**Abstract format:** Oral

The phytolith community has in recent years started to move towards the standardisation of phytolith data through the development of a common nomenclature and guidelines for morphometric studies. However, the routine adoption of these standards is still not straightforward. Indeed, a recent assessment of open science practices in phytolith research has found that only a very small percentage of studies adheres to the FAIR principles of making data Findable, Accessible, Interoperable and Reusable.

Prompted by these results and the need to raise awareness of the positive returns for our discipline for interoperability and wider data sharing, we initiated an open science working group leading to a project that is taking the first steps along the FAIRification journey for the phytolith community.

The project aims to conduct a FAIR evaluation of a large set of diverse phytolith data, and also draw on the results of a community survey concerning current data sharing practices and attitudes, to build a collaborative strategy to move forward with the FAIRification of existing data and guidelines to ensure future FAIR phytolith data. We understand that this is an issue that cannot be completed without consensus in the phytolith community and therefore we want to encourage participation in this project from all phytolith researchers.

In this presentation, we will explain how researchers can get involved through completing our survey, providing existing datasets for our FAIR evaluation and attending training sessions to FAIRify datasets. These initial efforts of training for FAIRification will create tools for use in the wider phytolith community, as it is important that we address the need for open science skills training in our discipline. The widespread adoption of open science practices is a challenge we must embrace to move our discipline into the era of open research.

**NEW METHODS TO REDUCE THE UNCERTAINTY IN MICROARCHEOLOGY**  
**Abstract author(s):** Andreu Diez, Oriol (University of Barcelona) - Albert Cristóbal, Rosa Maria (ICREA; University of Barcelona) - Boaretto, Elisabetta (Weizmann Institute of Science) - Pellicer Moscardó, Jaume (Institut Botànic de Barcelona - CSIC)  
**Abstract format:** Poster

Phytolith analyses and the study of other microremains such as calcium oxalates, spherulites, starches, etc. have been shown to be critical to better understand past and vegetation landscapes directly related to human activities and use of plants. Nevertheless, there are still some limitations that have directly affected our research and that we believe we are currently in a position to address, thanks to the advance of other related disciplines. These limitations are, i) preservation and dissolution of siliceous and calcitic microscopic remains that may affect our correct interpretation of the archaeological record; ii) the problem of redundancy and multiplicity of phytolith morphologies that may elude a precise taxonomic identification; iii) the uncertainty regarding the source of the occluded carbon present in the phytoliths and, therefore, its reliability for 14C dating. To do this, we propose a methodological approach divided into two fields of action. Firstly, the implementation of the latest advances in computer science and artificial

intelligence, using Deep Learning algorithms (Convolutional neural networks) to classification tasks. Then, introducing the application of techniques from other scientific disciplines such as cytogenetics (i.e: flow cytometry), and radiocarbon dating methods (Accelerator Mass Spectrometry) that will complement and expand the multi-proxy microarchaeological approach to improve the understanding of the phytolith production processes, and the interpretation of results, in particular, to improve the taxonomic identification of phytoliths.

We prospect that the implementation of this novel methodological approach will allow us to advance further in our research. In particular, our objective is to apply our results to better understand two different fields of research: a) agriculture as a driver of social change and b) the characterization of fuel in archaeological sites.

B. **PHYTOLITH CLASSIFICATION USING DEEP LEARNING: IMPLEMENTATION OF A U-NET NEURAL NETWORK FOR MORPHOTYPE IMAGE-SEGMENTATION**

**Abstract author(s):** Andriopoulou, Nafsika - Petrakis, George - Partsinevelos, Panagiotis (School of Mineral Resources Engineering, Technical University of Crete)

**Abstract format:** Poster

Phytoliths constitute microscopic plant biominerals of high importance to geosciences and archaeology. Despite of the valuable advances in phytolith analysis, typical phytolith classification is performed manually, which is usually time-consuming and may inherit human observer biases. Thus, an emerging challenge signifies the automatic classification of phytoliths that may enhance data homogeneity among researchers and facilitate reliable comparisons. The application of deep learning (DL) algorithms on phytolith analysis, offers an opportunity to classify morphotypes with a higher unbiased precision, continuous refinement as long as more data become available and even the potential to reveal inherent group dynamics. Herein, we implement a “fully convolutional network” (FCN) architecture to classify phytoliths extracted from wheats (*Triticum* spp.) using the dry method. Photomicrographs of phytoliths are acquired using optical microscopy, and morphotypes, morphologically unaltered at the highest possible level, are identified based on the standard literature. The photomicrographs are further manually annotated forming four classes of morphotypes linked to different anatomical plant parts (i.e. leaves, stem, and inflorescence). The resulting annotated dataset includes the classes of (a) Stoma, (b) Rondel, (c) Papillate, and (d) Elongate dendritic and is allocated to training, validation and testing data groups, feeding a U-Net neural network. The performance of the developed network architecture is assessed during training, by calculating the area of overlap between the predicted segmentation and the “ground truth”, in order to overcome the potential issue of unbalanced distribution of the classes. The results demonstrate that the model classifies and localizes the above classes of morphotypes in the predicted images with satisfactory accuracy. Although additional training samples and plant species datasets are required to optimise the results, the present dataset extracted from modern plant material is promising for building up the capacity of phytolith classification within unfamiliar datasets from natural sediments and archaeological contexts.

256 **IMPR – PHYTOLITHS BIOGEOCHEMISTRY - FROM PHYTOLITHS FORMATION AND ROLE IN MODERN PLANTS TO NEW PROXIES FOR ARCHAEOLOGY AND PALAEOECOLOGY**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Dreibrodt, Stefan - Dal Corso, Marta (Kiel University) - Chevalier, Alexandre (Royal Institute of Natural Sciences)

**Format:** Regular session

Biosilicification in plants is a complex process under genetic and environmental control. Suggested functions of phytoliths are structural support, protection against grazing and pathogens, and regulation and storage of minerals and heavy metals. For phytoliths to be deposited, plants need to take up silicon from their environment. Some plants produce many phytoliths, while others produce hardly any. Also the degree of taxonomic identification of phytoliths to plant groups, or even plant parts, is diverse. Concerning phytolith formation, there are still questions to answer, for example, the variation of phytolith formation within individual species, quantitative aspects and chemical aspects. An additional challenge is how we can turn aspects of phytolith biogeochemistry into proxies to use in environmental and archaeological research, e.g. by using chemical elements within phytolith structure (e.g. Carbon, Calcium, Aluminium, Nitrogen) for isotope analyses or for radiocarbon dating. Furthermore, this session also deals with those chemical aspects of both phytoliths and pedological processes that affect phytolith preservation and distribution. Proper understanding of taphonomy is key to the interpretation of the original plant assemblages.

This session aims to discuss new methodological developments in phytolith formation and quantification while studying phytoliths in the fields of plant systematics, evolution, physiology and biochemistry. The session welcomes contributions that address questions such as, but not limited to: where in the plants are phytoliths formed? What types of cells or other structures silicify, and how does phytolith formation vary within plants and within species? Can we increase the use of chemical aspects of phytoliths as a proxy in archaeological studies, including dating Carbon in phytoliths? How can isotope studies be applied to phytolith records? Which compounds and elements other than silica are included in phytoliths?

This session is part of the 12th International Meeting for Phytolith Research, the official conference of the International Phytolith Society.

**ABSTRACTS:**

1 **PHYTOLITH CHEMISTRY: WHAT WE KNOW AND WHAT WE DON'T**

**Abstract author(s):** Hodson, Martin (Oxford Brookes University)

**Abstract format:** Oral

Variation in phytolith morphology is now routinely used in archaeological and palaeoecological research to determine what plants were present, used by humans, or eaten. However, phytoliths vary not just in their morphology, but also in their chemistry. Increasingly, researchers are attempting to use the chemical features of phytoliths as proxies. But what do we know about phytolith chemistry?

The mechanism of silica deposition in plant cells is still poorly understood, but it is now clear that the deposition environment is critical in determining phytolith chemistry. There are two main classes of phytoliths when we consider their chemistry: those deposited in the cell wall, and form on a carbohydrate template; and those in the cell lumen which contain proteins and amino acids, but may also have lipids and even nucleic acids. Often cell wall phytoliths have a C/N ratio of over 25, while lumen phytoliths have a ratio below 5. We should remember that when we are analysing bulk phytolith samples they will include morphotypes with many different chemistries.

Small, delicate phytoliths, and those with a large surface area to volume ratio, are more susceptible to dissolution in the soil, but we are unsure whether phytolith chemistry (e.g. carbohydrate composition) also affects this.

There have been many attempts to use the isotopic composition (O, Si, C) of phytoliths as proxies, and to date phytoliths using <sup>14</sup>C. Likewise, there has also been a lot of interest in phytoliths and carbon sequestration. Unfortunately, our lack of understanding of phytolith development and chemistry often make the results from these studies difficult to interpret. The phytolith community needs more plant scientists and chemists to take an interest so that we can increase our understanding of phytolith chemistry, and give us more confidence in the results obtained from archaeological, palaeoecological and biogeochemical investigations.

2 **ELEMENTAL COMPOSITION OF CENTRAL EUROPEAN TREE LEAVES DELIVERS HINTS TO ENVIRONMENTAL SETTINGS, BIOGEOCHEMICAL CYCLING AND SOIL FORMATION**

**Abstract author(s):** Dreibrodt, Stefan (Kiel University, CRC1266)

**Abstract format:** Oral

Phytoliths of woody plants are found to contain higher amounts of alumina in contrast to grassland phytoliths. This is used to infer about vegetation history through phytolith analysis for instance. Databases are considerably small so far and little is known about the variability of elemental contents of trees from varying environmental settings. The presented paper is focussing on the elemental content of recent tree leaves, its relation to site conditions (parent material, water availability, climate), biogeochemical cycling and soil formation in central Europe.

60 samples of deciduous trees leaves and needles of conifers have been obtained from fresh litter fall at 40 sites in different European lowlands, focusing on northern and eastern Germany. The leaves were cleaned in deionized water (ultrasonic bath), burnt at 550 °C for two hours and the total elemental contents of the ash were measured using a p-ed-xrf device. Additional REM analysis on oak ash examples revealed the presence of alumina and iron in oak phytoliths.

The ash elemental contents related to 105 °C dried biomass show a certain variability between sites, reflecting the geochemical composition of the parent material. All samples contain measurable amounts of Sr, Zn, Fe, Mn, Ca, K, Al, Si, P, and Mg. At several sites, different tree species could be compared. PCA plots indicate genus specific differences of leaf elemental content and thus varying modes of biocycling. Selected elemental rations, e.g. Al: Si ratios, show similar trends, with decreasing values in the order: *Pinus sylvestris*, *Quercus petrea*, *Fagus sylvatica*. Oak and beech trees from alluvial plains behave different than their counterparts on dry lowland sites.

Since iron and alumina present in all investigated samples are major constituents of diagnostic forest soil horizons, the maintenance of the fast biogeochemical cycle of deciduous tree leaves for central European forest soil formation is discussed.

3 **PHYTOLITH PRODUCTION IN TWO DIFFERENT ENVIRONMENTS IN SOUTHEASTERN BRAZIL**

**Abstract author(s):** Ricardo, Sarah (National Museum of Brazil - Federal University of Rio de Janeiro) - Coe, Heloisa (University of the State of Rio de Janeiro) - Alves, Ruy (National Museum of Brazil - Federal University of Rio de Janeiro)

**Abstract format:** Oral

Restinga is coastal strand vegetation distributed in mosaic, associated with Quaternary sandy and rocky deposits. It may present, according to the predominant Phyto physiognomy, herbaceous, shrub and tree strata. Campo rupestre (rupestrian grassland) consists of mountain top and plateau vegetation above 900 m asl. with rock outcrops, where herbs, grasses and shrubs predominate. In general, Campo rupestre occurs in mosaics and not in continuous stretches, in transition areas between Cerrado (Brazilian savanna), Caatinga (semi-arid biome) and Atlantic Forest. Several plant species are known to occur in disjunction in these two distinct vegetation types. The present study aimed to verify possible differences in the amount, type, frequency, and size of phytoliths produced by the same plant species in these distinct vegetation types. The study areas were restingas located in the state of Rio de Janeiro and

campos rupestres in the São José mountain range in Minas Gerais, both in south-eastern Brazil. The samples were collected in 2017 and 2018 and specimens were deposited in the herbarium of the National Museum/UFRJ (R). Phytoliths were extracted through the wet method, using a solution of nitric acid 65% and sulfuric acid. Nine of the ten selected species produced phytoliths and showed differences in quantity, morphotypes, frequency and size of phytoliths. Nevertheless, similarities were also found. Principal component analysis (PCA) showed that individuals from the same species, but from different environments, tended to cluster. Results indicate that not only the environment, but also the taxonomic affinity seem to influence the production of siliceous particles and that there are patterns in their production.

4 PHYTOLITHS IN FERNS: CYATHEA DELGADII STERNB. AND PTERIDIUM ARACHNOIDEUM (KAULF.) MAXON FROM DIFFERENT ENVIRONMENTS

**Abstract author(s):** Ricardo, Sarah (National Museum of Brazil - Federal University of Rio de Janeiro) - Coe, Heloisa (University of the State of Rio de Janeiro, Brazil) - Alves, Ruy (National Museum of Brazil - Federal University of Rio de Janeiro)

**Abstract format:** Oral

Ferns are vascular plants which often present silicification in their tissues. This study analyzed the tree fern *Cyathea delgadii* Sternb (Cyatheaceae), and the bracken fern *Pteridium arachnoideum* (Kaulf.) Maxon (Dennstaedtiaceae). Both species are native, but not endemic, to Brazil. The specimens were collected in 2017 and 2018 in two environments with different characteristics: coastal strand restingas (RE) in Rio de Janeiro and campo rupestre (rupestrian grasslands) (CR), in Minas Gerais, Brazil. Phytoliths were extracted using nitric and sulfuric acids and analyzed for morphology, quantity, and size. Regarding the level of production, *C. delgadii* was classified as “Very high” (> 300 phytoliths in 3 transects) in both environments. The species presented 4 types of silicification in CR (ELONGATE, PUZZLE, stomata and trichomes), one more (trichomes) than in restinga. In both environments, the predominant type was PUZZLE (RE: 52%: CR: 59%). PUZZLE in *C. delgadii* presented almost twice the amount in CR. Silicified stomata were also slightly larger in CR. The production of phytoliths from *P. arachnoideum* was “Medium” (50-100) in RE and “High” (100-300) in CR. In restinga, ELONGATE, SPHEROID ORNATE, PUZZLE and trichomes were observed. In CR, the species produced practically the same types, although no SPHEROID ORNATE was observed, instead, stomata were present. The predominant morphotypes were PUZZLE (RE: 66%; CR: 67%) and trichomes (25% in both environments), showing relative similarity in the morphotypes and frequencies between the environments. PUZZLE presented a slightly longer length in RE than in CR. Results show that despite being from different families, the studied groups presented a large amount of phytoliths, with a predominance of PUZZLE. There are still many questions to be elucidated concerning the relationship between populations and different environmental variables with phytolith production.

5 PHYTOLITH PRESERVATIONS IN MODERN AND FOSSIL DEPOSITS FROM PERMAFROST IN THE KOLYMA LOWLAND

**Abstract author(s):** Zanina, Oksana (Institute of Physicochemical and Biological Problems in Soil Science RAS)

**Abstract format:** Oral

Rocks formed at Earth’s surface are under the influence of external processes, as a result, they lose their initial physical and chemical stability and are destroyed. In permafrost area at low temperatures and multiple phase transitions “water - ice”, these processes acquire a special specificity. Probably, cryogenic processes “erase” information about the existing biocoenoses, leading to the destruction of mineral and organic new formations (including phytoliths) in the material of the seasonally thawed layer.

Phytoliths are important microfossils used for paleoecological reconstructions of past plant communities. The latter studies have shown that phytolith assemblages are relatively unstable in soils and sediments. Given the vulnerability and ability of phytolith assemblages to partial destruction at low temperatures after sedimentation and its effect on paleoecological interpretation, it is surprising but this process poorly understood.

We investigated characteristics and preservation of phytoliths from about 25 modern and 10 paleosols at 30 sites in northeast Russia, Lower Kolyma area (68° с.ш., 161° в.д.). Studies have shown that strongly corroded phytoliths are constantly present in the permafrost. The assemblages of phytoliths within soils in the study area are similar. There are dominated by elongate and lanceolate phytoliths, followed by blocky, tabular and trapezoid phytoliths. On the surface of phytoliths from modern soils, there are individual caverns, numerous cracks, often the surface has scales, which indicates intensive weathering. The most common are corroded elongated, lanceolate, and trapezoidal forms. Quantitative and qualitative analysis of the phytolith in the Late Pleistocene Ice Complex showed their best preservation and diversity in the paleosols organogenic layers, peat bogs and lake sediments.

Cryogenic destruction of phytoliths is confirmed. The results can be used to clarify the genesis of the permafrost deposits and to reconstruct the paleogeographic conditions of their formation.

The study is supported by the RFBR grant №20-05-00559.

6 SILICON STABLE ISOTOPES IN PHYTOLITHS: A TOOL TO ASSESS WATER AVAILABILITY? PRELIMINARY RESULTS OF LASER ABLATION ANALYSIS OF EXPERIMENTAL CROPS

**Abstract author(s):** Lancelotti, Carla (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra; ICREA) - Frick, Daniel (GFZ German Research Centre for Geosciences, Earth Surface Geochemistry) - D’Agostini, Francesca (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra; CERES team. DIADE – Diversity and Adaptation and Development of plant Group, Université de Montpellier) - Varalli, Alessandra - Ruiz-Pérez, Javier (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra) - Madella, Marco (CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra; ICREA) - Vadez, Vincent (IRD – Institut de Recherche pour le Développement. Université de Montpellier, UMR DIADE, BP; ICRISAT – International Crops Research Institute for Semi-Arid Tropics. Patancheru) - Kholova, Jana (ICRISAT – International Crops Research Institute for Semi-Arid Tropics. Patancheru)

**Abstract format:** Oral

Identifying plant water availability from archaeobotanical remains is one of the open challenges of the discipline. Several methods have been developed with different degrees of success, especially for C3 plants. Amongst these, phytoliths silicon stable isotope analysis has been suggested as a possible proxy for the environmental conditions in which plant developed. In this paper we present preliminary results on the analysis of silicon stable isotope on phytoliths extracted from leaves of selected C4 species.

Landraces of *Sorghum bicolor* (L.) Moench, *Pennisetum glaucum* (L.) R.Br. and *Eleusine coracana* (L.) Gaertn. were grown in lysimeters under different water regimes at the International Crops Research Institute for the Semi-Arid Tropics (ICRISAT). The plants were watered according to their transpiration rate to simulate different conditions: from water abundance to extreme water stress. Phytoliths were extracted from the leaves of these plants and analysed by femtosecond laser ablation multi-collector inductively coupled plasma-mass spectrometry (fsLA-MC-ICP-MS). This method allows the measurement of individual phytoliths thus increasing the interpretation potential.

We have so far conducted 2 sets of analysis: the first on all three species and the second only on sorghum. For the first set we analysed 14 samples, each corresponding to a mixture of mature and young leaves, and we analysed bulk (i.e., clusters of phytoliths) and specific morphotypes within silica skeletons for a total of 239 data points. The initial results suggest no significant differences at large in relation to water treatment but highlighted differences between species and geographic origin. However, stomata reading in sorghum signal a sensibility of these phytoliths to water treatment signal. Thus, for the second set, we analysed 5 landraces of sorghum concentrating on bulliforms, stomata and elongates. The rationale behind this was to reduce noise and concentrate on the morphotypes that are related to the transpiration stream.

7 UNDERSTANDING THE RELATIONSHIP BETWEEN THE PHYSIOLOGY OF WATER TRANSPORT AND PHYTOLITHS PRODUCTION IN SELECTED C4 CROPS: AN EXPERIMENTAL APPROACH

**Abstract author(s):** D’Agostini, Francesca (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d’Humanitats, Universitat Pompeu Fabra; CERES team. DIADE – Diversity and Adaptation and Development of plant Group, Université de Montpellier) - Vadez, Vincent (CERES team. DIADE – Diversity and Adaptation and Development of plant Group, Université de Montpellier; IRD – Institut de Recherche pour le Développement. Marseille; ICRISAT – International Crops Research Institute for Semi-Arid Tropics. Patancheru) - Kholova, Jana (ICRISAT – International Crops Research Institute for Semi-Arid Tropics. Patancheru) - Ruiz-Pérez, Javier (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d’Humanitats, Universitat Pompeu Fabra) - Madella, Marco (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d’Humanitats, Universitat Pompeu Fabra; ICREA – Catalan Institution for Research and Advanced Studies; Department of Geography, Archaeology and Environmental Studies, University of Witwatersrand) - Lancelotti, Carla (CaSEs – Culture and Socio-Ecological Dynamics Research Group. Departament d’Humanitats, Universitat Pompeu Fabra; ICREA – Catalan Institution for Research and Advanced Studies)

**Abstract format:** Oral

Phytolith formation is related to the plant’s transpiration stream which in turn depends on water availability. As such, phytolith analysis have previously been used to explore past water regimes in archaeobotanical samples. For crops of agricultural interest, like some C4 grasses, the mechanisms of phytolith formation are not yet completely understood and there is debate whether genetically and environmentally controlled morphotypes are informative about water availability.

The aim of our research, conducted within the framework of the project RAINDROPS (ERC-Stg 759800), was to test if phytoliths from C4 crops could be used to identify different water regimes in archaeological contexts. Therefore, we carried out an experimental cultivation of ten traditional landraces each of sorghum (*Sorghum bicolor* L.Moench), pearl millet (*Pennisetum glaucum* L.R.Br.) and finger millet (*Eleusine coracana* L.Gaertn.), simulating irrigated and rain-fed scenarios. Experiments were conducted in lysimeters, which allowed us to keep a tight control on water regimes while plants grew in field-like conditions. Our first set of analysis concentrated on leaf samples, being the site of most transpiration, and consequently were assumed to produce the strongest variability among the different phytolith morphotypes.

In this paper we present the first results of analyses on phytolith concentration and morphotype assemblages. We found that millets presented similar patterns, producing more phytoliths in well-water conditions, whereas sorghum response was independent of the water regime. The ratio between fixed and sensitive morphotypes discriminated water availability only for some landraces. Within the same species, not all landraces responded equally to water treatments, suggesting that silica accumulation and mor-

8

phototypes production might also be influenced by genetics. Future steps will include the analysis of stems and chaffs to construct a complete picture of how water availability affects phytolith production and to better assess the potential use of C4 phytoliths for archaeological studies on past agricultural systems.

8

WHAT DO WE KNOW ABOUT HEATED PHYTOLITHS BECOMING AUTO-FLUORESCENT?

**Abstract author(s):** Hodson, Martin (Oxford Brookes University) - Devos, Yannick - Hermans, Rosalie (MARI, Vrije Universiteit Brussel) - Segato, Tiriana - Delplancke, Marie-Paule (4MAT, Université Libre de Bruxelles) - Chevalier, Alexandre (Royal Belgian Institute of Natural Sciences, Brussels) - Vrydaghs, Luc (MARI, Vrije Universiteit Brussel)

**Abstract format:** Oral

A number of methods have been used in the past to determine whether phytoliths in archaeological contexts have been fired and/or heated: morphological alterations, coloring and opacity, refractive index, and Raman spectroscopy. However, none of these have satisfactorily discriminated between burned and unburned phytoliths. We will report on a series of investigations into auto-fluorescence in heated phytoliths. We are hopeful that this may become an important proxy complementing the previously developed techniques for tracking evidence of fire and heating within archaeological contexts.

Our work has been in two parts. Firstly, we examined phytoliths found in soil thin sections of well-characterized modern and archaeological contexts from Northern Europe. Secondly, we carried out some experimental work to determine the precise temperatures at which auto-fluorescence occurs.

We have unequivocally shown that auto-fluorescent phytoliths can be found in many archaeological contexts where heating or burning has occurred. Unheated material shows no auto-fluorescent phytoliths, while combustion features and burned material revealed many auto-fluorescent phytoliths. These included both cell wall and lumen phytoliths.

As yet it is unclear precisely what the lowest temperature is where fluorescence can be observed, as lower temperatures often do not remove enough organic material to visualise phytoliths. Phytoliths show morphological alterations and melting as the temperature is raised above 500oC, and when this occurs auto-fluorescence can cease. As yet we are uncertain of the mechanism behind heat-induced auto-fluorescence, and that is an important topic for future research.

9

IT IS ABOUT TIME: FOUR CONSIDERATIONS IN STUDYING PHYTOLITH EVOLUTIONARY HISTORY

**Abstract author(s):** Katz, Ofir (Dead Sea and Arava Science Center)

**Abstract format:** Oral

Phytoliths are an important tool for archaeologists, palaeoecologists, and palaeobiologists, which enables interpreting human activities, animal diets, ecosystem structures and evolutionary histories. Nevertheless, its application is hindered by unclarity over the role of phytoliths in plant biology and ecology, environmental variations in phytolith formation, and lack of evolutionary framework. Thus, understanding the ecological roles of phytoliths and their evolutionary history is fundamental for increasing our understanding of this phenomenon, its origins, and its significance for past, present and future ecosystems. Achieving this goal requires acknowledging and incorporating into our thinking four key facts that many of us are prone to overlook. First, there is great taxonomic variance in plant silicon and phytolith contents, forms and roles, in herbivore responses and dietary preferences, and in types of current and fossil/archaeological evidence. Second, species and their traits, as well as whole ecosystems, should be seen in the context of their entire evolutionary history, and may therefore reflect not only adaptations to extant selective forces but be anachronisms. Third, evolutionary history and evolutionary transitions are complex, resulting in true and apparent asynchronisms. Fourth, evolution and ecology are multi-scalar, in which various phenomena and processes act at various scales. These considerations are also relevant to other types of archaeological studies, especially ones that employ evolutionary frameworks. Considering these will bring us closer to gaining a more complete understanding of one of the most exciting and elusive phenomena in plant biology and ecology and how it can be utilized.

ASSESSING PHYTOLITH PRODUCTION IN MEDITERRANEAN HERBS

**Abstract author(s):** García-Granero, Juan José (Spanish National Research Council - IMF-CSIC; University of Oxford) - Patús, Cristina (University of Barcelona)

**Abstract format:** Poster

Herbs are aromatic plants belonging mostly to the onion subfamily (Allioideae), the mint family (Lamiaceae), the parsley family (Apiaceae) and the tarragon family (Asteraceae), many of which are native to the Mediterranean. The culinary use of herbs has been textually documented in the eastern Mediterranean since the Late Bronze Age (Linear B tablets, Greece, c. 1450-1200 BC). However, due to the nature of the archaeological record, where most macroscopic plant assemblages are preserved through charring, herbs are largely underrepresented and have been seldom considered when assessing past culinary practices. Here we present the results of a modern phytolith reference collection of Mediterranean herbs, which show the great potential of phytoliths to bring ‘invisible’ plant ingredients into archaeological narratives. Although herbs are relatively poor phytolith producers, certain taxa produce distinctive morphotypes at different taxonomic levels that can be used to identify the culinary uses of Mediterranean herbs in the archaeological record.

LEAF PHYTOLITHS PRODUCTION IN PLANTS OF UPPER MONTANE RAIN FOREST (ATLANTIC FOREST BIOME) - BRAZIL

**Abstract author(s):** Mozer, Jonathan (PPG- Geography, UNIOESTE, Marechal Cândido Rondon) - Calegari, Marcia (Geography Collegiate, UNIOESTE, Marechal Cândido Rondon) - Vidal Torrado, Pablo (Department of Soil Science, ESALQ/USP, Piracicaba) - Madella, Marco (CaSEs Research Group, Department of Humanities, Pompeu Fabra University) - Macedo, Rodrigo (Instituto Nacional do Semiárido, Campina Grande) - de Souza, Erica (PPG- Geography, UNIOESTE, Marechal Cândido Rondon)

**Abstract format:** Poster

To understand the expansion/retraction dynamics of the Atlantic Forest on the Brazilian coast during the Quaternary, it is necessary to understand the records that it leaves on the ground. Phytolith analysis is a promising tool that provides subsidies for this purpose. This study aimed to know the phytolith production in representative plants of de Cloud forest (Upper Montane Rain Forest) collected in Parque Estadual Carlos Botelho (PECB), a permanent preservation area of the Atlantic Forest Biome, located in São Paulo State (Southeast Brazil). A phytolith reference collection (PRC) of leaves of 82 species, representing 39 families (26 eudicots, 11 monocots, 1 pteridophyta and 1 tracheophyta) was elaborated. For each sample, the phytolith production, redundancy, and the identifications of diagnostic morphotypes were established. The extraction procedure used was the dry ashing adapted from Campos & Labouriau (1969) and Piperno (2006). According to results of the PRC analysis, 53 different morphotypes were identified for this set of studies plants. 73% of the samples (60 species) presented abundant phytolith production, 15% (12 species) good production, 5% (4 species) rare production, and only 7% (6 species) did not produce phytoliths. The families belonging to the Eudicot group showed production of Spheroid psilate and Blocky psilate, which were the most frequent in species, 66% and 46%, respectively, of PRC in general, these are representative of forested environments, as corroborates Piperno (2006) and ICPT (2019). The Conical with acute basal projections morphotype demonstrated taxonomic significance for the Arecaceae family (Hat-shaped ICPN 1.0). The grass species (Monocot) produced short cells diagnostic morphotypes: Bilobate, Saddle, Blocky, and Polylobate; with specific Panicoid and Chloridoid Poaceaes subfamilies, and the Conical Cyperus where identified in the samples of Cyperaceaes, corroborate the studies that indicate these morphotypes as diagnostic for this family.

MOBILE PASTORALISM, SALT AND CHEESE. ETHNOGRAPHIC PERSPECTIVES ON THE SPATIAL CONFIGURATION OF A LONG-TERM MEDITERRANEAN TRIAD

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Attema, Peter (University of Groningen) - Neef, Wieke (University of Ghent)

**Format:** Regular session

This session is dedicated to a historically fundamental cornerstone of the Mediterranean economy, mobile pastoralism, and to an important precondition for its functioning, salt. Both are indispensable for the production of an easily preserved and traded commodity, hard cheese. Two previous EAA sessions (2011 and 2012) focused on upland pastoral sites, published in the edited volume “Summer Farms: Seasonal exploitation of the uplands from prehistory to the present” (2016, Sheffield Archaeological Monographs 16, edited by John Collis, Mark Pearce and Franco Nicolis). In his contribution “Hard cheese: Upland pastoralism in the Italian Bronze and Iron Ages”, Mark Pearce stressed the importance of the production of hard cheese for upland land use in later Italian prehistory, as well as the central role of salt in animal husbandry and cheese-making.

In this session, we aim to look beyond the upland summer farms and focus on the exchange networks in which they were embedded. We welcome papers that explore the spatial configuration of pastoral mobility of all ranges in combination with access to markets where salt could be obtained (if not at the source itself), where dairy products could be traded (if not directly to consumers) and ways in which the triad was organized. We aim at a mix of ethnographic, ethnoarchaeological and archaeological perspectives from around the Mediterranean basin.

ABSTRACTS:

1

WHITE ELEMENTS FROM A MOUNTAINOUS LANDSCAPE: SALT, SNOW, AND LONG-TERM PASTORALISM IN THE MONTI LUCRETILI AREA

**Abstract author(s):** Bernardi, Martina - Farinetti, Emeri (Dipartimento di Studi Umanistici, Università degli Studi di Roma Tre)

**Abstract format:** Oral

The mountain landscape of the Lucretili Mountains, a territorial district in the north-east of Rome in the Roman Sabina, has been marked, as still today, by pastoralism: for centuries, forms of mobile pastoralism have been practiced seasonally. However, we refer to a short and medium-range transhumance, since this activity developed mainly at a local level and not at a wide-ranging level, as instead attested in other Apennine areas.

In mountain contexts, it is also easy to find on the modern maps some talking toponyms that recall the presence in the rural landscape of some specific trades linked to the movement of shepherds. Sabina has always been ‘renowned’ for the salt trade. Like salt, snow was also an essential element in nutrition, a very useful resource for the preservation of foods or for their production. The transport and trade of snow continued, with perhaps a slowdown in the early Middle Ages, until more recent times, governed by

contracts granted by the Papal State. Snow, like salt, had to follow precise routes, both land and river, able to lead it first to small towns and then to the city.

The areas of the Lucretili that best suited this activity were Monte Gennaro, which dominates the south-eastern portion of the area, and Monte Pellecchia, near Monteflavio. Along the ‘routes of the snow’ it is still possible to find small places of worship dedicated to the Madonna della Neve: the evidence testifies to the strong devotional character that this activity, strongly rooted in the territory, assumed in the perception of the local population.

This paper will try to suggest ideas for a diachronic research on human mobility in the area, linked to pastoralism and to the élitarian trade of the ‘white’ elements of salt and snow.

2 THE MADONIE MOUNTAIN “UNDE SAL FODITUR”

**Abstract author(s):** Canale, Alessandra (Dipartimento Culture e Società, Università di Palermo)

**Abstract format:** Oral

In the north-western Sicily, into the Madonie mountains’ heart, a very big rock salt deposit has been known since the republic roman period and used until now. According to the most recent researches, human settlement interested the mountain area since the prehistoric period and we have reason to believe in the important role of salt, right in favour of pastoral economy development in this area of the island, till now.

The study benefits from the long term research carried out since the seventies in the Imera river valley (on the western slope of the mountains) as well as the studies developed about Halaesa roman town (on the east slope of the mountains).

The methodological approach, organized by samples areas, looks at the ancient paths system as a starting point of the analysis in the field. So we tried to understand the way in that natural resources was used in the past; to hypothesize pastoral mobility phenomena; to examine the relationship with the surroundings background (cities and rural settlement); to reconstruct the socio-economic implications over time.

3 “THOSE WHO SPRINKLE SALT PREFER MINERAL SALT” (VARRO R.R., 2.11.3): SHEPHERDS, SALT AND MARKETS IN ROMAN AND MODERN ITALY

**Abstract author(s):** Pasquinucci, Marinella (University of Pisa)

**Abstract format:** Oral

Ancient Greek and Roman sources document the use of salt in livestock and cattle breeding, in preserving cheese, meat and hides, in veterinary practices. In the Mediterranean district pastoral mobility, vertical and horizontal, short- and long-distance, small- and large-scale transhumance was and is practiced on various scales in various geographical and historical contexts. This practice, which is strictly connected with salt supplies, has persisted over time with diachronic divergences linked with political, social and economic factors (e.g. subsistence and market economies) varying through time. In Roman and Modern times, in particular, pastoral mobility was regulated and attracted investments in central and south Italy. During the late Roman Republican period and the Empire, the markets of Rome and other cities, as well as the military supplies (which included dairy products, meat, wool and hides) made the practice highly profitable. In Medieval/Modern times large evidence of products of the transhumant breeding and their marketing is provided by the Dogana romana (Roman Customs Duties), the Dogana dei Paschi di Siena (The Customs of the Pastures of Siena) and by the Customs (Dohana Menae Pecudum Apuliae) of Foggia.

4 ON THE TRAIL OF SHEPHERDS AND SALT FROM THE COAST TO THE MOUNTAINS AND VICE VERSA IN NE ITALY

**Abstract author(s):** Montagnari Kokelj, Manuela (University of Trieste) - Migliavacca, Mara (University of Verona)

**Abstract format:** Oral

Archaeology of pastoralism and archaeology of salt share research methods based on direct and indirect indicators: geomorphological and environmental characters, sedimentology and soil micromorphology, archaeozoology, ethnography, ethnohistory and material culture. The possibility of investigating only one or more of these elements is conditioned mainly by the results of past field explorations/studies and by the present-day research team (interdisciplinary or not) and available facilities.

On these premises we have compared the multidimensional character of pastoralism in Veneto and Friuli Venezia Giulia (NE Italy). Sedimentology and soil micromorphology have been fundamental to identifying some Karst caves as stables. The revisions of associated artefacts in the sites supported the hypotheses on the (dis)continuity of use, while faunal remains were less indicative. The presence of a relatively high number of exotic materials - whose non-local origin, first proposed on traditional, typological-comparative studies has been confirmed by recent archaeometric analyses - may be related to transhumant pastoralism, but marine salt might have been the main attractiveness. From prehistory to Roman times, and in a different context, a similar integration of methodologies resulted successful once again. Moreover, soil chemistry is giving good results also off-site, as demonstrated by the recent study of the Bronze Age embankment road devoted to the passage of herd localized in the Po lowland. This case study shows that ancient paths and roads and pastoral movements can be overlapping: in the reconstruction of both, physiographic features - particularly in mountain regions - play an undeniable role together with historical and ethnographic data. Our studies used regional ethno-historical data, combined with field ethnographic and ethno-archaeological research: though what is ‘traditional’ is

not inevitably ‘ancient’, our experiences indicate that data derived from the studied area - rather than from contemporary primitive societies - are useful to identify general trends and recognize sites and structures.

5 ALONG THE “VIA SALARA” (ABRUZZO – CENTRAL SOUTHERN ITALY). CHASING SALT AND ITS MARGINAL MOUNTAIN ROUTES

**Abstract author(s):** Del Fattore, Francesca Romana (Università degli Studi Internazionali di Roma)

**Abstract format:** Oral

This presentation examines in detail a segment of a route (about 20 km) located in Southern Abruzzo (Italy). The work is part of PECUS (www.pecus-project.org), an interdisciplinary project dedicated to the analysis of the drove-roads network in Central-Southern Italy. We are between Anversa degli Abruzzi and the Godi Pass (Province of L’Aquila), along the ancient path known in the local tradition as ‘via Salara’ (Salt Route). The area is rich in archaeological evidence, documenting, since protohistoric times, the presence of communities dedicated to pastoral activities. These traditions still exist today in residual forms: several local shepherds/breeders produce cheese in traditional ways. The ‘Via Salara’ connected this mountain district with the routes that, already in the protohistoric age, descended towards the Adriatic Coast, where important settlements flourished between the Final Bronze Age and the Early Iron Age. The area is also at the heart of the historic drove-roads network, along which thousands of animals (and humans, seeds, object, uses, ideas + salt) moved until the last Century. Stratigraphic excavations carried out between 2013 and 2016 along the route (‘I Giardini’ site), have brought to light a settlement of long duration (Republican/Late Antique period). Data from surveys carried out in the area of the Godi pass, further South, document an intense frequentation linked to the exploitation of summer pastures, from protohistoric times to contemporary times. Here, every year, a family of breeders (and cheese producers) brings their flocks from Apulia, reusing the ancient sheep-pens located exactly along the Via Salara. Archaeology and ethnoarchaeology will be used as tools, if not to physically document the presence of salt in the archaeological record, then certainly to reconstruct, diachronically, the network of routes in which our path was inserted. A model of that interconnected road system typical of the Central-Southern Apennine chain.

6 BUTTER AS CURRENCY: OUTLAND PASTORAL PRACTICES AND EXPORT MARKETS. THE VIEW FROM NORWAY

**Abstract author(s):** Hill, David (NIKU - Norwegian Institute for Cultural Heritage Research)

**Abstract format:** Oral

The demographic expansion from the end of the Viking Age and until 1350 put pressure on cultivable land. Mountain pastures and forest areas were taken into use for seasonal grazing. Summer farms became established and cattle, goats and sheep were moved into the outland zone. Established meadows and fields could then be used for crops and producing winter fodder thus expanding a farm’s production. Rents and taxation were fixed and paid in naturalia. Most farms were required to pay in butter and grain as well as other products. The church was the largest landowner (44%) and became an exporter of butter from towns. Salt was produced locally from sea water in cauldrons heated by fires. The production of calories in the form of preserved animal fat became therefore a currency. This paper will focus on the economy behind the production of butter and salt and their integration within export markets.

7 CHEESE (AND HONEY?) PRODUCTION AROUND DJEBEL GORRAA IN THE SOUTHERN BAGRADAS VALLEY (AFRICA PROCONSULARIS)

**Abstract author(s):** Raaijmakers, Mariette (Università di Trento) - Attoui, Redha (Université Badji Mokhtar, Annaba, Algérie) - Pol-la, Silvia (Freie Universitaet Berlin Institut für Klassische Archäologie) - Battisti, Alessandro (indipendent researcher) - Masrouhi, Amara (King Abdulaziz University: Jeddah)

**Abstract format:** Oral

Our countryside survey of 660 km2 in Africa Proconsularis, around Thugga and Thibursicum Bure, is in the centre of the Northeastern Maghreb salt province, one of the biggest, but also the least known in the world. Modern halotoponymy shows the presence of salt outcroppings and mines and saliferous streams: the very frequent hydronym oued Mellah of many streams in this Triassic region corresponds with flumen Salsum mentioned in the geography of ancient NAfrica by Pliny, NH 5.10. The salt outcroppings are on the margins of the surveyed region, so salt was a ubiquitous and cheap resource for the 21 cities and 264 farms. One partially excavated farm at Ain Wassel contained 6 plain ware vessels, some 20cm high, with some holes, used for honey and/or cheese making. Under the faunal remains of this farm sheep and goats are the most important species. The farm is situated at the foot of the Gorraa plateau (cuesta 7x 2,5 km), used for short distance transhumance during the rainless summers by the Pères Blancs since 1911 for their famous breed of black sheep of Thibar. Monchicourt admired in 1905 three herds of 200, 100 and 50 cows on the Gorraa. The Ain Wassel farm at 530 asl is only 2 km from the plateau at 850 asl. The many other farmers around the plateau could bring their sheep and goats there and eventually also their beehives as the many beekeepers did at the beginning of the last century, each summer when the flowering in the valleys ended. In the Bagradas Valley we have to imagine mixed farming, where pastoralism was an important but not exclusive activity, contributing to a sustainable system without (visible) solution of continuity during the first 7 centuries of our era.

8 INTRODUCTION: REFLECTIONS ON THE SPATIAL CONFIGURATION OF MOBILE PASTORALISM

**Abstract author(s):** Attema, Peter (University of Groningen) - de Neef, Wieke (University of Ghent)

**Abstract format:** Oral

In the introduction to this session the organisers will discuss the importance of the study of highland exploitation from the perspective of landscape archaeology and ethnography. We draw attention to established practices as well as recent theoretical and methodological advances in the spatial study of the long-term Mediterranean upland and highland triad of mobile pastoralism, salt and cheese. We will emphasize the importance of the study of the functioning of exchange networks in which the economy of mobile pastoralism and upland and highland exploitation was embedded. Our expectation is that the cases presented in this session will help explore the spatial configuration of pastoral mobility of all ranges in combination with access to markets where salt could be obtained (if not at the source itself), where dairy products could be traded (if not directly to consumers) and ways in which the triad of pastoralism, the salt trade and cheese production was organized. We will outline the need for a diachronic, pan-Mediterranean, interdisciplinary approach comprising of ethnographic, ethnoarchaeological, landscape archaeological, environmental and biological approaches to understand such systems.

9 SALT, CHEESE AND HIGHLAND EXPLOITATION. MULTIDISCIPLINARY INVESTIGATIONS OF PASTORAL LANDSCAPES IN THE POLLINO MOUNTAIN RANGE (CALABRIA, ITALY)

**Abstract author(s):** Attema, Peter (University of Groningen) - de Neef, Wieke (University of Ghent)

**Abstract format:** Oral

In this paper we discuss the results of the first campaign (summer 2020) of the multidisciplinary Monte Pollino Project landscape archaeological project (MPP) that arose out of the on-going Raganello Archaeological Project (RAP) of the Groningen Institute of Archaeology in northern Calabria (Italy). The project, a collaboration between the Universities of Groningen and Ghent, the local Gruppo Speleologico “Sparviere” and the prospection company Eastern Atlas investigates highland exploitation from the perspective of the longue durée using a combined landscape archaeological and ethnographic approach. The MPP seeks to understand highland exploitation within the context of changing highland and lowland socio-economic and cultural relationships from prehistory up to the present. MPP’s premise is that through the study of the ‘logic’ of sub-recent pastoralist practices and the study of environmental impacts - important topics that are worth of study themselves - we can design a useful framework for the interpretation of past practices and their impacts. In our contribution we will first report on our fieldwork at the Mandra Vecchia site, a summer pastoral camp at 2000 m altitude in the heart of the Pollino park that still functioned in the 1960s. The fieldwork here consisted of artefact and architectural survey, geophysical prospections and ecological research. Then we will look into the role of this camp in local cheese production and its position within a network of transhumance routes - among which the ancient salt route leading up to the Pollino massif from the foothills at Lungro, where a salt mine is located. Finally we will comment on the value of this information for the interpretation of past patterns and practices. Our first field campaign followed upon preliminary ‘desktop’ work published in Attema et al. 2019 (DOI: 10.5325/jeasmedarcherstu.7.4.0482).

10 SHEPHERDS AND ANIMALS ON MOUNT CORNÓN (TRENTINO – ITALY): LIVESTOCK COUNTS IN THE PASTORAL GRAFFITI OF THE FIEMME VALLEY

**Abstract author(s):** Bazzanella, Marta - Ciela, Marika - Tavella, Andrea (Museo degli Usi e Costumi della Gente Trentina)

**Abstract format:** Oral

On the slopes of Mount Cornón in the Fiemme Valley (Northern Italy), at an altitude between 1200 and 2000 meters, more than 47.000 inscriptions were painted during the centuries. These writings are significantly concentrated along the steep trails of the high pastures and date back to a period between 1400 and 1950 AD. The signs made by the shepherds engaged in the local short distance transhumance show: dates, signatures, initials, family symbols, the count of the herds, pictographs, sacred symbols, dedications and greetings.

At the beginning of the summer, the alpine pastures of the valley were crossed by two transhumance flows. An annual one, which arrives in according to usufructs agreed upon in ancient times; and a seasonal one bringing to summer pasture the livestock of local peasants and allowing them the farm work, during the short growing season, without the daily care of livestock.

The shepherds, authors of the writings, often placed after their name’s initials and the date of passage also the livestock counts and the species of the animals grazed. The writings have been inserted in a georeferenced database. The livestock counts are 6192, goats and sheep result more attested than young goats (anzole), billy goats (becchi), heifers and cows; the shepherds have been detected by their initials, signatures and family signs.

Analysing the spatial distribution of the counts and shepherds’ movements, the land use and the documentary sources, gave us a different view of the exploitation of the mountain, due to community choices or to the morphologic features of the area. Considering the livestock counts on a large time scale in relation to the ethno-historical and environmental information provided new data about pastoral strategies in Fiemme valley during the centuries and allowed new interpretative models for the evolution of the Alpine economy.

260 PROBATIO DIABOLICA: ABSENCE OF EVIDENCE IS NOT EVIDENCE OF ABSENCE

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Stead, Stephen (Paveprime Ltd; University of the Arts London - UAL) - Bruseker, George (Getty) - Velios, Athanasios (University of the Arts London - UAL)

**Format:** Regular session

The general understanding that Cultural Heritage documentation shows only the things that have been identified leads us to a diabolical proof (Probatio diabolica) that lack of evidence fails to prove the absence of something. Now this is fine where it is likely that our knowledge is incomplete (Romans in Tywi Forest in Wales) but becomes more of an issue where it is either very unlikely (Romans in Venezuela) or where comprehensive research shows no evidence (Blind-tooled decoration on a book with well-preserved covers).

This session is intended to provide an opportunity for practitioners grappling with documenting absence to talk about their approaches. Papers are invited to discuss:

- how researchers establish complete knowledge in specific areas of their domain to argue with certainty that there is absence of a feature,
- how researchers evaluate conclusions in their domain while being uncertain whether lack of documentation means absence of a feature,
- how researchers come up with criteria to help them choose which features to document as absent,
- what is the kind of automatic reasoning that researchers can compute based on knowledge of absence of a feature.

The session will include invited papers about initiatives from the CIDOC Conceptual Reference Model Special Interest Group (CIDOC CRM-SIG) to help make data about documented absence interoperable and reusable.

So if you are wrestling with recording sterile deposits or areas that show no remains after intensive field survey or missing features during finds conservation we want to hear from you!

ABSTRACTS:

1 FROM ABSENCE TO PRESENCE: SURFACING PARTIALLY PRESENT/ABSENT KNOWLEDGE IN FORMAL REPRESENTATIONS OF HISTORICAL KNOWLEDGE

**Abstract author(s):** Bruseker, George (Takin.solutions; ETH Zurich)

**Abstract format:** Oral

In the established paradigm for integrating cultural heritage information proposed by the CIDOC CRM, the representation of the temporal boundaries of ‘states of affair’ favours the use of start and end events against classes representing states, in order to support the general feature of providing a data structure that enables information integration. In the study of archaeological history, however, primary sources (which, when digitized, could be translated into a semantic representation) often do not provide us with knowledge that could be accurately expressed using start and end events, however. Rather, they often give us weaker, reported evidence of witnessed, on-going states (whose causal starts or ends are unknown). Such reports often do not warrant the strong knowledge claims that the suggested start and end event modelling procedures used in the data integration practices recommended by CIDOC CRM base would suggest. Often documentation is absent start or end events but only provides reported and inferential knowledge. This leads to a lack of expressiveness of this partial historical knowledge to cover these typical cases of partial knowledge and partial absence of knowledge available from primary texts. The absence of formal expressiveness threatens to misrepresent an absence of knowledge. In this paper, we will look at ways of extending the CIDOC CRM to represent reported past states of affairs using ‘state’ like classes. This mode of representation aims to be a compatible extension of CIDOC CRM, respecting but extending its basic logic to apply to the forms of evidence and inquiry typical to archaeological and historical research.

2 METAL, WHEREFORE ART THOU? THE IMPORTANCE OF UNDERSTANDING ABSENT AND INCOMPLETE EVIDENCE WHEN CONDUCTING A HOLISTIC STUDY ON METALS

**Abstract author(s):** Aulsebrook, Stephanie (University of Warsaw)

**Abstract format:** Oral

Archaeologists tend to conceptualise metal as a non-perishable material and treat its appearance in the archaeological record as reflective of its abundance. However, taphonomic factors and the retention of bullion value, due to the ease with which it can be recycled, means that metal is often less likely to enter or remain in the archaeological record whilst cultural influence can lead to its over-representation in certain contexts, especially the mortuary sphere. My current project is a holistic study of metal use at the Late Bronze Age site of Mycenae, in modern Greece, and the key to its success relies upon the contextualisation of the available data, taking account of this issue. This paper discusses several strategies I am pursuing to help fill in gaps in the data, which include detailed study of undisturbed ‘Pompeii-like’ destruction levels and burials of individuals outside of the funerary norms, integrating evidence from indirect methods to identify ‘missing’ objects (such as tool marks) and assessing continuity in Stone Age (i.e. pre-metal) technologies. The main case study is based upon the 1939 excavation season at Mycenae. Revisiting the original field notes has revealed extensive archaeologically significant variation in metal recording and retention strategies between the trench

supervisors, a comparison of which is being used to assess the likelihood of under-recording. Finally I will explain how my database has been designed to enable the recording of finds with poor data, so that every scrap of evidence can be included in my conclusions.

3 GALATIANS IN ASIA MINOR AND ARCHAEOLOGICAL HIATUS, A PROOF OF HELLENISATION?

**Abstract author(s):** Parachaud, Kevin (EA 4270 CRIHAM)

**Abstract format:** Oral

In the modern meaning of the term, Galatians are Late Prehistory European populations that have migrated and settled in Central Anatolia after 278 BC. These Celtic people remained autonomous in the heart of the Hellenistic world until their integration in the Roman Empire in 25 BC. If their presence is well documented in Asia Minor by historic – written as epigraphic – data, we observe a strong lack of archaeological remains from La Tène material culture, characteristic of Temperate Europe between 5th and 1st century BC.

For the moment, latenian material culture in this region is only represented by twenty-eight brooches, three rings and one weapon set. The current consensus considers this absence as an argumentum a silentio of the adoption, by Galatians, of local Hellenistic material culture. But is there not a bias? It is still seducing to suppose the influence of the classical world on Late Prehistory populations.

If we consider the hypothesis that the lack of latenian remains is a consequence of the adoption of Hellenistic material culture by Galatians, archaeological remains should be consistent with a high number of evidences dated to their arrival in the area (278-260 BC) followed by a progressive decline of latenian artefacts progressively replaced by local ones. However, chronological analyse shows on the contrary a random distribution of latenian artefacts all along the period. Furthermore, typological approach reveals some variations, indicating the manufacture of these latenian objects in Anatolia during this period.

In this talk, based on archaeological remains of Galatian migrations in Asia Minor, I would like to propose a reflection about the hypothetico-deductive process considering the interpretation of an absence of proof as a proof of absence.

4 NO DRAGONS HERE: RECORDING THE ABSENCE OF ARCHAEOLOGICAL REMAINS DURING FIELD SURVEY

**Abstract author(s):** Haas, Tymon (Leiden University) - van Leusen, Martijn (Rijksuniversiteit Groningen)

**Abstract format:** Oral

One of the more fundamental problems encountered by the authors when designing a CIDOC CRM extension for systematic archaeological field surveying is the seeming inability of an ontology (“a branch of metaphysics that deals with things that exist in the social world”) to handle things that are absent. In the case of systematic field surveys, some part of the surface of the selected landscape or region is investigated to determine the locations and character of any archaeological remains, but the concomitant observation that (within given confidence boundaries) such remains are NOT present is equally important – for both scientific and heritage management reasons. We therefore explicitly record the absence of surface finds in specific spatial units in our geodatabases, but have no ontological concepts to describe this reality. This paper is intended as a contribution to the session discussion about possible solutions to this problem. We also briefly wish to discuss a subsidiary problem that is more directly appropriate to the session abstract, namely, how to handle the provisional nature of any recorded absences of surface archaeology: obviously, a more intensive survey or a resurvey under more favourable visibility circumstances could well result in the recorded presence of archaeological remains.

5 EXPRESSING CERTAIN AND COMPLETE KNOWLEDGE ABOUT ABSENCE USING THE CIDOC-CRM

**Abstract author(s):** Velios, Athanasios (University of the Arts London)

**Abstract format:** Oral

In a database two approaches are generally adopted for non-existent records: a) the open world assumption where the lack of a record does not mean non-existence of evidence and b) the closed-world assumption where the lack of a record does mean non-existence of evidence. This paper examines an in-between state for a database of a partially complete world where lack of some types of records can be safely interpreted as lack of evidence, whereas the rest remain under the open world assumption. The paper takes a case study of survey forms for the description of the material and techniques of medieval bookbindings. It begins by examining the types of data entered in a database based on a bookbinding survey form. It considers how this data can be expressed using properties of the CIDOC-CRM. It identifies the data which should be considered under the open world assumption and discusses whether the records about non-existent things fall within this category or belong to context-specific closed worlds. It considers a newly-proposed CIDOC-CRM extension for making negative statements within the open world and partially closed world assumptions. The paper tests this categorisation of bookbinding data against a typical survey methodology and the kind of observations done on bookbindings by conservators and bookbinding historians. It concludes with recommendations on the interpretation of bookbinding survey form structures and bookbinding survey principles.

6 THE LINKED CONSERVATION DATA SEMANTIC TEST DATA SET

**Abstract author(s):** Stead, Stephen (Paveprime Ltd; University of the Arts, London; Delving BV)

**Abstract format:** Oral

A proposed new extension of the CIDOC-CRM allows the creation of statements that specific identifiable instances of a class do not have any instances of another class associated with them, providing the opportunity to record negative evidence. For example, it can be used to record that a particular defensive tower had no windows, or a specific archaeological deposit had no pottery in it. In normal databases these absences would appear as a lack of records linking window-like features to the Tower or no pottery records associated with the deposit. The interpretation of this lack of records is then in the hands of the user: if they subscribe to an Open-World view the absence is just an artifact of incomplete knowledge or if they are less “Open” minded it can be taken as anything from lack of knowledge through to an absence of windows or pottery. The ability of the original practitioner to say, with some degree of certainty, that there were no windows or pottery is lost. In addition, the integration of different data sources from, potentially different schools of recording practice, might generate contradictions or new insights.

The challenge is then how to provide tools that can explore the resulting composite data sets, that vary in granularity, complexity and completeness and seek out the extra insights or contradictions. These tools do not exist and are difficult to develop without data sets to trial them on. However, such data sets are resource intensive to compile and typically consist of a few hand-crafted records and there is a lack of impetuous to create them as there are no tools to exploit them: a chicken and egg problem. This data set provides a large body of rich data that such tools can work on with documented examples of contradictions and extra insights.

7 THE APPLICATION OF CRMINF TO DOCUMENTING NEGATIVE CONCLUSIONS

**Abstract author(s):** Stead, Stephen (Paveprime Ltd; University of the Arts, London; Delving BV)

**Abstract format:** Oral

The role of the CRMinf argumentation extension of the CIDOC CRM in documenting the inference chains supporting justifiable conclusions is well documented and understood. However, there is less experience with using CRMinf to document the lack of conviction in a conclusion or indeed in refuting a conclusion.

CRMinf allows the documentation of the adoption of beliefs from others on the basis of trust or the assessment of the underlying inference chains (see for example the excavation at Rigny (Buard et al 2018)). It also allows a practitioner to explicitly state that they do not believe in the conclusions made in previous work as well as laying out clearly on what basis such rejection is founded. This ability to refute previous conclusions, whether from others or yourself, also provides a mechanism to demonstrate the range of materials, theories and secondary evidence that have been considered alongside the primary evidence consulted.

The mechanics of implementing such documentation are explained together with examples that show its application to a variety of archaeological situations.

265 SWEET AND SOUR: SUCCESSES AND CHALLENGES OF COLLABORATION IN ENHANCING RESILIENCE AND SUSTAINABLE MANAGEMENT IN ARCHAEOLOGY [PUBLIC ARCHAEOLOGY]

**Theme:** 3. The new normality of heritage management and museums in post-Covid times

**Organisers:** Benetti, Francesca (Historic Environment Forum) - Westmont, Camille (The University of the South) - Olivier, Adrian (University College London)

**Format:** Regular session

Collaboration in archaeology can take make forms. It can include public bodies, NGOs, private companies, or any number of other groups; it can be time-limited or ongoing; it can have a specific target or very broad objectives. As the benefits of collaboration are increasingly recognized, many calls for grants -- including European grants -- are requiring projects to form partnerships with community organisations. However, making a partnership successful is often hard work. This session aims to explore if and how collaboration and partnerships can enhance resilience and sustainable management of archaeological assets as well as examine the challenges these groups must overcome. We welcome presentations on practical examples of current, past and forthcoming partnerships to explore the experiences from all angles and learn from our successes and failures. How can partnerships enhance the resilience of organisations working in the archaeology sector? What role can partnerships play in a post-Covid landscape? How can we measure successful collaboration? What are the challenges to face when building a partnership or making it work? How can we overcome these challenges? What kind of elements we must keep in mind when looking for partners?

ABSTRACTS:

1 MOVING FROM RESCUE ARCHAEOLOGY TO SUSTAINABLE CULTURAL NETWORKS - AND GETTING AWAY WITH IT. THE CASE STUDY OF “LA BIAGIOLA”

**Abstract author(s):** Sola, Giulia (University of Vienna)

**Abstract format:** Oral

The aim of this paper is to analyse the role that an archaeological site might fulfil in its territory, especially in rural areas. Given the importance of a more direct engagement of the public in communicating archaeological contents and the need of new management approaches in the cultural field, a series of successful good practices will be discussed with a focus on the central role played by archaeologists and local stakeholders.

We will present the case study of the “La Biagiola” archaeological site (Grosseto, Italy), which has been excavated by professional archaeologists under the direction of Italian non-profit ACT - Associazione “Cultura e Territorio” since 2012. The peculiar location of the site has allowed the development of a successful project, at the core of which stands the partnership between the archaeologists and La Biagiola Winery, owner of the land where the site lies on.

This partnership has developed into a series of cultural events blending archaeological guided visits with wine-tasting evenings, during which artistic performances are usually offered. Furthermore, the history of the site has influenced the marketing and production of the winery, as with the revival of the roman cocciopesto technique in winemaking. The result is a multifaceted cultural product capable of involving different audiences, which thereby guarantees mutual visibility to both partners, while also offering a fuller experience of the outstanding resources of the territory.

The successful experiment of La Biagiola is at the centre of a project of integrated cultural networking in the surrounding Area del Tufo. The research, started in 2019 as part of a doctoral project, aims at creating a regional-scale model of cultural networking for rural areas, starting from the investigation of the public of in-situ archaeology and exploiting the spatial interconnections between cultural and natural sites, local businesses and facilities.

2 THE EXPERIENCE OF THE MARINE PROTECTED AREA GAIOLA UNDERWATER PARK (NAPLES, ITALY) - A PUBLIC-PRIVATE PARTNERSHIP

**Abstract author(s):** De Vivo, Caterina (Centro Studi Interdisciplinari Gaiola Onlus - Progetto Museo)

**Abstract format:** Oral

The Marine Protected Area Gaiola Underwater Park is an underwater archaeological park located in Naples, Italy. The Park was instituted by the Italian Government in 2002 and it was managed through a public-private partnership with a local NGO that, in 2018, was nominated by the State as Manger Authority on the site. On the basis of this experience, also a nearby onland Park, the Pausilypon Archaeological Park, is managed now through a public-private partnership with the same local NGO.

This presentation is aimed at explaining to what extent this experience can be considered as successful, especially in terms of accessibility and of community awareness creation.

At the same time, the limits and the criticisms of this model of management will be presented. Particularly, the legislative and the financial issues related to this kind of partnership will be presented, considering the general context of Italy, which is a country where the heritage and archaeological sector is mainly public and managed by the State.

3 FAIL EARLY, FAIL OFTEN! – PRACTICAL EXAMPLES FROM THE CURRENT JOINT PROJECT “MUSEUM AS CO-LAB - OPEN THE BLACKBOX OF ARCHAEOLOGY!”

**Abstract author(s):** Ellwart, Anika (LWL Archaeological Museum)

**Abstract format:** Oral

It’s a paradox: The science which brings find(ing)s to light, lies in the dark. It is left to experts to recover, protect, preserve and to mediate cultural heritage. The public is often left as passive observer without deeper insights into the practices of archaeology. Therefore, the question is, if/how we can curate digital applications that mediate those competences or even give a sensual and interactive archaeological experience? Connected to that, we must also ask which kind of culture of digitality there has to be established in institutions and museums in order to sustainably implement digital applications and curation in exhibition practice?

In the above-mentioned project, three museums in North Rhine-Westphalia, Germany, collaborate in the field of archaeology and work on the development of new digital formats together. The LWL Archaeology Museum in Herne, the LWL Roman Museum in Haltern and the German Mining Museum Bochum aim at making archaeologic methods come alive with the help of augmented and virtual reality. The project focusses on users and their experience. Thus, narratives, (serious) games and digital applications are developed in co-creation using innovative formats. In joint workshops, game jams, prototests etc. there is developed, tested and adjusted what is going to be installed in the museums later on. This, though, requires new forms of work on the in- and outside: Experts from digital, marketing and consulting agencies support the process. They do not only bring along technical expertise, but also train the staff in agile and digital methods. Sticking with the motto “Fail early, fail often!”, in this session I will talk about best and

worst practices from the project. It is running from 2020 until 2023 and is funded by the Digital Fund within the Programme “Digital Culture” of the German Federal Cultural Foundation with 1.3 Mio Euros.

4 SUPPORTING SUSTAINABLE MANAGEMENT IN ARCHAEOLOGY WHERE ‘LONG-TERM’ IS NOT ALWAYS AN OPTION

**Abstract author(s):** Jorayev, Gai (UCL)

**Abstract format:** Oral

Based on the long history of engagements with Central Asia under different collaborative initiatives, this paper will highlight some of the specific challenges in maintaining institutional collaborations and public outreach work in the region. Most of the past initiatives in the region that the author was part of had a clear agenda of contributing to organisational resilience. All ongoing projects with the author’s involvement also have a goal of enabling better management of cultural heritage institutional, building the local capacity, improving participation, and supporting the local development agendas. Implementing those agendas in practice is not easy, partly because of the constraints of the local institutional partners. Similar constraints exist in other regions too, but where Central Asia seems to be truly unique is the diversity and changeability of those challenges. Starting from similar positions 30 years ago, the institutions of research and management now find themselves in very different political and socio-economic environments with direct implications for their day-to-day operations. How to stay committed to collaborations with long-term goals under those circumstances is the main challenge that require flexibility, and some of the first-hand experiences in this area will be presented as part of this paper.

5 BRIDGE OVER TROUBLED WATER: FACILITATING HIGH-LEVEL COLLABORATION IN THE HISTORIC ENVIRONMENT SECTOR IN ENGLAND

**Abstract author(s):** Benetti, Francesca (Historic Environment Forum) - Olivier, Adrian (ICAHM, Historic Environment Forum)

**Abstract format:** Oral

The Historic Environment Forum (HEF) has existed for more than 20 years. Its original aim was to produce an influential policy document for the management of the historic environment (‘Power of place’, 2000). Since then, HEF has brought together senior staff members of non-departmental bodies and NGOs to discuss collectively the priorities for the historic environment sector in England, providing an opportunity to share updates between its members and discuss high-level policies. From 2014-2020, it also hosted the Heritage 2020 programme, which enhanced collaboration in the sector towards an agreed vision. In 2020, HEF has been restructured, thanks to the support provided by Historic England (one of the HEF members). The core of the work is now based on a Strategic Framework for Collaborative Action, and a small number of delivery-focused and time-limited task groups will concentrate on achieving the priority outcomes. This paper will briefly explain the structure of the Forum and its resources, and will then explore its recent challenges and successes, and of course the significant impact of the Covid 19 pandemic on Historic Environment practice and policy.

267 HISTORY OF MEASURING AND CALCULATIONS IN ARCHAEOLOGY

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Plutniak, Sébastien (TRACES Laboratory, Toulouse) - Nakoinz, Oliver - Kerig, Tim (Institute of Pre- and Protohistoric Archaeology, Kiel) - Diachenko, Aleksandr (National Academy of Sciences of Ukraine, Kiev)

**Format:** Regular session

In archaeology, quantitative approaches have a long tradition and belong to the very core of the discipline. However, the history of quantitative archaeological reasoning might be not as straightforward as suggested by the disciplinary history commonly shared among archaeologists. Taken into account different social interests and traditions we doubt the narrative of linear methodological and technical progress, especially considering to a certain extent alternative developments of quantitative approaches in blocks of countries somewhat separated by language barriers. Different communities assign different roles and functions to quantitative procedures applied in archaeology. The use of a kuhnian “paradigm change” framework might be adequate to describe some parts of this history in large scale, but certainly not the whole picture in details, which also includes other complex socio-epistemic processes such as multiple discoveries, parallel developments, absorption, generational distinctions, etc.

This session aims to explore the multitude of factors that determine the development of quantitative archaeology. We intend to stimulate renewed perspectives on this aspect the history of archaeology, through approaches such as historical sociology, examinations of communication issues, analysis of the relationship between sciences and humanities, and of the friction between theory and method.

This session welcomes presentations addressing, for example :

- technological constraints
- different understandings of the role of archaeology within the poles of sciences and humanities
- research questions behind quantitative approaches
- ignorance of the other ideas due to misunderstandings and different slang
- foci on different questions and theories

- different underlying assumptions
  - social conflicts between actors
  - influence of other fields of science on the development of measuring and estimations in archaeology.

We assume that a deeper understanding of the history of research will allow us to develop less biased perspectives in archaeology and more coherent applications of quantitative approaches.

ABSTRACTS:

- 1

### THE MULTIPLE BEGINNINGS OF QUANTITATIVE REASONING IN EUROPEAN ARCHAEOLOGY

**Abstract author(s):** Kerig, Tim (Cluster of Excellence ROOTS, CAU Kiel)

**Abstract format:** Oral

In archaeology, quantitative reasoning is often seen as being introduced by the New Archaeology of the sixties and seventies. In such a perspective, an interest in numbers is too easily criticised as being a relic of an outdated old-fashioned positivism.

Without doubt, processual archaeology enormously brought forward quantification, statistical analysis and modelling. But looking into the actual beginnings of quantitative reasoning in archaeology leads to a very different and much more differentiated story. In the paper I will present and classify some of the multiple beginnings of archaeological measurements in the field, in quantitative reasoning aiming on chronological questions as well as in regards to past economies and social relations.

I will concentrate on some of the earliest examples of computing in archaeology. Using the term computing in its widest sense, its development starts in the West already at the end of the Renaissance and is obviously still ongoing. The reason for the choice of earliest examples is twofold: Research on historiographical agreed innovators can build on a relatively high standard of research and, within archaeology, the innovation itself can be clearly identified as either an archaeological invention or a borrowing from a neighbouring science.

The social context of the innovators as well as failure or success in transmitting the innovation to the following generation will be taken into consideration. Particular emphasis is placed on whether the social background of the innovators have had a significant influence on the success of the particular innovations.

As a baseline of the analysis, I will 1) concentrate on the specific beginnings and will focus on individual researcher’s inventions. Then, 2) these events will be collected in a chronological chart and 3) grouped by multi-dimensional scaling. Finally, 4) I will look into possible connections between those groups and the general history of thought.
- 2

### TAYLOR AND SPAULDING: QUANTIFYING THE PAST

**Abstract author(s):** Smith, Elizabeth (State University of New York University at Buffalo) - Zubrow, Ezra (State University of New York University at Buffalo; University of Toronto)

**Abstract format:** Oral

By the middle of the twentieth century, issues of measurement and methods of quantification were becoming increasingly relevant in archaeology. Two critical figures in North America were Walter T. Taylor and Albert Spaulding. Their works present a critical analysis of the issues and the limitations of technology regarding the development of measurement and quantification within the discipline. Taylor’s work in the late 1940s provided a platform for Spaulding’s work in the 1960s. Together they helped set the stage for what was to be known as ‘processual’ or ‘scientific’ archaeology. Taylor’s ‘A Study of Archaeology’ not only showed the importance of correlations between hypotheses and results, but also created what he termed a ‘conjunctive’ approach to analysis. Unfortunately, a fully-realized form of conjunctive archaeology was not possible due to constraints on calculating power at this point in time. Spaulding developed the concept of archaeology as a science, challenging its practitioners to think quantitatively. He regularly contemplated using correlation techniques to determine the relationships between form, space, and time in archaeological study. We argue that given this use of the nascent computer systems available he was able to actually fulfill what Taylor could not.
- 3

### WAR TECHNOLOGIES IN ARCHAEOLOGY: NUCLEAR PHYSICS AND COMPUTING. A COMPARATIVE HISTORY OF TRANSFERS (1950S-1970S)

**Abstract author(s):** Plutniak, Sébastien (TRACES Laboratory, Toulouse; Centre Émile Durkheim, Bordeaux) - Delley, Géraldine (Laténium, Neuchâtel; Université de Neuchâtel)

**Abstract format:** Oral

During the second half of the 20th century, archaeology in Europe featured several intertwined processes including disciplinarisation, professionalisation, and a global increase in the number of academics practitioners, institutions, and publications. Several factors were at stake, including the introduction and application of new technologies. Two technologies, in particular, had profound effects on the development of the archaeological practice: nuclear technology, leading to radiocarbon chronometers, and automatic computing, leading to computer applications in this field of research. These two technologies originated in the WWII developments and subsequently had crucial roles in the Cold War decades. As a minor scientific domain –compared to domains with direct technological and industrial applications (energy production, medicine, automatic translation, etc.)– the growing archaeological discipline

- nevertheless played a prominent role among the humanities, these technologies being used as a mean for collaboration between disciplines. Joining our previous studies on the history of radiocarbon (Delley 2015) and computers in archaeology (Plutniak 2018), drawing on technology transfer studies (Seely 2003), work on the development of science during the Cold War (Dahan&Pestre 2004; Krige2006; Creager2013), this contribution aims to further explore the specificities of these transfers when they concern scientific fields which are not directly related to the “hard” sciences (as in previous work on linguistics (Léon2015) and aerial photography (Reubi2018)). The case of archaeology is particularly interesting because the boundaries between disciplinary fields are not as clearly established as for other disciplines, and also because archaeologists took sometimes an active part in the development of these new instruments. Comparing the cases of nuclear and computing technologies, we compare the social and economic dimensions of their transfers to archaeology (key institutions and actors), their intellectual effects on archaeological knowledge and methods, as well as the ways these technologies were promoted, the resistance they raised, and their consequences on disciplinary boundaries.

### SAILING THE “BATTLESHIPS”: HISTORY AND FUTURE OF THE FREQUENCY SERIATION IN ARCHAEOLOGICAL METHOD AND THEORY

**Abstract author(s):** Diachenko, Aleksandr (National Academy of Sciences of Ukraine, Institute of Archaeology) - Sobkowiak-Tabaka, Iwona (Adam Mickiewicz University in Poznan)

**Abstract format:** Oral

This paper analyzes the frequency seriation in archaeology which widely known graphical representation has a shape of the “battle-ship curve”. Initially frequency serration was applied to the construction of relative chronologies, i.e. sequences of artifact groups. Recent Darwinian approaches in the discipline suggest additional application of the statistical tools enabling simultaneous consideration of the chronological and spatial factors shaping the data distributions into the “battleship curves”.

Neiman’s (1995) neutral model have shown that the variety of factors impacting the artifact frequencies may be reduced to the extreme case of the rate of innovation and random cultural drift being the only factors of the “battleship curve” arrangement. Further developing the logic of this approach, our paper links the properties of the frequency seriation accompanied by empirical observations to the recent debates on cultural transmission. Considering the obtained results, we argue that explanation in archaeology requires crucial reassessment of the system approach.

### DIGITAL DOCUMENTATION FOR CERAMIC NETWORKS IN THE ARCHAEOLOGICAL CONTEXT: THE CASE OF ROMAN PATRAS, GREECE

**Abstract author(s):** Kougia, Nickoula (Department of Geology, University of Patras; ERAAUB, Departament d’Història i Arqueologia, Facultat de Geografia i Història, Universitat de Barcelona) - Simoni, Heleni (Department of Geology, University of Patras; Institute of Local History, Patras) - Iliopoulos, Ioannis (Department of Geology, University of Patras; ERAAUB, Departament d’Història i Arqueologia, Facultat de Geografia i Història, Universitat de Barcelona)

**Abstract format:** Oral

The necessity has emerged for enriched approaches of interacting research datasets in order to support and reinforce our insight of past societies and their technologies. In an attempt to reconstruct the evolution of ceramic production and its networks in the territory of Roman Patras, Greece, a large corpus of excavated pottery kilns was recorded. Unfortunately, though basic documentation of these excavations survives in some cases, these sites (urban and rural) are superimposed by the modern city, inhibiting in-situ research with further inferences. In an attempt to overcome this paucity a question arose. How could the archaeological knowledge be shaped, reproduced, disseminated and further preserved in a digital age? Our approach moves towards intra-site documentation, data management, digital cartography and spatial analysis, utilizing different types of data for the evaluation of possible patterns indicative of the former urban and rural space. We endeavored to incorporate the archaeological knowledge that emerged in a digital database along with the subsequently acquired geodata of kilns and workshops for pottery production. In the context of their spatial representation, we embraced an alternative configuration for mapping, encompassed with GIS applications and web-based mapping platforms (Google Maps). The synopsis of the Roman ceramic workshops of Patras and their production repertoire, the interpretation of their spatial distribution, as well as the degree of clustering among them, reveal some conspicuous patterns with respect to what we know of the contemporary Roman urban plan worthy to be elaborated. Further assumptions emerged about their domestic or industrial use, whilst their spatial allocation pointed out their organization into discrete areas.

### COUNTING STONES. FROM MARBLE FRAGMENTS TO UNDERSTANDING ROMAN BUILDING SURFACES

**Abstract author(s):** Galán Palomares, Laura (Institut Català d’Arqueologia Clàssica - ICAC) - Soler Huertas, Begoña (Universidad de Murcia - UM; Institut Català d’Arqueologia Clàssica - ICAC) - Gutiérrez Garcia-M., Anna (Institut Català d’Arqueologia Clàssica - ICAC) - Garcia-Entero, Virginia (Universidad Nacional de Educación a Distancia - UNED)

**Abstract format:** Oral

In the last decades, the studies of stone materials have experienced an important boom and within them, the identification and examination of the coverings in marmora (marbles and other ornamental rocks) used in all kind of sites (rural villages, public and privates urban contexts) have multiplied. However, unlike ceramic research, for example, this proliferation in studies has not been accompanied by the development of a specific methodology aimed at the quantification of this type of materials.

This implies the existence of an interpretive problem, at multiple levels. On the one hand, depending on the type of counting performed, the representation of some stone typologies can vary significantly with respect to others (eg, individuals vs. weight vs. m2). On the other hand, the aforementioned absence of a common methodological approach makes it difficult to carry out comparative studies between the various case studies / sites.

The aim of this contribution is to present the problems we have been faced with in the development of this type of study and to propose new possible quantification methodologies. The analysis of specific cases of various kinds of sites and buildings, located mainly in Roman Hispania, and studied by different research teams are the basis of this contribution. This analysis have made it possible to test the suitability of our proposal of quantification methodologies that would allow us to obtain more useful data that can provide better information on the buildings and surfaces where those materials were used.

A. **APPLYING RANSAC ALGORISM TO ANALYSE ARCHAEOLOGICAL AND ARCHITECTURAL MATERIALS FROM OSTIA ANTICA**

**Abstract author(s):** Ogawa, Takuro (Faculty of Human-Environment Studies, Kyushu University) - Hori, Yoshiki (Dept. of Architecture and Urban Design, Kyushu University)

**Abstract format:** Poster

Since 2008, Japanese team has surveyed the whole of the city of Ostia Antica applying terrestrial laser scanners, which supply the reliable three-dimensional data for the shape and surface of buildings. Furthermore, that data allowing the detail shape of each material to be calculated, can provide the new analysis about archaeological finds, such as columns, capitals, coffins, and reliefs. The shape of these finds usually has circles or free curves, other than lines. However, it is difficult to accurately measure shape which has curvature, in archaeological and architectural analysis. So far, such materials had no choice but to be recorded on drawings with approximated to “circle” or “line” by extracting more clear sections of materials, or with freehand. Therefore, we could not objectively discuss about circle-like and sphere-like shapes of materials in analysis. In this paper, we will create reference geometrical shapes to three-dimensional data of original materials by using point cloud and RANSAC (random sample consensus) algorism which is one of the robust estimation methods, and we also will evaluate object’s shapes based on deviation in a normal direction between reference geometrical shapes and object’s shapes. Moreover, validities of reference shapes will be evaluated based on histograms of these deviations. In analysis, five Mensae Ponderariae from Ostia Antica, which were measured in 2015, will be dealt with. Mensae Ponderariae are counter for measuring volumes of liquid and solid goods such as oils and cereals, and they have hemisphere-like cavities which would have held bronze vessels.

B. **STANDARD MEASURES OF CAPACITY IN POMPEII AND HERCULANEUM**

**Abstract author(s):** Ogawa, Takuro (Faculty of Human-Environment Studies, Kyushu University) - Hori, Yoshiki (Dept. of Architecture and Urban Design, Kyushu University) - Ayatsuka, Ikuhiro (Obayashi Corporation)

**Abstract format:** Poster

In a small room beside the western perimeter wall of the Sanctuary of Apollo, a copy of the Mensa Ponderaria, the original of which is kept at the National Archaeological Museum of Naples, is displayed. It is a counter used to check the exact capacity measures used for liquid and solid goods in trade, such as oils and cereals, could be trans-measured between Roman and Oscan capacity feet (OCF and RCF). This counter has already existed in the Oscan period, as proved by the epigraph on carved into the face of the marble counter. When the colony was founded, the Romans upgraded to the system of Roman weights and measures, but traditional Oscan foot has been survived for a long while. Using 5 cavities on this counter Pompeians could easily convert measures by OCF into those by RCF, for example 20 OCF into 16 RCF, as the result of three-dimensionally measuring this copy of counter applying OPT scanner in 2015, where each main cavity was modeled in mesh data and its volume was exactly provided. Of course, we believed that the copy has been produced carefully and exactly into the same shape. This counter appears to have functioned as a standard measure of capacity in trade between the Oscan and the Roman. However, it is not unclear whether the standard measure had been given for vessels or container in daily use at Pompeii and Herculaneum. In the later part of this paper, the capacities of a lead bucket coming from House of Mosaic atrium and a bronze bathtub from House of the Stags are measured by OCF and RCF. Conclusively standard measures of capacity both in Oscan and Roman system could be applied into the containers in daily use at Pompeii and also Herculaneum.

268 **AT THE EDGE: LIMINAL ARCHITECTURE DURING THE MEDIEVAL PERIOD OR LIMINAL ARCHITECTURE: RESISTING THE STEREOTYPE**

**Theme:** 6. Material culture studies and societies

**Organisers:** Patrick, Laura (Queen’s University Belfast) - Kerr, Sarah (Department of Archaeology, University of Sheffield) - Berryman, Duncan (Queen’s University Belfast) - Huggon, Martin (Bishop Grosseteste University) - Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands)

**Format:** Regular session

In looking at the development of medieval buildings within cultural systems, researchers often focus on those within urban contexts, those focused on centres of power, such as castles and monastic estates, and those which show development and connec-

tions across networks and regions. However, often communities and buildings removed from such areas do not appear to conform to the contemporary styles of the period. Some buildings may have been formed in timber rather than stone for example, and as a result, are no longer visible on the landscape. They appear to be ‘missing’.

But what drove this deviation from the perceived norm? Was it the need to use materials more readily accessible? Or, was it a form of resistance against external cultural, political and socio-economic influences and influencers? Why were certain buildings located in liminal areas and did they serve specific functions? Were there liminal spaces within buildings and, if so, why?

This session seeks to explore:

- Communities on the fringe, socially or territorially, and how their architecture reinforced their identify in the face of modernisation, invasion or suppression.
- How medieval communities adapted to external pressures? Did they incorporate new building forms, creating architectural hybrids?
- For those forced to relocate to marginal landscapes, is architecture used as a vehicle to reinforce their identify?
- How have our modern typologies created an artificial sense of ‘liminal’ or ‘other’? And would communities in question have also viewed themselves in this manner?
- Liminal spaces – use of spaces between buildings or space within buildings that is marginalised or avoided.
- Does a lack of evidence necessarily mean a lack of existence? If not, how can this be examined?

**ABSTRACTS:**

1 **LIFE IN THE MARGINS – BUILDINGS AND LIVING ENVIRONMENTS IN THE EARLY MODERN URBAN CENTRE AND PERIPHERY**

**Abstract author(s):** Nilsen, Andrine (Dep. of Historical Studies)

**Abstract format:** Oral

Early modern Swedish urban- and liminal building practices were less divided through building technique, materials or form than their location in ideal- or non-ideal spaces. The regulated town plans created central or peripheral spaces through inclusion or exclusion in the street grid, or inside/outside urban enclosures. The urban building stock was almost entirely wooden in log timber, timber-framing- or post and plank constructions and often in a mix of these techniques. Stone architecture remained rare in Sweden until the late 19th century. Thus, the wooden architecture reflect all levels of society seen in both manor houses and the backyard privy. The Swedes have had a love-hate relationship with wooden buildings i.e. adaptable, movable, fire hazards yet warm and comfortable as well as relatively cheap. The suburban marginal landscapes were midway between the urban and the rural, which might reflect the most crucial difference between the settings. However, stereotypes were created through viewing these houses in the margins (which in fact looked the same as the rest of the building stock) as disorderly, chaotic and shanty for not being included in the formal street grid.

Swedish archaeologists rarely gets to investigate suburban archaeological deposits due to cultural heritage laws limiting the scope to within the urban confine this study is thus developed from historical sources i.e. probate inventories and fire insurance records.

2 **LIMINAL BUILDINGS OR LIMINAL TOWNS? IN SEARCH OF THE (EXTRA)ORDINARY IN FORM, FUNCTION AND MATERIALITY**

**Abstract author(s):** Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands)

**Abstract format:** Oral

When we imagine ourselves a typical medieval Dutch town, we mostly think of streets with beautiful robust stone gables, brick town walls and gothic churches. This ‘romantic’ vision is in fact an idealized view of a successful 16th - 17th century town in the Netherlands. In reality - especially in the Middle Ages - there was a great variety of towns, from very successful Hanseatic trading towns like Kampen - at the end of the Middle Ages replaced by Amsterdam - to ‘failed towns’ with an agrarian character like Terborg.

But even the idealized view we might have of for example Amsterdam doesn’t quite fit. At the end of the Middle Ages, the urbanized towns struggled with the wooden buildings within their borders. Especially because of safety (city fires) and the expanding upper floors above public space. Furthermore even these trade oriented towns still had an agrarian component. On the other hand, many smaller towns like Terborg could be considered as agrarian villages with town rights. The architecture of the buildings within these towns was therefore mostly adapted to farming. But what happens when a successful trade town – Enkhuizen - declines and becomes far more agrarian?

In my paper I will explore the relation between the main agrarian or non-agrarian ‘function’ of towns and the architecture and materiality of its buildings.

3

SPACE EXPLORATION IN MEDIEVAL VILLAGES: RELATIONSHIPS BETWEEN VILLAGES AND MANORIAL CURIAE

**Abstract author(s):** Berryman, Duncan (Queen’s University Belfast)

**Abstract format:** Oral

The built environment shapes the experiences of communities and individuals. Buildings were as important in the medieval country-side as they were in towns. Villages contained a range of buildings, from small peasant houses to the lords’ halls and barns. Interac-tions between peasants and the lord’s buildings occurred every day, and their appearance impacted those viewing them. The farm was the centre of village life, tenants entered to carry out labour services, and the hall hosted the manor court. The buildings of the farm and the hall must have imposed on the villagers a sense of the lord’s authority over them.

This paper examines the use of space within the manorial farm and village, indicating the relationship between the lord and peasants. It will suggest new ways of viewing the complex and understanding the buildings. Differences between farms set within villages and those set within parks will also be considered. The isolation of buildings may or may not be indicative of their importance or social interaction. The geographic focus is Britain and the temporal focus is the later Middle Ages.

4

MOVING THROUGH A LANDSCAPE OF WOOD AND STONE: LOOKING AT THE BUILDING PRACTICES OF SOCIETY IN ULSTER 1400-1650 AD

**Abstract author(s):** Patrick, Laura (Queen’s University Belfast)

**Abstract format:** Oral

In Ireland, the medieval period saw a shift from Anglo-Norman control to a Gaelic resurgence. In Ulster, the lineage to benefit most from this transitional period is undoubtedly the Ó Neill’s of Tyrone. Rising to the pinnacle of the Irish dynastic system, such as it was, The Ó Neill claimed over-lordship for many of the Ulster families, including the O Donnelly’s, O Devlins and the O Hagans: families of their Lucht Tighe or household. Anglo-Norman lords of comparable stature have left an indelible mark upon the Irish landscape, one thinks immediately of Carrickfergus or Trim castle, however, the Ó Neill’s and their household families appear largely untraceable, with the notable exception of Tullach Óg Fort. Partly explained by ‘Scorched Earth’ tactics employed during the Nine Years War, 1594-1603, further investigation shows, however, that this military strategy is all the more effective if the buildings are composed of flammable materials, for example timber, dried sods and thatch. In Ulster, while stone could be used for tower houses and church-es, timber was utilised for the construction of range of building types, and the post-and-wattle or sod-walled structures with cru-ck-roofs would also have been common. While other plantation provinces in Ireland, for example Munster, contain a plethora of stone tower houses, why does Ulster have so few?

This paper looks to investigate why the peasantry and elite alike choose to build their homes with organic materials? Is it a case of practicality, or are there underlying cultural nuances? And ultimately can we place these buildings within the landscape?

5

BRINGING LIMINAL TO LIGHT: FINDING MEDIEVAL PEASANT SETTLEMENT WITH DRONE IMAGERY

**Abstract author(s):** McAlister, Vicky (Southeast Missouri State University) - Immich, Jennifer (Unaffiliated)

**Abstract format:** Oral

The liminal nature of deserted medieval rural settlement in Ireland lies in their elusiveness in the archaeological record. In stark contrast to the wider British and European evidence, earthworks formed by nucleated settlement tend not to survive above ground in Ireland. The lack of visible earthworks has resulted in the survey of only spectacular sites -- such as Lisronagh Co. Tipperary -- and a paucity of research seeking to decisively identify medieval rural settlements. The “What Lies Beneath: Identifying ‘Lost’ Medieval Landscapes” project has concluded phase one of study, which successfully identified three nucleated rural settlements in Cos. Lim-erick and Tipperary using photogrammetry data collected by drone flights. This paper will present results of this study and, Covid-19 restrictions permitting, compare these Anglo-Norman controlled landscapes with the initial analysis from Digital Elevation Models generated by drone-based survey of a Gaelic Irish rural settlement site. Initial conclusions from the project show that lack of visibility does not mean lack of existence, and instead suggests that we are only now starting to scratch the surface of our understanding of medieval settlement desertion, a situation that will hopefully be rectified by the increasing availability of digital interrogation methods like those employed in the project. Furthermore, the paper will argue that the peasant settlement identified to date in Ireland reflects the hybrid nature of peasant communities in the wake of the Anglo-Norman Conquest. Instead of the standard trope of manorialism dominating the landscape, our results show a landscape where agricultural efficiency was key. The liminality of ag-ricultural landscapes in the past disappears, leaving the call-to-arms to draw on technology to remove the hidden, inconspicuous characteristics of rural medieval settlement in Ireland and shine a light on these elusive landscapes.

WATCHERS IN THE WASTELAND: REINTERPRETING HALLMUNDARHELLIR, A FORTIFIED CAVE ON THE MARGINS OF ICELAND’S INTERIOR

**Abstract author(s):** Smith, Kevin (Brown University, Haffenreffer Museum of Anthropology)

**Abstract format:** Oral

Hallmundarhellir, a fortified cave site located beneath the surface of a massive 10th century lava flow on the edge of Iceland’s des-olate interior highland desert, was discovered in 1956 and investigated in 1958. Almost immediately, it was interpreted as a Viking

Age outlaw shelter and its architectural features and location were used not only as evidence of the Icelandic sagas’ historicity but also to suggest that 13th century authors knew of such sites and used them both to set their scenes and to gain acceptance for their stories on the basis of their audiences’ familiarity with them. While the site quickly became a touchstone for understanding outlaws, the most marginal of all Icelanders, and for linking archaeology with saga studies, these interpretations were made without any independent evidence for the site’s age.

In 2017, we revisited Hallmundarhellir to confirm the accuracy of the mapping done in 1958, assess the site’s current condition, gain a better understanding of its zooarchaeological record, and obtain samples for dating. The results of our investigations clearly indicate that Hallmundarhellir is not a Viking Age site, at all, but dates to the Sturlung period (1150-1275), when contemporary medieval sources document the rapid consolidation of regionally defined polities across Iceland in the context of nearly constant civil war, the short-lived formation of an independent, unified Icelandic state, and its rapid absorption into the expanding Norwegian maritime empire.

This paper will integrate archaeological, geographic, and documentary sources to examine this marginal site at the distant edge of Europe in order to reevaluate its role within the Sturlung period and the process of Icelandic secondary state formation. In particular, it will consider whether Hallmundarhellir played a role in guarding the vulnerable highland margins of an emerging regional polity’s borders in western Iceland.

7

FEATURES OF THE CHURCHES PLANNING IN FORTIFIED SETTLEMENTS ON THE DANUBE LIMES

**Abstract author(s):** Voronova, Ariadna (St Tikhon Orthodox university)

**Abstract format:** Oral

This article considers the principles of the placement of churches of the IV-VI centuries in fortresses on the right bank of the Dan-ube (territory of Serbia), the spatial organization and architecture of these churches. Examples are presented in four types of forti-fied settlements: 1) a fortress on the Danube Limes with a military garrison (Lederata, Diana, Novae, Smorna, Taliata, Bassiana), 2) a city on the Danube Limes (Sirmium), 3) transformation of the imperial residence into a Christian settlement near Danube Limes (Romuliana), 4) a re-emerged Christian settlement away from the Danube Limes (Gradina on Elitsa, Balainac, Bregovina, Arsa).

There are two main types of churches: a one-nave church with a narthex and annexes and a three-nave basilica with an apse, a narthex and annexes, rarely with an atrium. Sometimes the first type of basilicas, through development and extensions, turns into the second, forming the so-called complex basilicas, they are characteristic of the interior regions of Dalmatia. Basilicas of both types often contain a syntron, an altar barrier, an ambo, and a baptistery, which indicates an intensive Christianization of the popu-lation. In terms of style, most of the three-aisled basilicas can be attributed to the so-called Hellenistic type. The discovery of Latin inscriptions demonstrates the western jurisdiction of this region, while many architectural and sculptural features of the churches indicate their eastern sources, implemented mostly in a crude way, far from the leading artistic trends.

As a result of the barbarian invasions, the fortified settlements of Illyricum take over the functions of economic centers from the once existing rustic villas, as a result of gradual ruralization, or become refuges for the local population. The burials indicate the presence of the Germanic federates in the population (possibly Arians) and representatives of other peoples, but the predominance of the Romanesque population is clear.

8

RETHINKING SPACE IN THE ‘OTHER MONASTICISM’: SIGNIFYING RELIGIOUS LIMINALITY THROUGH ARCHITECTURAL LAYOUTS IN ENGLAND AND WIDER

**Abstract author(s):** Huggon, Martin (Bishop Grosseteste University)

**Abstract format:** Oral

When discussing the use of space and buildings in medieval religious institutions the focus is usually on ecclesiastical or monastic norms. In contrast, this paper will focus on what Roberta Gilchrist referred to as the ‘Other Monasticism’, in particular friaries, hospi-tals, and the military orders. This ‘Other Monasticism’ includes a range of religious practices that can be argued to fall into the liminal position between ecclesiastic and monastic practice, often clearly mixing greater engagement with the secular world whilst still including elements of monastic organisation to daily life. Examples of these sites will be discussed in relation to current research examining the organisation of buildings and the creation of hierarchies of space in the medieval hospitals of England and Wales, which suggests that buildings were orientated around the concept that certain portions of the main site, usually to the east and south, were more often associated with high status areas compared to the north and west. This frequently seems to result in north-ern cloisters or claustral buildings in relation to chapels, an architectural form possibly associated with the melding of elements of out-dated Anglo-Saxon monasticism with institutions considered to not fit the more rigorous and strict definitions of monasticism introduced by Norman church leaders.

This paper aims to initiate discussion on the wider application of the hospital model, as well as begin to frame a more geographically extensive utilisation. Preliminary investigation has suggested this approach may only be applicable to institutions in the British Isles and Ireland, suggesting there is a possible early medieval antecedent to this utilisation of space that does not necessarily follow wider European trends. Both the functional and underlying conceptual implications of this use of space will be explored, tying archi-tectural layouts to the physical signifying of religious liminality between the secular and religious worlds.

BETWEEN VARIABILITY AND SINGULARITY: CROSSING THEORETICAL, QUALITATIVE AND COMPUTER-BASED APPROACHES TO TYPES AND TYPOLOGIES IN ARCHAEOLOGY [PAM]

**Theme:** 5. Assembling archaeological theory and the archaeological sciences  
**Organisers:** Hussain, Shumon (Aarhus University) - Plutniak, Sébastien (TRACES Laboratory, University of Toulouse) - Riede, Felix (Aarhus University)  
**Format:** Regular session

While the notion of the “type” and the integration of such types into typological systems played a vital role in the development of archaeology as a discipline, there has been a recent loss of innocence. Either deemed boring or practically fetishized, types and typologies continue to form important cornerstones of many culture-historical schemes and practices; they are used vicariously for inference-based dating, are often attributed cultural, historical or even quasi-ethnic meaning and typological change is read to imply societal transformation. Promoting the type concept and mobilising typologies is undoubtedly value-laden as well as theory-laden, even if only implicitly so. For many, the very term “typology” has thus become a battleground of seemingly incompatible archaeological research epistemologies, for instance reflected in a persistent rhetoric pitching so-called “typologists” against “technologists” in lithic studies and beyond. There is good reason to believe, however, that such inflammations have clouded our view of the utility and diversity of types in archaeology. A similar rhetoric also undermines any true community effort of developing and refining type concepts and type-based approaches to the past. Yet, recent developments both in computational archaeology and archaeological theory have begun to challenge some of these premises, opening up promising avenues of reflection, inquiry and interdisciplinary research.

This session seeks to identify, review and discuss these emerging perspectives. It is based on the ambition to revisit the “type” as an analytical and theoretical concept in order to re-activate type-sensitive archaeological research or to develop genuine alternatives. We invite scholars from varying backgrounds to interrogate our apprehension of types, and to re-consider the basic explanatory value of types and typologies, especially so vis-à-vis computer-based methods, emerging theoretical frameworks and, more generally, the consequences of such approaches and research frameworks for our understanding of types and typological thinking as core concepts of archaeological practice.

ABSTRACTS:

1 **TOOL TYPES AND THE ESTABLISHMENT OF THE LATER PREHISTORY TAXONOMIC SYSTEM IN THE NILE VALLEY AND THE HORN OF AFRICA**  
**Abstract author(s):** Leplongeon, Alice (Department of Archaeology, KU Leuven; UMR HNHP 7194, Muséum national d’Histoire naturelle, CNRS, UPVD, Paris) - Ménard, Clément (Centre Français des Etudes Ethiopiennes, Addis Abeba)

**Abstract format:** Oral  
Research on the prehistory of the Nile Valley and the Horn of Africa has a long history dating back to the late 19th century. Although research in these two regions is autonomous from a historiographical point of view, it followed similar global pathways. During the 20th century, the same ‘schools’ and at times the same people have worked in the two regions, but with limited comparisons of their archaeological records. Between the 1940s and 1980s, in each region, numerous cultural entities were defined based on tool and core typologies; this habit stopped after the 1980s when both regions saw a slowdown of research on the later prehistoric periods. Many of the cultural entities identified in the Nile Valley for the Late Palaeolithic (LP) and in the Horn of Africa for the Later Stone Age (LSA), are based on different types of backed pieces and truncations. These types often rely on subjective shape criteria, using a non-standardised vocabulary, making comparisons with new material or recent reanalysis of older assemblages difficult. Only recently in the Horn of Africa, LSA research has been reactivated with new fieldwork projects. Old terminology is no longer used or discussed, which is a major obstacle to integrating data from old collections. In the Nile Valley, some LP assemblages have been recently re-analysed but factors of lithic variability remain poorly understood and may be clouded by the use of a too rigid taxonomic cultural system. This study aims to explore the consistency and influence of the definitions of cultural entities on current research, in order to maximise comparability between previous and recent research data. We will particularly discuss tool types, with a focus on backed pieces and truncations, and further investigate their role in the construction of taxonomic systems by conducting comparative 2D outline analyses of published illustrations.

2 **TYPOLGY AND SOCIAL SIGNATURES – EXPLORING THE RELATIONSHIP BETWEEN ARTEFACT VARIABILITY AND PREHISTORIC INDIVIDUALS IN THE LATE UPPER PALAEOLITHIC**  
**Abstract author(s):** Pedersen, Jesper (Department of Archaeology and Heritage Studies, Aarhus University Moesgård)  
**Abstract format:** Oral

One of the most basic elements to archaeological practice is the methodological framework of typology. It represents a top-down approach to relatively date objects and place them and their presumed cultural context, reflecting a culture-historical vision of chronologically ordered phases. The method has proven particularly effective when studying material culture that is made using specific templates (i.e. moulds for metal casting) or the material culture of societies that are strongly normative. Yet, even within relatively normative artefact production it is possible to observe varying degrees of internal variability within particular object cate-

gories. Traditionally, such variability is interpreted as chronological trends and developments towards successive temporal phases with these artefacts serving as diagnostics. Recent studies indicate, however, that rather than reflecting temporal developments with production norms such variability may in many cases reflect the choices of prehistoric individuals. This paper uses a case-study from the Upper Palaeolithic in Europe – the Hamburgian phenomenon – to explore the potential ‘social signature’ (Harush et al. 2020) of individuals or of very small, closely related flintknappers. Using a mixed-method approach by employing a combination of qualitative technological and quantitative geometric morphometric analysis, I argue that parts of the Hamburgian archaeological record reflect a prehistoric learning environment that was exclusive to few people and that diagnostic projectile points instead of indicating chronological phases may be much closer related to the stylistic choices of individual flintknappers. Convincingly identifying individual flintknappers in the deep past remains challenging, yet viewing Hamburgian projectile points as the products of only few individuals has important implications for our understanding of this cultural phenomenon, its chronology and dispersal dynamic.

3 **PRELIMINARY RESULTS OF 3D GEOMETRIC MORPHOMETRIC ASSESSMENT OF GRAVETTIAN SHOULDERED POINTS FROM KOSTENKI, RUSSIA**  
**Abstract author(s):** Lada, Anton (Institute for the History of Material Culture Russian Academy of Sciences; Saint-Petersburg State University) - Pugacheva, Ekaterina (European University at Saint-Petersburg) - Bessudnov, Alexander (Institute for the History of Material Culture Russian Academy of Sciences)

**Abstract format:** Oral  
From the beginning of its study shouldered points from the Kostenki-Avdeev culture were considered to be a highly variable type of artifacts. Several researchers have faced difficulties working out a valid typology for these pieces. So, we decided to take on a different approach and classify Kostenki-Avdeev shouldered points using the newly emerging method – 3D geometric morphometrics. For the study, we selected 66 complete artifacts from 3 sites of Kostenki-Avdeev culture from Kostenki (Kostenki 1/I, Kostenki 13, Kostenki 14/I). As a control dataset for the study, we have chosen shouldered pieces from another Gravettian site – Kostenki 21/III. All of the analyzed artifacts are stored in the Institute for the History of Material Culture Russian Academy of Sciences. The analysis consisted of two phases. Firstly, using the structured-light scanner we created 3D models of shouldered points. Then, all artifacts were analyzed in Geomorph package of R software. For landmark placement, we used the configuration of 3 landmarks and 200 semilandmarks. All artifacts were orientated tip to the top and shoulder to the right. After, all analyzed artifacts went through Procrustes fit. Then principal component analysis, allometric and symmetry tests were run. According to the results of PCA, two groups can be distinguished: gracile points from Kostenki 21/III and small ones also referred to as atypical points of Kostenki-Avdeev culture, and large or typical points of Kostenki-Avdeev culture. Allometry and symmetry tests showed differences between typical and atypical points, which could be interpreted as functional differences. Overall, 3D geometric morphometric assessment of the shouldered points from Kostenki seems to be a powerful tool in distinguishing types of shouldered points, also it supports the hypothesis which considers large typical points to be knives than weapon tips. This work was funded by RSF grant №20-78-10151 and State assignment №0160-2019-0044.

4 **STYLE, FUNCTION AND VARIABILITY IN THE FINAL PALAEOLITHIC LARGE TANGED POINTS IN EUROPE REVISITED**  
**Abstract author(s):** Riede, Felix - Matzig, David - Hussain, Shumon (Department of Archaeology and Heritage Studies Aarhus University)

**Abstract format:** Oral  
Large tanged points are cherished cultural index fossil artefacts in European prehistory. In different research traditions and different regions, they are known by different labels – Lyngby points, Bromme points, Teyjat points, etc. – and they are mobilised in interpretations of culture-historical processes such as migration, territoriality, contact and even identity. Yet, some studies, including recent ones employing computational methods, highlight that (a) the size and weight of such points are suggestive of their use as dart-tips rather than arrowheads, and (b) they are so variable that regional or chronological groups are difficult to clearly demarcate. Large tanged points can therefore not be given the same status as culture-historical marker without due reflection about functional differences. In this paper, we review the research-historical roots of the notion of large tanged points as cultural index fossils and discuss the implications of novel analyses. In concluding, we suggest that there likely was a functional difference between the backed points that otherwise characterise the Late and Final Palaeolithic but that this does not necessarily preclude their status as culture-historical marker. We do, however, urge caution when it comes to using large tanged points as chronological or geographic indicators of different groups via typological labels.

5 THE TYPOLOGY OF TECHNIQUES – LATE PALAEOLITHIC LITHIC INDUSTRIES UNDER REVIEW

**Abstract author(s):** Reuter, Tobias (Centre for Baltic and Scandinavian Archaeology - ZBSA)

**Abstract format:** Oral

Typology and technology are often considered different methodologies in archaeological research. Traditional typological studies are employed to classify and group archaeological material such as ceramic vessels or arrowheads. As defined types are assumed to bear distinct social information, these types serve as cultural markers for grouping archaeological cultures in time and space. In practice, however, several factors complicate the classification of archaeological material. Often distinctive types are missing or different types occur in the same context. Moreover, the static concept of idealised types leaves little room for variation and distinctions appear arbitrary. In contrast, the study of technology focuses more on detailed aspects of the archaeological material. In the chaîne opératoire approach, all steps of artefact production are analysed, taking into account information from often the entire inventory. However, technological studies mostly rely on typological classification to fit their findings into the bigger picture. I argue that the shortcomings of both methods could be mitigated by combining typological and technological studies. By considering typology as an integral part of technology, additional information from technological studies can be used to review and evaluate existing classifications. This will be illustrated by examining technological characteristics of typologically classified Late Palaeolithic lithic industries from northern Germany. Using statistical methods, technological information on lithic artefact production from the Hamburgian, the Federmesser-Gruppen and the Bromme culture were analysed for their respective typological assignments. The results indicate that technological studies - due to a substantial requirement for interpretation - are prone to subjective evaluations and are thus not easy to compare. Therefore, before using technological studies to evaluate typological classifications, more objective research criteria must be established so that the results of typo-technological studies become more transparent and comparable.

6 TYPOLOGY AND CERAMIC TECHNOLOGY: CASES STUDIES FROM CARIBBEAN ARCHAEOLOGY AND EUROPEAN BRONZE AGE WITH COMPUTER-BASED APPROACH

**Abstract author(s):** Manem, Sebastien (CNRS, UMR 7055 - Préhistoire et Technologie)

**Abstract format:** Oral

The 1938 Ceramic Technology Conference in USA was organized – among other things – to encourage interaction between the general archaeologist and the technologist. Decades later, typological and technological works do not tend enough towards the desired symbiosis and are often studied separately.

Typological approach focuses on the visible part of material culture – vessel shape and decoration – to define chronologies or stylistic provinces that can identify cultural boundaries, presuming a universal correlation between type and identity. If this is seen in archaeological and ethnological contexts, numerous studies show the absence of regularity between social groups and stylistic provinces because morphology and/or decoration may depend on the production as well as consumption contexts. Therefore, the visible “type” gives information on the expression of demand, which may be similar to several neighboring cultures, while the technical tradition is related to producers and the expression of a social group because of transmission process.

Anthropological interpretation of chaînes opératoires fully integrates the type in their diachronic and synchronic variability. A synchronic technical variability can be explained if certain sequences correspond to particular vessels, thus inducing that the presence of several technical traditions is above all linked to functional variability and demand. Conversely, if several technical traditions produce the same vessel, their variability will induce social factors.

While a synchronic context can be “easily” interpreted, the question remains complex from a diachronic perspective to determine whether the type/demand or the technique is at the origin of the innovation when thousands of data have to be combined to express transmission processes between generations over several centuries.

In this paper, cases studies from Caribbean archaeology and European Bronze Age will be discussed in order to illustrate the interaction between typology and technology and the contribution of modelling to resolve diachronic variability.

7 RECONFIGURING LITHIC STUDIES THROUGH DESIGN THEORY

**Abstract author(s):** Hussain, Shumon - Matzig, David (Aarhus University)

**Abstract format:** Oral

Ever since Bleed’s seminal work on the optimal design of forager hunting weapons, the concept of ‘design’ has become an integral part of paleoarchaeological theory. At least one would think so. In reality, design – both understood with regards to technological systems and individual artefacts or tools – remains a poorly developed and surprisingly undertheorized concept. When it comes to stone tools, design is effectively deployed as a synonym of other, more intuitive and widely used notions to describe formal object qualities such as ‘morphology’, ‘type’, ‘style’ or ‘function’.

It might be argued that any serious attempt to develop a proper design theory for lithic studies has in part been undermined by the dominant discourse on style-vs-function in the early days of processual and Darwinian archaeologies. Another reason for the notable neglect of design considerations has likely to do with Bleed’s original grounding of the concept in the configuration of larger weapon systems of which lithic implements form only one component, making it difficult to study design principles when only the latter are commonly preserved.

We here suggest that although Bleed’s seminal work on design is widely cited and acknowledged among archaeologists, it has rarely been exploited to its full potential. We maintain that design ought to become a more central concept for lithic studies and that recent advances in lithic analysis and interdisciplinary design theory now offer new resources to reignite the study of design in lithic tools. We show that a careful triangulation of quantitative approaches to shape and geometry with qualitative UTF-type analyses and basic considerations of hafting modalities can not only rejuvenate Bleed’s influential distinction between ‘reliability’ and ‘maintainability’ but may also push the study of lithic variability beyond long-standing and ultimately mute dichotomies, thereby also enabling new ways of classifying and ordering the lithic material.

8 THE COMMON-SENSE TRAP IN ARTIFACT CATEGORIZATION

**Abstract author(s):** Iovita, Radu (New York University; University of Tübingen)

**Abstract format:** Oral

Complex tool use is one of the defining characteristics of our species, and, because of the good preservation of stone tools (lithics), one of the few which can be studied on the evolutionary time scale. For this reason, it is tempting to quantify lithics and use them as the dependent variable in evolutionary analyses. However, in this paper, I argue based on the psychological literature that current typologies frequently used in such analyses conform to folk biases (common-sense explanations or assumptions) in artifact categorization that may be peculiar to how contemporary humans classify ordinary objects. Conceiving of artifacts made by pre-modern hominins using such folk categorizations severely limits our ability to study them on their own terms and compare them to those made by modern humans. As an alternative, I propose an analytic-functional, pragmatist model for artifact categorization based on a combination of the causality of the tool’s physical properties, the user’s biological system, and the recorded use history. These can be objectively defined independent of species, but also gleaned from archaeological specimens through the study of wear traces. I conclude by mentioning the modern computational methods that will play a crucial part in making such a methodology feasible.

9 GRAPH HEURISTICS. CONTEXT-BASED TYPOLOGY OF ICONOGRAPHIC CONTENT WITH THE R PACKAGE ICONR

**Abstract author(s):** Huet, Thomas (LabEx ARCHIMEDE, ANR-11-LABX-0032-01) - Pozo, Jose - Alexander, Craig (Independent researcher)

**Abstract format:** Oral

By definition, elements within a defined type share more commonalities amongst themselves than they share with elements from any other type. This can be modeled by a (dis)similarity metric defining a measure of distance/proximity between elements. Assigning manufactured archaeological remains -- such as pottery, lithics or settlements -- to different types without precise measurements of these (dis)similarities will likely lead to non-robust typologies and lack of agreement about cultural definitions. Among manufactured remains, iconographic ones are probably those that have led to the most complicated typologies, whether these typologies are too idiosyncratic (e.g. the so-called Warrior stelae) or too general (e.g. an anthropomorphic figure). In the former case, the studies will be regional- and chronology-dependent, leading to tedious descriptions and overly numerous categories, most probably represented by only a handful of examples, making meaningful comparisons difficult. In the latter case, comparisons will necessarily suffer from a drastic loss of precision.

Our purpose is to present the insights achievable with the new R package iconr (<https://cran.r-project.org/web/packages/iconr/index.html>) which implements concepts and functions for modeling prehistoric iconographic compositions using graph theory and spatial analysis. To undertake modeling of a specific type of iconographic content (pottery decorations, cave painting, stelae, etc.), the a priori definitions required are minimal and only concern the graph elements: graphical units (i.e., vertices) and types of relations they share (edges). The iconographic composition (i.e. the semantic content) can be recovered a posteriori, by graph and spatial analysis. Graph theory also allows us to group these data into tree-like structures, introducing a hierarchy of typologies with controlled vocabularies, allowing generalization processes (up, the parent level) and specification processes (down, the child level) to facilitate comparisons and (dis)similarity measurements. Our paper will focus on the theoretical background of the R package iconr and present cases of application on selected corpora.

10 SAME THING, DIFFERENT TYPOLOGIES: A TYPOCHRONOLOGICAL MODULE FOR THE ARCHAEOLOGICAL TYPES IN THE CRFB DATABASE

**Abstract author(s):** Auth, Frederic - Domscheit, Wenke - Rösler, Katja - Hofmann, Kerstin (RGK - Romano-Germanic Commission DAI)

**Abstract format:** Oral

The digital transformation of one of the longstanding editorial projects of the RGK onto the <https://idai.world>, the Corpus der römischen Funde im europäischen Barbaricum (CRFB), challenges archaeological typologies. By utilizing the possibilities of digitization and software, we are developing a typochronological module, a service for bringing together different typologies and thus provide a chronological addressing of objects.

The CRFB is a joint European publication project, originally established in the 1980s at the Central Institute for Ancient History and Archaeology of the German Academy of Sciences at Berlin (ZiAga) in the GDR. It registers roman artefacts found outside the Roman Empire together with accompanying finds of regional origin.

ARCHITECTURAL DESIGN METHODS IN RESPONSE TO TYPOLOGICAL SYSTEMS IN ARCHAEOLOGY

**Abstract author(s):** Toulouse, Catherine - Lengyel, Dominik (BTU Brandenburg University of Technology Cottbus-Senftenberg)

**Abstract format:** Oral

Typological systems are equally controversial in architecture. However, architecture's use of typologies allows decisive contributions to the visual communication of archaeology, namely to give a type an appearance both identifiable and universal, e. g. an antique capital, the type of which is unambiguous due to the otherwise certainly reconstructible building, but the individual appearance of which is unknown and will in all probability remain unknown forever due to the findings. To visualise such a building in order to develop further questions requires a representation of the type itself e. g. by the way of interference-based modelling. Linguistically, the problem does not arise, but visually it does as individual finds are incompatible to typology at the first glance. And here it is the discipline of architecture that is able to design substitutes that as a basic explanatory value translate the linguistic uncertainty into visible forms. The emerging perspective is that the type becomes a utility and visual perception consequently becomes a part of the research process, taking into account any degree of certainty of knowledge. The authors have developed a method that takes this into account when creating spatial visions based on digital models.

The presentation aims to demonstrate and illustrate this method by several projects developed by the authors in cooperation with archaeological research institutions:

- Cologne Cathedral and its Predecessors (by order of and exhibited in Cologne Cathedral),
- Bern Minster – its first century (by order of and published by Bern Minster Foundation)
- The Metropolis of Pergamon (within the German Research Fund Excellence Cluster TOPOI),
- The Palatine Palaces in Rome (by order of the German Archaeological Institute, both latter exhibited in the Pergamon Museum Berlin),
- The Ideal Church of Julius Echter (by order of the Martin von Wagner Museum in the Würzburg Residence).

IT-BASED METHODS AND MACHINE LEARNING METHODS OF CLASSIFICATION: THE COOPERATIVE PROJECT CLARENET – CLASSIFICATION AND REPRESENTATION FOR NETWORKS

**Abstract author(s):** Hofmann, Kerstin - Wigg-Wolf, David - von Nicolai, Caroline - Möller, Markus - Tietz, Julia - Rösler, Katja (RGK - Romano-Germanic Commission DAI) - Tolle, Karsten - Krause, Robin - Deligio, Chrisowalandis (Frankfurt Big Data Lab - Goethe University Frankfurt)

**Abstract format:** Oral

The classification of archaeological finds and their representation are shaped by various object epistemological approaches and changes of medium. With ever increasing digitisation, there are now new possibilities of classification, e.g. using methods of automatic image recognition, as well as the representation of finds on the web with linked open data.

ClaReNet, a BMBF funded cooperative project of the Römisch-Germanische Kommission (German Archaeological Institute) and the Big Data Lab, (Goethe University Frankfurt) tests the possibilities and limits of new methods of classification and representation. To this end, traditional approaches of typification and the recording of attributes in numismatics and archaeology are compared with IT-based methods of classification, including deep learning, using the examples of three Celtic coin series that were each chosen to address particular research questions and problems.

The work processes are accompanied by a science and technology study that documents the production and circulation of knowledge, as well as instigating reflection on changes in cognitive processes resulting from the use of digital tools and algorithms. ClaReNet promotes an interdisciplinary dialogue to sound out the potential and limits of systematic automation for methods of classification and representation in numismatics and archaeology.

Starting out from the coinage of Armorica (Britanny), one of the Celtic coin series selected as an example for the project, we will present how deep learning classifies the coinage, how this may differ from classifications by numismatists, and the lessons to be learned from the exercise.

BEYOND SHAPE, TOWARDS IBERIAN CRAFTWORK: APPLYING AN AUTOMATIC CLASSIFICATION MODEL TO IBERIAN POTTERY (SPAIN)

**Abstract author(s):** Moreno Padilla, María Isabel (Grupo Patrimonio Arqueológico en Jaén - HUM-357; Departamento de Geografía, Historia y Humanidades. Universidad de Almería) - Molinos Molinos, Manuel - Fuertes García, José Manuel - García Fernández, Ángel Luis - Lucena López, Manuel José (Instituto Universitario de Investigación en Arqueología Ibérica de la Universidad de Jaén) - Navarro, Pablo (Instituto Patagónico de Ciencias Sociales y Humanas. Centro Nacional Patagónico, CONICET; Departamento de Informática, Facultad de Ingeniería, Universidad Nacional de la Patagonia) - Segura Sánchez, Rafael (Instituto Universitario de Investigación en Arqueología Ibérica de la Universidad de Jaén)

**Abstract format:** Oral

In the last years, the development of new theoretical and methodological approaches to the study of archaeological ceramics has demanded a constant and progressive renewal of typological studies. However, the potential of ceramics has been subordinated to watertight departments (the ceramic typological classes), which do not incorporate specific aspects of the containers or other general aspects associated with ceramics as a handmade product.

Our proposal is linked to the development of a groundbreaking typological proposal that overcomes, paradoxically, the concepts of typology, series and variant. Focused on the ceramics associated with the Iberian societies of the western Mediterranean during the Iron Age (VI c. B.C.- I c. A.D.), we try to break with the traditional "archeology of objects" to rethink them beyond their own materiality. This approach is closely linked to the new perspectives open from ceramic sociology, the Actor-Network Theory and the archeology of the senses. Our contribution deals with a common problem in the study of Iberian ceramics: the establishment of innumerable typologies based on subjective criteria established by archaeologists. To address this problem, and based on previous work published by the authors of this work, we have established a classification system of ceramic vessels using geometric matching learning techniques, which allows the automatic learning of ceramic sets through an architecture based on deep neural networks. This system individualizes each of the specific features of the container to later compare them with the rest of the artifacts of the same context. This exercise -the comparison between large groups of ceramics- results in a classification based on the specific variables of ceramics. The final goal of our methodological proposal is to understand the technology of Iberian pottery incorporating the inherent variability of handmade production, and removing at the same time subjective factors from the classification process.

TOWARDS AN INTERNATIONAL ARCHAEOLOGY OF FORTIFICATIONS: METHODOLOGIES AND INTERPRETATIONS [COMFORT]

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Schneeweiss, Jens (University of Kiel, ROOTS Cluster of Excellence; Centre for Baltic and Scandinavian Archaeology; University of Göttingen) - Ilsen, Timo (Centre for Baltic and Scandinavian Archaeology) - Ballmer, Ariane (University of Bern, Institute of Archaeological Sciences and Oeschger Centre for Climate Change Research - OCCR) - Maixner, Birgit (NTNU University Museum Trondheim, Department of Archaeology and Cultural History) - Fernández-Götz, Manuel (University of Edinburgh, School of History, Classics and Archaeology)

**Format:** Regular session

Prehistoric and early historic fortifications are outstanding archaeological sites, which in many cases are still visible in the terrain and therefore represent significant focal points in the landscape. However, numerous fortification works have also been lost due to construction activity and changing landscape uses during the 19th and 20th centuries. Today, there is a significant geographical and chronological diversity of countless monuments featuring different architectures and functionalities, as well as a large number of hillfort researchers across Europe. For a long time, the archaeology of fortified sites has pursued a culture-historical approach, mostly focussing on locating historical events and evidence for warfare. Newer research has expanded the focus to other aspects, such as the symbolic meanings of fortifications, construction labour, or their relationship with the wider natural and cultural landscape. In addition, fortification-specific research methods and techniques have been established, both in fieldwork and in further analysis. There are, however, barriers in scholarship related to political and linguistic boundaries, as well as period-related research traditions, which often make supra-regional and diachronic discussions difficult.

This session aims to explore the current state of research approaches on fortifications in prehistoric and early historic Europe. Individual investigations shall be located and critically reflected within the international research landscape. It is our explicit goal to outline the diversity but also commonalities in strategies and approaches, in order to contribute to the building of larger international networks that go beyond traditional divides. We invite speakers to focus on the concepts, theories and methods relevant to their own fortification research and to contextualise their approaches within the wider disciplinary framework.

ABSTRACTS:

1 COMPARATIVE TRIALS IN FINDING THE BLUEPRINTS FOR EARLY AEGEAN FORTIFICATIONS  
**Abstract author(s):** Turner, Daniel (Leiden University) - Prent, Mieke (Vrije Universiteit Amsterdam) - Thorne, Stuart (Netherlands Institute at Athens) - Brysbaert, Ann (Leiden University)

**Abstract format:** Oral

In comparing Final Neolithic (FN) and Early Bronze Age (EBA) fortifications in the Aegean (ca. 4000 – 2000 BC), very little of the walls remain, few have been recorded systematically, and fewer still are easily accessed in published reports. What we attempt here is a correspondence analysis of wall features mentioned in publications to see if any strong patterns emerge for a building guide or 'blueprint' in early Aegean fortifications. FN and EBA walls were highly visible, logical targets for mimicry and innovation as exchange intensified and competition encouraged security. They were also investments not lightly undertaken where scarcity loomed behind misfortunes such as consecutive poor harvests. Since wall construction was a high-stakes communal effort, planning and design had to navigate effectively through expectations (what a strong wall looks like) and constraints (how far to stretch local resources and labour). Expectations at least may have formed around the observations (and exaggerations) of travellers. Several recurring features like herringbone masonry and rounded bastions might have led to canonical forms through durable building traditions and experimentation, possibly stemming from one or more archetypes. Older walls certainly influenced community planning as sites developed over time, but they also imposed the burden of precedence on later design choices. Case studies discussed here will include Geraki (Laconia), Kiapha Thiti (Attica), and Strofilas (Andros).

Piecing together incomplete information allows for speculative reconstructions of early walls, provided the limitations of these augmented realities are made clear. The strength of correspondence among recurring wall features remains more dependent on definitive presence/absence variables than rigorous field measurements. Although always a work-in-progress, systematic catalogues of wall features benefit future comparative research even if patterns in prehistoric building practices remain hypothetical.

2 MEASURING AND RECONSTRUCTING IRON AGE AND EARLY MEDIEVAL HILLFORTS ON THE MOSKVA RIVER  
**Abstract author(s):** Chaukin, Sergey (Institute of Archaeology Russian Academy of Sciences)

**Abstract format:** Oral

Most of the Iron Age and Early Medieval hillforts in the forest zone of Eastern Europe are not well preserved, but significantly affected by erosion processes. Today, after a long period since their habitation, it is often difficult to imagine the past appearance and shaping of the hillforts (landscape and topographic characteristics). At the same time, there are also a sufficient number of well-preserved hillforts. In my previous research, I have revealed a correlation between specific shapes of the platform and specific structures of ramparts and ditches. This interrelation can also be noticed on other elements of fortified settlements. Comparing entire fortified settlements as well as their individual parts allow reconstructing the original appearance of ruined structures. For this purpose, it is suggested to apply precise measurements of individual components of the investigated hillforts. The paper focuses on methodological aspects of the measurements related to the reconstruction of the shaping of fortifications.

At the first stage the database is filled with individual hillfort parameters (measurements), such as: length, width and area of the platform, height and distance between the ramparts, etc. For this purpose, 3D models are created based on topographic plans or, in some cases, on lidar data. The outcome is a table of parameters that is examined by cluster analysis to group the most similar types. The resulting typology forms the basis for a hierarchical classification of the hillforts as well as for social and functional interpretations.

Tens of thousands measurements are expected to be made. The formation of detailed databases will make it possible to apply methods of Big Data analysis in the future.

3 BEYOND THE MILLENNIUM RESEARCH PROJECT. EARLY MEDIEVAL HILLFORTS IN EAST CENTRAL POLAND - CURRENT STATE OF RESEARCH APPROACHES  
**Abstract author(s):** Dzieńkowski, Tomasz (Institute of Archaeology Maria Curie-Skłodowska University in Lublin) - Wołoszyn, Marcin (Institute of Archaeology University of Rzeszów; Leibniz Institute for the History and Culture of Eastern Europe - GWZO) - Florkiewicz, Iwona (Institute of Archaeology University of Rzeszów)

**Abstract format:** Oral

Medieval archaeology in Poland started in earnest after 1945. A key stimulus was the “Millennium” research project investigating the formation of the Polish state (Piast realm). Medieval strongholds were the main focus of the project, as they were understood to reflect the emergence of an central power.

Despite initial declarations archaeological excavation concentrated mostly in Great Poland, Silesia and Pomerania. Lesser Poland, and particularly, eastern Poland, were much less well studied.

However, eastern Poland has no lack of fascinating archaeological features, also because it has few cities and less industry. Many strongholds and their hinterlands are better preserved than in the more urbanized western parts of Poland.

A major attraction of eastern Poland is its peripheral status of a Polish-Rus’ and (in the north) Polish-Balt borderlands, complete with the question of ethnic affiliation of its strongholds (Baltic, Polish or Rus’ ?).

Our paper reports on findings from strongholds investigated in eastern Poland (notably, Czermino, Gródek, Chełm). Made in a close cooperation with palaeogeographers, these studies present these sites freed from “tyranny of the historical record” (T. C. Champion) and highlight their relationship to their natural and cultural setting.

Eighty hillforts recorded in the border zone between Drohiczyn and Przemyśl offer major potential for research. Most have been excavated, but only on a limited scale. The recent research focuses on the region on the middle Bug River which is particularly “rich in hillforts”. The Czermino hillfort – historical Cherven’ (10th—13th c.) and the royal residence in Chełm (13th-14th c.) were excavated over several seasons. Archival and environmental studies were made of the Gródek hillfort – historical Volyn’ (10th-13th c.), and on a smaller scale at Szaśiadka (10th-13th c.) and Jurów (12th-13th c.). Archaeological and paleoenvironmental findings have been supplemented by a series of absolute dates from dendrochronology and C14 dating.

4 THE HILLFORT BROBORG NEAR UPPSALA IN SWEDEN – A TIME CAPSULE UNVEILING HOW IT BECAME VITRIFIED  
**Abstract author(s):** Sjöblom, Rolf (Tekedo AB; Luleå University of Technology) - Ogenhall, Erik - Hjärthner-Holdar, Eva (The Archaeologists in Uppsala) - Pearce, Carolyn (Pacific Northwest National Laboratory, Richland) - Schweiger, Michael (Contractor with U. S. Department of Energy, Richland) - Marcial, José (Pacific Northwest National Laboratory, Richland) - Weaver, Jamie (National Institute of Standards and Technology, Gaithersburg) - McCloy, John (Washington State University, Pullman) - Vicenzi, Edward (Museum Conservation Institute, Smithsonian Institute, Suitland) - Kruger, Albert (U.S. Department of Energy, Office of River Protection, Richland)

**Abstract format:** Oral

The hillfort Broborg is located on top of a solitary hill surrounded by flatlands, and overlooking a river and its ford, as well as an ancient road. The river was once a part of a major waterway connecting the powerful Uppsala region with the Baltic Sea. The construction of the fort dates back to around 400-550 CE. However, and over several centuries, the hillfort gradually lost its importance as a result of the land rise in combination with the unification of Sweden, and has since been abandoned.

About three fourths of the upper part of the present inner wall has been vitrified to a high bearing strength assessed to be sufficient for carrying e. g. a timber-laced wall on top. Two excavations have been carried out, one in the 1980’s and another one in 2017. The latter served the dual purpose of adding to the cultural heritage and providing a reference material (an anthropogenic analogue) to nuclear waste glass. Accordingly, the glass and the reasons for its vitrification have been the subject of comprehensive studies which have included cultural (incentives and competence) as well as natural sciences aspects.

It is concluded that each hillfort should be analysed individually, since the prerequisites may be quite different, even for similar types of rock and perhaps even with similar elemental compositions but different oxidation states for the constituent iron. It is also concluded, based on several factors identified, that the vitrification at Broborg was likely carried out intentionally, and for the purpose of constructing the fort. However, this does not seem to be the case for other hillforts in Sweden with vitrified wall material. Nonetheless, and considering the variations in the prerequisites together with the communication internationally at the time, Broborg may have siblings elsewhere awaiting (re)assessment.

5 REVISION OF KNOWLEDGE ABOUT THE CENTRAL FORTIFICATION AT STARÁ KOUŘIM  
**Abstract author(s):** Dvůráček, Daniel (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic)

**Abstract format:** Oral

Archaeological excavations of the early medieval fortified stronghold at Stará Kouřim, conducted by M. Šolle in the 1940s–1950s in the period which marked the beginning of extensive excavations of Slavic hillforts in the Czechoslovakia, revealed that this stronghold represented one of the most important fortified centres in Bohemia before the rise of the Přemyslids in the first half of the 10th century. More than 60 years have passed since the excavations were finished and the original interpretations have to be verified. The main results were published not long after the completion of the research, in a profusely cited monograph from 1966. Moreover, a great deal of knowledge still needs to be analysed and evaluated. This contribution is dealing with excavation of the central defensive wall, one of the three main fortification lines of Stará Kouřim. This structure was uncovered at multiple places but it did not always earn proper attention. The contribution presents the main results of a new revision of knowledge about this significant fortification.

6 WHO INVENTED RUSSIAN WOODEN FORTRESSES?  
**Abstract author(s):** Koval, Vladimir (Institute of Archaeology RAS)

**Abstract format:** Oral

Russian medieval city fortifications were a chain of rectangular sections built of oak logs. Each such section, as well as the gaps between them, were filled with earth. As a result, a wooden-earthen wall was obtained, which could not be destroyed with a battering ram and it was very difficult to damage it with stone-throwing artillery. True, such a wall could have been burned.

The earliest fortresses of this type appeared in Russia in the 9th century in Kiev and Novgorod (Rurikovo hillfort). From the end of the 10th century town’s walls began to be erected in the rost- (or hook-) constructions (Germanic and Polish names), which copied the fortification of Slavic Moravia, Poland and those slavic territories that later became part of Germany. In this case, the wall was created from layers of tree trunks, covered with earth (in each next layer, the trunks were laid perpendicular to the previous layer). However, in Russian towns such a construction system was used very rarely. Consequently, the West Slavic experience was accepted, but did not gain popularity in the Russian lands.

How the “East Slavic” (Russian) system of building fortress walls (a chain of rectangular sections with earth) arose remains unclear. The genesis of such a system in the lands of Eastern Europe is not traced. Such a method of fortification is not known in Western Europe either. It remains a mystery who and when developed such a simple and effective system of fortification, which was successfully used in Russia until the end of the 16th century.

### FORTIFY TO DEVELOP CONTACTS? ZOOMING INTO THE LATE BRONZE AGE ECONOMIC LANDSCAPES OF FORTIFIED SETTLEMENTS IN THE EASTERN BALTIC

**Abstract author(s):** Podenas, Vytenis - Minkevičius, Karolis - Piličiauskienė, Giedrė - Micelicaité, Viktorija - Čivilytė, Agnė (Lithuanian Institute of History)

**Abstract format:** Oral

Eastern Baltic region was commonly portrayed as a passive agent of Northern and Central European Bronze Age worlds limited to using metal artefacts as a proxy for the inflow of foreign ideas. However, recent studies of the fortified settlements suggest this process also permeated various other aspects of everyday life. Different data sources indicate that local communities developed different approaches to their economic subsistence which coincide with varying degrees of interregional communication. Zooarchaeological research revealed intraregional variation in animal husbandry alongside some cases of hunting. Archaeobotanical studies unveiled the presence of diverse crop package and allowed the identification of cases of intensive agriculture on nutrient-deficient soils. In addition, the examination of stylistic elements in various artefact groups illustrated the decrease in stylistic elaboration between the coastal and the inland sites. Finally, even differences in architectural tendencies and preferred settlement locations were observed. This is illustrated by the contrasting economic landscapes of the earliest fortified settlements. Sites established in the vicinities of larger rivers relied on active riverine communication, granting access to major economic routes. Whereas settlements located near isolated lakes or small rivulets suggest more nuanced networks in the Baltic Uplands. In this light, Eastern Baltic Bronze Age could be perceived as a distinctive, but economically unstable case. Susceptible and dependent on the import and ideas transmitted by visiting parties.

In this paper, we present findings from the 2020 excavations in Mineikiškės fortified settlement alongside the initial results of the BronzEko project, focused on the exploration of the Late Bronze Age economy of the Eastern Baltic region. By discussing differences among economic landscapes this paper aims to address the role of fortifications in the development and facilitation of interregional contacts. It also seeks to challenge the idea of economic and technological isolation of the local communities.

8

### LABOUR COST OF THE HALLSTATTIAN HEUNEURG FORTIFICATIONS

**Abstract author(s):** Remise, François (EPHE)

**Abstract format:** Oral

Many studies have been conducted about the architecture choice of fortifications, especially about their defensive capacity or their conspicuous objective. But only few labour cost analyses of these fortifications have been undertaken.

In this paper I present labour cost estimations of the three different successive types of fortifications built to surround the Heuneburg upper town between 620 BC and 540 BC using the Architectural energetics method: the log-cabin-style wood and earth system, the mudbrick on stone foundation wall and the more traditional Pfostenschlitz rampart.

The Architectural energetics method consists in identifying the raw materials used, then calculate their volumes, and estimate the labour cost for each task of the manufacturing, installation and maintenance process, using adequate work rate values which take into account the work site conditions.

The labour cost estimations of the three successive fortification allow to think these costs may have been taken into account in the choice of the building methods.

9

### DIFFERENT SOLUTIONS FOR DIFFERENT NEEDS: EXAMINING SIMILARITIES AND DIFFERENCES IN THE FORTIFICATIONS OF NORTH-EASTERN IBERIA (4TH-3RD CENTURIES BC)

**Abstract author(s):** Cuscó Badia, Oriol (Institut Català d’Arqueologia Clàssica)

**Abstract format:** Oral

This paper aims to present the state of research of an ongoing PhD thesis which focuses on the study of Iron Age fortifications in the north-eastern Iberian Peninsula (roughly present-day Catalonia). During the Middle Iberian period (4th-3rd centuries BC), this area was inhabited by several ethnic groups. Despite sharing a lot of cultural features, each of these groups had its own territory, political organisation and settlement hierarchy. Long before the beginning of the Roman conquest in 218 BC, war and conflict already

had an important role for these societies and especially for the aristocratic elites who ruled them, as evidenced by the weapons in their burials and by the defensive systems that protected most of their settlements.

Although these fortifications shared many common features and traits, they usually show significant differences in their degree of sophistication, their design, or even in the shape of specific elements. On the basis of an in-depth analysis of these fortifications, we intend to evaluate the causes behind their differences, showing that they are heavily linked with the typology and political importance of the settlements, but also with the regional peculiarities that characterised the aforementioned ethnic entities.

10

### UNDERSTANDING A MOUNTAIN SOCIETY THROUGH HILLFORTS: THE SAMNITE CASE

**Abstract author(s):** Fontana, Giacomo (University College London)

**Abstract format:** Oral

The Samnites are people without their own history. They most famously survive in Roman accounts that position them as formidable rivals in central Italy during a formative period of the Roman Republic, and indeed as iconic local alter-egos to Rome with quite different ways of organising themselves. It has long been clear archaeologically that the approximate territory of the Samnites was distinctive: full of hillforts, but with few, if any, obvious cities of a type familiar in neighbouring territories and so central to modern narratives of Iron Age Italian state formation. Still, the study of Samnite hillforts has focused on these narratives and the search for hypothetical Samnite cities. This endeavour stagnated research on these sites and neglected wider debates on non-urban societies and advances in the analysis of similar sites elsewhere. This project instead builds on recent research to understand Samnite hillforts according to concepts such as construction labour, state resistance and refusal, mobility, and guerrilla warfare. Different theoretical scenarios are tested using spatial and statistical analyses to highlight the function of hillforts within Samnite society and trace the past modalities of occupation across the challenging mountainous landscape of Samnium. This paper presents the first results of this research.

11

### A FORTIFICATION IS SELDOM FOUND ALONE. COMPLEX APPROACH TO FORTIFIED SITES AS PARTS OF A SYSTEM

**Abstract author(s):** Schneeweiss, Jens (University of Kiel, Centre for Baltic and Scandinavian Archaeology; Cluster of Excellence ROOTS; University of Göttingen)

**Abstract format:** Oral

Archaeological fortification research often concentrates on typological order and functional interpretation of individual sites. Typological thinking tends to focus on technical and constructive details, while the attribution of possible functions often remains bound to the dichotomy of Herrenburg – Fluchtburg (refuge). In early historical times, written sources can help creating attractive interpretations because they come up with names, dates and stories. At the same time, the zeitgeist has a non-negligible impact on researchers and research questions as well as on chosen methods and interpretations. Both factors contribute to the temptation to overestimate certain findings, as will be illustrated by case studies of Ottonian fortifications.

The paper intends to show the importance of recognising and scrutinising inconsistencies in the findings, as they can point the way to a deeper understanding and help to avoid conclusions being jumped to. The complex history of many fortifications can only be deciphered if the methods of investigation are adequate to the task. Micromorphological analyses, for example, can help to identify specific activities. Moreover, fortifications are never built by chance, but are the expression of a specific intention, usually as part of a superior and subordinate system. Unravelling the social context as well as the concrete relations to contemporaneous sites and cultural landscape elements enables a comprehensive insight into the functional levels of a particular fortification. Dating as precisely as possible is of fundamental significance. In doing so, it is necessary to analyse exactly what is being dated in each individual case: a local repair to the rampart, for example, can easily be misunderstood as a complete construction phase, and a fortified site can be inhabited before or after a fortification was built and in use. Attempting to identify the system a fortification belongs to is as important to its understanding as reconstructing the site itself.

12

### HILLFORTS AND SPATIAL ORDER: LEARNING TO LIVE WELL TOGETHER

**Abstract author(s):** Davis, Oliver (Cardiff University)

**Abstract format:** Oral

Over the last few decades, the role and function of later prehistoric hillforts has been much debated. In a British context, Prof. Barry Cunliffe (2006) has argued that once the enclosing boundary had been erected, their uses varied according to local need. The implication is that there may be no such thing as a typical hillfort. However, while a few hillforts appear ‘empty’, a common function shared by most is that they were places of settlement, either permanent or temporary. Indeed, in many parts of the world the development of the hillfort represents a significant point, where for the first time, large numbers of people, beyond merely the extended family, lived together in a centralised location. This has a range of important implications. For instance, once persuaded to move within the confines of a hillfort’s boundaries, how did these new ‘hillfort communities’ deal with the various social challenges? Groups who were used to living in dispersed, rural, settlements were now faced with dwelling in close proximity with neighbours. To some, this transition must have been difficult – the limitations on access to private space for instance may have accentuated one’s social condition, highlighting status distinctions and triggering petty differences and disputes. This paper will think through some of these issues by examining the arrangement of settlement within the interiors of hillforts and other fortified settlements throughout Europe. I will

EARLY AND MIDDLE BRONZE AGE FORTIFICATIONS IN THE SUB-CARPATHIAN AREA OF MOLDAVIA (EASTERN ROMANIA)

**Abstract author(s):** Vasile, Diaconu (Neamţ County Complex Museum)

**Abstract format:** Oral

After the decline of the famous Cucuteni culture, in the eastern area of the Carpathian Mountains, there were major cultural changes, amid influxes of people from the northern part of the Black Sea. In this context, the beginning of the Bronze Age meant a decline compared to the previous chronological stage, a fact supported by the modest settlements, the reduced territorial dynamics and a poor archaeological inventory.

For the sub-Carpathian area of Moldova, at the beginning of the Early Bronze Age, the foundations of some fortified settlements were laid, the existence of which has been linked to the control of some communication routes or to natural resources (salt). Although the number of their sites is reduced, they are of particular importance for the reconstruction of territorial control strategies. Based on recent research, important information has been obtained about the fortification system, but multidisciplinary studies should also be performed.

The same model of territorial distribution is followed by the fortifications of the Middle Bronze Age, which are reduced in number, but which benefit from stronger defensive systems.

An important detail is related to the fact that most of the fortifications are in forested massifs, which allowed a good conservation of the defense ditches. In fact, the defensive systems are made up of one, two or three ditches, and the related waves are not visible.

The location of the fortifications specific to the Middle and Late Bronze Age illustrates their arrangement on the eastern edge of the sub-Carpathian depressions, thus being a regional defense system.

BORDERS AND CONFLUENCES: SEEING THE BIG PICTURE AT A SMALL SCALE

**Abstract author(s):** Belford, Paul (Clwyd-Powys Archaeological Trust)

**Abstract format:** Oral

The border between England and Wales was fixed in 1536, but it is a line on a map that only approximately relates to a much wider cultural and linguistic border zone on either side of it. In contrast, the character of the borderland through which this line runs was shaped much earlier. This has always been a place where the high ground to the west gives way to lowland to the east; where rivers merge and flow onto the fertile plain. Hundreds of Iron Age hillforts and other enclosures dominate valleys and ridgeways, controlling movement and access along them. This was a borderland in the early medieval period too: linear earthworks were constructed to mark boundaries between kingdoms. The most famous of these was perhaps Offa’s Dyke, built in the 8th century; in places anchored by earlier hillforts, but running north-south across the grain of the landscape. Later, in the 11th and 12th centuries, French lords fought Welsh princes, and a network of earthen and stone castles – some again on or close to earlier sites – marked out their claims on the landscape. However, wider patterns of territoriality, land use, meaning and identity have since been obscured by barriers both in scholarship and administration. Archaeological scholarship has tended to emphasise the ‘defensive’ nature of these earthworks; it also creates period divisions for research: prehistory versus historical archaeology. Similarly, heritage management takes place within administrative silos – in this case the separate government heritage agencies of England and Wales – where the 16th century border removes the wider landscape context. This paper uses the example of the landscape surrounding the confluence of the Rivers Severn and Vyrnwy as a springboard for supra-regional and diachronic discussion about understanding and management of earthen fortifications (whether circular or linear) and their associated landscapes.

THE RE-INHABITATION OF THE PREHISTORIC HILLFORTS IN THE PROVINCE OF DARDANIA

**Abstract author(s):** Rama, Zana (Archaeological Institute of Kosovo)

**Abstract format:** Oral

During the Late Antiquity Period, as a result of different tribe invasions, in Dardania as well as in many places in the Byzantine Empire, the population started to abandon the field settlements and to relocate and reorganize themselves in the hilly locations. Various reasons affected the above movements of the populations, such as: escaping from the danger of invasions, for a better geostrategic position and natural protection, to control important routes and to create better communication between the settlements. Based on the descriptions of the scholar Procopius of Caesarea, in his work De Aedificiis (On buildings), during the rule of emperor Justinian I only, 69 fortifications in Dardania were built, 61 of them rebuilt and 8 of them were built new. The reconstruction of the fortifications took place in the strategic locations, most of which were inhabited also in Prehistory, mainly in the Bronze and Iron Age. This has been proven based on the archaeological excavations conducted so far, that brought to light a large number of prehistoric movable objects. Although the prehistoric architectural structures have not survived, they have left their traces behind to nowadays.

ARCHAEOLOGICAL TRACES OF THE ASSAULTS OF EAST SLAVIC HILLFORTS OF THE OLD RUSIAN STATE FORMATION EPOCH

**Abstract author(s):** Plavinski, Mikalai (Belarusian State University)

**Abstract format:** Oral

The end of the 10th – the first half of the 11th century is the time of the formation and functioning of a relatively unified Old Russian state. Its borders covered the territory of settlement of all East Slavic and some non-Slavic tribal unions. The few existing written sources describe this process extremely poorly. But there is no doubt that the spread of the power of the Kiev princes in many regions was violent.

In different regions of the settlement area of the Eastern Slavs, a number of archaeological monuments have been identified that can be confidently associated with military conflicts of the era of the formation of the Old Russian state. Among them, a number of hillforts stand out, usually located on the outskirts of the East Slavic oikumene. The materials revealed as a result of the excavations of these hillforts suggest that during the period of their functioning they could have played the role of regional trade, craft and administrative centers. In the 10th – the first half of the 11th century all of them were destroyed as a result of fires, in the layer of which numerous arrowheads and single finds of close combat weapons of the Northern European and early Old Russian types were revealed.

Despite the fact that the materials of excavations of such hillforts are mostly published, their special analysis from the point of view of the history of early medieval fortification and warfare has never been carried out. At the same time, it is obvious that the study of this group of monuments makes it possible to highlight a number of important issues in the development of fortification and warfare in the Eastern European region.

FORTIFICATIONS AND MILITARY THEORETICAL APPROACHES. OR: HOW CARL VON CLAUSEWITZ MAY HELP WITH THE INTERPRETATION OF EARLY MEDIEVAL FORTRESSES

**Abstract author(s):** Lemm, Thorsten (Centre for Baltic and Scandinavian Archaeology)

**Abstract format:** Oral

The position of a fortress in a particular region is never random. Fortresses have always been placed at certain locations based on strategic and tactical considerations. On a micro level it was essential to find the locality best suited for an effective defence of the respective fortress in a specific area. The decision for the specific area, however, was dictated by strategic considerations on the macro level very often relating to communication routes. Although several purposes (including administrative, economic etc.) must always be considered for fortresses, such strategic and tactical considerations are primarily relevant to their military functions.

Hence, it seems worthwhile to incorporate military theoretical approaches into the interpretation of fortresses – something that has been severely neglected in the past. However, military manuals of the early Middle Ages – the period considered in this paper – refer to fortifications only to a very limited extent. Far more productive approaches can be found in the famous work “On War” by the Prussian general and philosopher Carl von Clausewitz, written in the early 19th century. It is true that in it he refers to contemporary warfare; however, it is intended to show that his basic considerations on modern fortresses, which are quite theoretical in nature, can to a large extent be very well applied to early medieval conditions.

This paper will focus on Nordalbingia – the Saxon territory north of the river Elbe. Against a historical background characterised by socio-political changes I will use Clausewitz’s approaches to discuss overarching strategic concepts and a range of military functions of fortresses. The insights gained on the Nordalbingian fortresses – e.g. as fortresses used offensively in the course of a conquest or as fortifications to control communication routes – should also offer approaches for interpreting fortifications in other regions and from different periods.

THE FIRST MEDIEVAL FORTIFICATION IN COPENHAGEN? NEW INFORMATION ABOUT OLD QUESTIONS REVEALED AT GAMMELTORV 24

**Abstract author(s):** Borgius, Andréa (Museum of Copenhagen)

**Abstract format:** Oral

A recent excavation of a medieval moat in Copenhagen has raised questions about its function and its place in history. The moat and its rampart, which is completely covered by the modern city, is believed to be the oldest fortification which surrounded the location of the earliest part of the city and has previously been dated to the 12th century.

In 2019-2021, The Museum of Copenhagen had the opportunity to excavate a part of the feature, which had previously only been sparingly investigated. The aim of the excavation was to uncover as much as possible about the structure, how it was constructed, the period it was in use, as well as its connection to the surrounding area.

The excavation revealed new and interesting information about the construction of the moat, and of its immediate surroundings. The results raise questions of the military capacity of the feature, and suggests that other functions, such as administrative and representative, might have been equally important.

The paper will discuss what the results from the excavation may reveal about the functions of the moat and rampart, in the light of the recent decade's archaeological discoveries about the early town history. It is proposed that the construction of the moat and rampart was a move to consolidate power by the king or a local lord to control the town and its surrounding landscape.

19 **FORTRESS RESEARCH AT KIEL FJORD. AN ARCHAEOLOGICAL APPROACH TOWARDS FORTIFICATIONS OF THE MODERN AGE**

**Abstract author(s):** Pohl, Per-Ole (University of Kiel, ROOTS Cluster of Excellence)

**Abstract format:** Oral

During the post medieval period, new technical, political and social ideas and tranformations altered dramatically the European so-cieties and landscapes. In the 16th century, the bastionary fortification type, as an efficient response to the European firearm evolution, was developed and introduced as a privilege of the high nobility. Post Medieval fortifications were not only strong military sites originated from military engineering and warfare. Instead, they were complex facilities with agglomerated inhabitants from different social and professional groups, which created a socio-economic entity, separated by the surrounding landscape through a social and cultural borderland, highly constricted and regulated by the sovereign. Beside military, political and economical aspects, these fortifications had also an important symbolic and representative meaning.

Within my presentation I will report the results of my PhD research project at University of Kiel's Graduate School Human Develop-ment in Landscapes and Young Academy of the Cluster of Excellence ROOTS - Social, Environmental, and Cultural Connectivity in Past Societies. Within this project, my aim is to analyse the fortified landscapes of Scandinavia, by means of selected examples. The empirical base of the project is dedicated to the former Danish fortress Christianspries / Friedrichsort, which is located on the western shore of the Kiel Fjord. It is the only remaining, and largely preserved naval fortress in Germany and counts as an outstanding architectural, historical and cultural monument. Furthermore the fortress is considered as an important heritage sight and shares commonalities in Danish, Swedish and German history between the 17th and 20th century. According the CfP, I will present and discuss the current state of research approaches on post medieval fortifications, together with concepts, theories and methods of my own research at Kiel Fjords fortifications.

20 **HISTORY OF HILLFORT RESEARCH IN LATVIA: DEVELOPMENT OF METHODS AND INTERPRETATIONS**

**Abstract author(s):** Visocka, Vanda (University of Latvia)

**Abstract format:** Oral

Research of the settlements, especially hillforts, can provide us with a large amount of information regarding the everyday life and activities carried out in the past. These aspects, along with the easy identification of hillforts, have raised quite a large interest among researchers in the study of these types of settlements.

The research of hillforts in the territory of Latvia has a long and diverse history whose roots can be found in the 19th Century. Over this long period of time not only the methodology of archaeological research, but also the questions asked have developed quite significantly.

The aim of this paper is to characterize the development of hillfort research in Latvia, as well as the role of the hillforts in this region presented in the academic literature.

In this paper the history of archaeological surveys and excavations and their characteristics will be analysed through the excavation reports and published excavation and survey summaries. In turn, the change of the questions asked and role of the hillforts and their typology will be analysed through academic literature.

Due to a large amount of the material, the author will only focus on the most representative surveys and excavations in the territory of Latvia.

21 **DATING HILLFORTS THROUGHOUT TIME – CASE STUDIES FROM EASTERN PRUSSIA**

**Abstract author(s):** Ibsen, Timo (Zentrum für Baltische und Skandinavische Archäologie)

**Abstract format:** Oral

As in all Baltic regions, the hillforts in former German province East Prussia (today divided between the modern states of Rus-sia, Poland and Lithuania) are extremely numerous. Over an area of almost 40,000 square kilometres, nearly 500 monuments have been documented until today. In several specific phases in the last almost 200 years, hillforts have been registered, mapped and described. However, detailed investigations have taken place to very different extents, depending on the questions pursued by the excavators. The least is known about the chronology of the monuments. The few finds from excavations usually provided little information about the time of origin and occupation phases. The majority of the monuments was dated to the period between the Migration Period and the Teutonic Order, only a few seemed to exist already in earlier times.

Shortly before the end of the World War II and thus before the end of German research in the region, several scholars formulated dating as the most urgent concern of hillfort research and suggested different strategies.

In the following decades, the number of hillfort investigations increased, now in the responsibility of the respective national states of Lithuania, Poland and Russia. However, especially in the northern part (nowadays Kaliningrad Region of Russia), dating until recent-ly was based mainly on pottery finds, which are difficult to classify typologically. It is only in recent years that radiocarbon dating has been used in larger series for chronological classification by the author. The results draw a completely new picture of the develop-ment of hillforts in the Region and prove a continuous use from late Bronze Age up to the Middle Ages.

The paper leads through the history of research on hillforts in former East Prussia, discusses the different methodological ap-proaches and finally puts new dating results into the broader context.

22 **EARLY IRON AGE FORTIFICATIONS IN CENTRAL EUROPE: NEW RESEARCH TRENDS AND RESULTS**

**Abstract author(s):** Ballmer, Ariane (University of Bern, Institute of Archaeological Sciences & Oeschger Centre for Climate Change Research) - Fernández-Götz, Manuel (University of Edinburgh, School of History, Classics and Archaeology)

**Abstract format:** Oral

The study of fortifications occupies a prominent position in Central European Iron Age research and looks back on a long research tradition. While initial investigations focused predominantly on defensive considerations from a military perspective, research of the last few decades has paid increasing attention to the social and symbolic role of the fortifications. Despite (or because of) the intense research, fortifications are still highly significant for Early Iron Age archaeology and offer great research potential. The authors will define and evaluate the current status quo of Early Iron Age fortification research in terms of questions, technical pro-cedures, analytical methods, and interpretive frameworks, in order to then propose a set of prospective research approaches. This includes, among other aspects, going beyond the rigid typologies that were established to define certain fortification types, thus acknowledging the existence of 'hybrid' works that escape traditional classifications. In addition, the paper will explore the potential of fieldwork techniques that go beyond the traditional excavation of a wall section in order to gain knowledge about chronology and typology. Examples from Germany and France will illustrate the discussion and build a basis for a future research agenda.

23 **ALL AT SEA: WHAT IF PROTOHISTORICAL HILLFORTS FROM THE CHANNEL-ATLANTIC SEABOARD WERE OVER-INTERPRETED AT THE EXPENSE OF THE HINTERLAND?**

**Abstract author(s):** Duval, Hervé (CReAAH)

**Abstract format:** Oral

The French Channel-Atlantic seabord occupies an important place in the archaeology of the northwest part of France. From the thousands archaeological sites discovered on its coastal and insular environments, several dozen are fortified sites of the protohis-torical period. For reasons still closely linked to historiography, most of the archaeological interventions (surveys and excavations) have focused on documenting this geographical context, until now. On the contrary, the hinterland has not benefited from such a great enthusiasm, which contributes to a very imbalance situation for the scientific data currently available. In fact, archaeological theories have often focused on the best documented sites, putting the hinterland in the background. Some major fortified sites are therefore unexploited or remain unknown, despite their great archaeological and cultural value

This communication seeks to question our ability to reverse our research paradigms through a critical and updated reading of the results obtained on the French Channel-Atlantic seaboard. Far from a historiographical assessment, it aims to highlight this imbal-ance which marked an oriented the reading of archaeological results concerning the protohistoric fortified sites. Solutions are also proposed, considering what is currently being done on a larger scale, in order to discuss future researchs and the methodology that wish to be systematized.

24 **MEDIEVAL FORTRESSES IN UKRAINE: DIRECTIONS OF STUDY**

**Abstract author(s):** Manigda, Olga (National Academy of Sciences of Ukraine)

**Abstract format:** Oral

Studies of fortified settlements in Ukraine in last 10-15 years have moved from the definition of land ownership markers to com-prehensive researches related to the exploration of landscapes, ethnic identification, the strategy of defense on the frontiers. All these directions are common to investigations of fortified settlements in different epochs. However, as a specialist in medieval settlement systems, I will talk about the fortresses of the 10th-13th centuries from the territory river Dniester pool.

One of the most common directions of study is the archaeological mapping of region. This direction allows to reveal the degree of ar-cheological research, areas of traditional settling, agglomeration, and ways of communications. It also allows to create a prognostic models for poorly researched territories. As an example, we could say about the archeological map of the Galician Princedom created by the author, which counts about two thousand archeological sites (settlements, fortresses, cemeteries of 10-13 centuries).

The second direction is the study of settlement structures, which organically arises from a huge array of accumulated information about the sites that we received from the archaeological mapping. This direction allows us to understand how life has changed in a certain area, the stages of growth and decay. After that we get the opportunity to reconstruct landscapes in the areas of study.

EARLY MEDIEVAL HILLFORTS IN CENTRAL POLAND. THE STATE OF RESEARCH AND WHAT NEXT?

**Abstract author(s):** Sikora, Jerzy (Institute of Archaeology University of Lodz)

**Abstract format:** Oral

Between 2013 and 2016, researchers from SNAP branch Łódź and from the University of Lodz conducted four programs of comprehensive integrated multi-disciplinary non-invasive research of early medieval strongholds/hillforts in central Poland (medieval lands of Łęczyca and Sieradz). Their aim was to recognise the spatial structure of not only the stronghold but also of the surrounding rural settlement, its environmental background, and preservation conditions. During these programs, twelve strongholds with their vicinity were surveyed. In 2017, a monograph summarising the research was published. Just a few years earlier, in 2014, a three-volume monograph of a multi-year program of multidisciplinary research of the stronghold in Tum was published. In the near future, we expect the same team from the Museum of Archaeology and Ethnography to publish another monograph on the recently finished research of the stronghold in Czerchów. The state of our knowledge seems to have grown considerably over the last decade. But could we really use it to build a comprehensive narrative of changes in the stronghold network and its role in the settlement transformation and development of tribal and state organisations in the Early Middle Ages? What are the prospects for future research? What should be done in the fields of academic archaeology, heritage protection, and public archaeology? And how this quite local, peripheral archaeology of fortification could be relevant in a wider European context?

CROSSED APPROACHES TO TRANSITIONS IN THE NEOLITHIC: UNDERSTANDING SOCIAL MECHANISMS UNDERLYING MATERIAL CULTURE TRANSFORMATION USING THE CONCEPT OF CHAÎNE OPÉRATOIRE

**Theme:** 6. Material culture studies and societies

**Organisers:** Denis, Solène (Masaryk University; PaTHs Unamur; UMR 7055) - Gomart, Louise (CNRS, UMR 8215) - Tóth, Peter (Masaryk University)

**Format:** Regular session

The processes underlying change in European Neolithic material cultures are the subject of long-lasting debates, revolving around questions on human group identities, mobility and interactions. In this framework, the sequences of production and use (i.e. the chaînes opératoires) of material goods can act as powerful proxies to grasp the anthropological conditions leading to these critical shifts, as they reveal habits transmitted over generations. Identifying raw material supply territories and processing, as well as the manufacturing processes and uses of the artefacts produced by a given human groups provides information on its sociological nature, as well as evidence on its spatio-temporal trajectories and interactions with other communities (e.g. shared supply territories, exchanges, technical borrowing, stylistic imitation...). A systemic perspective, combining data, appears however pivotal to untangle the social dynamics of the identified communities and eventually assess their role in complex transition phenomena.

The session proposes to discuss the social mechanisms leading to Neolithic material culture transformation, using the concept of chaîne opératoire. By focusing on material culture stability versus transformation in a technological perspective, we wish to investigate the diversity of economic and social patterns at the basis of changes in production and consumption of material goods: who are the groups engaged in material culture change? What kind of interactions can lead to transformation in material culture? As part of these interactions, what is transmitted? What is reinterpreted? What is rejected? Do the different technical spheres display the same rhythms and processes of change and how can these differences be interpreted? Our goal is ultimately to apprehend the different historical scenarios at the root of the turning points identified in the archaeological record.

The session welcomes research on all kinds of artefacts and analytical methods (petrography, technology, use-wear analyses, bioarchaeology...), with an emphasis on integrated approaches combining different types of data.

ABSTRACTS:

DYNAMICS OF CULTURAL CHANGES IN THE NEOLITHIC OF THE FOREST-STEPPE VOLGA REGION (EASTERN EUROPE)

**Abstract author(s):** Andreev, Konstantin (Samara State University of Social Sciences and Education)

**Abstract format:** Oral

Goal of the presentation - to show the dynamics of cultural changes in the Neolithic of the forest-steppe Volga region. The materials of the research are the complexes of the sites of the Mesolithic and Neolithic eras of the region. When considering the indicated problem, a set of methods was used: typological, palynological, radiocarbon and others.

Neolithization (the appearance of ceramic dishes) in the forest-steppe Volga region is associated with the carriers of the Elshanskaya culture. The first groups of the early Neolithic population appeared in the region at the beginning of the VII millennium BC as a

TRACING THE NEOLITHIC TRANSITION THROUGH THE FIRST POTTERY (NEOPOT)

**Abstract author(s):** Tóth, Peter - Petřík, Jan (Masaryk University) - Bickle, Penny (University of York) - Petr, Libor - Slaviček, Karel - Adameková, Katarína (Masaryk University) - Pokutta, Dalia (Masaryk University; University of Stockholm)

**Abstract format:** Oral

In this paper we will use the most common archaeological find – pottery – to reveal new perspectives of the spread of farming in the Pannonian region. How did pottery first appear in this area? Was it moved by people or was it a local innovation, learned from farming cultures to the south? By application of ground-breaking analytical methods we approach this research question through four inter-related topics: a high resolution mathematical model of radiocarbon dates, technological traditions of pottery, cooking practices (such as the first appearance of dairy products) and provenance of the pottery. Together this forms the basis of the NeoPot project.

In this paper, we will focus on presenting a method of treating the samples for 14C dating, which produced highly precise absolute data. Preliminary results show the earliest pottery appeared in SW Slovakia around 5600 BC, which corresponds with the formative phase of the LBK in Transdanubia (Szentgyörgyvölgy-Pittyerdomb) and Lower Austria (Brunn am Gebirge). Preliminary results of the ceramic technology study of the earliest pottery show the use of grass instead of chaff, which contrasts with Starčevo and Körö/Criș traditions in terms of firing temperature and tempering practices. The work is supported by Grant Agency of the Czech Republic under the contract No. GA20-19542S.

CULTURAL TRANSITION OR RUPTURE WITHIN EARLY NEOLITHIC TOOLKITS: THE CASE OF LBK GRINDING TOOLS

**Abstract author(s):** Hamon, Caroline (CNRS)

**Abstract format:** Oral

The spread of the Neolithic throughout Europe is accompanied by major technological innovations, among which ceramic productions, polishing tools and grinding tools take a major part. Though often considered poorly indicative from a cultural perspective, neolithic grinding tools offer a wide range of technical and functional characteristics that contribute to differentiate specific regional and chronological patterns. The close study of the distribution of these different grinding tools technologies design diffusion roads and frontier effects that can be interpreted in terms of adoption and innovations through time and space. In the frame of this communication, we will discuss the possible mechanisms related to the adoption or abandonment of grinding tools systems within early neolithic contexts in Western Europe. As but an example, we will discuss the reasons explaining the wide diffusion of emblematic grinding tools types during 5 centuries throughout the European Lbk, and the final abandonment of one of this emblematic implement at the end of the sequence at the arrival of Lbk people on the western margin of the Lbk diffusion between Meuse and Seine. The respective and combined role of possible internal technological innovations related to the evolution of cereal processing and food habits, as well as external cultural influences with a margin effect, will be discussed.

TRANSFORMATION OF A NEOLITHIC SETTLEMENT ON THE EXAMPLE OF THE RECONSTRUCTION OF POSSIBLE HOUSEHOLDS ON THE SITE OF HULÍN-PRAVČICE

**Abstract author(s):** Kalabková, Pavlína (Palacký University Olomouc)

**Abstract format:** Oral

The multi-cultural Neolithic settlement on the site of Hulín-Pravčice (Czech Republic) has been explored in 2007–2010. The settlement is dated back to the period of the LBK, STK and LgK. Archaeologists uncovered here more than fifty Neolithic house plans and over eight hundred sunken Neolithic settlement features of various shapes and functions (storage pits, clay pits, ovens, building pits). Movable finds are represented by fragments of ceramic vessels, stone artefacts and clay daub. The research outputs also include results of various types of environmental analyses (petrography, archaeozoology, archaeobotany) and a series of absolute dates. The site is located in a region whose natural conditions are ideal for agriculture and permanent settlement. It also lies on the long-distance routes in the basic north-southern communication corridor in Moravia. This is indirectly evidenced by raw materials for lithic industry imported from the Carpathian Basin, Lesser Poland and Bohemia. We suppose that the Neolithic settlement on

5 this site existed continuously from the end of the 6th millennium until the mid-5th millennium BC. The settlement continuity is also verified by on-site detections – mutual respecting of individual settlement features (houses, households), joint (long-term) use of clay pits, backfilling of the settlement pits with common garbage. An evidence might also be the frequent reutilization of stone tools – for example, the transformation of LBK shoe-last celts (adzes) into the LgK tools, or the production of ceramic spatulas of the LgK from fragments of handled vessels of the LBK. Petrographic analyses of pottery proved that all three Neolithic cultures in this settlement used the same sources of potting clay. The contribution will thus try to use the model example of Hulin-Pravčice to verify the thesis that Neolithic communities intentionally created long-term settlement areas.

**ATH “ LES HALEURS “, TWO VILLAGES LBK AND BLICQUY/VILLENEUVE-SAINT-GERMAIN: SEARCH FOR TRANSITION MECHANISMS THROUGH THE INTEGRATED STUDY OF PRODUCTIONS**  
**Abstract author(s):** Denis, Solène (Masaryk University; UMR 7055) - Deremaix, Isabelle (Agence wallonne du Patrimoine) - Cayol, Nicolas (INRAP; UMR 8215) - Gehres, Benjamin (UMR 6566 CReAAH) - Goemaere, Éric (Royal Belgian Institute of Natural Sciences) - Gomart, Louise - Hamon, Caroline (CNRS, UMR 8215) - Jadin, Ivan (Royal Belgian Institute of Natural Sciences) - Teetaert, Dimitri (Ghent University, Department of Archaeology, Pre-and Protohistory of Europe) - Zeebroek, Martin (RPA)

**Abstract format:** Oral  
At the turn of the sixth to the fifth millennium BC, a historical turning point occurred in continental neolithization of Europe as the Linear Pottery culture broke up into a mosaic of cultural entities. The northern half of France and Belgium were occupied by the Blicquy/Villeneuve-Saint-Germain culture (BQY/VSG). The recently discovered site of Ath “Les Haleurs” in the west of Belgium (Hainaut Province) represents a key site for exploring in detail the mechanisms of the cultural transition between these two cultural spheres. Indeed, established along the eastern branch of the Dender river, the “Les Haleurs” site has the particularity of offering the remains of the two successive Early Neolithic cultures, i.e. Linear Pottery Culture (LBK) and Blicquy/Villeneuve-Saint-Germain. This proximity is exceptional: sites with houses of the two cultures are rare (three sites in Hainaut and two in Hesbaye, the Belgian Liège province) especially when they show such a high closeness (less than 3 meters). Thus, this communication will present the first results of the technological and integrated study of all the artifacts found at the site of Ath “Les Haleurs”. We propose to cross-reference the origin of raw materials, typo-technology, and use-wear analysis of ceramic productions, lithic industry, macrolithic tools, and stone ornaments. The rhythms of change in the different technical sub-systems will then be compared and questioned.

**6 EXPLORING THE SOCIAL CONDITIONS OF THE LBK/POST-LBK TRANSITION IN EASTERN BELGIUM THROUGH THE INTERGENERATIONAL TRANSMISSION OF CERAMIC AND LITHIC KNOW-HOWS**  
**Abstract author(s):** Gomart, Louise (French National Centre for Scientific Research) - Denis, Solène (Masaryk University, Department of Archaeology and Museology; Université de Namur, Laboratoire Interuniversitaire d’Anthropologie des TECHniques LIATEC)

**Abstract format:** Oral  
In this communication, we will present the results of an integrated technological analysis performed on the ceramic and lithic assemblages from the early Neolithic villages of Verlaine and Vaux-et-Borset (Hesbaye, Belgium), both characterised by a double LBK and post-LBK (i.e. Blicquy/Villeneuve-Saint-Germain, abbreviated BQY/VSG) occupation. Our study, centred on the reconstruction of the manufacturing chaînes opératoires, aims to identify technical traditions, revealing learning networks that are specific to producer groups. Tracking these technical traditions in time and space at the larger scale of Belgium and north-eastern France enables us to assess (1) continuity and ruptures in know-hows in Hesbaye during the transition from LBK to BQY/VSG; (2) the mobility patterns of producers; (3) possible processes of interaction between producer groups. The detailed reconstruction of lithic and ceramic technical know-hows during the transition between LBK and BQY/VSG in Hesbaye reveals distinct producer groups whose spatial trajectories and socio-economic behaviours seem to have changed profoundly at the turning point of the 6th and 5th millennia BC. Our systemic study shows the potential of the chaîne opératoire approach to apprehend the sociological relationships between these two cultural entities and to propose a scenario of historical transition, taking into account the cultural, social and economic dynamics that led to the fragmentation and disintegration of the LBK system.

**7 FARMER-FORAGER INTERACTIONS AND THE NEOLITHIC TRANSITION IN NORTHERN BELGIUM: RESULTS OF AN INTEGRATED STUDY OF HUNTER-GATHERER POTTERY AND LITHIC MATERIAL**  
**Abstract author(s):** Teetaert, Dimitri - Messiaen, Liesbeth - Halbrucker, Éva - Crombé, Philippe (Ghent University, Department of Archaeology)

**Abstract format:** Oral  
During the 5th millennium BC, the last hunter-gatherers (Swifterbant Culture) of northern Belgium and the Netherlands gradually adopted the knowledge of pottery production, animal husbandry and crop cultivation from farmers of the NW European loess areas. The social mechanisms behind this transition are still poorly understood. So far, there was no clear indication as to which farming populations were responsible for these knowledge transfers. Recently, all pottery and lithic remains from five transitional sites in the Scheldt river valley were studied in detail. The pottery technology and changes in the lithic industry of the hunter-gatherers in northern Belgium indicate that they had strong social relations with farmers of the Blicquy/Villeneuve-Saint-Germain Culture in central Belgium and northern France. This paper presents the main results of these studies. It combines information on pottery/

lithic technology, raw materials and use with archaeobotanical/-zoological data and radiocarbon dates. It is suggested that the hunter-gatherers of the Scheldt river valley adopted the knowledge of pottery production from BVSG potters, and possibly had their first direct contact with domestic animals as well as cereals through interactions with the BVSG Culture, between c. 4800 – 4600 cal BC.

**8 NEOLITHIC TRANSITION IN THE EASTERN ADRIATIC: NETWORKS, CULTURAL TRADITIONS AND TECHNOLOGICAL TRANSMISSIONS**

**Abstract author(s):** Kacar, Sonja (TRACES, UMR-5608 University of Toulouse)  
**Abstract format:** Oral  
This presentation focuses on the Eastern Adriatic, were beginning of the Neolithic dates back to ca. 6000 cal BC and is associate with the Impressed Ware Culture. However, this cultural uniformity seems to be only apparent, i.e. limited to the same ceramic style. Indeed, the lithic assemblages show obvious regional differences in the organisation of lithic production systems and variable chaîne opératoires, clearly distinguishing two different cultural zones: Dalmatia and Istria. The Impressed Ware lithic assemblages from Dalmatia are characterized by the complex pressure blade production techniques on exogenous south Italian (Gargano) cherts reflecting important socio-economic and technical mutations that are specific to the Neolithic. The technical systems from Istria, however, can be described as local since the locally available cherts were used in on-site expedient production. The bladelets and bladelet-like flakes were obtained by direct and indirect percussion, possibly reflecting some Late Mesolithic (Castelnovian) features.

This difference in technical systems probably reveals different technological traditions in the production of stone tools. Besides, while the Gargano cherts continue to be used in Dalmatia during the Middle and Late Neolithic, it seems that Istria and Northern Adriatic were excluded from this south Italian chert distribution network. In these regions, from the Early/Middle Neolithic (Danilo culture; after ca. 5500 cal BC), finished products (blank or retouched blades, pressure-flaked arrowheads) on the high-quality exogenous cherts were recorded, but it seems that they were originating from the Northern Italy (Alpine foothills).

In this presentation we aim to understand social mechanisms behind the Neolithic transition by combining different types of data (lithics, ceramics, past subsistence, paleoenvironment...). The results suggest that during the 6th millennium BC several human groups of different origins and cultural traditions, integrated into different technological networks, were co-existing in the Eastern Adriatic.

**9 TOWARDS A MULTI-PROXIES ANALYSIS OF TECHNICAL BEHAVIOUR IN THE EARLY NEOLITHIC PERIOD IN THE RHÔNE VALLEY**  
**Abstract author(s):** Caro, Joséphine - Defranould, Elsa (UMR 5608 Traces) - Convertini, Fabien (UMR 5140 ASM; INRAP) - Manen, Claire - Perrin, Thomas (UMR 5608 Traces; CNRS) - Beeching, Alain (UMR 5133 Archéorient)

**Abstract format:** Oral  
During the 6th millennium BCE, the neolithisation of the north-western Mediterranean is marked by the development of the Impresso-Cardial Complex, which gathers several facies. The renewal of the chronometric framework and recent works of synthesis underline the complexity of the spatio-temporal dynamics and allow varied scenarios to interpret this polymorphism. The aim of our paper is to characterise the evolution of lithic and ceramic material productions through the prism of ‘chaîne opératoires’ in order to approach these facies as techno-complexes and to question their cultural reality. Our investigation concerns the second half of the 6th millennium BCE in the lower Rhone valley. This region is an ideal study area for this type of combined approach: it corresponds to a Neolithic penetration way inland and offers contrasting landscapes, conducive to the diversity of human settlements. In this context, the sites of the Baume de Montclus (Gard Department) and the Baume de Ronze (Ardèche Department) appear as key sites of Holocene prehistory in the south of France. In the Early Neolithic, the stratigraphies of these two sites record a succession of occupations over several centuries (ca. 5600-4800 BCE), attributed to two main ceramic facies: Cardial and Epicardial. Their chrono-stratigraphic articulation offers the conditions for addressing the ruptures or continuities which characterise the evolution of material productions and hence the mechanisms of change.

Thus, this presentation provide an opportunity to introduce a comparative analysis of the origin of raw materials and the ‘chaînes opératoires’, both lithic and ceramic. Several neighbouring and contemporaneous sites can be used for comparison purposes. We try to interpret the different rhythms of evolution of the production sub-systems, to question their relationships with ceramic styles, but also with the development of networks for the circulation of materials or products able to transcend (or not) “cultural” particularisms.

277 **LIVING IN THE MOUNTAINS: SETTLEMENT STRATEGIES FROM THE BEGINNING OF THE HOLOCENE TO MODERN TIMES IN SOUTHERN EUROPE. PART 1**

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Alliot, Pascal (Department of Antiquity and Middle Age Studies, Autonomous University of Barcelona - UAB) - Stagno, Anna (Laboratory of Environmental Archaeology and History - DAFIST-DISTAV, University of Genoa) - Olesti, Oriol (Department of Antiquity and Middle Age Studies, Autonomous University of Barcelona - UAB) - Gassiot Ballbè, Ermengol (Department of Prehistory, Autonomous University of Barcelona - UAB) - Portillo, Marta (Institutió Milà i Fontanals, Spanish National Research Council - CSIC)

**Format:** Regular session

Over the last few decades, our understanding of human occupations in mountain areas of Southern Europe from the Pleistocene-Holocene transition onward has increased notably. Interdisciplinary attempts and the integration of geosciences and natural sciences has become and extension to conventional archaeological approaches. There is a range of evidence for subsistence practices from key moments tracking the emergence of early farming, the domestication of plants and animals, the relationship between socio-economic changes and environmental resources management, and the impact on the environment.

This session will place together recent research exploring settlement patterns from the early/middle Holocene to modern times, through a wide diversity of approaches, such as bioarchaeology, geoarchaeology, archaeometry, technology, landscape archaeology, and ethnoarchaeology. We suggest participants particularly explore human-environment interactions in mountain areas in different regions across Southern Europe through time, and in key episodes of cultural change. Interdisciplinary studies to delineate the complex environmental and social contexts in mountain occupations from all archaeological records and historic periods are most welcome.

**ABSTRACTS:**

1 **THE CERRETANI (ORIENTAL PYRENEES): SETTLEMENT AND PRODUCTIVE PATTERNS FROM THE IRON AGE TO THE ROMAN CONQUEST (4RTH-1ST C. BC)**

**Abstract author(s):** Vila, Oriol (Universitat Autònoma de Barcelona)

**Abstract format:** Oral

The archaeological research developed in the Cerdanya region (Oriental Pyrenees) in the last 20 years has allowed to identify the main settlement, social and productive patterns of the Cerretani, the Iberian community living in the Pyrenees. Considered as a mountain –and marginal- society, not urbanised, the research has showed his complex territorial system (based on several hill-forts), an agro-pastoral productive system (with also complex livestock strategies), and an important development of literacy.

The paper analyses also the process of conquest and integration of the Cerretani to the Roman empire, a process started in an early chronology (mid 2nd c. BC), and well documented thanks to the urbanistic and economic changes identified in most of the cerretanian sites. The continuity of some economic indigenous traditions, can be balanced with the presence of some new requirements (specially about metals) and the influence of the Roman Army occupation. The final abandonment of the Iberian hill-forts, and the foundation of the city of Iulia Libica about the augustean period, show the end of this historical process.

2 **INTEGRATED LANDSCAPE RESEARCH IN TER HIGH MOUNTAIN VALLEYS (EASTERN PYRENEES, SPAIN): LIVESTOCK, SETTLEMENT DYNAMICS AND LAND-USE IN A LONG-TERM PERSPECTIVE**

**Abstract author(s):** Palet, Josep Maria - Pescini, Valentina - Colominas, Lúdia - Garcia-Molsosa, Arnau - Euba, Itxaso (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - GIAP-ICAC)

**Abstract format:** Oral

Since 2010, an integrated archaeological and palaeoenvironmental research programme has been developed in the Ter High Mountain Valleys (Eastern Pyrenees), with the aim of studying the long-term landscape shaping of these Mediterranean high-mountain environments. This programme integrated archaeological extensive survey, GIS, excavation and radiocarbon dating of archaeological structures, palaeoenvironmental research, as well as archaeobiological and micromorphological analysis.

Settlements dynamics discontinuities, since the Middle Neolithic-Late Neolithic transition (~3600 cal BC) until modern and contemporary periods, will be characterized together with changes in landscape and in environmental resources management practices.

Results allow drawing a densely exploited landscape, and showing the deep and ancient occupation activities shaping the Pyrenean high mountain spaces. Some of the analysed sites will be discussed. Open-air Neolithic settlements show a strong presence of alpine and subalpine vegetation communities (mountain pine, birch, willow) while an increase in juniper has been highlighted in sites of Roman times and Early Middle Ages. Actually, Antiquity reports an important period in livestock expansion, with an especial intensity from the 2nd – 3rd centuries and during Late Antiquity. Settlement dynamics show a new expansion from the Early Middle Ages (9th 10th c.), with the reuse of roman structures and the construction of new ones clearly more specialized (cheese production). The importance of livestock management practices (including fire-driven forest openings and grazing activities) together with forest exploitation in these areas especially during medieval and post-medieval periods are among the main causes of the timberline low-

ering. Finally, archaeological data attest a new phase of pastoralism expansion from the 14th-15th c. to modern and contemporary periods.

3 **ARCHAEOLOGICAL SURVEY IN A HIGH-MOUNTAIN ENVIRONMENT: LIVESTOCK SETTLEMENTS, LAND-USE AND LANDSCAPE DYNAMICS IN PUIGPEDRÓS MASSIF AND DURAN VALLEY (EASTERN PYRENEES, SPAIN)**

**Abstract author(s):** Carbonell, Arnau - Palet, Josep - Colominas, Lúdia - Martínez, Jesús - Pescini, Valentina - Gallego-Valle, Abel - Aliende, Paloma (Catalan Institute of Classical Archaeology. Landscape Archaeology Research Group - ICAC-GIAP)

**Abstract format:** Oral

Since 2018, GIAP-ICAC has been carrying out an archaeological survey in high-altitude areas in the Puigpedrós mountain range, at the high Segre valley in La Cerdanya (Catalonia). The survey has been guided by previous photointerpretation work in order to carry out a pre-inventory of archaeological structures. A total of 119 structures grouped in a total of 20 sites have been documented. Until now, the research has comprised the excavation of test pits in a total of 5 sites and 16 structures located between 2300 and 2500m. The sites are areas of livestock occupation, dry-stone huts, and enclosures, but also settlements surrounded by dry stone walls, with differentiated occupation phases. The survey has provided an accurate inventory of archaeological structures and has made it possible to study their functionality and chronology, essential features in order to characterize occupation dynamics and land-use in these high mountain areas. The results show a very important occupation sequence with a structurally very important first phase during the late Neolithic, a second period at the beginning of the Iron Age, very rare in High Pyrenean contexts, a Roman occupation, and an expansion of livestock activities in Late Antiquity. Finally, occupation during the Middle Ages (12th-14th centuries) has been also attested. The reutilization of some sites over time explains the excellent state of conservation of many structures and their high heritage value.

4 **FLYING OVER THE PASTURES. TOWARDS NEW PROCEDURES FOR ARCHAEOLOGICAL SURVEYS IN HIGH ALTITUDE AREAS**

**Abstract author(s):** Calastrenc, Carine - Baleux, François - Poirier, Nicolas - Antoine, Laurent - Philippe, Magali - Rendu, Christine (CNRS)

**Abstract format:** Oral

The interest of archaeologists and the dialogue between the human and natural sciences allow us to understand the dynamics of mountain territories. Subjected today to integrated interdisciplinary questioning, they reveal long and complex histories.

The different research teams involved in this work are confronted with the problem of primary data acquisition. As an essential pre-requisite for any archaeological research, high-mountain survey has its own specificity and particular challenges.

- How to go beyond the visible threshold, enrich information (subsurface and diversification of sensors)
- How to systematize acquisition to ultimately deal with larger territories.

Accessing the most complete archaeological information in a relatively short period of time is the challenge of the

The new technological advances, the diversification and miniaturisation of sensors, the democratisation and development of aerial drones and the progress in the computer ergonomics of data processing software make it possible to think about the implementation of new procedures for primary information acquisition, data processing and fusion to optimize the detection of archaeological remains in high-altitude environments.

This is what the TAHMM (Télédétection Archéologique en Haute et Moyenne Montagne) research program proposes to do since 2018 (<https://www.tahmm.fr/>). It focuses on four workshop areas located in the Pyrenees.

Its objective is to cross several sources with highspatial, spectral, radiometric and temporal resolution: satellite and UAV remote sensing, geophysics and chemical soil analysis are used for exploratory purposes.

This communication will present the first results of this research.

5 **PEOPLING THE ITALIAN MOUNTAINS, 9500-2000 BC: ANSWERING OLD AND NEW QUESTIONS**

**Abstract author(s):** Skeates, Robin (Department of Archaeology, Durham University)

**Abstract format:** Oral

This paper reviews the current archaeological evidence for the peopling of the Italian mountains over multiple scales of time and space: initially during the Early Holocene by Mesolithic hunter-gatherers, then extending across the mixed-farming societies of the Neolithic, Copper Age and Early Bronze Age (c. 7500-2000 BC). In the process, it provides answers to a series of old and new questions:

How were mountain zones colonised, over time and space? What routes did mobile human groups take within them? What impact did climatic change and fluctuations have on faunal and human territories and subsistence strategies in the mountains? How extensive were human territories within and around the mountains over time and space? How were these territories ordered and marked? In what kinds of mountain habitat did human groups concentrate their activities and related sites? How variable were these sites and activities over space and time? How frequently were these sites abandoned and reoccupied? To what extent were human mobility,

6 subsistence and settlement practices in the mountains scheduled seasonally? What food and other material resources did people exploit in the mountains? How specialised were these practices? Over what distances were mountain resources transported, and to what extent were these material flows connected to wider networks of production, interaction and exchange? How did these networks vary over space and time? Did human actions have any negative impacts on soil, woodland or wild animals in the mountains? What kinds of social groupings and relations did humans maintain in the mountains? How strongly defined were gender- and age-based activities, identities and relations? How and to what extent did prominent social groups control mountain zones? What kinds of symbolic acts, ceremonies and rituals did human groups perform in the mountains? To what extent did these performances complement socio-economic strategies?

6 CHALLENGES FOR PREHISTORIC ALPINE FOREST SUBSISTENCE ECONOMIES: STRATEGIES OF DIVERSIFICATION, FOOD STORAGE AND PRESERVATION – THE LEVENTINA (TICINO) CASE STUDY

**Abstract author(s):** Della Casa, Philippe (University of Zurich)  
**Abstract format:** Oral  
From around 3500 BCE, all-year inhabited dwellings emerged in the inner valleys of the Alps, to the north and south of the watershed. It is believed that these settlements lived on a simple subsistence economy, not dissimilar to sub-recent ethnographic models in the Alps and other mountain regions. The term “forest subsistence economy” has been coined for such mixed economies relying on farming, breeding and forest products.

Biological macrorests from settlement situations are the most important source of knowledge on early mountain economies, along with archaeological features relating to subsistence activities, and palynological data on vegetation history. A conceptual framework is always needed in order to interpret the data, and propose cultural activity models.

The settlement of Airolo-Madrano TI was excavated in the years 2004–08 (cf. Della Casa ed., Zurich Studies in Archaeology 12, 2018). It is situated at an altitude of 1150 masl, above the Leventina valley floor, in an area situated at the climatic limits of crop cultivation. The excavations yielded abundant material finds and biological macrorests. Charcoal analysis attests for a human-impacted forest environment and an extensive use of ligneous resources, which is also reflected in the local vegetation history. In the archaeological record, a number of stone-lined firing pits bordered by rows of pales stand out as conspicuous features of subsistence activities. These always contain cracked stones and charcoal, various plant remains, burnt animal bones and ceramic shards, and are thus interpreted as pit ovens and drying kilns.

An all-year local subsistence economy can be postulated for the site, completed by the use of the abundant forests and (sub) alpine pastures in the valley. A possible site catchment Airolo-Madrano has been modeled using environmental parameters in GIS. The observed features and phenomena are discussed against the background of seasonal cycles, agricultural produce, and food preservation techniques.

7 THE “MASSIF DU FOSSARD”, BETWEEN MOUNTAIN AND FOREST : A WINDOW OPENED ON THE ANTHROPIISATION OF THE VOSGES MOUNTAINS

**Abstract author(s):** Kraemer, Charles (HisCAnt-MA - Université de Lorraine)  
**Abstract format:** Oral  
For some time now, the mountain has been the object of particular attention. The Vosges massif is no exception. Echoing the work already carried out on the high stubble and the Alsatian hillside, a multidisciplinary team is looking for the dynamics of a forest area on the Lorraine side over the long term. The choice of the “Fossard”, which dominates the western foothills of the massif and extends over nearly 150 km² between Epinal and Remiremont, results from the close link with the latter born of a medieval alto abbey founded in a perched late-antique castrum.

In this sector of medium mountains where superficial sandstones rub shoulders with crystalline outcrops, the question arose as to whether the forest that developed after the disappearance of the glaciers, around the tenth millennium before present, has undergone, since the Neolithic period, the same alternation of clearings and recoveries as others. During the first millennium, did it remain a space reserved for the hunting activities of the powerful or, on the contrary, was it only impacted from the 7th century onwards by the monks who cleared the land, as the account of the lives of the holy founders of Remiremont Abbey suggests? Did the abbey develop new models of land management there? Did it encourage the settlement of the massif by clearing the land, as the name “Fossard” evokes, long before its conquest in the 16th century? These are all questions which, thanks to a LiDAR carried out for the occasion and a multi-disciplinary approach, should provide some answers to better understand the phases of anthropisation of this “mountain forest”.

This paper will review the results of a first phase of research from a window of about ten km²; it will compare the first field observations with the usual geohistorical sources.

8 THE CHANGING LANDSCAPES OF MONTE PRIMO (CENTRAL APENNINES, ITALY): NEW PERSPECTIVES ON A MONUMENTAL MOUNTAIN TOP SITE

**Abstract author(s):** de Neef, Wieke (Ghent University)  
**Abstract format:** Oral  
This paper presents new research of the monumental mountaintop site Monte Primo near Pioraco (Marche, Italy) and the changing landscape in which it is situated. Monte Primo was in use between the Late Bronze Age and the Roman Republic period and is characterized by a series of large enclosures of uncertain date which cover an area of ca. 2 hectares. The earliest occupation of this 1300 m high summit is often interpreted as a fire offering place (‘Brandopferplatz’) related to pastoral land use. Iron Age and Roman activity is attested by various bronze figurines found by metal detectorists and/or looting. Geophysical prospection, aerial photography, and surface modelling allowed to analyze the spatial organization of the large enclosures and natural features on the mountain, and to model the ritualized access to the summit. By placing Monte Primo in a longue durée context of increasing social complexity and landscape formation processes, this presentation proposes how this site was embedded in its cultural and natural surroundings, and how its role changed during its 1000-year occupation history.

9 THE BRONZE AGE DEPOSIT OF EL MIRADOR CAVE: A HIGH-RESOLUTION INVESTIGATION OF ANIMAL HERDING USING MICROMORPHOLOGY AND PHYTOLITH ANALYSES

**Abstract author(s):** Polo-Díaz, Ana (Department of Archaeology. University of Sheffield) - Burguet-Coca, Aitor (IPHES-Institut Català de Paleoeecologia Humana i Evolució Social) - Vergès-Bosch, Josep Maria (IPHES- Institut Català de Paleoeecologia Humana i Evolució Social; Universitat Rovira i Virgili - URV)  
**Abstract format:** Oral  
Mountain areas are key for the investigation of the introduction and expansion of early farming in the SW Mediterranean. During the Late Prehistory caves and rock-shelters were used for herding of domestic herbivores, entailing the formation of deposits commonly referred to as fumiers. These sites, although displaying variable thickness and preservation degree depending on location and time period, commonly consist of a mixture of weathered and burnt organic matter which investigation requires microscopic analytical approaches to fully unravel their composition and formation processes.

El Mirador Cave, is a fundamental site for the study of herding practices in the Iberian Peninsula with an extensive fumier deposit dating back to the Neolithic period. In this presentation we focus on the Bronze Age section of this fumier deposit (2nd millennium cal BC) to explore questions regarding some stratigraphic particularities of the sequence observed in the field.

Integrated data of micromorphological and phytolith analyses allowed us to improve our understanding of the human activities and natural dynamics involved in the accumulation and alteration of the deposit and clarify aspects concerning the taphonomy of the archaeological record.

10 ABOUT A RITUAL DAMAGE OF A ROMAN ARMOR IN A SANCTUARY GURZUFSKOE SEDLO

**Abstract author(s):** Novichenkova, Maria (Institute of Archaeology of National academy of Science of Ukraine)  
**Abstract format:** Oral  
A paper will deal with the peculiarities of ritual rites hold in a barbarian sanctuary near the pass Gurzufskoe Sedlo, situated in the Mountain Taurica on a height 1434 m under a sea-level – the ritual damage of a Roman armor used as votive offerings. The sanctuary began its functioning not later than the 4th century BC with the use of numerous animal sacrifices. In the last quarter of 1st century BC, there was constructed a new ritual complex with the arch system of ritual pits and the use of fire rituals in rites.

During the investigations, a sanctuary hold in 1981-1993 (the archaeological expedition of Yalta Historical and Literary Museum, the head of an expedition – N.G. Novichenkova) along with the other votive objects there were revealed more than 2600 items, details, and fragments of the Roman military equipment of the 2nd cent BC – 3rd century AD – an offensive, defensive weapons, details of a military suite and camp life. The majority of items date by the Early Principate period. Most part of Roman armor – e.g., the helmets, chain-mail Lorica Hamata, gladii were cut on pieces and dispersed on a vast territory of a sanctuary.

A. HUTS, ENCLOSURES, AND OTHER DRY-STONE STRUCTURES: TOWARDS AN UNDERSTANDING OF THE ARCHAEOLOGICAL RECORD IN HIGH MOUNTAIN ZONES OF SOUTHEASTERN EUROPE

**Abstract author(s):** Garcia Casas, David (Institute of Heritage Sciences Incipit - CSIC)  
**Abstract format:** Poster

In the last two decades numerous research programs have been carried out in different high mountain zones of Europe. Consequently, new data and a large amount of new archaeological sites are available for areas that had been overlooked in previous research. There are some common problems that researchers in mountain archaeology must face. The first one is the methodology to record and classify an archaeological record that appears sparse in the landscape. Another common problem is the chronological and functional identifications of the remains in a zone without previous archaeological studies and consequently no references to interpret the archaeological sites.

In this poster, I have focus on two case studies located in alpine environments. I have examine the archeological record of the Parc Nacional d'Aigüestortes i Estany de Sant Maurici (Southern Central Pyrenees) and the archaeological record of Ubaye Valley (French Alps). Moreover I have analysed the features of open-air structures in these zones in order to explore if it is possible to build types of pastoral settlements. Finally, in this work I discuss similarities and differences in all zones in two ways: in the features of empirical record and in terms of the evolution of subsistence practices and long-term sociohistorical dynamics.

278 **SYSTEMIC APPROACHES TO AGRICULTURAL AND LAND USE CHANGE IN PREHISTORIC SOCIETIES. PART 1**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Antolin, Ferran (Integrative Prehistory and Archaeological Science - IPNA/IPAS, University of Basel; Department of Natural Sciences, German Archaeological Institute) - Whitehouse, Nicki (Archaeology, School of Humanities, University of Glasgow; School of Geography, Earth and Environmental Sciences, Plymouth University)

**Format:** Regular session

Farming practices are embedded within a complex and inter-dependant system that involves crops and livestock and their management, soils, the environment and climate, as well as social and land-use dynamics. Changes in agricultural practices are therefore never simple or easy to track, but archaeobotanical and archaeozoological data generated over the past few decades informs us that they took place, sometimes at a very broad scale. The question we would like to address in this session is: what drove agricultural changes and innovations in prehistory, when farming practices were mostly locally rooted and depended largely on household level decision-making and what were their social and ecological consequences?

Archaeology has the ability to tackle this complex network of processes and consequences by interlinking multiple proxies that can be evaluated independently, combined and contrasted with multiple sources of information. This session welcomes papers that deal with all types of archaeological proxies that are combined with data on agricultural dynamics at the local, regional or supra-regional scale to understand the scale of agricultural change, innovation and productivity, as well as the effects on social and ecological systems, including land cover and land use change. We particularly welcome multi-proxy and systemic approaches to the understanding of agricultural decision-making in the past.

This session is supported by the AgriChange Project (<https://agrichange.duw.unibas.ch>), funded by the Swiss National Science Foundation (PP00P1\_170515) and the LandUse6k working group of PAGES (<https://landuse.sas.upenn.edu/>).

**ABSTRACTS:**

1 **DEVELOPMENTS IN EARLY NEOLITHIC PLANT MANAGEMENT PRACTICES DURING THE EMERGENCE OF HOUSEHOLD-BASED FARMING COMMUNITIES IN SOUTHWEST ASIA**

**Abstract author(s):** Weide, Alexander (School of Archaeology, University of Oxford) - Hodgson, John (Department of Archaeology, University of Sheffield) - Dovrat, Guy (Department of Natural Resources, Agricultural Research Organization, Israel) - Bogaard, Amy (School of Archaeology, University of Oxford)

**Abstract format:** Oral

This paper discusses a recently developed functional ecological model and its ability to discriminate between different plant management regimes. The model focusses on functional traits positively related to mechanical disturbance (e.g. soil tillage and weeding) and is based on modern vegetation survey data from non-arable wild cereal communities and ‘traditionally’ cultivated arable fields (=no herbicides and minimal mechanisation) in Israel and Palestine. It is able to correctly reclassify between 83-89 % of arable and non-arable habitats, depending on the combination of functional traits used in the discriminant analysis. This differentiation is primarily based on the absence of tillage and other disturbances related to cultivation in the wild cereal communities. We applied the ecological model to Early Neolithic archaeobotanical datasets, spanning the development from early wild cereal exploitation to established farming communities with domesticated crops. All earlier datasets, which have been claimed to represent systematic cultivation, match the untilled wild cereal communities in our model. Weed floras from unequivocal Neolithic farming contexts match the modern arable fields, indicating that cultivation practices, including soil tillage, intensified during the Neolithic transition. We attribute this to the emergence of increasingly independent households, which had the ability to mobilise more labour than earlier communities, reflecting a change from communally-organised to household-centred subsistence strategies.

2 **NEW INSIGHTS ON THE IDENTITY AND DOMESTICATION-STATUS OF ‘NEW GLUME WHEAT’ IN THE CONTEXT OF BROAD-SPECTRUM SUBSISTENCE AT NEOLITHIC ÇATALHÖYÜK**

**Abstract author(s):** Roushannafas, Tina - Bogaard, Amy - Charles, Michael (University of Oxford)

**Abstract format:** Oral

Decades of archaeobotanical work have established that the inhabitants of Neolithic Çatalhöyük (central Anatolia) utilised a broad subsistence base which included a diverse range of crops and other food plants. Such a strategy naturally buffers the risk of any one food source failing, and thereby creates a resilient environment conducive to experimentation in cropping. The adoption of so-called

‘new glume wheat’ (NGW) represents such an innovation, cultivated first by inhabitants of the North area of the settlement, and later replacing emmer wheat as a staple crop across the community.

‘NGW’ is an archaeobotanical type first identified from Neolithic and Bronze Age sites in northern Greece and subsequently recognised at a wide range of sites across Europe and western Asia. Morphological analyses along with newly-published aDNA evidence, strongly links NGW and the *Triticum timopheevii* wheat group, now restricted to western Georgia. The large NGW assemblage from Çatalhöyük represents a significant source of data regarding this once widespread, but subsequently neglected, crop.

We present new morphological/geometric morphometric analyses of ‘NGW’ chaff and grain from the eastern mound at Çatalhöyük which use modern timopheevii wheats as reference. By comparing with wild and domesticated timopheev’s wheats, it is argued that NGW was actively undergoing processes of domestication during the thousand-year settlement sequence. This local domestication sequence occurred in the context of an established agricultural regime incorporating a range of domesticated crops. Associated arable weed flora suggest that cereals and pulses were grown under relatively fertile and disturbed growing conditions at Çatalhöyük, providing a rare opportunity to assess domestication processes in terms of selection pressures arising in a well characterised agro-ecological context.

3 **LANDUSE AND AGRO-PASTORAL PRACTICES FROM A HOUSEHOLD PERSPECTIVE: A MULTI-PROXY BIOARCHAEOLOGICAL STUDY OF AN EARLY NEOLITHIC ASSEMBLAGE FROM SLATINA (BULGARIA)**

**Abstract author(s):** Ivanova, Maria (University of Vienna) - Takorova, Desislava (National Institute of Archaeology, Bulgarian Academy of Sciences) - Gorczyk, John (Cornell University) - Blanz, Magdalena (University of Vienna) - Casanova, Emmanuelle - Evershed, Richard (University of Bristol) - Marinova, Elena (State Office for Cultural Heritage Baden-Württemberg) - Nikolov, Vassil (National Institute of Archaeology, Bulgarian Academy of Sciences)

**Abstract format:** Oral

Studies of plant and animal remains, combining a range of traditional zooarchaeological and archaeobotanical proxies with novel developments in isotopic and biomolecular archaeology, allow in-depth understanding of prehistoric agro-pastoral systems. Although this approach is equally well suited to uncover inter-regional trends as well as household level decision-making, it is most often employed in broad-scale comparative studies. In contrast, we focus on the bioarchaeological assemblage from one well-preserved Early Neolithic (c. 6100-5850 cal BC) building at the site of Slatina, to uncover the agronomic decisions of an individual household at the scale of the annual farming cycle. The site of Slatina dates to the period of initial establishment of sedentary farming villages. The bioarchaeological assemblage, including a large number of charred annual crops and gathered fruits in storage bins as well as animal bones, originates from a fully excavated burnt house, covering an area of 147 m<sup>2</sup>. Destroyed in a single event of intense conflagration, this large assemblage reflects just one or a few consecutive annual cycles, and thus provides a rare snapshot view of a number of agricultural decisions made during the same short time period. We integrate the results of archaeobotanical and faunal studies with isotope analyses of crops, domestic animals and absorbed lipids in pottery, to reconstruct the household’s agro-pastoral decisions regarding crop choices, soil management, animal diet and dairy exploitation within a mixed farming system. This work thus provides detailed insights into past decision-making on a short-term household scale, which are required to understand broader changes in land use.

4 **A CHANGE IS GONNA COME: TOWARDS A MULTIPROXY APPROACH TO AGRICULTURAL PRACTICES IN THE NORTHWEST MEDITERRANEAN REGION AROUND 4000 BC**

**Abstract author(s):** Antolin, Ferran (Deutsches Archäologisches Institut; IPAS, University of Basel) - Häberle, Simone - Jesus, Ana - Martínez-Grau, Héctor (IPAS, University of Basel) - Prats, Georgina (Universitat de Lleida) - Schäfer, Marguerita - Steiner, Bigna (IPAS, University of Basel) - Hajdas, Irka (Laboratory of Ion Beam Physics, ETH) - Jaggi, Madalina - Bernasconi, Stefano (Department of Earth Sciences, ETH)

**Abstract format:** Oral

The diffusion of agriculture from SW Asia to the Southern Balkans was based on a large crop diversity including a wide range of cereals and pulses. A progressive reduction of this suite of crops is observed as farming practices expanded towards the West. In the NW Mediterranean, a rapid focus towards naked wheat and naked barley took place at the end of the 6th millennium cal. BC. Both crops dominated the plant spectrum, together with some legumes such as pea and common vetch, until the end of the 5th millennium cal. BC. For unknown reasons, an increase in glume wheats (either einkorn or emmer or both) is observed in many sites around 4000 cal. BC.

In order to discuss potential explaining factors for this change, a robust archaeobotanical dataset (including new sites with good preservation of plant remains) has been built, along with interdisciplinary analyses of potential crop pests, storage techniques as proxy for household-scale productivity and isotopic analyses of cereal grain that reveal crop growing conditions. These have been combined with a radiocarbon dating programme to secure the necessary temporal accuracy. The main underlying question is whether crop change was a cultural decision or an adaptive response to climatic or other natural hazards and whether any proxies anticipate the change or if it took place suddenly. This work is carried out within the SNF Professorship project AgriChange (PP00P1\_170515).

5 **PER CAPITA LAND USE AND GLOBAL CLIMATE CHANGE MODELS: TRACKING HISTORIC ANTHROPOGENIC LAND USE THROUGH TIME AND SPACE**

**Abstract author(s):** Madella, Marco (ICREA - CaSEs Research Group - Universitat Pompeu Fabra) - Hill, Chad - Morrison, Kathleen (University of Pennsylvania) - Whitehouse, Nicki (University of Glasgow) - Jiménez-Arteaga, Carolina (CaSEs Research Group - Universitat Pompeu Fabra) - Hilpert, Johanna (University of Köln) - Welton, Lyn (University of Toronto) - Biagetti, Stefano (CaSEs Research Group - Universitat Pompeu Fabra) - Bates, Jennifer (University of Pennsylvania) - Kolár, Jan (Czech Academy of Sciences)

**Abstract format:** Oral

Humans have been important drivers of environmental change for millennia. Changing human land use drove changes in land cover, with the most dramatic changes resulting from the agricultural revolution and the domestication of plants and animals. Tracking this anthropogenic land cover change (ALCC), through models of historical per capita land use (PCLU) combined with historic population models, is crucial for climate modeling as well as global climate change studies. However, until now, ALCC models have been limited by the relative lack of historical data on per capita land use. There has not been an investigation of how per capita land use is related to climate and the type of biomes where people settled, or how climatic settings influence land use. To address this, we have been building a global database of historic per capita land use. In this presentation we explore this land use data, comparing temporal, environmental, and technological variables in order to understand the archaeological significance of per capita historical land use and, potentially, provide much needed nuance for land cover change models.

6 **EUROPEAN LAND-USE AT 6000 CAL BP**

**Abstract author(s):** Whitehouse, Nicki (Archaeology, School of Humanities, University of Glasgow; University of Plymouth) - Vander Linden, Marc (IMSET, University of Bournemouth) - Madella, Marco (ICREA - CaSEs Research Group, Department of Humanities, Universitat Pompeu Fabra) - Antolin, Ferran (Department of Natural Sciences, German Archaeological Institute, Berlin; Integrative Prehistory and Archaeological Science, University of Basel) - Dreslerová, Dagmar (Dept of Archaeology, University of Prague) - Filipovic, Dragana (Institute for Pre- and Protohistory, Kiel University) - Kolar, Jan (Department of Vegetation Ecology, Institute of Botany of the Czech Academy of Sciences; Institute of Archaeology and Museology, Masaryk University) - Marinaova, Elena (Baden-Württemberg State Office for Cultural Heritage, Laboratory for Archaeobotany) - Nowak, Marek (Institute of Archaeology, Jagiellonian University) - Out, Welmoed (Dept of Archaeological Science and Conservation, Moesgaard Museum, Højbjerg)

**Abstract format:** Oral

The PAGES LandCover6K group is concerned with prehistoric human impacts on land cover and if these impacts were sufficiently large to have affected regional climates. This is usually done via modelling land cover using different scenarios. However, there are major differences between the current available land use scenarios, between these scenarios, and reconstructions based on pollen analysis. A promising way to achieve a more realistic assessment of the land use changes needed to affect past climate is to input land use models with more accurate land cover and land use changes inferred directly from both palaeo-vegetation (land cover) and archaeological records (land use).

We present a top-level land use map for Europe at 6000 cal BP and summarise key land use activities for selected regions, derived primarily from radiocarbon dates, compared with site-based distribution maps and records of animals and plants used by people as proxies for the past economy, alongside contextual data. By 6000 cal BP, large areas of Europe were already subjected to land use change, although the intensity of land usage at this time varied significantly between regions, likely the consequence of both gaps in archaeological knowledge and differences in land use practice (e.g. the degree of reliance on agriculture, if any) and population dynamics. Incorporating this variability in land use intensity will produce a considerable improvement in existing land-use scenarios and improve understanding of how past land use may have impacted past climates.

\*The European Land use work represents the efforts of many scholars, not all of whom are listed here for reasons of space; a full list of Europe participants is here: <https://landuse.sas.upenn.edu>.

\*\*The PAGES LandCover6K project is co-ordinated by Marie-Jose Gaillard; global land use co-ordinators are Kathy Morrison, Marco Madella and Nicki Whitehouse. The full leadership group may be found here: <http://pastglobalchanges.org/science/wg/landcover6k/intro>.

7 **COMBINING SETTLEMENT DYNAMICS AND BIOARCHAEOLOGICAL EVIDENCE FOR INFERRING THE IMPACT OF LANDUSE ON THE NEOLITHIC LANDSCAPES IN SOUTHEASTERN EUROPE**

**Abstract author(s):** Marinaova, Elena (Laboratory for Archaeobotany, Baden-Württemberg State Office for Cultural Heritage) - Filipović, Dragana (Institute for Pre- and Protohistory, Christian Albrecht University Kiel) - Gorczyk, John (Dept. Anthropology, Cornell University) - Bulatović, Jelena (Laboratory for Bioarchaeology, University of Belgrade) - Vander Linden, Marc (Institute for the Modelling of Socio-Environmental Transitions, Bournemouth University)

**Abstract format:** Oral

Bioarchaeological studies of past subsistence are essential for understanding how human societies have shaped their environment. However, those studies only provide an indirect measure of land use and this measure considered on its own has a qualitative

character. A possible way to obtain quantitative estimates for given subsistence pattern and land use lies in the combination of bioarchaeological (i.e. archaeobotany and zooarchaeology) and settlement data (as inferred from 14C-dated sites). Here we test this approach with evidence from the Balkans covering the time span between 8000 and 6000 cal BP and discuss it in view of its implications for reconstructing anthropogenically induced land cover change.

The extent and nature of settlement patterns will be inferred from the analysis of archaeological sites, privileging those with direct 14C information. Diachronic trends in crop and weed diversity will be used to estimate organisation of crop field growing. Human impact on vegetation cover will be further estimated based on wood charcoal data from settlements and the wild/gathered plants component of the archaeobotanical assemblages. Zooarchaeological data will provide a measure of the reliance upon both domesticates and wild animals and their informative value for the land use and landscape development.

8 **AGRICULTURAL AND LAND-USE MODELS IN SOUTHERN POLAND: NEW ARCHAEOBOTANICAL DATA FROM EARLY AND MIDDLE NEOLITHIC CASE-STUDIES**

**Abstract author(s):** Moskal-del Hoyo, Magdalena - Korczyńska, Marta - Kapcia, Magda (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) - Nowak, Marek (Institute of Archaeology, Jagiellonian University, Kraków) - Kenig, Robert (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków; Institute of Archaeology, Jagiellonian University, Kraków)

**Abstract format:** Oral

Loess-mantled areas of southern Poland belong to the first regions occupied by the Neolithic groups. The first communities that were responsible for bringing a new type of economy based on food production appeared in the second half of the sixth millennium BC (the Linear Pottery Culture). Their patterns of farming and spatial arrangements were close to those of the Balkan-Danubian Neolithic cultures. During the first half of the fourth millennium BC these patterns changed considerably, following the appearance and spread of the Funnel Beaker Culture. A relatively intensive agriculture and enclave-type settlement were replaced by extensive, environmentally universal agriculture and more evenly distributed settlement. In this presentation we will focus on plant economy and its implications for the potential land-use models, based not only on farming practices associated with domesticated plants, but also on the use of wild plants. In order to track the evolution of plant-based agriculture in southern Poland, we will present the analysis of charred plant remains coming from recently excavated and thoroughly sampled archaeological sites of the Linear Pottery culture (Biskupice site 18), the Lengyel-Polgar culture (Spytkowice site 26) and the Funnel Beaker culture (Mozgwa site 1-3). These sites were studied in light of all available regional archaeobotanical records and other multi-proxy data. The research was conducted in the context of local palaeoenvironmental conditions since the sites, although located in loess areas, represent different regions, including the foothills, the upland zones and alluvial environments. Also, our study took into account various types of settlements as the data came from relatively small settlements based on a few contemporary households and from large settlements extending over 20-30 hectares.

9 **NEOLITHIC LAND-USE IN THE DUTCH WETLANDS: ESTIMATING LAND-USE IMPLICATIONS OF RESOURCE EXPLOITATION STRATEGIES IN THE MIDDLE SWIFTERBANT CULTURE (4600-3900 BCE)**

**Abstract author(s):** Dusseldorp, Gerrit (Faculty of Archaeology, Leiden University; Palaeo-Research Institute, University of Johannesburg) - Out, Welmoed (Moesgaard Museum, Department of Archaeological Science and Conservation)

**Abstract format:** Oral

The Dutch wetlands witness the gradual adoption of Neolithic novelties by foraging societies during the Swifterbant period. Recent analyses provide new insights into the subsistence palette of Middle Swifterbant societies. Small-scale livestock herding and cultivation are in evidence at this time, but their importance is unclear. Within the framework of PAGES Land-use at 6000BP project, we aim to translate the information on resource exploitation into information on land-use that can be incorporated into global climate modelling efforts, with attention for the importance of agriculture.

A reconstruction of patterns of resource exploitation and their land-use dimensions is complicated by methodological issues in comparing the results of varied recent investigations. Analyses of organic residues in ceramics have attested to the cooking of aquatic foods, ruminant meat, porcine meat, as well as rare cases of dairy. In terms of vegetative matter, some ceramics exclusively yielded evidence of wild plants, while others preserve cereal remains. Elevated  $\delta^{15}N$  values of human were interpreted as demonstrating an important aquatic component of the diet well into the 4th millennium BC. Yet recent assays on livestock remains suggest grazing on salt marshes partly accounts for the human values. Finally, renewed archaeozoological investigations have shown the early presence of domestic animals to be more limited than previously thought.

We discuss the relative importance of exploited resources to produce a best-fit interpretation of changing patterns of land-use during the Middle Swifterbant phase. Our review combines recent archaeological data with wider data on anthropogenic influence on the landscape. Combining the results of plant macroremains, information from pollen cores about vegetation development, the structure of faunal assemblages, and finds of arable fields and dairy residue, we suggest the most parsimonious interpretation is one of a limited land-use footprint of cultivation and livestock keeping in Dutch wetlands between 4600 and 3900 BCE.

SOCIAL AND ECOLOGICAL CONSEQUENCES OF LAND-USE CHANGE IN NEOLITHIC IRELAND

**Abstract author(s):** McClatchie, Meriel (University College Dublin) - Whitehouse, Nicki (University of Glasgow)

**Abstract format:** Oral

Farming began in Ireland during the early centuries of the Neolithic period (4000-2500 BC). There is widespread evidence for engagement with agricultural activities – both plant and animal – soon after 4000 BC, as well as new ways of shaping local and wider landscapes through the construction of substantial settlements and burial monuments. Although we can detect changing practices in land use during the preceding Mesolithic period, human impacts on landscapes take place on a very different scale during the Neolithic period in Ireland. These new practices do not persist, however. From the Middle Neolithic (starting c. 3600 BC), both arable agriculture and settlement become increasingly difficult to detect in the archaeological record. What were the social and ecological consequences of these shifts in behaviour? This paper will explore dynamic practices in agriculture and land use during the Neolithic period in Ireland, drawing upon a variety of archaeological evidence and proxies, including archaeobotany, zooarchaeology, palynology, palaeolimnology and organic residue analyses. The evidence from Ireland will be considered in the wider context of Europe, drawing upon findings by the LandUse6k working group of PAGES.

BIODIVERSITY AND LAND-USE CHANGE IN THE BRITISH ISLES - A MULTI-PROXY APPROACH TO INTERPRETING HUMAN-ENVIRONMENT INTERACTIONS

**Abstract author(s):** de Vareilles, Anne (Historic England, Fort Cumberland, Portsmouth) - Woodbridge, Jessie (School of Geography, Earth and Environmental Sciences, University of Plymouth) - Smith, David (Department of Classics, Ancient History & Archaeology, University of Birmingham) - Pelling, Ruth (Historic England, Fort Cumberland, Portsmouth) - Fyfe, Ralph (School of Geography, Earth and Environmental Sciences, University of Plymouth)

**Abstract format:** Oral

The Biodiversity and Land-Use Change in the British Isles project brings together fossil pollen, plant macrofossils and ancient insect remains to explore past changes in land-use and land-cover in Britain. We have chosen the south-east of England as a case study area where we use the three different lines of evidence to generate a multi-proxy approach to identifying land-use and land-cover changes from the Neolithic to the Roman period. The three sources of evidence enable us to define landscapes at different spatial and temporal scales, offering a novel way by which to investigate past human-environment interactions and long-term changes in biodiversity. Climatic records and population “boom and busts” inferred from summed radiocarbon dates are integrated into our analysis, to better understand the causes and effects of land-cover changes. Initial results have demonstrated complex relationships between land-cover and population density (Woodbridge et al. 2020). This paper will present the methodology and results of our ongoing analyses, which offer new insights into the inter-relationship between land-cover (reconstructed from the palynological data), land-use (from the archaeobotanical data) and biodiversity (from pollen and insect data), and reflects on how these may be integrated to understand ecological change in the past.

Woodbridge et al. 2020. What drives biodiversity patterns? Using long-term multidisciplinary data to discern centennial-scale change. Journal of Ecology. DOI: 10.1111/1365-2745.13565

LIVING IN THE MOUNTAINS: SETTLEMENT STRATEGIES FROM THE BEGINNING OF THE HOLOCENE TO MODERN TIMES IN SOUTHERN EUROPE. PART 2

**Theme:** 5. Assembling archaeological theory and the archaeological sciences

**Organisers:** Alliot, Pascal (Department of Antiquity and Middle Age Studies, Autonomous University of Barcelona - UAB) - Stagno, Anna (Laboratory of Environmental Archaeology and History - DAFIST-DISTAV, University of Genoa) - Olesti, Oriol (Department of Antiquity and Middle Age Studies, Autonomous University of Barcelona - UAB) - Gassiot Ballbè, Ermengol (Department of Prehistory, Autonomous University of Barcelona - UAB) - Portillo, Marta (Institutió Milà i Fontanals, Spanish National Research Council - CSIC)

**Format:** Regular session

Over the last few decades, our understanding of human occupations in mountain areas of Southern Europe from the Pleistocene-Holocene transition onward has increased notably. Interdisciplinary attempts and the integration of geosciences and natural sciences has become and extension to conventional archaeological approaches. There is a range of evidence for subsistence practices from key moments tracking the emergence of early farming, the domestication of plants and animals, the relationship between socio-economic changes and environmental resources management, and the impact on the environment.

This session will place together recent research exploring settlement patterns from the early/middle Holocene to modern times, through a wide diversity of approaches, such as bioarchaeology, geoarchaeology, archaeometry, technology, landscape archaeology, and ethnoarchaeology. We suggest participants particularly explore human-environment interactions in mountain areas in different regions across Southern Europe through time, and in key episodes of cultural change. Interdisciplinary studies to delineate the complex environmental and social contexts in mountain occupations from all archaeological records and historic periods are most welcome.

ABSTRACTS:

MOUNTAIN LANDSCAPE ECONOMY. CHARACTERIZATION OF ANCIENT AGRARIAN SPACES IN THE UPPER SEGURA RIVER BASIN

**Abstract author(s):** González Reyero, Susana - Sánchez-Palencia Ramos, Francisco-Javier (Spanish National Research Council)

**Abstract format:** Oral

Our study of a landscape of prebetic and subbetic mountain ranges in the southeast of the Iberian Peninsula, structured by the upper basin of the Segura River, has led us to the analysis of the productive practices developed in these landscapes. We consider these economic activities as practices integrated into the rest of social activity and as a central aspect to address the processes of continuity and social change in ancient societies.

We have prioritized working on several scales and in a multidisciplinary way. In this presentation we will address the identification and characterization of agricultural production spaces located in the vicinity of the habitats of the 1st millennium BC. In Jutia, the integration of photointerpretation, geophysics, palaeoenvironmental studies and surveys allows us to hypothesize the agrarian use of the valley in a long diachrony, which begins in the 1st millennium BC and includes Iberian and Roman Republican times. In Morra de los Castillejos we have combined photointerpretation and prospecting, identifying possible agricultural structures and a registry compatible with subscriber practices. With this, we seek to analyze the production models of these landscapes, taking into account the mixed models that integrate pastoralism or livestock and taking care of the possible identification of specific solutions of these mountain landscapes.

JURISDICTION, LOCAL SOCIETIES AND PRACTICES. A METHODOLOGICAL PERSPECTIVE ON THE ARCHAEOLOGY OF COMMONS IN THE BASQUE COUNTRY

**Abstract author(s):** Stagno, Anna Maria (University of Genova - DAFIST- Laboratory of Environmental Archaeology and History) - Narbarte, Josu (University of the Basque Country) - Portillo, Marta (CSIC - IMF, Archaeology of Social Dynamics, Barcelona) - Santeramo, Riccardo (University of Genova - DAFIST) - Tejerizo García, Carlos (University of the Basque Country)

**Abstract format:** Oral

This papers aims at discussing the theoretical and methodological background of an investigation conducted in different mountainous areas of the Basque Country, focused on the archaeological analysis of the common-lands. This investigation forms part of a wider project (ARCHIMEDE) which tested the possibility to archaeological investigate the jurisdictional dimension of common-lands, through case studies located in different mountains of southern Europe.

Investigations crossed archival research, archaeological surveys and excavation, integrated with geochemical and archaeobotanical analyses, including wood charcoal, pollen, non pollen palynomorphs, phytoliths and other calcitic microfossils and radiocarbon dating. We will focus in particular on the results of the investigation of medieval and post-medieval seasonal settlements (Malla and Beorlatza), where the investigation linked in-site and extra-sites contexts. The aim was to reconstruct changes in the environmental resources management practices and in the way to occupy and inhabit the mountain space, considering practices in their double meaning of ways to product primary products and possession acts to claim jurisdiction and access rights. The methodological question are referred to the relationship between of site and off-site and between synchronicity and diachronicity in the archaeological record and at a micro-analytical level.

IMPACT OF PASTORALISM ON THE OPENING UP OF THE LANDSCAPES OF THE MERCANTOUR AND CRITICISM OF STRUCTURALIST AND PALEOENVIRONMENTAL PARADIGMS

**Abstract author(s):** Suméra, Franck (Ministère de la Culture France)

**Abstract format:** Oral

For several decades, two paradigms have organised archaeological research in the Southern French Alps. The first one is linked to a structuralist discourse that refers to the notion of mountain «affordance» and gives a timeless dimension to pastoral practices in the management and organisation of southern Alpine terroirs. The second is linked to the numerous paleoenvironmental studies that have demonstrated the existence of persistent pastoral practices since the Neolithic period and that of an opening of the landscape that has been progressing since the Subboreal, and which speculate on the importance of the causal link between these two facts.

The study presented here reconsiders these paradigms in the light of the signals returned by recent archaeological research and the analysis of archaeological, historical and palaeoenvironmental documentation. It points out the weaknesses of the dominant discourse and shows, through archaeological examples, the non-linear character of the historical processes linked to pastoralism in the Mercantour mountains from protohistory to modern times.

4 **ARCHAEOLOGICAL AND PALAEOENVIRONMENTAL SURVEYS IN JURA MOUNTAIN WOODLANDS: METHODOLOGY AND FIRST RESULTS**

**Abstract author(s):** Chevassu, Valentin - Bichet, Vincent - Richard, Hervé - Gauthier, Emilie (UMR 6249 Chrono-Environnement / Université de Bourgogne-Franche-Comte)

**Abstract format:** Oral

Jura mountains are characterized by a landscape of plateaux and high valleys between 600 and 1700 m high, on the French/Swiss border. This region is nowadays mainly covered by pastures and wooded areas.

Numerous high resolution and well dated paleoenvironmental analyses performed on peat deposits and lakes are available in the studied area. These information items are completed by a large collection of medieval and modern archives, still underused. More recently, facing the lack of archaeological data, a survey program has been launched on this area since 2015 by Chrono-Environnement Laboratory. This program is based upon the analysis of LiDAR data and seeks to bring chronological data about the spotted archaeological structures, often located in mountain spruce forests. Several field approaches have been tried to characterize as well as possible these different types of sites, from pedestrian surveys to test pits. The main results are concerning the numerous remains of medieval and modern forest exploitation - such as tar kilns, lime kilns and charcoal-making platforms - and pastoral activities - modern deserted hamlets and dairy huts, drystone field boundaries -, that were never studied or surveyed before.

A systematic crossing between these different approaches has been done thanks to a database linked to a Geographical Information System. It may be possible then to describe and understand more precisely the evolution of land-use, beyond the usual prejudices about marginality and late land clearing in mountain territories. On another side, the crossing of written sources with statistical analyses of palynological data may enable us to estimate more precisely the impact of various historical phenomenon on the evolution of land-use.

5 **BIOSTRATIGRAPHIC ANALYSIS FOR THE HISTORY AND CHRONOLOGY OF ENVIRONMENTAL RESOURCES MANAGEMENT. NEW RESULTS FROM LIGURIAN APENNINES (BORZONASCA, GENOVA, N-ITALY)**

**Abstract author(s):** Attolini, Davide - Montanari, Carlo - Stagno, Anna Maria (Laboratory of Environmental Archaeology and History - DAFIST-DISTAV, University of Genova)

**Abstract format:** Oral

Based on previous rural archaeology investigations carried out by the Laboratory of Environmental Archaeology and History of the University of Genova in Valle Sturla (Western Ligurian Apennines), the paper aims to discuss possibilities and difficulties to gain a good chronological definition of land management events that can be read in pollen assemblages. The aim is to make it possible to compare and contrast archaeobotanical results with archaeological and archival research in post-medieval contexts. The focus is on the micro-analytical characterization of agro-forestry-pastoral activities as a key element to reconstruct changes in the organization of the local societies and to understand the differences in the population dynamics of settlements. The selected case study concerns Perlezzi, a small hamlet of the municipality of Borzonasca (Genoa, Italy), where pastures, irrigation aqueducts, and terraces are still in use, as opposed to what happens in most of the Ligurian Apennines, characterized by a widespread abandonment of agro-silvo-pastoral activities. Previous research showed a visible change in the relationship between the management of environmental resources (in particular water resources and grazing activities) and the transformations related to access rights to commons, which took place in the last three centuries. Research suggested that between eighteenth and nineteenth centuries, short-distance transhumance ("monticazione") finally established in Perlezzi, leading to important changes in the management of grazing resources, which still wait to be analytically investigated. The study's goal is to verify whether it is possible to observe these changes and better characterise them by means of biostratigraphic sources, i.e. micro and macro-remains preserved in wetlands sediments. For this purpose, we have selected two peat-bogs, "Pian delle Moglie" and "Moglia del Fango", from which samples were extracted for pollen analysis. Multi-proxy analyses have been carried out, including pollen, NPPs, microcharcoal, sediment texture and micromorphology.

6 **HISTORICAL PERSPECTIVES ON ALPINE IRRIGATION FARMING AND ENVIRONMENTAL RESOURCE MANAGEMENT**

**Abstract author(s):** de Jong, Carmen (University of Strasbourg) - Meier, Thomas (University of Heidelberg)

**Abstract format:** Oral

Few studies relate irrigation farming in the European Alps with climate, hydrology and environmental resource management over history. Under current threats of climate change and anthropogenic impacts understanding how alpine irrigation agriculture survived droughts and dry summers in the past is essential. Considerable potential exists for reconstructing hydro-climatological conditions as well as agricultural characteristics such as irrigation canals, fields and meadows. This requires an interdisciplinary approach across geography, hydrology, climatology, history and archaeology ranging from excavations to the study of archives and interpretation of topographic, imagery and lidar maps. Across the southern Alps and inner alpine dry valleys, the beginning of irrigation is not well known but archaeological evidence from the Bronze Age exists in Vinschgau, South Tyrol. Nevertheless, the first written records date from the 12th century AD. In regions with a rainfall deficit, strong winds and southward exposure, irrigation was essential to

increase the biodiversity and yield of hay meadows during the summer at altitudes as high as 2000m a.s.l. Benefits included gravitational water flow from torrents or glaciers that gradually warmed and infiltrated into the soil, bringing water and nutrients directly to the plant roots and reducing evapotranspiration losses. Settlement patterns developed together with irrigation systems, often consisting of multiple parallel irrigation channels. Scattered hamlets appeared at major canal distribution points. Irrigation infrastructure was planned, built and maintained by village councils. Elected officials enforced an equitable allocation of precious water resources especially during droughts. During the 20th century, irrigation canals and participative water management were replaced by larger autonomous farming ventures with individual energy-consumptive water pumps and sprinklers causing high evaporation losses. There is no real accountability and sustainability mechanism to prevent water overuse and conflicts especially with growing water pollution and abstractions for tourism. Nevertheless, existing irrigation canals are increasingly restored for tourism and ecological conservation.

7 **MOUNTAINS BC/AD. MOUNTAINOUS LANDSCAPES AND ECONOMIC STRATEGIES IN THE CENTRAL-SOUTHERN APENNINES (1000 BC-2021 AD): THE JOVANA VALLEY (ABRUZZO, IT)**

**Abstract author(s):** Del Fattore, Francesca Romana (Università degli Studi Internazionali di Roma)

**Abstract format:** Oral

The presentation is part of "PECUS", a multidisciplinary research focused on the sheep-tracks network in Central-Southern Italy (www.pecus-project.eu). The field-data (2010- 2016) comes from the "Fluturnum project", conducted in collaboration with the University of Bologna. The aim is to reconstruct diachronically the human landscapes and the occupation/exploitation strategies of a sample territory located in southern Abruzzo - the valley of the Jovana stream (1,200 - 1,600 m a.s.l.) - between the 1st millennium BC and the contemporary age. Archaeology, Ethnoarchaeology and Cultural Anthropology will guide the analysis. The results of surveys and stratigraphic excavations, the testimonies of memory carriers, the study of recent rural architectural evidence and the relationship with the shepherds still active in the area will be used as tools. A representative pattern of the complexity that has characterised the Apennine chain over the last two thousand years. From South to North, along the Jovana stream, three samples areas are taken into consideration: 1) the Godi pass, where traces of seasonal settlements (Late Bronze Age/Early Iron Age) linked to the exploitation of high-altitude pastures have been documented. The area is still used by a family of transhumant breeders, the heart of the PECUS project; 2) the 'I Giardini' complex, where surveys have documented terracing works and considerable quantities of surface materials (8th century BC - 6th / 7th century AD). Excavations here have brought to light a necropolis (1st-2nd centuries BC) and a settlement (3rd-6th centuries AD), probably abandoned following seismic events; 3) Jovana, where remains of a fortified structure from the late Middle Ages and traces of the nearby village are still visible. Ancient landscapes, where recent traces survive, linked to the activities carried out by the local communities until the 1960s and in some cases – in a residual form – still alive today.

8 **ARCHAEOLOGY OF MOUNTAINS VERNACULAR ARCHITECTURE. AN EXAMPLE IN MASSIF CENTRAL, FRANCE: THE FARMHOUSE OF CLASTRE**

**Abstract author(s):** Laffont, Pierre-Yves (Université Rennes 2; UMR 6566 CReAAH)

**Abstract format:** Oral

The farmhouse of Clastre is located in the small village of Sainte-Eulalie (Ardèche) in the south of Massif central, 1230 m high near the Loire river spring. This building, very well preserved today, is the last farmhouse in the heart of a village in France with a roof covered with broom, a very usual kind of covering in this area before WW2.

Until the end of the 1970s, the farmhouse of Clastre was a small classical farm as many others in this mountainous area, specialized since the Late Middle Ages in cattle breeding due to very high quality natural pastures. In the 1980s, the building was bought by a local association in the aim to valorise the local architectural and rural heritage. It became a small open-air museum, presented as a typical example of vernacular architecture dated between the 16th to the 19th century. During this decade, the building was one of the rare farmhouses in France to benefit from the "Monuments historiques" protection programme and during the 1990s it also benefited from some dendrochronological analyses, a very rare experience for this kind of building in France during the 20th century.

A large programme of restoration works in the middle of the 2010s allowed us to engage important studies (archaeological excavations, archaeology of buildings, archeometric analysis, archives analysis) on the building which was in reality not well known and not exactly dated.

The studies have shown that the present building is the result of a very long time history that dates back to Carolingian times, closely linked to the history of the Saint-Eulalie church and presbytery located immediately next to it. The farmhouse plan and appearance changed regularly throughout the centuries until the last important modifications made in the 1930s.

9 **SETTLEMENT IN WESTERN MASSIF CENTRAL (FRANCE): THE CASE OF NORTHERN CORRÈZE**

**Abstract author(s):** Pichon, Blaise (Université Clermont Auvergne)

**Abstract format:** Oral

I will present the results of the research conducted by the Programme Collectif de Recherche «Habitat antique de la moyenne montagne corrézienne» team since 2014 in the East of the territory of Lémovices. We made first a critical review of all of archaeological and paleo-environmental data available for the area. Concurrently, the team defined a protocol for new research on previously

- 10

known antique sites. We carried out geophysical prospecting, using several methods (electrical prospecting, magnetic prospecting, georadar), in order to be able to obtain plan on large surfaces, before carrying out excavations on small surfaces in order to have stratigraphical and chronological data. Secondly, we carried out paleo-environmental analyses in wetlands near antique sites.

This work made it possible to better understand the organization of the sites, their architectural characteristics, their functions and their dynamics, from the beginning of the Roman period to Late Antiquity. Now, it makes possible to propose new schemes of development of these territories. The forms of ancient rural settlements are various and adapted to the topographical constraints of the sites where they are located. Other forms of settlement (small towns, public buildings) are now attested on the plateaus in northern Corrèze, making it possible to call the idea of little-developed and sparsely populated spaces into question.

**SHEPHERDS' LIFE THROUGH PASTORAL GRAFFITI ON MOUNT CORNÓN IN THE FIEMME VALLEY (TRENTINO – ITALY)**

**Abstract author(s):** Bazzanella, Marta - Ciela, Marika - Tavella, Andrea (Museo degli Usi e Costumi della Gente Trentina)

**Abstract format:** Oral

The writings left by the shepherds on the slopes of the summer pastures of Mount Cornón in the Fiemme Valley (Northern Italy) are more than 47.000 and represent a significant ethnographic heritage of the pastoral culture in the Alpine region between XIV to XIX centuries. The writings record data in order to fix it in memory through the use of support (in this case a rock face) and a medium (a local red hematite pigment known as ból) for the benefit of others (shepherd, passers-by).

The messages, called 'historiolae', contained in the writings consist of a text of variable length, linked to “practical” or “intimate” aspects, usually located after the initials, signature, or family sign of the author. The 'historiolae' count is 2005. Each of them was classified by content: summarized in diary or greeting forms, warnings, exclamations, exhortations, prayers, the shepherds' origin village, pieces of information on working in the mountains, social status, and the mood of the shepherds. Depictions, in association with the 'historiolae', can provide useful information to characterize the author, its political sphere, and in some cases the historical period.

The systematic study of the messages left by the shepherds on the rocky walls of Mount Cornón allowed us to highlight an evolution in the economic exploitation of sheep and goat farming, and also a cultural change. Since the nineteenth century, we can also remark a progressive process of secularization of writings, increasingly characterized by a social affirmation of the shepherds.

**LIVING IN THE MOUNTAINS: SETTLEMENT STRATEGIES FROM THE BEGINNING OF THE HOLOCENE TO MODERN TIMES IN SICILY**

**Abstract author(s):** Forgia, Vincenza (Dipartimento Culture e Società, Università di Palermo) - Ollé, Andreu - Messana, Chiara - Allué, Ethel - Expósito, Isabel (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art) - Martín, Patricia (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art; SERP, Departament d'Història i Arqueologia, Facultat de Geografia i Història, Universitat de Barcelona) - Di Simone, Giovanni (Scuola di Specializzazione in Beni Archeologici “Dinu Adamesteanu” – Università del Salento) - Arnone, Massimo (Geologo) - López-García, Juan Manuel (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA) - Vergès, Josep Maria (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Dept. d'Història i Història de l'Art)

**Abstract format:** Oral

In this contribution, we explore human-environment interactions in the Madonie mountain range, in northwestern Sicily, in a diachronic perspective, analyzing and interpreting the new results of our ongoing research project HUMAnS (Human Upland Mobility in Ancient Sicily). In particular, we present the archaeological evidence recorded with the surface survey of sample areas and the archaeological excavation of a key-site (Vallone Inferno, Scillato – Palermo); then we discuss the results of a spatial analysis aimed to the interpretation of the settlement strategies in their palaeoenvironmental context. In particular, we will highlight the interest for the mountainous environment by prehistoric pastoral communities, mainly during the Middle Neolithic and the transition between the last phase of the local Copper Age and the beginning of the Early Bronze Age, but also during the more recent times. Moreover, we discuss the contribution of the pastoral mobility as one of the main factors for the spread of cultural elements on the island.

- 281

tribe and on the endogenous process of the emergence of the state in tribal and rural areas. The paper will focus on the multifaceted main features of this key place in the history of medieval Morocco, with a specific emphasis on material culture and modes of production and consumption in the context of an agro-sylvo-pastoral economy that can be precisely defined by the bioarchaeological approach.

**RESOURCE USE AND RECYCLING IN URBAN ECOLOGIES**

**Theme:** 1. Widening horizons through human-environment interconnections

**Organisers:** Fitton, Tom (Department of Archaeology, University of York) - Bobou, Olympia (Centre for Urban Network Evolutions, Institute for Culture and Society, Aarhus University) - Lisowski, Mik (Department of Archaeology, University of York) - Raja, Rubina (Centre for Urban Network Evolutions, Institute for Culture and Society, Aarhus University) - Wynne-Jones, Stephanie (Department of Archaeology, University of York)

**Format:** Regular session

In this session we invite papers on resource use and recycling in urban settlements from any geographic region, to encourage a broad discussion of urban ecologies from Antiquity to the Early Modern period.

Towns and cities rely on a complex web of resources, woven into the infrastructure and the practices of urban society. Archaeology is increasingly able to characterise such resource use using high-resolution methodologies to investigate human-centred stories about the urban past. These approaches have also begun to recover evidence for ‘circular economies’ of recycling and reuse in past urban settings, which contribute to contemporary discussions on sustainability and resource depletion.

Archaeological studies of urban ecology rely on combining multiple scales of analysis from domestic production to landscape use, and draw on landscape archaeology, environmental archaeology, and archaeometric studies of craft production among others. This array of methodological avenues also creates a challenge, in that having set out to study environmental resource use, ecological impact, and networked relationships from a wide variety of data sources, it is easy to focus on the results of a single mode of analysis rather than a holistic narrative.

What we offer in this session is the opportunity for researchers from diverse methodological backgrounds to present the results of empirical studies with an emphasis on humanist narratives of resource use and recycling. This might include macro- or micro-scale studies utilising settlement and landscape archaeology, zooarchaeology or archaeobotany, stable isotope or other archaeometric analysis, as well as more traditional archaeological and historic studies, provided the emphasis is on the themes of resource use or circular economies in urban contexts, supported by evidence of practice.

We hope thereby to stimulate discussion on the anthropological narratives of urban dynamics and ways of life which bind archaeological studies of urban ecology, rather than contrasting methodological procedure alone.

**WHO CONTROLLED RECYCLING? NEW DATA FROM LATE ANTIQUE ROME**

**Abstract author(s):** Bison, Giulia (University of Leicester)

**Abstract format:** Oral

In very recent decades, archaeological evidence for recycling in late antique urban centres emerged as a striking feature all across the former territories of the Western Roman Empire. Rome is no exception, with new excavations revealing a widespread pattern of spoliation of classical public and private complexes for recycling.

This phenomenon can be considered a direct reflection of changed political, economic and social life with diverse demands and a different concept of the city and its decorum. Indeed, recycling involved not only urban economics and craft production, but also social practices: in particular, close analysis of the reuse of decayed buildings for recycling offers an important tool to explore the relationship between city-dwellers and site resources and, consequently, social dynamics and power relations within the urban society. Understanding WHO may have controlled and thus could access such spaces and their materials would shed light on how the City was managed, and the new priorities set.

Within this context, metallurgy likely played a significant role in late antique Rome. Metals were vital to city life from multiple points of view (tools, roofing, dress fittings, money, etc) and as a result were a core economic resource and subject to extensive recycling. This paper will frame this process through the analysis of three different case studies, in which prestigious sites located within the former city centre were turned into large-scale metalworking facilities; I will propose a multi-faceted approach that exploits archaeology, texts (including laws) and archaeological science.

Analysis of these metalworking processes and practices through the lens of resource use helps properly question late antique urban systems, economics, authorities and lifeways.

2 THE USE OF RECYCLED MATERIALS IN ROMAN VERNACULAR ARCHITECTURE(S): A CASE STUDY FROM THE PORTA STABIA, POMPEII

**Abstract author(s):** Poehler, Eric (University of Massachusetts Amherst) - Ellis, Steven (University of Cincinnati)

**Abstract format:** Oral

The durability of architectural materials makes them a prime candidate for recycling and reuse in urban environments. This is especially true in the context of Roman cities, where stone was a ubiquitous building material and vernacular architecture evolved to require very few specialized forms. This paper explores the recycling of architectural materials through an architectural survey and associated excavation in two complete city blocks in Pompeii’s Porta Stabia neighborhood. In general, some ten independent ground-floor properties, constituting more than #m of standing architecture, document a history of increasing heterogeneity of building materials, revealing the trendline for recycling between the mid-second century BCE and the late first century CE. This trend toward recycled architectural material can be shown to have been punctuated - indeed motivated - by episodic, city-wide growth spurts. More specifically, these architectures provide an opportunity to explore some archaeological approaches to reuse and recycling in stone-built architectures. These methods include qualitative assessments of stone shapes and types, quantitative assessments of material volumes (especially leveling fills), and metrological analyses of cut stones used in framing other materials. Finally, we approach the question of material procurement through the construct of an archetypal, individual builder, in order to set these piecemeal and vernacular construction activities within a broader urban and socio-economic framework.

3 USE AND RE-USE OF ORGANIC RESOURCES IN LIMITED SPACES - MEDIEVAL WASTE MANAGEMENT IN COPENHAGEN

**Abstract author(s):** Mayer, Simone - Topcagic, Zenon (Museum of Copenhagen)

**Abstract format:** Oral
